ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
 agric., agricultural.
 ambas., ambassador(s).
 Amer., American.
 anct., ancient.
 ann., annual.
 arron., arrondissement.
 A.-S., Anglo-Saxon.
 A.V., Authorised Version.
 b., born.
 Biog. Dic., Biographical Dictionary.
 bor., borough.
 bp., birthplace.
 Brit., British.
 C., Centigrade.
 c., about.
 cap., capital.
 cf., compare.
 co., county.
 com., commune.
 cub. ft., cubic feet.
 d., died.
 Dan., Danish.
 dept., department.
 dist., district.
 div., division.
 E., east; eastern.
 eccles., ecclesiastical.
 ed., edition; edited.
 e.g., for example.
 Ency. Brit., Encyclopædia Britannica.
 Eng., English.
 estab., established; establishment.
 F., Fahrenheit.
 fl., flourished.
 fort. tn., fortified town.
 Fr., French.
 ft., feet.
 Ger., German.
 Gk., Greek.
 gov., government.
 Heb., Hebrew.
 hist., history.
 horticult., horticultural.
 h.p., horse-power.
 hr., hour.
 i.e., that is.
 in., inch(es).
 inhab., inhabitant(s).

is., island(s).
 It., Italian.
 Jap., Japanese.
 jour., journal.
 Lat., Latin.
 lat., latitude.
 lb., pound(s).
 l. b., left bank.
 long., longitude.
 m., mile(s).
 manuf., manufacture.
 min., minute(s).
 mrkt. tn., market town.
 MS., manuscript.
 mt., mount; mountain.
 N., north; northern.
 N.T., New Testament.
 O.E., Old English.
 O.F., Old French.
 O.T., Old Testament.
 oz., ounce(s).
 par., parish.
 parl., parliamentary.
 pop., population.
 prin., principal.
 prof., professor.
 prov., province; provincial.
 pub., published; publication.
 q.v., which see.
 R., riv., river.
 r. b., right bank.
 Rom., Roman.
 R.V., Revised Version.
 S., south; southern.
 sec., second(s).
 sev., several.
 Sp., Spanish.
 sp. gr., specific gravity.
 sq. m., square mile(s).
 temp., temperature.
 ter., territory.
 tn., town.
 trans., translated; translation.
 trib., tributary.
 univ., university.
 urb., urban.
 vil., village.
 vol., volume.
 W., west; western.
 Wm., William.
 yd., yard.

The article ABBREVIATIONS contains a list of those in general use. See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

Bulgaria, republic lying between Rumania and Greece on the N. and S. and Yugoslavia and the Black Sea on the W. and E. N. B. proper is separated from S. B. (E. Roumelia) by the Balkan Mts. A plateau region descends by successive terraces from the Balkan Mts. to the Danube, by which the country is separated from Rumania, and is crossed by the deeply eroded channels of the tribs. of that riv., the Tarak, Lom, Isker, Vid, and Osma. The Rhodope Mts., rising in parts to a height of 7200 ft., separate B. from Greece. Between that range and the Balkans stretches the plain that is watered by the Maritza and its tribs. The climate is characterised by hot, dry summers, and short, dry winters, rainy springs and autumns, and a wide range of temp., but it is healthy except in the marshes along the rivs. and the Black Sea. Forests, composed mainly of oak, sumach, thorn, elder, cover over 7,000,000 ac., and orchards of plums, walnuts, apples, pears, and cherries occur frequently, particularly near Kustendil. Bear, wild boar, red and roe deer, chamois, eagles, wild fowl in the marshes, and partidges, wolves, squirrel, and marmot are plentiful everywhere. Sturgeon are taken in the Danube, trout in all streams, and mackerel (for drying) in the Black Sea near Burgas. The chief domestic animals are horses (small and hardy, for riding only), asses and mules, buffaloes, sheep, oxen, goats, and swine. Coal is the most plentiful of minerals, the chief mines being the State-owned ones of Pernik, Maritza, and Bobovdoli; these mines produce about 1,500,000 tons yearly for home needs. Other exploited minerals are copper, lead, zinc, aluminium, and salt, but mining development is slow. There are also a number of mineral and thermal springs. The chief occupation of the people is agriculture, which engages about 80 per cent of the pop., but, nevertheless, of an area of 26,000,000 ac., only one-third is cultivated. The land is divided for the most part into small holdings, held in absolute freehold by the proprietors, and there is a land-tax. Agric. methods are primitive. Cereals (wheat, maize, rye, barley, oats) are the prin. crops, and rank first among the exports. Wine is produced everywhere, especially near the Black Sea. Roses are cultivated to a large extent, especially round Kazanlik and Karlovo and on the N. side of the Rhodope Mts., for attar of roses, which is largely exported. Silk-worms are bred in Plovdiv and Haskar. Tobacco is cultivated and forms one of the chief articles of export; cotton and sugar-beet are also grown. Industry is backward, but was improving in the decade before the Second World War. Besides the native branches, which include

the production of native cloth, carpets, trimmings, and ribbons, there are some brewing and distilling (slivovitsa from plums), leather work at Sumen, copper work, and pottery making. Works had also been estab. to manuf. textiles, both wool and cotton, leather, metal goods, chemicals, and soap. Flour milling and sugar refining are the two chief industries. Chief exports are grain, tobacco, silk cocoons, live-stock, butter, eggs, hides, attar of roses, charcoal, sunflower seed and cake, hardwoods, beans, nuts, copper matte, and lead ore, sent chiefly to Turkey, France, United Kingdom, Austria, and Hungary. The pop. consists of Bulgarians, Turks, Gks., Sp. Jews, and gipsies, though three-quarters are Bulgarians. Bulgars are descended from Finno-Ugric Bulgari, but have been thoroughly Slavised. The Orthodox Gk. Church is the State religion, and has over 5,000,000 members. There are also 821,000 Moslems (Pomaks) and 45,000 Rom. Catholics. In 1916 the Gregorian calendar came into force. Elementary education is compulsory up to the 4th standard and free up to the 7th standard, i.e. for children between the ages of seven and fourteen, and illiteracy is decreasing (about 20 per cent of the male, and over 40 per cent of the female, pop. were illiterate before the Second World War). There is one univ. at Sofia (4400 men and 1650 women students and 285 profs.), and B. has also sev. technical schools.

Executive power until Sept. 1946 was vested in the Council of Regency on behalf of the tsar and is exercised by a council of ministers. The legislature is a unicameral National Assembly or Sobranje of 160 deputies, elected for four years by adult manhood suffrage and married women. The Sobranje was suspended from 1934 to 1938, though elections were held in 1938. The Vienna to Constantinople railway runs through the cap., Sofia, and Plovdiv. Altogether there are 1750 m. of ordinary gauge railway and some 260 m. of narrow gauge, all State owned; there are over 15,000 m. of good roads. Before the First World War, military service was compulsory, but by the terms of the treaty of Neuilly, 1919, compulsory military service was abolished, and the total military force could not exceed 20,000 men, but these limitations were abolished by the Salonika agreement of 1938. Bulgarians are, as a rule, of smaller stature than their neighbours. They are powerfully built, laborious, and sensible. They are thoroughly domesticated and love their homes and family. The chief tns. of B. are Sofia, Plovdiv, Rustchuk, and Varna. Sofia is the cap., and is situated on the R. Isker. It is a busy place of trade in consequence of

its important position on the Vienna-Constantinople railway. It has a pop. of (1942) 400,000. Varna (80,000) on the Danube is the largest Black Sea port. Bourgas (40,000) is also a Black Sea port. Plovdiv was the cap. of E. Roumelia. It exports attar of roses. Rice, the vine, cotton, and olives also grow in the valley. It has a pop. of over 110,000. Rustchuk is a large riv. port on the Danube, with a pop. of 50,000. Other tns. are Plieven (36,000), Vidin (20,000), Lom (17,000), and Svistov (14,000). Pop. of B. (1940) 6,700,000. Area (with S. Dobrudja) about 43,000 sq. m.

thus weakening the Bulgarians in their rivalry with Byzantine emperors. At the end of the tenth century part of E. B. was incorporated with the Byzantine Empire, and in 1018 the W. Bulgarian kingdom became a Byzantine prov. In 1186 a third Bulgarian kingdom was formed by a successful rebellion, and remained until the arrival of the Osmanli Turks. The Gks. hated and abused the Bulgarians to such an extent that the word B. became a byword among the European nations. An attack on Constantinople by Bulgars and Serbians was repulsed, and the Bulgarian cap. was

THE VALLEY OF THE ISKER, NEAR KARLUKOVO, BULGARIA

E.N.A.

Historical.—B. was originally inhabited by Thracians, and under the Romans formed the prov. of Moesia. Later it was occupied by the Slavonic Slavonians. The Bulgars were originally a Ural-Altaic people. They came from the banks of the Volga and crossed the Danube in the sixth century, and occupied the E. They overcame the Slavs, adopted their language and customs, and thus became a great Slav power. In 864 Prince Boris, their chief, was baptised, and the Bulgarians became dependent on the patriarchate of Constantinople. The Bulgarians were victorious against the Magyars and Gks. in the ninth and tenth centuries. Simeon, their prince, assumed the title of 'Autocrat of all the Bulgarians and of all the Gks.', and Serbs and Byzantines paid tribute to him. The Bulgars dominated Macedonia, Thessaly, Epirus, and Albania. In 963 the W. part of B. broke away and formed a new kingdom,

taken in 1393. Under the influence of Byzantium and of Christianity, B. had attained in the Middle Ages a degree of civilisation equal to that of W. nations, but this was destroyed by the invasions of Tatars and Osmanli. For close upon 500 years the Bulgars were subject to the tyrannous rule of the Ottoman Empire. About the middle of the nineteenth century the unconcealed aspirations of the Christians attracted the suspicions of the Muslims and Turkish inhab. of B. These rose against their unarmed neighbours, and assisted by the bashi-bazouks (or body of irregular troops), destroyed villages wholesale. In the prov. of Plovdiv and dists. around, more than fifty-eight vills. were destroyed in a few months, and men, women, and children were cruelly slain. These 'Bulgarian atrocities' awakened horror throughout Europe, and especially in England, and suggestions

were made of forming two autonomous states. The Porte refused to make concessions, and in 1877 Russia, as guardian of the Slav races of Turkey, declared war. As a result of the war, the Berlin Treaty (1878) constituted an autonomous though tributary B., N. of the Balkans, whilst to the mainly Bulgarian prov., S. of them, known as E. Roumelia, it granted administrative autonomy. In 1885 E. Roumelia was incorporated with the Bulgarian state. Taking advantage of the Young Turk revolution, 1908, and Austria's annexation of Bosnia-Herzegovina, Prince Ferdinand repudiated the last shred of Turkish suzerainty and proclaimed himself tsar. This action was allowed to stand by the great powers. In 1912, B. with Serbia, Greece, and Montenegro formed the Balkan League, and with its allies formulated the demands which led to the Balkan war (*q.v.*) between the League and Turkey. To B.'s lot fell the heaviest fighting, and it is hardly too much to assert that the successful issue of that war was due, in the main, to the valour of the Bulgarian troops, and the martial skill of Gen. Savoff. See BALKAN WAR AND TURKEY.

Bulgaria and the First World War.—B. entered the war in Oct. 1915, and almost exactly three years later surrendered unconditionally to the Entente forces. The hist. of this ill-starred country, after it became a sovereign independent state, was one of victimisation to dynastic ambitions. After the abdication of Prince Alexander of Battenberg in 1887 the throne was offered to Prince Ferdinand of Saxe-Coburg, who inherited the overweening ambition of his mother, Princess Clementine. On the death of his first wife, the Grand Duchess Marie of Parma, Prince Ferdinand married Princess Eleanor of Reuss-Kostritz. In 1908 Ferdinand proclaimed himself king of B. and, three years later, changed his title to tsar. There can be but little doubt that the misfortunes of his country may be attributed to the overmastering aspirations to power of this monarch, who, after the fiasco of the Balkan wars of 1912-13 sought to retrieve his country's ruin by intrigues with Germany, the outcome of which was the loss of his crown and, to the country, not only of everything it had won in the Balkan wars, but of its prosperity for years to come.

It was obvious at the very outset of the First World War that B., standing in the highway of Ger. aspirations S.E. to Bagdad, would sooner or later be involved. What was not obvious, at least to the Entente diplomats, was that the Bulgarian king and his Cabinet had definitely decided, long before the Bulgarian armies crossed the Serbian border late in 1915, to throw in their lot with the Central Empires. King Ferdinand's object was nothing less than aggrandisement. He had visions of the sure triumph of the Central Empires, with Germany's trade and prosperity reaching out overland towards India and his own kingdom, enlarged beyond recognition, a member of the new Kaiserbund of *Mittel Europa* and

the natural corridor between the new Germany and Asia Minor, and the custodian of the great Ger. railway from Berlin to Bagdad. But as regards the Bulgarian people at large, ill-educated peasantry for the most part, it may be assumed that the one thing, if any, that stimulated their war ardour was their fear of the creation of a Greater Serbia. The annihilation of King Peter's kingdom was the best means of averting this fear, and it was no less a means of clearing the Ger. route to Bagdad. Thus, the Bulgarian people, or at least a majority, and the king were in agreement, though what King Ferdinand regarded as a means to an end, the people looked upon as the end itself. By preserving outwardly a neutral attitude, while in secret sympathy with the Central Empires, B. was able or hoped to secure the neutrality of both Greece and Rumania; immensely to strengthen the position of Turkey and thwart the allied Gallipoli expeditionary force of any chance of success; to disperse the allied effort into Syria, Mesopotamia, and Salonika instead of permitting it to be concentrated on the Danube; eventually to open to the Austro-Ger. armies the road eastward through Serbia; by the ultimate debacle of the Serbian army to render possible the Bulgarian acquisition of Thrace, Macedonia, and most of Serbia; to avert the possibility of the union of the Serbs, Croats, and Slovenes in a single state; and, finally, to secure the hegemony of the entire Balkan Peninsula. Early in 1915 Venizelos (then Prime Minister of Greece) endeavoured, with the strong support of Viscount Grey, to renew the Balkan bloc on the basis of mutual concessions to B. To this proposal, Rumania and Serbia were agreeable. Furthermore, acting on the assumption that the territory variously styled Serbian or Central Macedonia was the prin. demand of B., the Entente in the celebrated note of Aug. 4, 1915, conceded Serbian Macedonia, E. Macedonia or Kavalla (at the expense of Greece), and the whole of Turkish Thrace to the Enos-Midia line. Against this offer the Central Empires could do no more than offer some of the above terms, contingently upon conquering them. Bulgarian claims were admittedly more than satisfied. Yet, for reasons which have been sufficiently indicated above, the offers were refused and the bribe failed of its purpose. The Bulgar diplomats were merely bluffing to give the Austro-Ger. forces time to launch their great attack on Serbia. The mobilisation of the Bulgarian Army in the early autumn of 1915 in the alleged interests of 'friendly neutrality,' coupled with the presence in this army of large numbers of Ger. officers, caused the Russian Gov. on Oct. 3, in concert with the other Entente powers, to send an ultimatum to B. This led to war within three days. On Oct. 7 Austro-Ger. troops invaded Serbia and four days later the Bulgarian armies under the direction of Ger. officers crossed the Serbian frontier from the E. Shortly afterwards a secret Germano-Bulgarian treaty was revealed, by which R., as the

price of her aid in siding with the Central Empires, was promised Albania together with Gk. and Serbian Macedonia. On Oct. 16, 1915, Great Britain sent a note to the Bulgarian Gov. to the effect that a state of war existed between the two countries. On Oct. 22, 1915, the Bulgarians captured Uskub. The Serbian army fled before the combined Austro-Ger.-Bulgar drive into Albania with the loss of its artillery and transport. Thereafter all was quiescent for many months, the Allies, operating from Salonika, hesitating to move forward for fear of treachery on the part of Constantine, king of Greece. It was not till late in Aug. 1916 that the campaign was renewed, when the Bulgarians moved on Kavalla. The probability of further success against the Allies was for a time averted by Rumania's entry; but by the end of Nov. 1916 the Rumanian army was practically *hors de combat*, though in the interim and in spite of Constantine's continued treachery, Gen. Sarrail, commanding the Allies, had advanced on and captured Monastir. The Bulgarian army had by now shot its bolt so far as any further marked successes were concerned. With the abdication of King Constantine, the Allies contented themselves with more raiding and patrolling operations. Meanwhile M. Venizelos was organising a Gk. army and the Serbs were reconstituting their forces at Corfu. In Sept. 1918 the Balkan front once again blazed into activity, and in a few weeks the Bulgarian Army, defeated and outclassed, was in headlong retreat. (See under MACEDONIAN OFFENSIVE.) On Sept. 30, 1918, the Bulgarian envoys came to Salonika and signed an armistice with Gen. Franchet d'Esperey (g.v.), commander-in-chief of the army of the Orient. The most important effects of this unconditional surrender were that the direct Ger. route to Constantinople fell under allied control; the Lower Danube ceased to be available for enemy traffic, while Germany and Austria-Hungary found themselves unable to reinforce or supply Turkey except through Black Sea ports.

By the treaty of Neuilly, 1919, B. ceded to Greece her Thracian ters., thus losing her access to the Aegean Sea; though an economic outlet to it was provided by the treaty, the exact terms remain a subject of dispute. To Rumania, B. lost S. Dobruja, her richest wheat-growing land, and she also lost a strip of ter. to Yugoslavia. In 1920 an Agrarian gov. came into power, under Stambolisky, who, though not nominally a Communist, allied himself secretly with the Communist party in his own country and the Bolshevik Gov. of Russia. In June 1923 a *coup d'état* overthrew the gov., Stambolisky being killed and other Agrarian ministers imprisoned. During the Tsankov Gov. which then followed, there was much unrest and disturbance. In Sept. 1923 a plot was discovered which led to the arrest of 1000 Communists, and sev. thousands of persons were killed in local outbreaks; during 1924, about 200 assassinations took place in the following year an attempt

was made upon the life of King Boris (g.v.), and 120 people were killed and over 300 injured when a bomb exploded in Sofia cathedral. The necessarily repressive Tsankov Gov. remained in power until Jan. 1926, when it was succeeded by a democratic gov. under Liapchev. B. then pursued a policy of making treaties with the Little Entente countries, conditional on the satisfaction of her territorial and economic claims, with the result that she became isolated from the Balkan countries. Boris desired better relations with his Balkan neighbours, but would not agree to part with B.'s territorial claims. His internal policy, too, did not please the army, with which, indeed, he was never on good terms; and in 1934 a military *coup d'état* overthrew the gov. of Agrarians and Democrats, and the king was now forced to agree to the formation of what was in effect a semi-military dictatorship to offset the political and moral deterioration of his country. The new gov. turned upon the Macedonians, whom the army soon reduced to obedience or expelled. The gov. was so hostile to Boris that he was in danger of deposition, but his diplomacy and popularity with the peasantry, in conjunction with the dissensions in the army, saved his throne, and ultimately the militarist combination fell to pieces. In 1938 the king won a diplomatic success by securing the release of B. from the punitive clauses of the treaty of Neuilly; but by that time European peace was threatened, and Boris decided to sound the possibility of bringing B. into the orbit of the W. powers; but he mismanaged the undertaking and, moreover, the outbreak of war found B. with next to no market for its produce save Germany; the army was entirely dependent on Ger. weapons; Ger. intrigue was rife and the general staff was largely pro-Ger. Though the army was not used against Russia and diplomatic relations were retained with the U.S.S.R., B. joined in the signing of the second anti-Comintern Pact; Bulgarian troops and Macedonian bandits oppressed Gks. and Yugoslavs; and the king declared war on Great Britain and the U.S.A. to please his Ger. patrons. Ger. troops entered the country in March 1941 and occupied Black Sea ports, though B. was not officially at war with Russia. In 1943 the king d. suddenly in his palace in Sofia, after a mysterious illness, and was succeeded by his infant son, Prince Simeon. Reports that Boris had died from violence persisted in neutral quarters. B. had lost a ruler who was strong enough to unite politicians and generals who ordinarily did not readily co-operate. On August 28, 1944, the gov. declared B. to be neutral in the Russo-Ger. war, and Bulgarian delegates to Cairo tried to secure eleven-hour terms of peace from Great Britain and the U.S.A. Russia, however, refused to recognise the so-called neutrality of B. and called upon B. to declare war against Germany, and when no satisfactory reply was received by Sept. 3, Russia declared war on B. B. could only

sue for an armistice, and on Sept 7 its gov. declared war on Germany. Hostilities with Russia ceased a few days later. An armistice with the United Nations was signed in Moscow on Oct. 28. Russian troops occupied the country throughout 1945 and were still in B. in 1946, though it was agreed by the allied foreign ministers in Paris that Russian troops should evacuate the country within three months after a treaty was signed with B.

Sept. 9, 1946, second anniversary of the Bulgarian revolution, by which the Fatherland Front seized power, was marked by the proclamation of a People's Republic, for which the plebiscite of the previous day had given a large majority. The young King Simeon was forced to abdicate. The Fatherland Front was formed during the war by the Communist, Agrarian, Socialist, and Zveno (professional and army class) parties. It provided the political leadership of the Partisan movement, and brought the Bulgarian Army into the war on the allied side. The Partisans fought throughout spring and summer of 1944 against the forces on the pro-Ger. side, and if they achieved little at least they did not lack courage. The army fought efficiently in Yugoslavia and Hungary for the last seven months of the war. By late 1946, after the secession of the Agrarian party and the split in the Socialist party of 1945, Communist control was almost as complete in Bulgaria as in Yugoslavia. The police, now called militia, were controlled by the Communist-led Ministry of the Interior. A decree of 1946 created a 'frontier militia,' also under the Ministry of the Interior, to which men were transferred from the army. The secret police of B. is the state security section of the militia, whose members do not wear uniform. It includes men who received special training in Russia. The increased tempo in the direction of Communist control was probably explained partly by the departure of the Red Army anticipated in the peace treaty. The Soviet Gov. doubtless felt that the presence of its own forces was no longer needed, since its Bulgarian friends were now so firmly in power. A general election was held on Oct. 27, 1946. The Fatherland Front obtained 364 seats (277 of which went to the Communists) and the opposition 101. In Aug. 1947 the oppositional Agrarian Union was dissolved and its leader, Nicola Petkov, was hanged on Sept. 23 on a trumped-up charge of treason. The peace treaty was signed in Paris on Feb. 10, 1947. On Aug. 1, 1947, a treaty of friendship, collaboration, and mutual assistance was signed with Yugoslavia, and a similar treaty with Rumania on Jan. 16, 1948.

Language and Literature.—The original Bulgarian tongue was Ural-Altaic, but it has left only few traces in the Slavonic speech adopted by Bulgars who settled in the Balkan Peninsula. The Bulgarian-Slavonic tongue is closely allied to the Russian, but some Serbian, Gk., Rumanian, Albanian, and Turkish elements have found their way into the language. As

in most peasant nations, the legends of B. are many and widely told; as in most Slavonic nations, there is in the literature an atmosphere of sadness. The literature in the old days of B.'s glory consisted chiefly of translations from Gk. and theological works. From 1782 until B.'s liberation in 1878, the literature consisted chiefly of eds. of a popular and political nature. Modern literature is realistic, mystic, or philosophical in tendency, and is strongly under Russian influence. Ivan Vassov, poet and novelist, who d. in 1921, is the greatest modern figure. The poems of Slavkov, the novels of Karavelov, the historical works of Drinov and Radev, the dramatic works of Yavorov, Raynov, and Thodorov also deserve mention. There is also a rich lyrical popular poetry. The Cyrillic alphabet is that in general use, as in Russian, viz. that modified from the Gk. by Cyril.

Bulgarian Milk, milk containing lactic acid. Sour milk has long been looked upon as a healing agent, and the hastening of the souring process by introducing a portion in which the bacteria have already been at work is an idea borrowed from the Bulgarians and Tatars. The bacteria help in the formation of lactic acid, which acts as a preservative, preventing further decomposition. It is suggested that when sour milk is taken as food, the bacteria multiply in the intestines and aid digestion by preventing harmful fermentation.

Bulgarin, Tadel Venediktovitch (1789-1859), Russian writer, b. in Lithuania, of Polish ancestry; served against France, and later in Napoleon's Polish army; settled in St. Petersburg about 1820. In 1823 he founded the *Northern Archive*, and in 1825 a new ed. of the *Northern Bee*, where his bitter and sarcastic writing attracted much attention. He was a follower of the Absolutist party, and was intimate with the secret police. His novels include *Ivan Vishigin, or the Russian Gil Blas* (1829, Eng. translation, 1831); *Peter Ivanovitch Vishigin* (1830); *Mazepa* (1832); and he also pub. *An Historical, Geographical, and Literary Survey of Russia* (1837).

Bulmus is the name of a large genus of land-snails comprising over 1000 species. They have external shells, and are related to the hedge- and grass-snails.

Bulimia, Boulimia, or Bulimy, insatiable hunger (Gk. *βουλμία*, from *βουε*, OX, *λιμός*, hunger), state of ill health due to various causes. The patient has a constant morbid craving for food.

Bulkheads: 1. The partitions which divide up the internal spaces of a ship. They are generally transverse and water-tight, but they may be longitudinal and partially or completely non-water-tight, as the circumstances may require. In warships particularly the transverse water-tight B. are very numerous, to check the entrance of water through damage while in action, and, as a rule, each bulkhead is fitted with an hydraulically worked door which closes automatically when the compartment is flooded. The subdivisions required by Lloyd's Register for all steamers are four, i.e. one bulkhead at each end of the machinery spaces and one at a reasonable distance from each end of the ship. For larger steamers other B. have to be fitted according to their size. The bulkhead nearest the bows is called the collision bulkhead and that nearest the stern the after-peak bulkhead. In sailing ships the collision bulkhead only is required. 2. The sea-walls which mark the line of the shore and from which the piers and quays project. 3. A general term for a partition in mines and tunnels, etc., sometimes solid and sometimes provided with a door for passage of men and materials.

Bulkley, Lucius Duncan (1845-1928), Amer. dermatologist, educated at Yale and later studied medicine in Europe. Took a leading part in the foundation of the New York Skin and Cancer Hospital, where he acted as consulting physician and later held similar positions in New York Hospital and other important institutions. Publications: *Eczema and its Management* (1881); *Manual of Diseases of the Skin* (1898); *Compendium of Diseases of the Skin* (1912); *Cancer, its Causes and Treatment* (1915-17); *The Medical Treatment of Cancer* (1919); *Cancer and its Non-surgical Treatment* (1921); *Cancer of the Breast* (1925).

Bull, see Ox.

Bull, papal instrument, ordinance, letter, or decree, issued by the Apostolic Chancery, and differing from briefs down to 1878 in being written in Gothic script. At that date Pope Leo XIII. ordered the use of Lat. script, and restricted the use of the very anct. leaden seal to important Bs., replacing it in other cases by a red one. Bs. are written on parchment, to which the seal is attached by a yellow or red silk cord when concerned with the granting of favours, but by a grey one when dealing with the administration of justice. The name comes from the Lat. *bulia*, meaning the capsule of wax surrounding a seal; the term being extended to the seal itself, and then to the document. All Bs. begin with the name of the pope, followed by *Servus servorum Dei*. Among the most famous Bs. of hist. are *Clericis Laicos*, 1296, and *Unam Sanctam*, 1302, issued by Boniface VIII. against Philip le Bel of France, both dealing with

the taxation of church property (see under CLERICUS LAICOS); *In Cena Domini*, 1362, issued against heretics by Urban V.; *Execrabilis*, 1460, in which Pius II. declared the papal superiority over the councils; *Etsurge Domine*, 1520, issued by Leo X. against Luther and burned by him; *Unigenitus*, 1713, which condemned Quesnel; *Dominus ac Redemptor Noster*, 1773, issued by Clement XIV. to abolish the Jesuits; *Ecclesia Christi*, 1801, which estab. the Concordat with France; *Sollicitudo Omnium*, 1814, by which Pius VII. restored the Jesuits; *Ineffabilis*, 1854, proclaiming the doctrine of the Immaculate Conception, and *Pastor Aeternus*, 1870, in which Pius IX. proclaimed papal infallibility.

Bull, amusing and unintentional blunder in speech, due to the conjunction of incompatible ideas, and implying an evident contradiction in terms. Bs. are usually associated with Ireland, and many of the best examples are Irish. One of the most famous is that made by a speaker during the Farnell Commission, himself a soldier who had run away during action, who stated that it was 'better to be a coward for a few hours than to be dead all the rest of your life.' See R. L. Edgeworth, *Essay on Irish Bulls*, 1802 (new ed., 1898).

Bull, George (1634-1710), learned Eng. churchman, educated at Tiverton School and Exeter College; would not take the oath of allegiance to the Commonwealth, and was privately ordained, in 1655, by Bishop Skinner, who thereby committed a capital offence. As minister of St. George's, near Bristol, he followed the liturgy under the cloak of extemporary devotion. His *Harmonica Apostolica* (1659), written in Lat., served to minimise the divergence in the views of St. Paul and St. James on justification, but the work which estab. his high reputation was entitled *Defensio Fidei Nicenæ*, 1655.

Bull, John, popular term for the typical Englishman. It took its rise from Arbuthnot's *History of John Bull* (1712) (in which the Church of England figures as his mother), a political skit satirising the duke of Marlborough, and stirring up public feeling against France. J. B. begins to figure frequently in broadsides and caricatures about the time of the Fr. Revolution. The idea has since evolved in *Punch* and other humorous papers.

Bull, John (1563-1628), Eng. musical composer, b. in Somersetshire; became organist of Hereford Cathedral in 1582, and in 1585 was admitted to the Chapel Royal. He was the first prof. of music at Gresham College, and one of the musicians of Prince Henry. He left England in 1613, and d. in Antwerp. *God save the King* has been attributed to him.

Bull, Ole Borneman (1810-80), Norwegian violinist, b. at Bergen, and was largely self-taught. In 1828 he appeared at a concert, and was so successful that in 1829 he went to Cassel to study under Spohr. He soon returned to Bergen, but in 1832 made his true début in Paris. Here he heard Paganini, and adopted his

style of playing. He performed with great success all over the Continent till 1839, when he went into retirement for a few years. In 1843 he went to America, which he frequently revisited. His technique was brilliant and he showed to best advantage in the national fantasias of his own composition.

Bulla, term applied by the Romans to any ornamental stud or boss, but particularly to an amulet worn round the neck by children of noble birth till they attained maturity. The custom was of Etruscan origin, and after the second Punic war was extended to all children of free birth.

Bulla, or **Bubble-shell**, is a genus of gastropod molluscs of the order Euthyrea. The species inhabit muddy and sandy sea-water and feed on animal matter. The shell is external, has no projecting spire, and is so thin that it resembles a bubble. *B. solitaria* is an Amer. species.

Bullace, or *Prunus insititia*, is a species of Rosaceae which is nearly related to the sloe and plum. The fruit is globose, and the plant is a native of Britain.

Bullae, collections of serum raising the outer skin from the true skin. They may be due to injury or friction as in rowing, or be symptomatic of skin affections, as pemphigus and hydroa.

Bullant, Jean (c. 1515-78), Fr. architect and sculptor, developed his taste and acquired his knowledge by a faithful study of the classical monuments and statues in Italy. This may be gathered from his later treatise entitled *Regle generale d'architecture des cinq manieres* (1568), the earlier being a description of the various methods of making sundials, which he called *Recueil d'horlogiographie* (1561). His *Château d'Ecrouen*, begun about 1540, is universally recognised as one of the finest architectural achievements of the period, and is remarkable, above all, for the purity of its style. For Catherine de' Medici, who early appreciated his talent, he built the Hôtel de Soissons, which stood on the site now occupied by the Bourse de Commerce. The Hôtel Carnavalet, the central buildings of the Tuilleries, and the tomb of Henry II. and his patroness, Catherine, are also his work.

Bullard, Robert Lee, distinguished Amer. general, b. at Youngstown, Alabama, Jan. 15, 1861. Trained for the army at W. Point Academy, he served in the Sp.-Amer. war and the campaign in the Philippines. He had risen to the rank of colonel when America entered the First World War. He landed in France as the commander of a brigade in the first div. of the Amer. expeditionary force in 1917. Later in this year and in 1918 he commanded in turn the First and Second Amer. Armies, taking a prominent part in the second battle of the Marne in July 1918. He retired in 1925 from the army. *Pub. Personalities and Reminiscences of the World War* (1925).

Bullas, in Spain, site on hill in prov. of Murcia; interesting Rom. remains; manufs. hempen fabrics, earthenware, and brandy.

Bull-baiting, formerly a popular sport in England. A bull, with the points of its horns protected, was fastened to a stake and attacked by bulldogs. The sport was abolished by law in 1835.

Bulldog, breed of dog, employed for the baiting of bulls (abolished by law in 1835). It is probably a sub-variety of the mastiff, crossed with lesser breeds, and the tales concerning its descent from the hyena may be dismissed as so much fiction. In Elizabethan times these dogs were perhaps the most sought-after Eng. breed, because of the prevalence of the sports of bull- and bear-baiting. Their ability to seize and cling to the muzzles of the animals they baited became proverbial, and was only due in part to their innate courage, as popularly conceived, the nature of the 'underbite' or locked jaw

BRITISH BULLDOG

peculiar to the breed making it difficult for the animal to loose its hold when once securely fixed. There is some evidence that the B. was known in Rom. Britain. During the eighteenth and early nineteenth centuries the breed was in high favour because of its fighting propensities. But the modern B. evinces anything but a pugilistic character, and, as every breeder knows, is notorious for its good nature, especially with children, who are much safer with it than with the more 'snappy' breeds. The breed is not long-lived, a B. of six years being considered advanced in years, and few live much beyond that age. As a watchdog the B. is useless. The points of the modern B. are as follow: colour, white (the standard colour), brindle, fawn, brown, *not* black, which is disallowed; skull of massive proportions, deep 'stop' between the eyes, which should be placed well apart; nose black, if spotted with pink it is known as a 'dudley nose', and tends towards disqualification; ears 'rose' or 'tulip', neatly set and light; neck thick and short; chest well developed, legs massive, showing plenty of bone, and short, so set as to give the dog the appearance of being 'cloddy' or set near the ground; body short, tapering near the short ribs, and neatly proportioned; back shaped 'like that of a roach; tall very short, and never carried high. The dog must be 'short-faced,' and the nose well

set back—the further the better—between the eyes, and the teeth, upper and under, should be well displayed. Weight from 20 to 65 lb.

Toy Bulldogs have of recent years achieved considerable popularity as a breed, especially in France. They possess few of the characteristics of the heavier breed, with faces less 'set back,' and heavy bat-ears.

The *Dogue de Bordeaux* is a species of B. employed as a bull-baiter in the bull rings in the S. of France. It has the appearance of a cross between a B. and a mastiff, and is steadily growing in popularity among breeders in this country.

T. Fall

FRENCH BULLDOG

When crossed with other breeds, especially with the mastiff, the B. tends to become vicious and even dangerous, and this cross is much in demand among night-watchmen and persons who have the charge of premises during the night.

Bulldog, German, see BOXER.

Bulldog, or Bull-dog, refractory material composed of ferric oxide and silica, made by roasting ferrous silicate (tap cinder) in air. It is used for lining the hearths of puddling furnaces.

Bullen, Frank Thomas (1857-1915), Eng. author, b. at Paddington; left school in 1866 to become an errand boy. Led an adventurous life. Went to sea in 1869, and made many voyages, becoming chief mate at one time. Left the sea in 1883, and entered the Meteorological Office, where he remained till 1899. Amongst his many works may be mentioned *The Cruise of the 'Cachalot'; Idylls of the Sea; The Log of a Sea-Waif; With Christ at Sea; The Apostles of the South Sea; Deep Sea Plunderings; A Whaler's Wife; Creatures of the Sea.*

Buller, Sir Redvers Henry (1839-1908), Eng. general, b. near Crediton, Devonshire. In 1860 he served in China; in 1870 in the Red R. expedition; in 1874 in the Ashantee war; and in 1878-79 in the Kafir and Zulu campaigns. In these

last he specially distinguished himself, and won the V.C. for the rescue of three comrades. In 1881 he served in the Boer war as chief of the staff to Sir Evelyn Wood; in 1882 in the Egyptian campaign as head of the intelligence dept., and in 1884-85 as chief of staff in the Sudan war, receiving the K.C.B. in 1885. He became a quartermaster-general in 1887, and also under-secretary for Ireland, in 1890 was promoted to adjutant-general, in 1891 to lieutenant-general, and in 1894 received the G.C.B. In 1898 he obtained the command of the First Army Corps and the Aldershot garrison, and in 1899 became commanding general of the Brit. forces in S. Africa, and later general officer commanding in Natal. Owing to severe reverses round Ladysmith he was superseded by Lord Roberts, and after engaging in the expulsion of the Boers from Natal, returned to England in 1900. He was again commander of the First Army Corps at Aldershot, but was retired in Oct. 1901 in consequence of an imprudent speech. Sev. unfortunate facts concerning his S. African leadership became public, and he left the army in 1906. See C. M. Melville, *The Life of Sir Redvers Buller*, 1924.

Buller, Sir Walter Lawry (1838-1906), New Zealand ornithologist and jurist, whose contributions to science form one of the chief factors in his career, was b. in New Zealand, and was educated at Wesley College, Auckland. Took a prominent place in the affairs of the Maoris, appointed gov. interpreter at Wellington in 1855. Created magistrate in 1862; came to England in 1871; called to the Bar in 1874. Received titles of F.R.S., C.M.G., K.C.M.G., and Sc.D. of Cambridge.

Bullet, solid projectile discharged from small-arms of all kinds, in contradistinction to the larger missiles used by the artillery. In the old smooth-bore muskets, accuracy of aim was spoiled by various difficulties, such as the pressure of the gas generated by the discharge, and the fact that the projectile must always be smaller in diameter than the bore of the gun. This early caused the invention of the system of rifling the bore, and hence came a revolution, also, in the form of the B. The smooth-bore musket had fired a heavy spherical lead shot. In William IV.'s reign the Brunswick percussion rifle was introduced into the Brit. Army, and for a while the old form of B., slightly enlarged, was retained. It was, however, 'belted,' that is to say, it had a projecting ring round it which fitted into the grooves in the barrel. In 1836, Greener, an Eng. gunmaker, produced an expanding B., for which, twenty-one years later, he received a reward of £1000 from the gov. The ball was oval in shape, fitted with a plug which the force of the discharge drove into the lead of the B. The lead was thus forced to expand and fill the grooves. The result of this expansion is to prevent windage, and to communicate a twist to the B. which enables it to travel steadily. Greener's invention was never made practical use of, as the gov. objected to its complication. Meanwhile, in France,

Capt. Delvigne had also perfected a new form of rifle, with a similar kind of B., and this was introduced into the Fr. Army. About 1849 a further step was made by Capt. Minié, a Frenchman, who invented a cylindro-conoidal (in the earlier patterns only conoidal) B. The plug was discarded in favour of a hemispherical iron cap, which served the same purpose. In 1851, the Minié rifle was introduced into the Brit. Army. The introduction in the Minié rifle of an elongated B. made the use of the muzzle-loading rifle somewhat more easy, but the breech-loading rifle was soon in use. Most difficulties had now been overcome. The boring gave the B. the twist necessary to enable it to keep its course, the expansion enabled it to grip the bore properly so that B. and bore had one axis. The use of the cylindrical B. now made it possible to diminish the size of the bore, while retaining a heavy B. Thus came the introduction of small-bore rifles, where the B. was made longer still. It was, of course, essential that the weight of the B. should not be diminished too much. A result of this lengthening was that rifles were made with a greater twist in the grooving. The B., to be of use, has to travel point foremost. It is kept in position by the rotation communicated to it from the bar.[†] and so any lengthening of the B. causes it to require greater rotation to keep it from drooping or deflecting. Further, to prevent deflection, some early Bs. were furnished with circular grooves. If they turned at all, the wind caught in these and returned them to their original direction. The Bs. for large-bore rifles had been formed of lead, slightly hardened, but this would be rendered soft and shapeless by too rapid a rotation. Hence, the small-bore B. is generally covered with some harder metal. No expansion of this can take place, and so the B. is made slightly larger in diameter than the bore it will pass through. The dum-dum, or expanding B., has the lead exposed at the end, and so expands when it strikes. Its use is now forbidden in civilised warfare. Most modern Bs. are of composite form, consisting of a cupro-nickel or coated steel envelope containing various types of filling. Filling usually consists of lead, but frequently an aluminium or a fibre tip is placed inside the nose of the B. to improve its ballistic properties. Armour-piercing Bs. contain a lead sleeve and a pointed tool steel centre giving much greater penetrating power than ordinary Bs. In tracer Bs. the rear portion of the filling consists of a burning composition which is ignited by the flash of the charge and leaves a visible wake for the greater part of its flight. Explosive Bs. were introduced by the Austrians during the First World War as range indicators; incendiary Bs. were developed for use against aircraft. For military purposes B. calibres range from 0.256 in. up to 1 in., beyond which size the term B. ceases to be applicable. During recent years attempts have been made to increase the ranging properties of Bs. by streamlining the bases. Ranges up to

5700 yds. have been thus obtained. Bs. for revolvers are in some cases of the solid lead type, but for the higher-velocity automatic arms it is necessary to use the harder enveloped type.

Bulletin, Fr. word which has been imported into the Eng. language, signifying a short authentic account of some passing event, intended for the information of the public. B. is derived from Lat. *bulleta*, a seal. When kings and other persons of high rank are dangerously ill, daily Bs. are issued by the physicians relative to the state of the patient. The B. des Lois is the Fr. statute book.

Bull-fight. Combats of men with bulls have for long been a favourite national sport with certain of the Lat. races. They appear to have been common in Greece and Rome, and still exist in Portugal, France, Mexico, and especially in Spain, where they were abolished by Charles IV., but reintroduced by Joseph Bonaparte. Up to the Sp. Civil war (1936-39) Bs. were held in all the large towns of Spain, particularly in Madrid, either for personal profit or for charitable objects. But since the war the sport has waned. The bulls are bred in Castile and Andalusia, the former being preferred. The most famous fights were held in the Plaza de Toros at Madrid, a kind of open-air circus, surrounded by tiers of seats and boxes, and capable of accommodating 10,000 to 12,000 people. The typical B. begins with a processional entry of the combatants, in which the matadors lead, being followed by the banderilleros, the picadors, and lastly the *monos sabios*, or attendants with spare horses. After saluting the mayor, the picadors, dressed in a picturesque national costume, armed with lances, and mounted on worn-out horses, take up their position in the centre of the arena. A bull is then led out, and the picadors attack it with their lances. The horses are urged on by attendants with sticks, who are dressed in blue and red, and when a horse is either wounded or throws its rider, the banderilleros attract the attention of the bull by waving their red and yellow capes while the picador makes his escape. The banderilleros save themselves by leaping over the barricades. After the picadors have fought for some time, they leave the ring and are succeeded by the banderilleros, who infuriate the bull by means of banderillas. These are gaily coloured and ornamented barbed darts, about 2 ft. long, sometimes having fire-crackers attached to them which the men stick into the animal's neck. Finally a matador, bearing a naked sword and a *muleta*, or vermilion flag, enters and salutes the mayor. He lures the bull by means of the red cloth, and as it blindly rushes at him, steps aside and stabs it between the left shoulder and the blade, usually killing it in a short time by means of this or some other stroke. As soon as the bull is dead, the performance recommences with a fresh animal, and should the matador, as occasionally happens, be fatally gored by the bull, another matador takes his place. Eight or ten bulls are often killed in one

day, and the slaughter of horses is very large and involves revolting cruelty. Successful matadors achieve immense popularity and are able to retire with large fortunes. The two most famous have been Rafael Guerra, or Guerrita, and Manuel Esparto. Bs., in the milder form of bull-baiting, have in recent years been introduced into S. France, but the worst abuses are avoided.

Bullfinch, *Pyrrhula europæa*, is a passeriform bird of the family Fringillidae, and differs from other finches in the thickness of its head and neck. It is small, bluish-grey or black, red or chocolate-breasted according to sex, and is a native of woods. It is a favourite cage bird, and in captivity it can be taught in the moulting season to whistle tunes (the ordinary species known as the piping finch).

Bullfrog, *Rana catesbiana*, a species of Ranidae, is a N. Amer. frog which utters a bellowing noise, and thus obtains its name. It is aquatic, green in colour, and reaches a length of 7 in.

Bullhead, or **Miller's Thumb**, is the popular name of *Cottus gobio*, the typical genus of the Cottidae. The species are usually found near sea-coasts in the pools, but may also occur in fresh water. They are ugly, spinous fishes, with broad, depressed heads, and are of no value as food. *C. scorpius* and *C. bubalis* are common marine species in Europe and are numerous in rock pools. In America the name B. is given to members of the catfish family, or Siluridae.

Bull, tn. of New S. Wales, Australia, 60 m. by rail S. of Sydney. Centre of a colliery dist. On the B. Pass is Weber's Lookout, a holiday resort.

Bulliard, Pierre (c. 1742-93), botanist, used to design and engrave his own illustrations, and was the first to print plants in colour. Among his works may be cited *Flore parisienne* (1774); *Herbier de la France* (1780-93), besides a botanical dictionary (1783), and treatises on poisonous plants (1784) and mushrooms (1792).

Bullinger, Heinrich (1504-75), Swiss reformer and Protestant theologian, was b. at Bremgarten, the son of a priest, who himself later embraced the reformed faith. During his studies at Cologne he gained a first-hand knowledge of the Bible and an acquaintance with Luther's works. He studied for a time under Zwingli, whom in 1528 he accompanied to the Berne Conference. In 1529 he married an ex-nun, and was made pastor at Bremgarten, which city he gained to the Reformers. On the death of Zwingli at Cappel in 1531, he left Bremgarten and took refuge at Zürich, where he became chief pastor and champion of the Protestants.

Bullion, term denoting the precious metals of gold and silver in their refined condition, before they are coined or otherwise manufactured. Though this is the true sense of the word, it is often extended, in speaking of exportation, to include the coined metal also. The values of B. as a means of exchange are too numerous to mention, as barter is a process which must necessarily die out at the beginning of civilisation. Gold and silver

are the same in quality throughout the world; they do not deteriorate greatly with age or use; they are not so rare that the coins have to be made inconveniently small; they are capable of easily receiving and retaining an impress. Since gold and silver are so universally used as a medium of commerce, it has of course been necessary to arrange that in all civilised nations the B. should be made with a standard quantity of precious metal in proportion to its alloy. In earlier times this was not so, and in the Middle Ages it will be remembered how commerce was frequently injured by the debasing of the coinage. Though even now matters are not so arranged that equal quantities of the B. of various countries are exactly equal in value, yet the difference is so small as to be inconsiderable.

Bull Mastiff, see MASTIFF.

Bull Moose, name of a third party founded in 1912 by the friends of former president, Theodore Roosevelt, and which gave occasion to one of the most famous presidential campaigns in the hist. of the U.S.A. In 1908, when the presidential term of Roosevelt was expiring, he brought about the nomination of W. H. Taft (q.v.) by the Republican convention. But shortly after Taft entered the White House, a notable coolness sprang up between the two men, because Roosevelt thought Taft had gone back on progressive principles. When the Republican convention of 1912 met in Chicago, Roosevelt entered the lists against Taft for renomination, his friends putting him forward for a third term. But Taft and the old-line politicians had a firm grip on the convention. As soon as this became apparent, the Roosevelt followers left the convention and set up a 'rump' convention of their own. Roosevelt was promptly nominated for the presidency. One day while attending the Republican convention Roosevelt was asked how he felt. He replied, 'Like a bull moose.' The metaphor was at once seized upon by newspaper cartoonists and political orators, and the new party was promptly christened the 'Bull Moose' party. The nominees of the party were placed on the ballot under the emblem of the bull moose, just as in most states the Democratic candidates are listed under the rooster and the Republicans under the Amer. eagle. The net result of the Bull Moose ticket was to split the Republican party completely. Woodrow Wilson won by the greatest majority known in modern times. Taft was likewise the most heavily defeated man. The Bull Moosers, as they were popularly known, had declared their intention of forming a permanent progressive third party, and expectation was keen as to what would happen in 1916. But the political genius of the Amer. people is against more than two major parties, and Roosevelt himself destroyed the chances of his new party when he declined to stand again.

Bullock, Shan F. (1865-1935); Irish novelist. His first success was *Robert Thorne*, a mirror of the life of the average London clerk, which was pub. 1907.

Other novels were *The Awkward Squads* (1893), *The Squireen* (1903), and *Hetty* (1911). He also wrote a biography of Thomas Andrews, designer of the *Titanic*, and a vol. of poems, *Mors et Vita*, which appeared in 1912 and 1923 respectively.

Bullock's Heart, see CUSTARD-APPLE.

Bulldozer, **Whizzer**, **Whizzing Stick**, or **Lightning Stick**, instrument employed by savage people usually for the purpose of causing rain. It consists of a rectangular slat of wood from about 6 in. to 2 ft. long, and $\frac{1}{2}$ in. to 2 in. wide, suspended by one end to a cord, the latter

John H. Stone

BULL-TERRIER

often being provided with a wooden handle. It is whirled rapidly about the head, and the noise of the air against the slat produces a roaring or whizzing sound. Among some Australian tribes it is thought to be employed for the purpose of frightening the women away from tribal councils or religious orgies, the females being told that it is the voice of the presiding god or demon. But in N. America it is, or was, used as an instrument of sympathetic magic, its noise being supposed to represent that of the wind which accompanies rain, and it is employed to induce by mimicry the actual wind itself.

Bull Run River, small riv. in Virginia, U.S.A., which has given its name to two battles fought in the neighbourhood during the Civil war: (1) July 21, 1861, when the N. troops, under M'Dowell, were utterly defeated by the Confederates under Beauregard. (2) Aug. 28, 1862, when the Union forces under Pope, who was attempting to guard the Potomac

line, were crushed by the Confederate forces under Lee, reinforced by Jackson.

Bulls and Bears. In the slang of the Stock Exchange 'Bulls' are men who have nominally bought stock, but with no intention of paying, hoping to sell again at a profit before long. 'Bears,' on the contrary, are men who have sold stock which they do not possess, hoping that a fall in prices will enable them to buy at a profit.

Bull-terrier, cross-breed of bulldog and terrier. The B. is a very strong, plucky dog, and a fearless fighter, with infinite determination. It is somewhat ferocious as a house-dog, but is gentle and affectionate to its owner. It has short, smooth hair, which should preferably be white in a good breed, but may be reddish, brown, or fawn. It weighs from 20 to 50 lb., but some toy varieties have been produced which weigh as little as 7 lb. The tail is left uncropped, and should be carried in a straight line with the back; the front legs firm and straight, and the jaw strong. White Bs. are permitted black markings on the nose, ear, and eye.

Bull, The, see TAURUS.

Bull's Eye (star), see ALDEBARAN.

Bull Trout is a term applied to various species of *Salmo*, which are natives of N. Europe, and belong to the Salmonidae, or family of trout salmon, and char. The name is frequently applied to *S. erior* and *S. cambricus*, also known as the grey trout. *S. trutta* possesses this name as well as those of sea trout, salmon trout, sewin, and phinok.

Bully Tree, name given to certain trees, especially those possessing a milky juice, such as the balata and chickie gum trees. They belong to the genera *Mimusops*, *Lucuma*, *Bumelia*, etc., all of which furnish trees of considerable utility. See BALATA, GUM, etc.

Bulmer, William (1757-1830), printer of the eighteenth century, celebrated for his production of the *Boydell Shakespeare*, which consists of nine vols. folio, with a vol. of engravings called *The Shakespeare Gallery*, 1791-1805. Bewick, an intimate friend of B., engraved some of the illustrations for the vols. B. also printed other costly eds., such as Milton (1793-97, 3 vols. folio), and Goldsmith (1796, 4to), for which latter ed. Bewick also provided illustrations.

Bülów, Bernhard Heinrich Martin Karl, Prince von (1849-1929), Ger. statesman, was b. at Klein-Flottbeck, Holstein—then Dan.; educated at Frankfurt-on-the-Main and other schools; went to the univs. of Lausanne, Leipzig, and Berlin. Joined the Prussian regiment of Royal Hussars and did military service as lieutenant in the campaign of 1870. Entered the diplomatic service and served in St. Petersburg, Vienna, Paris, and Bucharest (1873-88); ambassador at Rome, 1893. He was then appointed Prussian minister of state, and finally received the appointment of Ger. imperial chancellor in 1900. He was made prince in 1905. The Reichstag having rejected his budget, he resigned, 1899. In Dec. 1914 he was sent as ambas. to Rome. When Italy joined the Allies

in May 1915. B. finally retired. His *Memoirs*, pub. in 1930-31, contain an embittered narrative of Ger. diplomacy, political corruption, and personal jealousies (see vol. III, *The World War and the Collapse of Germany*)—lessons evidently lost on the later Nazi rulers of Germany.

Bülöw, Friedrich Wilhelm (1755-1816), count of Dennewitz and Prussian general, was b. at Falkenberg, and entered the army in 1768. He had already had fair experience of war, when in 1813 he took up arms against France. He earned great distinction at Grossbeeren, a victory gained almost entirely by his generalship, and at Dennewitz, where Napoleon's advance on Berlin was checked. In 1815 he arrived too late to share in the battle at Ligny, but he played his part in the victory at Waterloo. He d. at Königsberg.

Bülöw, Hans Guido von (1830-94), Ger. pianist and conductor, was b. at Dresden, the son of Karl Eduard B., a noted author. He studied under Wieck and Liszt, and soon decided to make music his life-study. For a time he visited Wagner to study conducting, but he soon came back to Liszt, whose daughter he married in 1857. In 1864 he became chief conductor at the Royal Opera in Munich and in 1865 director of the Conservatorium. Here he organised and produced, with exceptional talent, the works of Wagner. In 1869 his wife divorced him and married Wagner, but this did not dim his enthusiasm for that composer's work. He d. at Cairo. B. was a pianist of the very first class, and a talented conductor. His own compositions are few, but his taste and critical ability were remarkable.

Bülöw, Karl von (1846-1921), Ger. field marshal, son of a Ger. military officer. He joined 2nd Guards regiment infantry, 1864. Distinguished at Königgratz in Austro-Prussian war, 1866. Served throughout Franco-Prussian war, 1870. Held various staff appointments; placed in command of 4th Guards regiment, 1894; major-general, 1897. Began invasion of Belgium, 1914, leading brigade of Second Army which occupied Liège Aug. 7; then marched towards the Marne, where he was driven back. During his retreat following this disastrous reverse, and during the battle of the Aisne, he was placed in command of the First and Ninth Armies—apparently to saddle him with responsibility for the failure. In 1916, at his own request, he was retired; he d. in Berlin.

Bulrush is the name given to sev. plants which grow in marshy ground and bogs. The commonest of these are *Typha angustifolia* and *T. latifolia*, called also the reed-mace and cat's-tail, or great and lesser reed-mace respectively. The inflorescence of the B. is a spadix in which the flowers form a long cylindrical mass, the yellow male flowers above and the brown female below. The perianth is represented by long hairs, there are one to five monadelphous stamens, and the female flower has a single carpel. The fruit is an achene, covered with long hair, and is wind-distributed. These species

belong to the Typhaceae, but another B., *Scirpus lacustris*, belongs to the Cyperaceae; its stems are used for making mats, baskets, and the seats of chairs. *Pennisetum typhoides*, an Indian species of Gramineae, is the pearl millet, or B.

Bulsar, seaport of India, 115 m. N. of Bombay. It exports some timber. Pop. 14,000.

Bulthaupt, Heinrich (1849-1905), Ger. author, b. at Bremen. Was appointed librarian of the Bremen library in 1878. Wrote dramas, poems, and other works. His dramas include *Die Arbeiter* (1876); *Eine neue Welt* (1886); and *Der verlorene Sohn* (1889). He also pub. a vol. of poems called *Durch Frost und Glut*. Other works which brought him into prominence are *Dramaturgie des Schauspiels* (1884), which ran through sev. eds., *Dramaturgie der Oper*, and *Shakespeare und der Naturalismus* (1893).

Bulti, or Bultistan, the N. part of Kashmir, India, once an independent state.

Buluwayo, see BULAWAYO.

'Bulwark', Brit. battleship, one of later ships of *Formidable* class, 400 ft. long, of 15,000 tons, and 18 knots. Launched 1899. Blown up at Sheerness, Nov. 26, 1914.

Bulwer, Edward George Earle Lytton, and Edward Robert, see LYTTON.

Bulwer, Sir William Henry Lytton Earle (1801-72), Eng. diplomatist and author, elder brother of Lord Lytton. He was employed on diplomatic service at The Hague, Brussels, and Vienna, and in 1830 elected parl. representative of Wilton. He later sat for Coventry, and from 1835 to 1837 represented Marylebone, in each case in the Liberal interest. In 1837 he became attached to the Brit. embassy at Constantinople, and his successor here was such that in 1843 he was made minister plenipotentiary to the court at Madrid. Here he offended Narvaez, who secured his withdrawal on the accusation of complicity in certain plots. In 1849 he was sent to Washington, where he represented Britain in the negotiation of the Clayton-Bulwer treaty (*q.v.*), and in 1858 to Constantinople. In 1851 he was made G.C.B., and in 1871 he became Baron Dalling. His works include *France, Social, Literary, and Political* (1834); *Historical Characters* (1868-70); and a *Life of Viscount Palmerston* (1870).

Bulwer, John (fl. 1654), Eng. physician, was the first to write, in Eng., on the methods of imparting knowledge to the deaf and dumb. Except that he was himself a teacher of the deaf and dumb, nothing is known of his private life. *Chirologia, or the Natural Language of the Hand* (1644), *Philosophus, or the Deaf and Dumb Man's Friend* (1648), and *Pathomyologia, or a Dissection of the Significant Muscles or Affections of the Mind* (1649), are his chief works.

Bumble-bee, see HUMBLE-BEE.

Bumboat, broad, clumsy boat employed to carry provisions, etc., from land to vessels lying in port or near the shore. They were formerly managed by women. A scavenger's boat for removing ships' refuse is sometimes called a B.

Bunbury, in W. Australia, seaport and tn. in the co. of Wellington; its famous harbour Koombanah has breakwater constructed on a coral reef. Chief exports are coal, tin, timber, and agric. produce. Pop. 6,000.

Bunbury, Sir Henry Edward (1778-1860), seventh bart., son of Henry Wm. B. (q.v.). He served in the army from 1795 (when he obtained a lieutenancy) to 1829. He was under secretary of state from 1809 to 1816. He conducted an important secret mission to Wellington, and, later, was given the task of informing Napoleon that he was to be sent to St. Helena. In 1830 he became member of Parliament for Suffolk. He was the author of sev. works, of which the chief is the *Narrative of Certain Passages in the Late War with France* (1852), dealing with the Peninsular war and the period which preceded it.

Bunbury, Henry William (1750-1811), Eng. caricaturist, b. at Mildenhall, Suffolk, was the son of Sir Wm. B. He was educated at Westminster and Cambridge, and his faculty for caricature early showed itself. He never attempted political subjects, thus keeping himself on good terms with all parties, but his humorous drawings became so famous as to give him rank with his contemporaries Rowlandson and Gillray. He was never forced to trust to his talent for his livelihood. Examples of his work are 'The Country Club' and 'The Barber's Shop.'

Buncrana, mrkt. tn. and watering-place of co. Donegal, Ireland, on Lough Swilly. There is some fishery and trade in agric. produce. Pop. 2000.

Bund (dyke), see **BAND**.

Bundaberg, port of Queensland, Australia, near the mouth of the R. Burnett, 270 m. N. of Brisbane by rail. It has saw-mills, breweries, etc., and is the centre of a sugar-making dist. Pop. 11,000.

Bundelkhand, collection of nine Indian states in central India. Diamonds of good quality but small size are found in some parts.

Bundesrat. This council, together with the Reichstag, formed the federal gov. in Germany from 1871 to 1919. Its place was taken, under the Weimar Constitution, by a similar body called the Reichsrat. The B. consisted of delegates chosen by the govs. of the different states for each session, whilst the Reichstag, or popular assembly—which before the Second World War became a puppet body—contained members chosen by the people. The king of Prussia presided over both chambers under the title of Ger. emperor. The B. was the superior governing body, and could withhold measures passed by the Reichstag. Under the Nazi regime the Weimar Constitution was abolished and government was concentrated solely in the hands of Hitler, the Führer. See **CONSTITUTION, Germany**.

Bundl, native state of India, in Rajputana. The state is wild and crossed by two ranges of hills. The R. Meji drains it, and there are no railways.

Chief tn., B. Area 2250 sq. m. Pop. 187,000, tn. 19000.

Bundoran, vil. and watering-place of co. Donegal, N. Ireland, on Donagal Bay, 4 m. S.W. of Ballyshannon. Pop. 1000.

Bundy, Edgar (1862-1922), Eng. painter. Elected an associate of the Royal Academy in 1915. Subjects mainly historical, his pictures illustrative of Brit. seapower being highly popular and widely reproduced.

Bungalow (Anglo-Indian word from native *Banglā*, Bengalese), a one-storeyed house with a veranda, and a pyramidal roof, generally thatched. It is the kind of house in general use by Europeans in India. Dak Bs. are gov. erections for the use of travellers in the interior of India. The name is now given in England and America to light erections for seaside and holiday use, and, loosely, indeed, to any dwelling-place of one storey only but with one or more rooms in the roof-space.

Bungay, mrkt. tn. of Suffolk on the R. Waveney. It has two par. churches of interest architecturally, and large printing works and malt trade. Pop. 3100.

Bungener, Louis Félix (1814-74), Fr. Protestant theologian, was b. at Mar-sailles, of Ger. parentage, and studied and taught theology at Geneva. He pub. sev. works written as novels, but each intended to defend some principle of Protestantism. Of these may be named: *Un Sermon sous Louis XIV.* (7th ed. 1881); *Histoire du Concile de Trente* (2nd ed. 1854); *Trois Sermons sous Louis XV.* (6th ed. 1902); *Christ et le Siècle* (1856); *Rome et la Bible* (6th ed. 1860); *Calvin, sa vie, son œuvre, et ses écrits* (2nd ed. 1863). Almost all have been trans. into Eng. and Ger.

Bunhill Fields, public gardens and cemetery in Finsbury, London. In the time of the Great Plague it was used for the burial of the dead from the epidemic. Became the chief burial-ground for the dissenters of London. Bunyan and Defoe are buried here. Opened as a public garden in 1869.

Bunin, Ivan Alexievitch (b. 1870), Russian novelist and short-story writer. Resisting newer tendencies in Russian literature, B. remained a traditionalist, displaying in his work all the force and the weakness of Russian realism—its elaborate description, care for exactitude, vague touch of mysticism, carefully built-up study of characters. No Russian writer has been more careful to describe the exact colour of a thing seen, the exact tone of a thing heard. He had thus made himself master of a certain sort of style, aided by an enormous vocabulary. The main criticism of his product is that there is something static in his books. His characters do not act. They look, listen, dream, remember. His best-known books, many of which have been trans. in various languages, are *The Village* (1910); *The Cup of Life* (1914); *Monsieur de San Francisco* (1917); *The Love of Mitia* (1925); *The Well of Days* (1933); *Grammar of Love* (1935); *She* (1936); *Tolstoy's Liberation* (1937).

Bunion, inflamed swelling of the

bursæ mucosæ, or synovial sacs, occurring most commonly over the metatarsophalangeal joint of the first or fifth toe. This may be accompanied by corns or suppuration, and generally causes distortion of the joint. The most common cause of Bs. is pressure produced by badly fitting footwear, but the tendency may be hereditary. A cure may be effected by the removal of the cause of inflammation and treatment with soothing dressings, but in bad cases a surgical operation may be necessary.

Bunium is a name sometimes used for a genus of umbelliferous plants which are now included in the *Carum* and *Conopodium* genera. The tuberous roots when boiled or roasted are edible and are a good food for pigs.

Bunker Hill, small hill in Boston, Massachusetts, U.S.A., which gave its name to the battle between the Eng. and Amers. which began the war of Independence, 1775. The Eng., under Howe, only succeeded in carrying the position at the third assault, and at enormous loss. The Amers., mostly hastily loved volunteers, were under Col. Prescott. A granite column indicates the site.

Bunkum, mere speaking to obtain publication in the press, or any humbug. Phrase arose in 1820, when, in the U.S.A. Congress, the member for Buncombe, N. Carolina rose to speak. He had apparently nothing to say, and members began to leave. He continued, telling the others they could go also, but his electors expected a speech from him and he was only 'speaking for Buncombe.'

Bunsen, Christian Charles Josias, Baron von (1791-1860), Ger. scholar and diplomatist, b. at Korbach, in the principality of Waldeck. His studies at Marburg were chiefly on theology, but in 1809 he went to Göttingen Univ., where he gave much attention to philology. In 1813 he won the univ. prize essay with the treatise *De jure Atheniensium hereditario*. Came to Berlin in 1815, where he became acquainted with the historian Niebuhr, by whose recommendation he was, in 1818, made secretary to the Prussian embassy at Rome. Before this, though, he had studied Persian and Arabic under Silvestre de Sacy, and had, in 1817, married Frances Waddington, by whom his *Memoirs* were later pub. In 1824, on the retirement of Niebuhr, B. succeeded him as resident minister. During his stay at Rome, B.'s researches led him in many directions, but chiefly towards Egyptology. After leaving Rome (1838) he was for two years ambas. in Berne. In 1842 he was transferred to the London embassy, where he passed the remainder of his diplomatic life. He resigned because he disagreed with Prussia's attitude towards the Crimean war, and retired to Heidelberg, being made baron in 1857. Among his numerous works may be named *Die Basiliken des christlichen Roms* (1843); *Aegyptens Stelle in der Weltgeschichte* (1844-57). See F. von Bunsen, *A Memoir of Baron Bunsen*, 1868.

Bunsen, Robert Wilhelm (1811-99), Ger. chemist and physicist, b. at Göttingen,

where he pursued his early studies, afterwards completing them at Paris, Berlin, and Vienna. In 1836 he became prof. of chem. at the Polytechnic Institute of Kassel, whence three years later he passed to Marburg. In 1852 he was made prof. at Heidelberg Univ., and here he spent the rest of his life. He was one of the greatest teachers of chem., but rigidly abstained from theoretical discussion. Hence no school rose under his name, in spite of the great number of his pupils who made their name as chemists. His publications were extremely numerous, and his discoveries very valuable. The burner which bears his name is known to all. His researches on cacodyl, begun in 1837, cost him the use of one eye, and almost proved fatal. Even before this he had discovered the use of hydrated ferrie oxide as an antidote to arsenic. He was also the first to obtain magnesium in a metallic state. But the greatest of his achievements was the discovery, in company with his friend Kirchhoff, of spectrum analysis, a discovery which has proved of inestimable value both to chemists and astronomers. Among his works are: *Enumeratio ac Descriptio Hygrometrorum* (1830); *Gasometrische Methoden* (1837); and numerous pamphlets.

BUNSEN BURNER

Bunsen Burner, burner invented by the famous chemist Robert Wilhelm Bunsen of Heidelberg, about 1855, for use in the univ. laboratories so that coal gas could be burned without leaving a sooty deposit upon the articles heated. Air, about three vols. to every vol. of gas, is drawn into the burner tube through which the gas issues by a fine jet at the bottom. The mixture burns with a non-luminous flame and the combustion is complete. The Bunsen flame has an 'oxidising' zone, or outer envelope where oxygen is in excess, and a 'reducing' zone in the centre where unburnt gases are to be found. Such everyday apparatus as incandescent burners, gas cookers, and gas fires depend for their operation upon the use of the B. B. There are various modifications, e.g. the Meeker burner in which the burner head is fitted with a nickel grid $\frac{1}{2}$ in. deep, thus giving a large number of narrow Bunsen flames. This burner

allows the injection of a larger amount of air giving a very hot 'solid' flame. When supplied with compressed air at 10 lb. pressure it is very useful for furnaces, the temp. attainable being about 1830° C. (3326° F.).

Bunsen Cell, voltaic cell which contains a plate of zinc surrounded by sulphuric acid and a carbon plate surrounded by nitric acid, the two plates being separated by a porous partition of unglazed earthenware. It was invented in 1841 by R. W. von Bunsen, the Ger. chemist, who employed it to produce the electric arc. It is now obsolete.

Bunt, see SMUT.

Bunter (Ger. *bunter Sandstein*, variegated sandstone), in geology, a series of rocks forming the lowest div. of the Triassic system. It consists of variegated red sandstones and conglomerates. Their prin. exposure is in Germany. They may be subdivided as follows: (1) Lower B., consisting of fine red sandstone, with a thickness of as much as 700 ft.; (2) Middle B., of coarse sandstone, with a thickness of 1000 ft.; (3) Upper B., of red and green marls, varying in thickness. In England it occurs chiefly in the mudlands. Few fossils have been found in Eng. and Ger. beds, but plant life is represented by ferns and conifers.

Bunting, or *F. beriza*, is a genus of the family Fringillidae or finches. *E. citrinella*, the yellow B. or yellowhammer, is the commonest Brit. species. The next commonest species is the Corn B. (*E. miliaria*); another species, reed-B. (*E. schanicius*) is common on the Norfolk Broads. The Lapland B. and Snow B. (*Plectrophanes nivalis*) belong to other genera.

Bunting, Jabez (1779-1858), Eng. Wesleyan minister, was b. at Manchester, where he entered the ministry at the age of nineteen. He was four times president of the conference, and in 1835 was made president of the first Wesleyan theological college. For twenty years he was secretary to the missionary society. He may almost be considered the founder of the Wesleyan polity.

Buntingford, mkt. tn. of Hertfordshire, 7 m. S. of Royston, the terminus of branch line of the railway. It has almshouses and a school for mentally defective boys. Pop. 5000.

Bunyan, John (1628-88), author of the *Pilgrim's Progress*, was b. at Elstow, near Bedford. Members of his family, under the name Buington, lived in Bedfordshire as far back as 1199, whilst the grandfather of his own grandfather was a certain Thomas Bonyon (fl. 1512), a 'common brewer of beer' and 'common baker of human bread.' His mother d. in 1642, and soon after this he was drafted by a local levy into the parl. army. The war at an end, he returned to his native place. He thus describes his marriage in 1649 with a religious wife: 'This woman and I came together as poor as poor might be, not having so much household stuff as a dish or spoon betwixt us both.' She brought with her a book of her father's, entitled *Plain Man's Pathway to Heaven*,

which exerted a powerful influence over her husband, as may be seen in his *Life and Death of Mr. Badman* (1680). It was about this time that he underwent, like Blake and Cowper, many strange religious experiences. He had been very fond of ringing the bells of Elstow church, but was induced to forgo this harmless pleasure, as he believed the steeple would fall on his head did he persist in this crime. One time he was arrested in a game of tipcat by a voice which threatened him with hell if he did not repent him of his wickedness. Many long hours he spent in prayer, but it was a hard battle before he could finally renounce his pet vice of dancing on the village green. In his *Grace Abounding* he vividly describes the agony of his sufferings at this period.

JOHN BUNYAN

Dreadful hallucinations banished sleep from him at nights. He began to think, for instance, that he could have no faith unless he performed miracles, and that he would not be saved because he was not a child of Israel. But the clouds vanished and an active life healed his morbid imaginings. In 1653 he joined a dissenting community, and two years later began to preach in neighbouring vills. His first book, *Some Gospel Truths Opened* (1656), is a truly remarkable production, considering that its author was the son of a tinker and unlearned in syntax and spelling. It was one of a series of controversial writings against the followers of George Fox, the Quaker. In 1660 B. was confined to Bedford co. jail as 'a common upholder of sev. unlawful meetings,' and here he remained for twelve years. He spent his time writing and began his immortal *Pilgrim's Progress*. After the Declaration of Indulgence he was released, and was chosen pastor to his old church, but when the declaration was repealed, he was sent to the tn. jail for

six months, because he was a Nonconformist preacher. On regaining his freedom he took up his pastoral work once more, and continued it till his death on Snow Hill, Holborn. He was buried in the gloomy graveyard of Bunhill Fields. Whilst his *Holy War* (1682) is only inferior to *Pilgrim's Progress* as an allegory, the latter is, of course, his masterpiece. B. actually wrote some sixty books, but only these two and *Grace Abounding* continue to be read. Pub. in 1667 (the second part in 1684), it was at once appreciated by the common people, though it was some time before men of letters recognised the homely beauty of its biblical language, its spirited dialogue, and vivid characterisation, its imaginative descriptions, as for example of the Delectable Mts. and Vanity Fair, and above all the passion of its religious fervour. Christian's pilgrimage from the City of Destruction to the Celestial City has brought comfort and joy to men all the world over. That there is a peculiar fascination about the pilgrim is not to be denied, even by those who may be averse from B.'s religious opinions. Of this latter we have a striking instance in Dean Swift, who, in his famous Letter to a Young Clergyman, says: 'I have been better entertained, and more informed, by a few pages in the *Pilgrim's Progress*, than by a long discourse upon the will, and the intellect, and simple and complex ideas.' See also Cowper's moving lines on the pilgrim, beginning, 'O thou, whom, borne on fancy's eager wing.' Collected works ed. by C. Doe, 1692; G. Offor, 1853, 1862; H. Stebbing, 1859. Biographies and commentaries: Lives by R. Southey, 1830; Lord Macaulay, 1850; J. A. Froude, 1880; John Brown, 1885; C. H. Firth, 1911; also G. B. Harrison, *John Bunyan: a Study in Personality*, 1928; J. Lindsay, *John Bunyan: Maker of Myths*, 1937; M. P. Willcocks, *Bunyan Calling: a Voice from the Seventeenth Century*, 1943.

Bunyoro, see UNYORO.

Bunzlau, or Węgliniec, before the 1939-1945 war tn. of Prussian Silesia, but since then included in Poland. It is famous for the pottery made here since the sixteenth century. There were also before the war of 1939-45 glass works, wool spinning works, and iron foundries. The Moravian colony of Gradenburg is near by. Pop. 20,000.

Buonarroti, Michael Angelo, see MICHELANGELO.

Buonarroti, Michael Angelo, the Younger, see ANGELO BUONARROTI.

Buonfede, Appiano (1716-93), It. philosopher, was appointed to a professorship of theology at Naples in 1740. Later he joined the religious brotherhood of the Celestines, and became, in course of time, general of that order. His *Della Restaurazione di ogni Filosofia ne' Secoli* (1789), one of many works, gives a good account of sixteenth-century philosophy (Italian).

Buoninsegni, see DUCCIO.

Buononcini, Giovanni, see BONONCINI.

Buononcini, or Bononcini, Giovanni Maria (1640-78), It. composer, b. in

Modena, studied in Bologna. Entered service of Francis II., duke of Modena, became maestro di capella of San Giovanni in Monte. Wrote many instrumental and vocal compositions, and the theoretical work, *Musico pratico* (1773).

Buononcini, Giovanni Battista (1672-1748), son of the above. Became famous as a composer of operas, rivalling Handel for a time. He was court composer at Vienna for ten years. He wrote the second act of the famous pasticcio *Muzio Scevola* (an operatic medley performed in London 1721, and of which the other acts were written by Mattel and Handel). For some time he shared with Handel and Arcostl the directorship of the operatic enterprise known as the Royal Academy of Music.

Buoy, an anchored floating body used as a guide to navigation or for the purpose of mooringships. Mooring-buoys are made of wood or iron, and are used in places where anchorage is impossible or inconvenient. The more important use of Bs., however, is to mark the limits of a navigating channel, or to indicate the existence of dangerous obstructions as rocks, shoals, sunken wrecks, etc. Bs. may be differentiated by colour, shape, or the attachment of a signalling apparatus, as whistles, bells, fixed or flashing lights, etc. The following general principles are adopted in the use of Bs. in the United Kingdom: Bs. showing a conical top above water are called conical Bs., and should be kept on the starboard-hand; Bs. showing a flat top above water are called can Bs., and should be kept on the port-hand; Bs. showing a domed top are called spherical Bs., and mark the ends of middle-grounds. In the above definition, starboard-hand means the right side of the vessel in ascending a riv. or estuary, or in going with the main stream of the flood of the tide on the coast. In Scotland it is established that conical Bs. should be painted red and can Bs. black; spherical Bs. are painted with horizontal white stripes throughout the United Kingdom. Bs. bearing bells, lights, whistles, or distinguishing structures other than the foregoing are used for special positions. Bell-Bs. are actuated by the undulating of the waves; lights are provided by compressed oil gas, though acetylene and electricity are sometimes used; whistling is effected by the provision of a hollow cylinder extending some 30 ft. downwards; the up and down motion of the B. produces an inhalation and expulsion of air from this chamber, and the whistle is blown in a fitful manner corresponding to the motion of the waves. Wreck Bs. are painted green, and bear the word 'wreck.'

Buoyancy, that property by which a body tends to float in water, or, more scientifically, the pressure upwards on a floating body is equal to the weight of the body, and that weight is equal to the weight of the water displaced by the immersed part (Archimedes' principle). That is to say, if the floating body were removed, the space occupied by the immersed part would be filled up by

water, and there would still be equilibrium. The loss in weight of an immersed body is shown by Archimedes' principle to equal the weight of liquid. If a ship has a certain draught line to which she may safely be loaded, the measure of her B. may be taken as the additional weight required to bring the draught line on a level with the water. To ascertain the true weight of a body, a correction must be made of the weight in air, to allow for the B. of the air. This correction is zero if the body has the same density as the weights, but may be as much as six milligrams per gram weight of a body of sp. gr. 0.2 (using brass weights).

Bupalus (*B.* 540 B.C.), Gk. sculptor, with whom his brother, Athenis, is always associated, belongs to the school of sculpture in Chios at a time when its hist. just ceases to be legendary. The brothers never advanced to the representation of the nude: all their figures (carved in marble) were draped. B. did a figure of Tyche (Fortune) and also the Graces for the temple of Nemesis in Smyrna.

Bupalus is a genus of lepidopterous insects of the family Geometridae, in which the wings are erect in repose and the larvæ have ten legs. *B. piniarius*, the bordered white moth, is a beautiful species found in the vicinity of fir-trees.

Buphaga is a genus of birds of the starling family, or Sturnidae. *B. africana*, the ox-pecker, is generally seen in companies of seven or eight, attending a herd of buffaloes or antelopes.

Bupleurum (Gk. *βοῦς*, ox, *πλευρόν*, rib) is a genus of plants of the family Umbelliferae, which are natives of temperate climates in most parts of the world, and are remarkable for their simple leaves. The Brit. species are known by the name of hare's ear or buplever, and obtain the generic name from a supposition that they are injurious to cattle. (Another explanation of the name is that it refers to the ribbed fruits or ribbed leaves of the plant.) *B. rotundifolium*, the throw-wax, or throw-wax, has its upper leaves perfoliate, i.e. the basis of the leaf are joined around the stem, which seems to pierce the leaf.

Buprestidae is the name of a family of coleopterous insects which have short antennæ and are very brightly coloured. Green is the most common colour, but blue, red, gold, and copper are also frequent, and have a burnished appearance. They live on the trunks of trees, crawl slowly, but when on the wing fly rapidly.

Bur, or **Burr**, a slight ridge of metal raised on edges of a line engraved by the burin, rocker, or dry point. Usually removed by a scraper, as it retains too much ink in printing the plate, producing the effect of a smear. Sometimes left to produce a peculiar effect of its own. Seymour Haden and other etchers often keep it; so does Rembrandt. In mezzotint engravings the whole effect comes from the bur.

Bur, or **Burr**, is the name given to a fruit which has developed a process like a hooked spine to aid it in its distribution. *Arctium Lappa*, the burdock, is a common

example, as is also the horse chestnut. In Scotland the word is applied to the thistlehead and to the firecone.

Buran, very violent sandstorm and snowstorm occurring in central Asia, or even in the Caucasus and on the outskirts of Siberia. The storm heralds itself in a peculiar manner, and comes on quite suddenly. The sky becomes inky black, and the atmosphere is choking, on account of the clouds of fine sand blown along by the wind, which tears along at a remarkable velocity. Sometimes the wind is so cutting that it brings along in its train fine particles of partially frozen snow. There are two kinds of B., the kara-buran or black storm, and the sarik-buran or yellow storm.

Burano, ls. and tn. of N. Italy, 5 m. N.E. of Venice. Some fishing, and important lace-making industry. Pop 10,000.

Burbage, James (d. 1597), one of the most famous actors of Elizabethan times. Renowned for being the builder of The Theatre in Shoreditch, and the Blackfriars Theatre in 1596. Also built the Globe with Shakespeare's financial help.

Burbage, Richard (1562-1619), great Elizabethan actor, son of the above; in spite of his short and stout figure, played with immediate success the leading parts in most of Ben Jonson's dramas, and was famous for his impersonations of Hamlet, Lear, Othello, and, above all, Richard III.

Burbank, Luther (1849-1926), Amer. plant-breeder; b. March 7, 1849, on a farm at Lancaster, Massachusetts. Began market gardening as a youth. In 1875 estab. a plant nursery at Santa Rosa, California. He gave up business in 1893 to devote himself to plant-breeding experiments, by which he gained world-wide celebrity. Introduced many famous varieties, especially the Burbank potato. See BREEDING.

Burbot, or **Eel-pout**, common name of *Lota vulgaris*, a species of the Gadidae, or cod family, related to the whiting, haddock, and ling, and remarkable as being the only fresh-water fish of its family. It is common in European and Amer. streams, it is found in Great Britain chiefly in the Ouse and Cam.

Burchiello, It. poet of the fifteenth century. Date of birth uncertain, d. at Rome in 1448; his real name, Domenico di Giovanni. An original poet, who practised the trade of barber, and whose shop was the meeting-place of the literary wits in Florence. B. is a satirist, and his poems are sonnets of the comic burlesque type, and licentious. Different opinions are held as to the merit of B.'s poems; some regarded him as a genius little short of Petrarch, whilst others considered him to be merely 'a poetic buffoon.' Il Doni, his chief friend, wrote a commentary on his poems, which is as obscure as the text of the poems themselves.

Burckhardt, Jakob (1818-97), Swiss writer on social hist. and art critic, especially famous for his works on the It. Renaissance. Educated at Berlin and Bonn, and a pupil of Franz Kugler, the art historian. He was a prof. of hist. at Basle Univ. for nearly fifty years. His

first important work was pub. in 1842, and dealt with the works of art in Flemish cities. His masterpiece is his *Kultur der Renaissance in Italien* (1860), a brilliant survey of the period, in spite of defects arising from inherent difficulties opposed to all historians of this epoch. It was the compilation of his *Cicerone* or art guide to painting in Italy, first pub. in 1855, that led to his further study of the Renaissance and to the writing of *Die Kultur* and also of his *Geschichte der Renaissance in Italien* (1867). This latter work shows deep historical insight, but requires to be supplemented by a work like Sismondi's *Histoire des républiques italiennes* for details of the hist. of the various It. states. B. essays to prove that the moral and political salvation of the papacy was due to its mortal enemies; that but for the Reformation, which compelled the popes to put their house in order, their own degradation would have brought the whole eccles. state to an end; and that the enslavement of Italy by the Spaniards saved that country from the Turks and from barbarism. Works include *Die Zeit Konstantins des Grossen* 1853 (1924, a valuable study of the decay of anct. civilisation); *Der Cicerone: eine Anleitung zum Genuss der Kunstwerke Italiens*, 1855, trans. into Eng. by Mrs. A. H. Clough in 1873 and reprinted in 3 vols. in 1925; *Die Kultur der Renaissance*, 1860 (14th ed., 1925), trans. into Eng. in 1878, and again in 1929 by S. G. C. Middlemore; *Geschichte der Renaissance*, 1867 (7th ed., 1924); *Griechische Kulturgeschichte*, 1898-1902 (pub. posthumously). Consult: K. Joël, *Jakob Burckhardt als Geschichtsphilosoph* 1918; W. Behm, *Jakob Burckhardt*, 1930; A. von Martin, *Die Religion in Jakob Burckhardt Leben und Denken*, 1942.

Burckhardt, John Lewis (1784-1817), Anglo-Swiss traveller. Son of Col. B. who, becoming involved in the Fr. Revolution, nearly lost his life on the scaffold. He had a good education and his boyhood life was full of promise, for as one of the sons of an eminent Basle family, a choice of many careers was open to him. Accepted the offer of Sir Joseph Banks, a member of the African Association, to explore the hinterland of Africa. Disguising himself as a Muslim, he spent two years in Asia, during which he acquired so complete a mastery over Arabic and over the contents of the Koran that he passed among the natives themselves as a learned doctor of their law. After visiting Palmyra, Damascus, and Lebanon he went to Cairo. In 1812 he went up the Nile as far as Mahass, and after traversing the Nubian desert, succeeded, under the guise of a Syrian merchant, in making the pilgrimage to Mecca, by way of Jedda. He also journeyed to Mt. Sinai, but was prevented by death from joining the caravan which travelled towards Fezzan, whence he had intended to explore the sources of the Niger. Having accomplished so much at so early an age, speculation would be justified in assuming that he might easily, had he survived, have done enough to figure among the half-

dozen of the world's greatest travellers. He was a man of genuine greatness of mind and high principles of honour, qualities which, allied to his capacity for learning and power of observation, enabled him to overcome difficulties which would have baffled lesser men. The results of his travels were pub. in 1819 in *Travels in Nubia* by the Association for Promoting the Discovery of the Interior Parts of Africa; *Travels in Syria and the Holy Land* (1822); *Travels in Arabia* (1829); and *Notes on the Bedouins and Wahabys* (1830).

Burdekin, riv. of Queensland, Australia, rises not far from the coast, to which it runs almost parallel till it empties itself in Upstart Bay.

Burden, law term in Scotland, signifying any encumbrance or restriction on property of any kind. It must be secured legally, with a form stating the exact sum of money and the names of the persons concerned, given under the hand of the creditor. In the case of a B. on land, registration in the Register of Sasines is also essential. See the Scottish Land Titles Acts, 1868 and 1874.

Burder, George (1752-1832), Congregationalist pastor, after being minister in turn of the Independent church, Lancaster, 1778-83, and of the West Orchard chapel, Coventry, 1783-1803, was preacher at Fetter Lane chapel for the remainder of his life. Besides being honorary secretary to the London Missionary Society, he was editor of the *Evangelical Magazine*, and, above all, author of the remarkably popular *Village Sermons* (8 vols., 1797-1820).

Burdett, Sir Francis (1770-1844), Eng. politician, was the son of Francis B., and the grandson of Sir Robert B., bart. He was educated at Westminster and Oxford. The Fr. Revolution probably did much to mould his political opinions. He entered Parliament in 1796, having three years earlier married the heiress of the banker Coutts, and became distinguished from the first as an advocate of freedom and of radical opinions. He was arrested by order of the House for breach of privilege, having caused one of his speeches to be pub. His arrest took some time, since he barricaded his house and refused to surrender. He was, however, captured and taken to the Tower, where he was kept a prisoner until the prorogation of Parliament. His prin. political ideals were the passing of a reform bill and the taking away of Catholic disabilities. In 1820 he was again imprisoned for his denunciation of the Manchester massacres, and was fined £1000 and imprisoned for three months. He saw the Catholic Relief Bill passed in 1829, after he had made vain attempts to pass a similar measure in 1825, 1827, and 1828. After the passing of the Reform Act his active policy ceased, and he seemed satisfied with the victory which had been gained for freedom and reform.

Burdett, Sir Henry Charles (1847-1920), author and statist; son of Rev. Halford B., M.A., of Gilmorton, Leicester co.; made K.C.B., 1897, and K.C.V.O.,

1900. At one time superintendent of the Queen's Hospital, Birmingham, and of the Seaman's Hospital, Greenwich. Many publications on financial topics, including *Burdett's Official Intelligence of British, American, and Foreign Securities* (17 vols.); *The National Debt; Local Taxation in England and Wales; National Debts of the World; Municipal, County, and Indian Finance; Seventeen Years of Securities*.

Burdett - Coutts, Angela Georgina, Baroness (1814-1906), daughter of Sir Francis Burdett, was b. April 21. In 1837 she inherited almost all the great wealth of her grandfather, Sir Thomas Coutts, left by the will of his widow, the duchess of St. Albans, once Henrietta Mellon, the actress. Many offers of marriage were made her, but she resolved to remain single, and to devote her vast wealth to the cause of philanthropy. In 1881, however, she married Wm. Ashmead-Bartlett (1851-1921), who assumed her name, and was sev. times elected as member of Parliament for Westminster. In 1871 she was created a peeress, and in 1872 she was presented with the freedom of the City of London, being the first woman to receive this privilege. She d. on Dec. 30, 1906, and was buried at Westminster Abbey. Her philanthropic exertions were on such a vast scale that it is difficult to find any dept. of life they did not touch. She endowed the three bishoprics of Cape Town, Adelaide, and Brit. Columbia. Her love for her own sex caused her to do much for reformatories, and to secure great improvements in the education of girls at the national schools. Her interest in emigration was great, and she did much to aid in this work.

Burdock, or Arctium Lappa, is a common Brit. species of Compositae which is often found growing by roadsides. It occurs also in Asia and on the Continent. The leaves of the involucre are hooked and spinous when the fruit is ripe, and assist in its dispersal. The stem is about 4 ft., with lance-shaped leaves, and the lower leaves are 12 in. across, heart-shaped and thickly coated with white hairs on the underside. See BUR.

Burdon-Sanderson, Sir John Scott (1828-1905), Eng. physiologist, b. at Jesmond, near Newcastle-on-Tyne. Was the second son of Richard Burdon, who took the additional name of Sanderson on his marriage with Elizabeth, only daughter of Sir James Sanderson, first baronet, M.P. He went to the univ. of Edinburgh in 1847, came to London as practising physician in 1853, and was appointed medical registrar, then lecturer, at St. Mary's Hospital, London. In 1867 elected fellow of the Royal Society and Croonian lecturer. In 1870 devoted himself to scientific research. Initiator of new Eng. school of experimental work in pathological and physiological research. He was especially interested in the study of the functions of living tissues.

Burdur, tn. in Asiatic Turkey, 65 m. N.N.W. of Adalia. Pop. 127,000.

Burdwan, cap. of dist. B., W. Bengal, India, 67 m. from Calcutta. It contains the palace and gardens of the

maharaja of B. and numerous temples. It is a collection of 73 vills. and suburbs. Pop. 48,000. The dist. has an area of 2697 sq. m., and a pop. of 1,439,000. There are coal mines at Raniganj. The prin. exports are silk, jute, tobacco, rice, and iron and coal.

Burdy, Samuel (c. 1760-1820), Irish author, curate first at Ardglass, 1783; promoted to Killelef, c. 1800. His *Life of the Rev. Philip Skelton* (1792) is one of Ireland's literary treasures. Amongst other poems, he wrote *Ardglass, or the Ruined Castles* (1802).

Bure, in Norfolk, Eng. riv., 50 m. long, joining the Yare at Yarmouth.

Bureau (Fr. *bureau*, coarse cloth used as a covering) denotes a desk, or writing-table. By metonymy the meaning is transferred from the desk to the business office or dept. of gov., and further to any group of officials. The word B. is especially particularly to mean a gov. dept., used in France. In the U.S.A. B. means a subdivision of a great executive dept., e.g. the Bureau of Statistics, a dept. of the Treasury Dept.

Bureaucracy, a term signifying gov. by depts., each ruled over by its separate chief, as opposed to gov. by ministers, owing a collective or associated responsibility to the people, and hence the word is often loosely used to mean officialism, red-tapeism.

Burette, apparatus used in practical chem. for delivering measured quantities of a liquid. It consists of a graduated cylindrical tube fitted with a stop-cock. A small glass float with a fine horizontal line engraved upon it may be used at the surface of the liquid to indicate the extent of movement of the top of the column with greater accuracy.

Burford, tn. on the Windrush, in the Woodstock div. of Oxfordshire, England. Historical interest attaches itself to B. Priory, and also to the place itself, as the scene of the overthrow of Ethelbald of Mercia by Cuthred of Wessex (A.D. 752). B. was obliged to send a member to Parliament in 1306, but petitioned to be excused henceforth and was so. The anct. corporation was dissolved in 1863. The seal dates from about 1250. The church of St. John the Baptist was originally Norman. Pop. 1500.

Burg, tn. of Saxony, Germany, 15 m. N.E. of Magdeburg by rail. It has manufs. of cloth and boots. Its prosperity is largely due to the Fr. and Walloon immigrants who came after the Edict of Nantes. Pop. 25,000.

Burgage Holding and Tenure. B. *tenure* denotes the particular feudal service or tenure of houses or tenements in anct. cities or bors. The incidents of this tenure, which prevailed in Normandy as well as in England, vary according to the particular customs of each bor. (q.v. and **BURGESS**). It is generally considered to be a species of socage tenure, as it was usually held either at a pecuniary rent or for services having no relation to military service. The later importance of the tenure was mainly in regard to the bor. franchise. B. *holding* is one of the forms

of feudal tenure in Scotland, and is that by which burghs-royal (see BURGHs) hold of the Crown the lands contained in their charters of erection. Property held on this tenure is at the present day practically all allodial.

Burgas, chief S. port of Bulgaria, on the gulf of Burgas, in the Black Sea. It has a considerable transit trade, and large exports of agric. produce, and also of clay for pipes and pottery. Pop. 41,000.

Burgdorf (Fr. *Berthoud*), tn. in the canton of Berne, Switzerland, on the R. Emme, 14 m. N.E. of Berne. It has silk and cloth-making industries. It is a picturesque tn., and its castle was the seat in which Pestalozzi set up his school, 1798-1804. Pop. 10,000.

Burges, small ponnant used by yachts and pointed or swallow-tailed according to the owner's status. Bs. of clubs are invariably pointed, that of a commodore or vice-commodore swallow-tailed. Only the royal yacht squadron may fly the white ensign, but other royal clubs may have a crown on the B.

Burgenland, prov. of Austria, has an area of 1532 sq. m. and a pop. of 265,000. It is composed of dists. ceded by Hungary after the First World War, and lies between Hungary and Austria on the E. and W., and Bohemia and Yugoslavia on the N. and S. Owing to its position the ownership of this area was in great dispute, Czechoslovakia and Yugoslavia desiring it as a connecting link between them, Hungary claiming it on historical, Austria on ethnographical, grounds. In 1919 it was allotted to Austria. The chief tn., Sopron, was, however, mainly Magyar in sympathy, and after considerable trouble and unrest, that tn. was given, by plebiscite, to Hungary. After the cessation of the war in 1945 B. was included in the Russian zone of occupation of Austria. The cap. of B. is Eisenstadt.

Bürger is the Ger. synonym for 'freeman.' Most of the men who inhabited Germania at the time of Tacitus were freemen. Each freeman carried arms, had slaves, and usually possessed land. The freemen attended the assemblies of the vil., hundred, and tribe. Charlemagne (A.D. 800-807) excluded the common freemen from the national diets, and limited their rights by enforcing arduous military service, etc. Henry the Fowler, king of Saxony, did much to advance the interests of the burgher class (A.D. 918).

Bürger, Gottfried August (1747-94), Ger. poet, son of a Lutheran pastor. In 1764 he entered the univ. of Halle as a theological student, but he early gave up theology for jurisprudence and a life of dissipation. His friendship with men of literary tastes saved him from his evil habits and he pub. his first poems in the *Musenalmach*, of which he himself became editor in 1778. As a ballad writer his popularity spread far and wide. Such ballads as *Lenore* (1773), *Der wilde Jäger*, and *Das Lied vom braven Manne* are almost unequalled for dramatic intensity, virility of style, and atmospheric suggestiveness.

Burgers, Thomas François (1834-81), president of the Transvaal, a native of

Cape Colony, and minister of the Dutch Reformed Church. Elected president by the Boers, 1872, in a most critical period of the hist. of the Transvaal. Kruger systematically opposed B.'s policy, with the result that the Boers refused to pay taxes, and entered into warfare with Secocoeni, a native chief. Transvaal was also menaced by the Zulus. At this crisis England appointed Sir Theophilus Shepstone to inquire into matters; B. was compelled to resign, and the annexation of the Transvaal was formally declared in 1877.

Burgess (Low Lat. *burgensis*, citizen; old high Ger., *tn.*) formerly meant simply an inhab. of a bor. or a leading craftsman in a guild belonging to a bor. Gradually the term B. came to be applied to a freeman of a bor. possessing a tenement in a bor. The early importance of Bs. lies in the fact of their inclusion as one constituent part of the Third Estate of the Realm or Commons in Parliament. In 1264 Simon de Montfort, in issuing writs for a parliament in London, summoned for the first time two citizens from each city and two Bs. from each bor. to sit with the knights of the shire, thus eliminating the barrier which had hitherto kept them apart. From this union springs the bulk of our national liberties. The Bs. or representatives of bors. attended Parliament regularly from the time of the Model Parliament, 1295. The creation in 1835 of the 'municipal corporation' as a unit of self-gov. included that of a uniform qualification for the municipal franchise. That qualification is known as the old B. qualification, and is now practically the same as, but not necessarily co-extensive with, the parl. franchise. The qualification of a B. is enrolment on the B.-roll as a ratepaying occupier of a house or other building in the bor. or within 7 m. of it. Women may be Bs., and are now also eligible for corporate office. Where the bor. is a city, the Bs. are called citizens. See also BURGH.

Burgess, John Bagnold (1829-97), a Brit. painter, b. in London. He studied in the Royal Academy, and later lived for some years in Spain, whence he chose the greater part of his subjects. A.R.A., 1877, R.A. 1889. Among his best-known pictures are 'Bravo Toro' (1865); 'Stolen by Gypsies' (1868); 'Visit to the Nursery' (1870); 'Licensing Beggars in Spain' (1877).

Burgess, John William (1844-1931), Amer. historian, b. in Giles co., Tennessee. Educated at Cumberland Univ. and at Göttingen. Appointed in 1873 prof. of hist. and political science at Amherst College. Later, prof. of political science and constitutional law at Columbia College. Works: *Political Science and Constitutional Law* (1890); *The Middle Period of United States History* (1897); *The Civil War and the Constitution* (1901); *The Transformation of the Constitutional Law of the United States between 1891 and 1900* (1921); *Recent Changes in Constitutional Theory* (1923).

Burgess Hill, tn. in Sussex, England, 8 m. N. of Brighton. Pop. 6000.

Burgh means a Scottish tn. possessing

incorporation (corresponding to the Eng. 'borough') and a local (generally petty) jurisdiction. Formerly only royal Bs. could send representatives to Parliament, but since 1832 there have been parl. Bs. or tns. not being royal Bs. but sending representatives to Parliament, e.g. Falkirk, Leith, Hamilton. The General Police Act for Scotland extends the meaning of B. and defines it to mean all Bs. and populous places whose boundaries have been fixed. The Act further provides that the sheriff may, on the representation of seven or more householders, fix the boundaries, and thereby constitute a B. for purposes of local gov. The jurisdiction of B. magistrates is practically restricted to police offences, payment of B. dues, and summary ejections. See W. M. Mackenzie, *The Scottish Burghs*, 1948.

Burgh, Hubert de (d. 1243), most famous of an Eng. noble family of the Middle Ages. Served Richard Cœur-de-Lion, then John, siding with him against the barons but urging the signing of the Magna Charta. Justiciar of England. During Fr. war checked Louis at Dover Castle, and defeated the Fr. fleet, 1217. About 1221, with Langton, Hubert became regent for Henry III. After rising to great power, fell into disfavour (1232), and lost his influence at court. Shakespeare's account (*King John*) is unauthentic. Consult Stubbs, *Constitutional History of England*, vol. II, 1896.

Burghersdorp, tn. of Cape Province, near banks of Stormberg Spruit, on railway to Aliwal North, about 39 m. from it. Important trade in wool. Was in Boer hands early in S. African war. White pop. over 2000.

Burghley, William Cecil, see BURLEIGH, LORD.

Burgin, George Brown (1856-1945). Eng. author, son of Joseph B., barrister, secretary of Author's Club, 1905-8; joint honorary secretary of New Vagabond Club; writer of many books, amongst which may be mentioned: *The Judge of Four Corners* (1896); *The Belle of Santiago* (1911); *Dickie Diver* (1912); *The Duke's Stragem* (1931); *A Pious Fraud* (1938).

Burgkmaier, Hans (1473-1531), Ger. painter and wood-engraver, was a friend of Albert Dürer, and father-in-law to Holbein the elder. His renown rests on his woodcuts—nearly 700 in all—which are truly remarkable for their faithful presentation of contemporary life, and for their dramatic strength. Especially noteworthy are his engravings for *The Triumph of Maximilian*, and for a Ger. translation of Petrarch's Lat. treatise *De Remediis utriusque Fortune*. His wood-engravings are wrought with fire and the vigour of a robust, struggling, and reforming age. A portrait of himself and wife may be seen in Vienna, whilst the galleries of Munich, Berlin, and Augsburg, his native place, possess examples of his work in fresco painting.

Burglary (etymology uncertain. The O.E. word was *burg-bræce*, breaking into a strong place. Wyld gives Low Lat.

burg(u)lator. In Norman-Fr. the word was *burgessour*, from Fr. *bourg*, the second element being given as O.F. *laire*—mod. Fr. *larron*—but the evidence shows that the *l* is intrusive. A common suggestion is that the word comes through O.F. from Lat. *burgi latrocinium*). In O.E. law B. was known as *hamsocna*, in Eng. common law, is defined as the breaking and entering a dwelling-house by night, with intent to commit a felony. *Breaking* may be either by forcing open a closed window, door, etc., by some necessary aperture such as a chimney, or by collusion with a servant or inmate of the house. It may be before the felony, to secure entrance, or after it, to secure escape. For *entry* it is sufficient that the hand or arm should be inserted. A *dwelling-house* is any permanent building in which the owner or some tenant sleeps. Any building or out-house forms part of the dwelling-house only if it be connected with the same either directly or by an enclosed passage. *Night* is defined as the period between 9 p.m. and 6 a.m. The punishment for B. is penal servitude for life, or any period not less than three years' penal servitude, or two years' imprisonment. If the offence be committed by day, or in some place other than a dwelling-house, it is not B., but housebreaking. In Scotland all cases fall under the law of housebreaking, and the name 'B.' is not used. In the U.S.A., on the contrary, B. is made to cover many cases of housebreaking, and is never punished by penal servitude for life.

Bürglen, picturesque situated vill. in the canton of Uri, Switzerland, the traditional home of Wm. Tell, who is said to have been b. here and to have met his death at a spot indicated by a stone cross, while rescuing a child. Pop. 2000.

Burgmaster, title of chief magistrate of a Dutch, Flemish, or Ger. tn. It corresponds to the Eng. 'mayor' and Scottish 'provost.'

Burgos, prov. of Spain, in area 5480 sq. m. It is a tableland crossed by ranges of high mts., with a severe climate and a barren soil, watered by the Ebro and the Douro. The 394,000 (in 1947) inhab. live in small vils. and are mostly occupied in growing corn and raising cattle. Some make paper hats, gloves, linen, and crockery. B., the city of the legendary hero of Spain, the Cid, is the cap. of the prov. with a pop. (1947) of 78,900. It was first formed into a tn. by Alfonso III. (866-910), who surrounded sev. hamlets with a wall to defend them against the Moors. The cathedral is the most glorious Gothic monument in Spain, and there are other beautiful old churches and palaces of the medieval nobility. The museum contains some very noble sepulchral monuments, as does also the convent of las Huelgas founded by Alfonso VIII., son-in-law of Henry II. of England. Three m. from B. is the Cartuja de Miraflores, a monastery in which are more superb monuments. The citadel, now a heap of ruins, successfully resisted the duke of Wellington in 1812. It was in B. in July 1936 that Gen. Franco set up his

Insurgent gov. under the title Junta de Defensa Nacional.

Burgoyne, John (1722-92), Eng. general. He entered the army at an early age, and was also at an early age compelled to sell out in order to pay his debts. His youth was further distinguished by his runaway marriage with the daughter of the earl of Derby. He spent the years following the selling of his commission abroad, but was, by the influence of his father-in-law, restored to his rank in the army in 1758. He became the first commander of light infantry in the Brit. Army in 1759. He became an M.P. in 1761, and was made a brigadier-general in the following year. At the close of the Seven Years war he devoted his time to politics and the drama, his first play being produced in 1775. In that year, on the outbreak of hostilities with the Amer. colonists, he was appointed to the command of a div., and made a fatal attempt to attack the colonists from Canada. He was surrounded at Saratoga by Gen. Gates and the Amer. Army, and forced to surrender with 3500 men. He was deprived of all his appointments, but was restored to them in 1782. He retired, however, into private life, and occupied his time with dramatic work. His most popular work, *The Heiress*, appeared in 1786. In 1808 his poetical and dramatic works were pub. See W. L. Stone, *Campaign of Lieut.-Gen. J. Burgoyne*, 1877; F. J. Hudleston, *Gentleman Johnny Burgoyne*, 1927.

Burgoyne, Sir John Fox (1782-1871), Eng. field marshal, a natural son of John B. (q.v.) and Susan Caulfield, an opera singer. His education was received at Eton and Woolwich. He obtained his commission in 1798, and two years later served in Abercromby's expedition to the Mediterranean. He joined Wellesley in Portugal in Feb. 1809, was present at the passage of the R. Douro and the taking of Oporto, being promoted captain. His military skill at the sieges of Badajoz and Ciudad Rodrigo won him the rank of lieutenant-colonel in 1812. Chairman of the Irish Board of Public Works, 1831-45. Later he served with distinction at the Crimea, and was promoted to general in 1855, and created a baronet in 1856. Field marshal, 1868.

Burgstädt, tn. in Saxony, Germany, 35 m. S.E. of Leipzig. Its manufs. are linen and gloves, and cotton printing and wool weaving are carried on. Pop. 9000.

Burgsteinfurt, tn. in Westphalia, Germany, 17½ m. N.W. of Münster, on the Aa. It has textile manufs., and a fine castle. Pop. 6000.

Burgundil, The, were a tribe of N. Germany, who early estab. themselves about the source of the Mein (Main). Although they took part in the great barbaric invasion of Rome in 406, they were often loyal allies of the Romans against the Huns and Franks. In 475 they occupied the Rhone valley. They had adopted Christianity before Cloaire, the Frankish king, finally put an end to their kingdom in 534.

Burgundy, Dukes of, see PHILIP THE BOLD and PHILIP THE GOOD.

Burgundy, formerly an independent monarchy, and later a prov. of France. Its earliest inhab. were a Ger. tribe, the Burgundil (q.v.), who had extended their settlement from the banks of the Oder and Vistula to the Rhine and Neckar. A defeat by the Huns, followed by the chaos resulting from the decay of the Rom. Empire, saw them holding sway over the whole of the Rhone valley. They accepted Christianity later, and in 534 were conquered by the Franks. In 832 B. regained its independence and gradually attained great power; but a later absorption of the prov. by the Gers. saw its gradual decomposition into a number of small states, all of which were finally taken over by France. It now comprises the depts. of Ain, Côte-d'Or, Saône-et-Loire, and Yonne, and is world-famous for its wines. Its prin. tns. are Dijon, Mâcon, Autun, Châlon-sur-Saône, and Bourg, and it is watered by the Rhone, Seine, and Loire Rs.

Burgundy Pitch, yellowish-white resin prepared from common frankincense, the exudation of the Norway spruce-fir (*Abies excelsa*), by melting it in hot water and separating it from the greater part of the oil which it contains. B. P. is hard and brittle, and can be distinguished from its many imitations by its pleasant smell and lack of bitterness. It is used in medicine for plasters, and acts as a mild irritant.

Burgundy Wines, fine and world-famous wines produced from the vines cultivated on the sun-bathed slopes of the low hills of Côte-d'Or, the dept. which, together with Yonne and Saône-et-Loire, corresponds to the old dist. of Burgundy. Beaune is the centre of the dist. and of the trade. The most celebrated red wines are Romanée, Chambertin, Richebourg, and Clos de Vougeot, while the finest white Burgundies are those of Montrachet and Chablis. The celebrated Hospice de Beaune derives its revenues from some of these vineyards.

Burhanpur, tn. in the Central Provs. of India on the Tapti with 40,000 inhab. (30 per cent in 1947 were Muslims). It was for centuries the cap. of independent Moslem princes.

Burial Acts. Burial is the ordinary mode of disposing of the body of a deceased person, but the Eng. law contains no prohibition of other methods, so that cremation was lawful even before the Cremation Act, 1902, was passed to regulate it. Nor does the law require burial in any particular place; nor, if elsewhere than in consecrated ground, is any particular ceremony prescribed; and burial in private ground is allowable provided such burial does not amount to a nuisance or infringe any statutory prohibition against burial in any particular locality. But all burials must be effected in a decent and orderly manner whether with or without a religious service; and disregard of this provision of the Burial Laws Amendment Act, 1880, is a misdemeanour. Under the Act of 1880, wilful obstruction of a burial or burial service, or the delivery of an address

which is not part of the religious service permitted by the Act or by any lawful authority, is a misdemeanour. No one can by will or in any other way legally dispose of his body after death, and any such testamentary disposition may be ignored by his personal representatives; but he may effectively give directions regarding the anatomical examination of his body. In most par. there is a burial-ground recognised as the par. churchyard, and this place constitutes the ordinary place of burial unless closed for burials by Order in Council, contravention of such order involving penalties under the Burial Act of 1855. There is no certainty as to what conditions constitute a par. churchyard, but consecration, whether actual or presumed, seems to be essential, and length of time during which use as a par. churchyard has prevailed is really the only conclusive evidence of a presumption apart from actual consecration. Every parishioner and inhab. of a par. and every person dying in the par. has the right to be buried in the par. churchyard or burial-ground, a right enforceable at common law as well as by the eccles. court. The churchwardens and incumbent can, however, permit non-parishioners to be buried in their par. churchyards, subject to a possible injunction by the chancery div. if such interment amounts to actual inconvenience to the parishioners. The right of burial does not carry with it a right to have a monument erected nor a vault. Generally burial in an iron coffin will be regarded by the eccles. court as proper. Parishioners have no right to burial within the church. Burial in a church depends on the issue of a faculty in that behalf. Erecting a monument to the dead in a churchyard or church otherwise than under the authority of a faculty therefor is an offence cognisable by the eccles. court. Also, in the absence of a faculty, there is no exclusive right to the use of a particular part of the churchyard for burial purposes. By the eccles. canons it is the duty of every minister of the Church of England to perform the burial service over the body of any person not excluded from Christian burial, and otherwise entitled to burial in a churchyard; and refusal or failure to do so may entail suspension from his ministry and possibly an action for damages. Suicides, where a verdict of *felo de se* has been found, must be interred in the ordinary manner as if no such verdict had been returned, but the rites of Christian burial are not to be performed on interment, so that such burial may be without any religious service or with such ordinary Christian service other than that of the Church as the person having charge of the burial thinks fit. The common law allows no fee in respect of burial, but such fees may be due by immemorial custom or by statute. Fees alleged to be due by custom are commonly paid, and generally to the incumbent. Additional fees are paid for the erection of monuments or vaults. The Eccles. Commissioners have power to fix tables of burial fees, and

such tables must be registered in the diocesan registry. Burial-grounds are provided and maintained by burial boards and other authorities under the Burial Acts, 1852 to 1906. The power of adopting these Acts for a poor law par. in an urb. dist. rests with the vestry, subject to the consent of the urb. authority, and the vestry can elect and control the burial board. Consent of urb. authorities is indispensable to the adoption of the B. A., and in some cases the sanction of the Ministry of Health is necessary. The burial board may also in some cases contract with cemetery owners, and the board has all necessary legal powers to acquire the requisite land. Urb. authorities, that is bor. councils and non-municipal urb. dist. councils, may exercise the functions of a burial board. In a rural par. the par. meeting have exclusively the power to adopt the B. A. for the whole of the par. subject, if the par. is divided for eccles. purposes, to the consent of the Ministry of Health. In London, outside the city, the B. A. were declared by the London (Adoptive Acts) Scheme, 1900, to be in force in certain metropolitan bors., while in the remaining bors. the Acts may be brought into force by Order in Council. The burial authorities for London are the metropolitan bor. councils, and in most cases they are not subject to the control of any vestry or similar body. The corporation of the City of London have the functions of a burial board for the city. Under the Public Health (Interments) Act, 1879, any urb. or rural dist. council may provide a cemetery and must if so required by the Ministry of Health. There are also statutory provisions for regularising the provision and maintenance of private cemeteries. These are usually owned by companies, who must provide for due registration of burials in the cemeteries owned by them. The powers of a burial authority to provide and maintain burial-grounds or cemeteries extend to and include the provision and maintenance of crematoria. (See also CREMATION.)

Burial Customs. From the earliest times definite customs and manners have crystallised around the act of human sepulture, and in numerous instances these bear a striking similarity to one another, although widely separated by circumstances of time and geography. It is well known, for example, that many primitive peoples, both prehistoric and modern, bury their dead in the foetal posture—that is, with knees drawn up to the chin, and placed upright in the grave dug to receive the body. Early burials in many countries bear traces of fire, and show that cremation after inhumation was resorted to. Later a rude effort at preservation of the corpse was attempted, as in prehistoric Egypt, where bitumen was smeared over the remains—the first attempt at mummification. In the evolution of B. C. we can distinctly trace the various steps as follow: eating of dead kindred, in order to partake of their virtues, pounded bones

or ashes eaten by kinsmen, water in which the body was placed drunk by kinsmen, foetal burial, attempts at cremation, rude embalment, urn burial, aerial burial, inhumation in cists or stone coffins, modern sepulture. It is not advanced that these methods came into use one after another in any one sphere, but that this is an ideal course of their evolution culled from the mortuary customs of many lands and ages.

Europe.—Paleolithic burials are seldom encountered in Europe, and consisted chiefly in placing the remains in caves or similar retreats. It is very unlikely that any fixed custom attached to the disposal of remains until at least later Paleolithic times. In Neolithic times foetal inhumation was probably customary, but in some centres cremation and burial in stone cists and urns prevailed. In later Neolithic times burial in barrows or mounds obtained. The shape of these varied with race, the long-skulled aborigines who preceded the Celts in Europe placing their dead in long barrows, whilst the round-skulled Celts buried theirs in round barrows. Many of these barrows are honeycombed with graves, and yield rich results to the archaeologist, who usually discovers therein tools and weapons of the Bronze period. It was customary for the early races of Europe, and indeed for primitive races all over the globe, to inter with their dead such articles as they considered would be necessary for their comfort in the world of shadows, and it is fortunate for modern archaeology that primitive graves have yielded these in abundance. Graves of the Bronze Age all over Europe bear a great resemblance to one another. In Greece and Rome cremation was resorted to. Burials of the early Christian period were usually made in catacombs, such as those at Rome, where the bodies were placed in niches in the walls, and their resting-places decorated with paintings and sculpture. Outside of the Roman sphere of influence burial in Europe retained its primitive character, the offering of objects to the *manes* of the deceased being almost universal. With the introduction of Christianity, however, sepulture in consecrated ground began to be regarded as essential for the good health of the soul, and this obtained throughout the Middle Ages, and to some extent is still looked upon as desirable. Propitiation of the *manes* of the deceased is seen in Europe in the custom which until comparatively recently obtained in Northumberland of sacrificing domestic animals prior to the burial of the dead, and even a trace of human sacrifice may be preserved in the custom at highland funerals of the friends of the dead person fighting until blood was drawn—an example of the substitution of the part for the whole. Even the practice of the eating of dead kindred is typified all over Britain by the revolting custom of 'sin-eating,' in which a paid person devours a piece of bread and cheese or a cake and drinks a mug of ale over the coffined body of the dead. Until the beginning of last century the

burial of a gipsy chief was often accompanied by the sacrifice of his horse, either as a propitiation to his spirit, or because it was regarded as essential to his comfort in the next world.

Asia.—Burial in early Palestine appears to have been effected in caves and similar places, where the corpse would not be readily got at by beasts of prey. In Moslem countries inhumation in cemeteries is common, and the turban cut in stone, the symbol of the Muslim faith, is usually found upon the graves. In India the Parsees expose the dead off the summits of towers, where they are devoured by birds of prey. The splendid tombs of Hindustan are eloquent witnesses of the manner of disposing of the dead which obtained among those of the Brahman religion. In China, where ancestor-worship is the national religion, a paper house is constructed for the soul of the departed about 10 ft. high by 12 ft. deep. This contains various apartments, and a paper image of the dead is placed inside it, with paper models of food and all necessities. The deceased is afterwards worshipped by his children. In China mourning materials are white. Throughout Asia customs of sepulture differ but in minor details, and in Japan, Burma, Korea, and the Mongolian peninsula consist of burial according to the rites of ceremonial Buddhism.

America.—In America many of the customs alluded to as prevalent in prehistoric times obtain. Thus interment in mounds and stone cists or caves is frequent, but tribal custom often dictates methods of sepulture which are strictly adhered to. Thus the Mohawks formerly made a large round hole in which the body was placed in a squatting posture, after which it was covered with timber and earth. Some Carolina tribes placed the corpse on a cane hurdle and deposited it in an outhouse for a day. It was then wrapped in cane matting or rushes and deposited in a grave, logs or stone slabs being placed over it so that the earth might not fall on the body. The Creeks and Seminoles of Florida generally buried their dead in a circular pit about 4 ft. deep, the corpse with a blanket or cloth wrapped about it being placed in a sitting posture, the legs bent under and tied together. Wooden vaults are also sometimes found, as are dome-shaped stone vaults. Sometimes clay was spread over the corpse and fire applied before burial. Sometimes even mummification was practised. Aerial sepulture in trees and upon raised platforms, burial in lodges, in canoes and urns, are other American modes of disposing of the dead. In S. America very similar methods are in vogue, the habit of scraping the bones and hanging them up in baskets in trees or at the doors of lodges being very common. Mummification was practised in anct. Peru.

Africa.—The funerary customs of Egypt are too well known to require lengthy description. (See EMBALMING.) There were three modes of mummification, undertaken by a special caste who were abhorrent to the rest of the pop., namely

entire embalmment, which cost about £700; partial embalmment; and a mere smearing over of the corpse with bitumen. The mummy was placed in a rock-cut tomb, surrounded with paintings representing objects supposed to be useful to it, and *ushobtu* figurines which represented servants to attend to its requirements in Ananti or Hades. The modern tribes of the Sudan practise burial after the Moslem fashion, whilst those of central Africa, if cannibals, often devour the corpse or a portion of it, and if non-cannibal bury it, often with many strange ceremonies. Some tribes, however, merely take the body into the bush or forest and leave it to be devoured by wild animals.

In Polynesia until recently it was customary to devour a dead relative in order that his virtues might enter the bodies of his descendants. Among the Eskimos burial by canoe is often practised, and in Australia the nomad tribes either leave the body to rot, or bury it in the ordinary manner. See Sir T. Browne, *Hydrotophia*, *Urne Buriall*, 1658; V. Schulze, *De christianorum veterum rebus sepulchralibus*, 1879; J. Fergusson, *History of Indian and Eastern Architecture*, 1910; G. Quell, *Die Auffassung des Todes in Israel*, 1925; B. S. Puckle, *Funeral Customs*, 1926; E. Bendaun, *Death Customs: an Analytical Study of Farina Rites*, 1930; Sir J. G. Frazer, *Garnered Sheaves*, 1931; L. V. Grinsell, *Ancient Burial Mounds of England*, 1936.

Buriats, race of Mongolians inhabiting the neighbourhood of Lake Baikal. They resemble the Chinese in their small slanting eyes and their pigtails. Their religion is Buddhism, though there are Shamanists and Christians among them. Contact with the Russians took place first in the sixteenth century, from which people they learned farming and irrigation, occupations in which they excel the Russians themselves. Their country has been formed by the Soviet Gov. into the Buriat-Mongolian autonomous S.S.R. with an area of 419,000 sq. m. and a pop. of 485,000. Its cap. is Verkhue Udiinsk. Pop. 30,000.

Buridan, Jean (c. 1297-c. 1358), Fr. philosopher. A native of Artois, he studied under Wm. of Occam in Paris, where he later became prof. of philosophy, and, in 1327, rector. Under an ordinance of Louis XI. the reading of his works was prohibited. His philosophy is based upon the doctrines of his teacher Occam. His ideas in connection with free will, contained in his comments on Aristotle's *Ethics*, bear a resemblance to Locke's.

Burigny, Jean L'Evesque de (1692-1785), man of letters, is remarkable for his extraordinary versatility and the volume of his publications, as well as for his erudition. Among his works are biographies of Grotius and Erasmus (1750 and 1757); a treatise on papal authority (1720); and a *Histoire des révolutions de l'empire de Constantinople* (1740).

Burins, see CHISELS.

Burid Palm, or *Mauritia tinifera*, is a handsome species of *Palmaeae* found in

S. America, especially in Brazil. It is one of the loftiest of palms, growing to a height of 100 to 120 ft., and it yields many useful products. Among these are a pulp from the fruits which is converted into a sweetmeat, a juice which makes a delicious beverage, and leaf-fibre used for making mats.

Burkburnett, city in Wichita co., Texas, U.S.A. Centre of a large oil-field. Pop. 5300.

Burke, Edmund (1729-97), Eng. statesman. Very little is known of the early life of B.. In fact the exact date of his birth is hidden in some obscurity, although it is most probable that he was b. on Jan. 12 1729. His bp. was Dublin,

EDMUND BURKE

An engraving after a painting by Sir Joshua Reynolds

where his father was at this time practising as an attorney. His father was a Protestant, a faith in which Edmund himself was brought up; but his mother belonged to the Rom. Catholic faith, and this, together with the fact that his earliest schoolmaster belonged to the Society of Friends, gave him the foundations of the toleration which he later applied to religious questions. In 1743 he entered Trinity College, Dublin, where he studied hard but in a desultory fashion, making himself, however, well acquainted with the Lat authors. He took his degree in 1748, and two years later came up to London to study law. His health at this time was weak, and he spent a great deal of his time travelling, and of this period of his life we know little, since there are no letters of his to be found which deal with it. In fact we find him later writing 'to atone' for his neglect of his chief correspondent Richard Shackleton, the son of his old schoolmaster. In 1756 he seems to have been living near Temple Bar, and to have made the acquaintance of sev.

well-known men, such, for example, as Garrick. During this period of his life he showed an increasing disinclination to follow the legal profession and an increasing devotion to letters. In 1755 his attitude towards law and his desultory career so displeased his father that he stopped his allowance. B. therefore set himself to work to gain a living for himself. In 1758 his first pub. work appeared, *A Vindication of Natural Society*, which purported to be a posthumous work by Bolingbroke. It was a satire on the views of that statesman, but so close was B.'s imitation of Bolingbroke's style, and so grave the irony, that its point as a satire was largely missed. If as a satire the book failed its style attracted immediate attention to the author, and in the same year his fame was enhanced by the publication of the *Philosophical Inquiry into the Origin of our Ideas on the Sublime and the Beautiful*. This book attracted so much attention that it was trans. by Lessing into Ger. Towards the end of 1756 B. married, his wife being the daughter of his medical man, Dr. Nugent. They had two sons, Richard, b. in 1758, and Christopher, who d. in his infancy. By 1756 we may definitely say that B.'s political ideas are fixed, and undergo from this time forward no great change. His mind was also turning from abstract speculation to the solution of the political and economic problems of the time. His *Abridgment of the History of England* was partially printed during this year (1757), but was not pub. until after his death. In 1758, when the events of the Seven Years war were just beginning to favour England, B. put forward the idea of the *Annual Register*, a publication which was to give a review of the chief events and movements of the year. The first vol. of this work appeared in 1759, and B.'s connection with the pub. continued actually until 1788, and probably even after that date he had much to do with it. He gradually came to be well known in society, and in 1759 he became secretary to 'Single-speech Hamilton,' whose affairs occupied the whole of his time and prevented him doing any literary work except on the *Annual Register*. He accompanied his patron to Ireland when he was made secretary to the earl of Halifax, and on their return to England (1763) B. was awarded a pension of £300 per annum. He remained with Hamilton until 1764, but in that year threw up his pension owing to Hamilton's demands on the whole of his time and service, and returned to live with his father-in-law. But his financial position at this time was not so bad as it had been, and there is evidence that he had some command of money. During the whole of this time he had kept up his friendship with Johnson, Reynolds, and Garrick, and his reputation as a talker and thinker ranked very high indeed. In 1765 he was appointed private secretary to the marquess of Rockingham, who had just been made Prime Minister. His appointment was the signal for the beginning of

those slanders that never really ceased. He was a papist and a Jesuit according to the tales which at this time reached the ears of his new patron. But his manner under accusation speedily won the heart of Lord Rockingham, and he can be said to have become from this time not only his secretary but also a personal friend. In 1765 he was returned for Wendover, and in Jan. of the following year, 1766, he took his seat and began his career as an active politician. He spoke on the Amer. question and against his party when he made his maiden speech about a fortnight later. He speedily gained for himself a reputation as a parl. speaker, and although his voice was harsh and his action awkward, he was soon one of the most eloquent and powerful speakers in the House. In 1766 the Rockingham ministry was overthrown, and B. spent a short time in Ireland. On his return he was offered a post in the administration which the earl of Chatham was forming, but declined to leave his old leader, and became during the session one of the leading members of the Opposition. While faithful to his party, he did not follow it blindly, and allowed himself some latitude in giving his vote, especially as he was gradually making himself indispensable to it. In 1768 he purchased a house and an estate. But during the period which immediately followed B. and his relative and friend (Wm. B., q.v.), suffered great financial losses. B., however, still lived the same extravagant and generous life that had distinguished him previously. In 1769 he pub. *Observations on a late Publication on the Present State of the Nation*, and made a brilliant criticism of the policy of Grenville. He was much absorbed during the year with questions which touched the constitution and was against the policy which the House adopted towards the Wilkes v. Luttrell election. In 1770 appeared his famous *Thoughts on the Present Discontents*. In this he put forward the grievances of the people, and showed that the fault lay not with the people but with the Gov., and with the court and its secret cabals. He attacked the policy of the House towards the printing of reports of the proceedings, and was himself bitterly attacked, being without the slightest foundation charged with the authorship of the *Letters of Junius*. In 1772 he visited France, and there saw Marie Antoinette at Versailles, a visit which he was to remember. In 1774 began the famous alliance between himself and Charles James Fox, who, a youth of twenty-five at this time, had been won over by the influence of B. and always regarded him as his political master. From 1774 until the outbreak of war in 1775 he was continually striving for conciliation with the Amer. colonies. He was elected member for Bristol in this year, and introduced his famous resolutions for conciliation. In 1776, on the failure again of his attempts at conciliation, he withdrew practically from all debates on Amer. questions, but he still played his part in the House. His speech against the employment of Indians in

America was one of the most brilliant which he ever made (1778). The next few years were occupied with plans for economic reform and with pleadings for Catholic relief. His known advocacy of Catholic relief measures roused the anger not only of the people of London, but also of his constituents at Bristol, who rejected him at the next election. The rejection of B. by Bristol was compared at a later date by Lord John Russell to the rejection of Macaulay by Edinburgh. He, however, received a seat at Malton at the hands of Rockingham. He again brought forward his motion for economic reform, which was again rejected, but the fall of North's ministry in 1782 was due entirely to the series of attacks made upon it by B. and Fox. On the formation of the next Rockingham ministry he was not given cabinet rank, but he became paymaster of the forces, an office which he tried to reform. In 1782 he lost his friend and leader Rockingham. The Shelburne administration was overthrown by the unnatural coalition of North and Fox, a coalition which B. approved. He accepted again the office of paymaster of the forces under the Portland ministry and gave his attention to the question of India, he being to a great extent responsible for the drawing up of Fox's India Bill. His acquiescence in the coalition, however, rendered him no service, and after the dissolution he found himself treated with marked contempt by the House, and he was continually received with interruptions and jeers when he rose to speak. The accession of Pitt to power threw great obstacles in his way, but he determined to bring Hastings to book for his alleged misdeeds. At first his chance of success seemed small, but the Opposition took the question up and ultimately the impeachment moved by Fox was accepted by Pitt. In 1788 he began his famous speech on the impeachment, a speech which he concluded with a brilliant peroration; and his labours only ended with Hastings's acquittal in 1795. He was still rejected as a politician even by his party, and even when it seemed likely that his party would come to power his claims for high office were overlooked, and it was again decided to offer him the office of paymaster of the forces. In 1789, on the outbreak of the Fr. Revolution, B. was asked his ideas on the revolution. His answer was practically the *Reflections on the Revolution*, a book which saw nothing but evil in the outbreak of a disordered mob against the rule of law and order. The attack of the 'swinish multitude' could not be reconciled with his love of order, in which alone he saw liberty. His book created a great stir; it gave rise to at least two famous replies, *The Rights of Man* (Paine) and *Vindiciæ Gallicæ* (Macintosh). It called forth the congratulations of the kingdom, of the king, and of many of the sovereigns of Europe. But it put an end to B.'s love of toleration; henceforth in projected reform he saw only revolution, and he even opposed the repeal of the Test and Corporation Acts. His opinions on the revolution so widely

different from those of his friend Fox, led to the withdrawal of B. from the party he had so long supported, and to a breach of his friendship with Fox. His desertion of his party called down much calumny on his head, but as he himself said, dear as was his friend, the love of his country was dearer still. After his retirement from his party he set himself to lead Whig thought back to the principles of 1688, and pub. his *Appeal from the New to the Old Whigs*. He took little part in parl. life during the next session, and when he did, opposed toleration. During the remaining years he continued to attack what he conceived to be the principles of the revolution; he was still bitterly attacked by both Fox and Sheridan, and it must be owned that on occasion he laid himself open to their sarcasm. In 1795 the impeachment of Hastings ended, and in July of that year B. retired from Parliament. His retirement was made easier for him by the grant of a pension, but the death of his only surviving son just after his election to Parliament in succession to his father broke his heart, and he retired to Beaconsfield, a shattered man. In 1796 he began the publication of the *Letters on a Regicidal Peace*, but they were greatly delayed owing to his frequent and increasing illness. In 1797 his illness gradually became worse, and on July 9 he d. It was proposed that he should be buried in Westminster Abbey, but he had preferred the par. graveyard at Beaconsfield, and here he was borne to his last resting-place by members of the 'Whigs whom he had converted to Conservatism.' 'There is but one event, but that is an event for the world—Burke is dead.' See Sir J. Prior, *Memoir of the Life and Character of the Rt. Hon. E. Burke*, 1824; Viscount Morley, *Edmund Burke, an Historical Study*, 1893; Sir H. J. C. Grierson, 'Edmund Burke,' in *Cambridge History of English Literature*, vol. xi, 1914; B. Newman, *Edmund Burke*, 1927; D. C. Bryant, *Edmund Burke and his Literary Friends*, 1939; E. E. Reynolds, *Edmund Burke: Christian Statesman*, 1948.

Burke, Sir John Bernard (1814-92), Brit. genealogist. He was b. in London and received his education here, afterwards in France. His father, John B. (1787-1848), instituted the work which has since been issued annually, called *Burke's Peerage*, besides compiling an *Encyclopædia of Heraldry*. Sir John became Ulster king-of-arms in 1853, and was knighted in the following year. He ed. *Burke's Peerage* till his death, besides producing, among other works, *Anecdotes of the Aristocracy* (1849); *Vicissitudes of Families* (1859-63); and *The Book of Precedence* (1881).

Burke, Robert O'Hara (1820-61), explorer of Australia. A native of Ireland, he was educated in Belgium, and became at the age of twenty a captain in the Austrian Army. He joined the Royal Irish Constabulary in 1848, and in 1853 he sailed to Melbourne, where he became a member of the police. He led an expedition into the interior of Australia in 1860, which

ended tragically. Dissensions caused fatal delays to an expected relief party, and B., with Wills and Gray, two of his companions, perished miserably, only one man, King, surviving to tell the tale.

Burke, William (d. 1798), kinsman of Edmund B., and one of the reputed authors of *Junius's Letters*, travelled with his famous kinsman in 1752, and assisted him in the *Account of the European Settlements in America* (1757). From 1755 to 1758 he was under-secretary of state, and from 1766 to 1774 was M.P. for Great Bedwin. In Parliament he showed, according to Horace Walpole, 'his cousin's presumption,' with 'neither manner nor talents.' In 1769 he was bankrupt as the result of unfortunate speculations. From 1777 to 1792 he spent most of his time in India, having been appointed, in 1782, commissary-general of the forces in the E. Indies. He had already lived with Edmund B. at Queen Anne Street, and at Gregories, and, on his return home in 1793, gladly availed himself of the offer to nurse his broken health at Beaconsfield. As B. had introduced him to the Gerrard Street Club, he is depicted in Goldsmith's *Retaliation* as 'honest William.'

Burke, William (1792-1829). Irish criminal. Failure in a variety of trades led to his adoption of body-snatching as a livelihood. In co-operation with a man Hare, a lodging-house keeper, he sold the body of a fellow loafer to Dr. Robert Knox of Edinburgh for £7 10s. This was his first attempt. Later the two men perpetrated a series of murders by means of suffocation, afterwards disposing of the bodies to anatomists, chief among them being Dr. Knox. By the time the fifteenth murder had been committed suspicion culminated in their arrest, and on queen's evidence from Hare, B. was hanged in 1829. The slang term 'to burke' signifies the process of suffocation skillfully arranged to leave no signs of violence, and hence to suppress quietly. See W. Roughhead, *Burke and Hare*, 1948.

Burke's Peasage, see under BURKE. See JOHN BERNARD and PRECEDENCE.

Burkhan-Budda Mountains are a range of the Kuen-lun system, Tibet, which is largely composed of schists and Archean crystalline rocks, with Paleozoic sediments. It runs in a W.N.W. to E.S.E. direction, keeping between 96° and 98° E. The average elevation is over 16,000 ft., whilst Pryhevalski has an altitude of 17,000 ft.

Burkitt, William (1650-1703), Eng. divine and commentator, b. in Suffolk; educated at Stowmarket and Cambridge grammar schools and at Pembroke Hall. After leaving the univ. he became chaplain of Bildeston Hall; later (c. 1672), rector at Milden; in 1692 vicar of Dedham, Essex; preached against Baptists, 1691; helped Fr. Protestant exiles, 1687-92, and showed great zeal for foreign missions. Among his works are *Argumentative and Practical Discourse on Infant Baptism* (reprinted 1722); *Poor Man's Help and Young Man's Guide* (32nd ed. *Help and Guide to Christian Families*, 1764); *Explanatory Notes on the Four Evangelists*; *Expository Notes*

on New Testament. His works were frequently reprinted and abridged. See Parkhurst's life, 1704; Calamy, *Account*, 1713; Palmer, *Nonconformist Memorial*, 1803.

Burlamaqui, Jean Jacques (1694-1748), Swiss writer on natural law, after travelling in France and England, became prof. of law, and later, when his health gave way, member of the council of state at Geneva. His belief in a rational utilitarianism is expressed in the lucid, unaffected writing of his *Principes du droit naturel* (1747), and his *Principes du droit politique* (1751).

Burleigh, Bennet (ante 1850-1915), Brit. war correspondent, was on the staff of the *Daily Telegraph* from 1882. His early years are wrapped in mystery. He was probably b. in Scotland, for he said he left school in Glasgow during the Amer. Civil war, in which he fought, and in which he was twice sentenced to death. Throughout the Egyptian war he was at the front, at first as the *Central News* correspondent, and then as the representative of the *Daily Telegraph*. Besides accompanying the desert column from Korti to Metemeh (Metemma) in 1884, he went on the Ashanti and Athara expeditions. Finally he was at the front during the S. African, Somali, Russo-Jap., and Balkan wars. Thus in his various publs. he was able to draw on a wide experience, the best of those being *On the Road to Omdurman* (1898).

Burleigh, or Burghley, William Ceoll, Lord (1521-98), was b. on Sept. 13, at Bourne in Lincolnshire. His descent was traced to an Owen of the time of King Harold, and a Sitsylla of the reign of Rufus, but the authenticity of this connection is doubted. William was the eldest son of Richard, a yeoman of the wardrobe, and Jane Heckington. At the age of fourteen he entered St. John's College, Cambridge, where he met Roger Ascham and John Cheke. Here he obtained an unusual mastery of the Gk. language. At the age of twenty-one he married Cheke's sister, by whom he had Thomas, an only child and the destined earl of Exeter. In 1543 Mary Cheke d., and he remarried, three years later, a daughter of Sir Anthony Cooke. It is reported that Roger Ascham placed her with Lady Jane Grey as the two most erudite women in the country. In 1543 he sat in Parliament, and four years later accompanied the Protector Somerset on his Pinkie expedition. About 1548 he became private secretary to Somerset, and shared to a certain extent the anxiety felt by the protector during his fall. He was sent to the Tower in 1549 by order of Somerset's opponents, but in Jan. of the following year was released upon oath. He successfully won Warwick's good graces and presently became one of his secretaries. In 1551 he was knighted. During the changes brought about by the accession of Mary he adopted an accommodating attitude, and by a series of clever dissimulations retained royal favour, though in Mary's Parliament he had no seat. Before Mary's death B. had estab. an intimate understanding with

Elizabeth, and had ingratiated himself so much with her that she reposed in him no small measure of confidence. On her accession, the many pitfalls about her demanded the skill of a man of B.'s stamp, and his experience had left him a master in the art of avoiding, not meeting, danger. In the following years he occupied the positions of master of the court of wards, and chancellor of Cambridge Univ., and throughout his parl. career earned a reputation for honesty of purpose. He was made a peer in 1371. He succeeded the marquess of Winchester as lord high treasurer in the following year. B.'s domestic life was particularly free from the licence that was a feature of the time. See M. A. S. Iime, *The Great Lord Burghley*, 1898; A. Jessopp and others, *William Cecil, Lord Burghley*, 1904.

Burlesque (from It. *burla*, a jest) is applied to writing, acting, speaking, and to drawing, where it is more often called 'caricature.' It consists in distorting or exaggerating a work of art, the object being to excite ridicule. Thus it throws into strong relief peculiarities and affectations and lays stress on all incongruities and oddities, and since it is not malicious, as satire often is, it is used to expose bombast and insincere rhetoric, sham virtues, and all hypocrites, rather than to display in a ludicrous light. Above all, it loves to rouse laughter by discord between subject and style, to make 'gods speak like common men, and common men like gods.' Thus all mock-heroic poetry, such as Butler's inimitable *Hudibras*, Pope's *Rape of the Lock*, and many of the smaller poems of Gray and Cowper, where rabbits and birds and cats are endowed with the sense—and folly—of human beings, are also Bs. What may be styled 'animal' Bs. have been popular from the time of Chaucer; indeed his *Nun's Priest's Tale*, where Chanticleer, the cock, and Pertelote, his wife, discuss the value of ominous dreams after the manner of Gk. sages, has never been surpassed. Most people would agree in giving to Aristophanes the highest place among B. writers. Even to-day the splendid fun of his representations of Socrates up in a balloon studying the heavens, or of the demagogue Cleon as a sausage-seller, can be appreciated by every classical student, and how much more monstrous must the B. have appeared to the actual contemporaries of Socrates and Cleon, who could enjoy at once the piquancy of many an allusion lost to-day. The It. word originates in the *Opere burlesche* of Berni, 1497-1535. In France Scarron made a clever mock imitation in his *Virgile travesté*, 1648-53, and throughout Louis XIV.'s reign travesties of the Iliads of antiquity were fashionable. In *Don Quixote* the ideals of chivalry are ludicrously misrepresented through the adventures of Don Quixote, the enthusiast, and Sancho Panza, the apostle of common sense, whilst Chaucer in his *Rime of Sir Thopas*, gently scoffs at the interminable and tiresome romances of his day, and Racine in his one comedy, *Les Plaideurs*,

burlesques judicial ineptitude. Buckingham's *Rehearsal*, Gay's *Beggars Opera*, Fielding's *Joseph Andrews*, G. B. Shaw's *Androcles and the Lion* and many other plays, Burnand's *Black-eyed Susan*, and the operas of Gilbert and Sullivan, and the Gaiety burlesques may also be cited as illustrations of B.

Burley, city of Cassia co., Idaho, U.S.A. Pop. 4000.

Burlingame, Anson (1820-70), Amer. diplomat. He was a native of New Berlin, New York. He graduated at the Harvard Law School in 1846, and subsequently practised successfully at Boston. His speeches in support of the Free Soil party (*q.v.*) attracted considerable attention. He was a member of the Massachusetts Senate, 1853-54, and of the House of Representatives, 1855-61. His advocacy of Hungary's independence evoked a hostile Austrian attitude to his appointment as minister at Vienna. He was transferred to China by Lincoln, as a result. His activities produced the 'B.' treaty, in which China's right of dominion over all her ter. was acknowledged.

Burlington: 1. City of New Jersey, U.S.A. It is situated on the Delaware R., 18 m. N.E. of Philadelphia. Its pop. is 11,000. The B. Society library, estab. 1757, is one of the oldest in America, and the tn. owes its settlement to Eng. Quakers, in 1677. 2. City of Chittenden co., Vermont, U.S.A. It is placed on the E. coast of Lake Champlain, and is the largest tn. in the state. Its pop. is 27,500. Its situation gives it some popularity as a summer resort. Its manufs. include sashes, doors, blinds, boxes, furniture, woollens, refrigerators, and paper. 3. City of Iowa, U.S.A., is situated on the Mississippi. Pop. 25,750. Good limestone is quarried, while its industries include lumber, furniture, and baskets. 4. City in Alamance co., N. Carolina, U.S.A. Pop. 12,000.

Burlington, in Yorkshire, see BRIDLINGTON.

Burlington, Earls of, see BOYLE.

Burlington House was built on the N. side of Piccadilly, 1665-68. In 1854 the gov. paid £140,000 for the old house, which Richard Boyle, earl of Burlington, had built. The Royal Academy acquired a lease of it and of a garden behind in 1867, and two years later opened exhibition galleries and schools over the garden site. The new building in the It. Renaissance style, erected 1869-72, now provides accommodation for the examining body of London Univ., and for the following societies: Royal, Astronomical, Antiquarian, Linnean, Geological, and Chemical. The Gibson statuary and diploma works are stored in the upper storey, whilst the Royal Academy holds its ann. exhibition and banquet here in premises consisting of thirteen halls, a theatre, and a central octagon, the total cost of which was £150,000.

Burlus Lake, shallow lagoon, 38 m. long, in the N. of the delta of the Nile, Egypt, with which it is connected by canals. One channel also connects it with the Mediterranean.

Burma, republic of S. E. Asia, inaugurated on Jan. 4, 1948, formerly a Brit. dependency, constituting the W. portion of Indo-China, and, until 1937, the largest prov. of Brit. India. It comprised the previously independent kingdom of B., and Brit. B., secured by the wars of 1826 and 1852. It is divided into Upper and Lower B. and the Shan States. Its length from N. to S. is 1200 m., and its greatest breadth 575 m. Its boundaries are, on the N., Tibet; on the E., Chinese Shan States, parts of Yunnan, Indo-China (Fr.), and Siam; S., Siam; W., the

of Bengal. It is navigable for the whole year as far as Bhamo, 900 m. from its delta. The only navigable affluents for large vessels are the Chindwin, the Shweli, and the Myit-nga. The Salween, rising in the snows of Tibet, is navigable for 300 m. during the rainy season and for half that distance in the dry part of the year. The Sittang rises in the hills of Mandalay. Innumerable native craft ply on these rivers, and their tribes, during the rainy season, but, save for the largest streams, they are useless for navigation in the dry season. At floods, which are

THE GOLDEN KIUNG (MONASTERY) AT MANDALAY

bay of Bengal and Assam. Its coastline is about 1200 m., and the area 261,600 sq. m. The country comprises chiefly the basin of the Irrawaddy, the area drained by the Salween and Sittang Rs., and the provs. of Arakan and Tenasserim, which are both maritime. With the exception of the deltas of the Irrawaddy, the Salween, and the Sittang, the country is hilly and rugged. Extensive dists. attain a height of 2000 to 4000 ft. The chief mts. are the Patkoi in the N., 12,000 ft.; the China Hills, 15,000 ft., which are snow-capped; the Arakan Yoma Mts.; the Pegu Yoma; and the Tenasserim; while mts. cover the entire ter. of the Shan States. The chief riv. is the great Irrawaddy, whose source is at present undiscovered, but whose known length is 1100 m. It flows from Tibet to the bay

frequent in the wet season, the great rivers spread their waters over a space of 10 to 15 m. from each bank, and only the precaution of building the native huts on piles, and the fortunate circumstance of the slowness of motion, saves the Burmese householders from destruction. Two hundred miles from the sea the Irrawaddy is one mile wide. The climate and rainfall vary considerably in the different parts of the prov. The mean rainfall on the coast is 100 in., while near the Irrawaddy it falls rapidly. At Prome it is only 42 in., and at Thayet-myo scarcely 37 in. The rainfall is particularly heavy on the Upper Chindwin, on the Ruby Mines plateau, and on the Shan Hills. The duration of the wet season at the delta extends sometimes over a period of five to seven months, and though the atmosphere is excessively

moist, the temp. is not extremely hot. Indeed from Nov. to Jan. the temp. sometimes drops to 60° F., but from Feb. to April the delta atmosphere is hot and dry, and the thermometer records frequently 100° in the shade. It is immune from the excessively hot wind that prevails in India, and the nights generally are cool. The fact that, at the Ruby Mines plateau, no higher temp. is registered than 86°, induced the authorities to erect a military sanatorium there. On the whole, the climatic conditions are less easy to endure than those of the plains of India. There is an abundance of useful and valuable trees in the forests of B. The most important type of forest in B. is the mixed deciduous forest, which is at its best along the Pegu Yoma and in the Mu valley of Upper B. These forests contain the timbers of primary importance—teak (*Tectona grandis*), the world's finest general utility timber, pyinkado (*Xylia dolabriformis*), padauk (*Pterocarpus macrocarpus*) which are the source of much the greater part of the forest revenue of the country. Teak trees here are seen sometimes with a girth of 25 ft. and a height of 120 ft. from the ground to the lowest branch. In all the qualities that distinguish a good timber—resistance to shock, strength as a beam, weight freedom from movement—it compares favourably with any of the generally accepted best timbers of the world, though in one particular quality, resistance to shock, it has to give way to ash and hickory and to one Burmese timber, yom (*Auopisus*) (see also TEAK). Next to teak, pyinkado is probably of the next importance in the royalty it pays to the gov. and is of great value as being an extremely heavy and strong timber for railway sleepers and other heavy construction. It is a beautiful tree with a reddish flaky bark and shiny leaves rather like large pea leaves and a flower like an aracia. The tree flowers in the hot weather and emits an agreeable smell. Padauk is a tree whose wood is used for gun-carriages. It has very sweet-scented little orange flowers. Kanyin, one of the big dipterocarps (*Dipterocarpus alatus*), is a very fine tree, with a good timber known as gurlan. Thitya (*Shorea obtusa*), ingyin (*Pentameris suavis*), taukkyan (*Terminalia tomentosa*), pyinma (*Lagerstræmia floris-reginæ*) are all timbers of importance not only to the country but to the world. There is in certain places a potentially most important type of forest not mentioned above—the practically pure bamboo forest of the Arakan Yoma. The importance of the bamboo (*Melocanna bambusoides*), called by the Burmese *kayinwa*, arises from the fact that its non-clumping habit of growth has prevented the successful estab. of any tree species over many hundreds of sq. m. in Arakan and thereby formed very large areas of pure bamboo forest, potentially a source of great quantities of paper pulp. There are also many sq. m. of *Dipterocarpus tuberculatus* forest, corresponding closely to the sal forests of India. The timber is called *in* in Burmese, and is usually combined with that of another dipterocarp,

kanyin. This latter species is extremely resistant to the teredo or marine borer and is therefore of great use when treated for the purpose of wharf piling. Another type of forest peculiar to B. is the Indrag or deciduous dipterocarp forest, normally found in lateritic and sandy soils and seen at its best in the country N. of Mandalay and E. of the Irrawaddy around the mouth of the Shweli R. (see address by D. J. Atkinson, 'Forests and Forestry in Burma,' *Journal of the Royal Society of Arts*, July 2, 1948). The different forest products also include oil, varnish, tannin, gums, and rubber. The teak of the forests is controlled by the State, which pays much attention to the scientific culture of this valuable tree. As much as 350,000 tons of teak have been obtained in a single year. The area of reserved forestry is over 20,000,000 ac. Teak is the prin. export after rice. The wild animals of B. include the elephant, rhinoceros, tapir, buffalo, bison, deer, hog, cattle, tiger, leopard, and bear. There are no horses, and sheep and goats are rarely met. Python and cobras are found in great numbers, while that deadliest of E. reptiles, the hamadryad, is occasionally encountered. An extraordinary profusion of beautiful and varied birds forms a striking feature of the country, and an equal richness marks the fish supply. From the shark to the shrimp, all piscatorial specimens are food for the Burmese. In the caves of the Mergui Archipelago are procured the edible birds' nests which form one of the delicacies of Burmese diet, while turtle eggs are also held in high esteem. The gathering of these eggs is controlled by the State. The mineral deposits of B. comprise gold in riv. sand in small quantities; silver in the Shan States, over 6,000,000 oz. being obtained in 1927; tungsten ore; iron, copper, and lead in large but unworkable quantities; tin in the Mergui dist. In S. Tenasserim; petroleum by the Irrawaddy, of which the output has reached over 250,000,000 gallons in a year; and Arakan oil, an oil which may be used immediately it is obtained from the well; jade and amber are worked, though the former is the more successful; good white marble is quarried at Mandalay, where it is used in the ornaments of Buddhist temples; coal is mined at many places in Upper B., especially at Kale on the R. Chinuwin, and at Thingadaw on the Irrawaddy; limestone is procurable, and is burned in large quantities. In Mandalay the finest rubies in the world are found. Agriculture supports nearly 75 per cent of the pop. of B.—16,823,700 (1941). Rice is the prin. crop, the staple food, and chief article of export; other crops are millet, tobacco, cotton, sesame, and ground nuts; some rubber, also, is cultivated. The native pop. is composed chiefly of Burmese, Arakanese, Karens, Shans, Chins, Kachins, and Talings. The non-indigenous elements, of whom there were approximately 887,000 Indians in 1941, Chinese (about 150,000 in 1931), and Europeans, Anglo-Indians, and Anglo-Burmans are an important factor

In the economic life of B. The Burmese people are short and thick-set, and approach the Chinese rather than the Aryan type. They are easy-going, good-natured, and play-loving; the women take part in public life, being keen-witted and excellent traders. The dwellings of the Burmese are almost invariably of wood, generally bamboo. Only the wealthiest members of the race have houses of masonry. Buddhism is their religion, and it is of the purest form. Politically, the Burmese developed extraordinarily during the decade 1920-30, and even then had a wider franchise than any other

from central Asia. The Shans early occupied the country, and later it was peopled by the Taluings. The earliest monarchs in B. were Buddhists from India, and the Burmans first occupied the Irrawaddy valley about 2000 years ago, migrating from central Asia. Settlements by the Fr. and Eng. were not made until early in the seventeenth century, though the Portuguese had occupied parts of the Irrawaddy delta in the fifteenth century. In the eighteenth century Chinese armies invaded the ter. from the N. During the beginning of the last century the Burmese conquered Assam, and in 1820 they met the Eng. Burmese depredations led to a war in 1824, at the conclusion of which the Burmese consented to observe a treaty. But hostilities were renewed in 1832, and Pegu was taken by the Brit. An interval of peace succeeded till 1885, when further violence and insult, under the Burmese King Theobaw, made a fresh expedition necessary. Resistance against the Brit. was half-hearted, and Mandalay surrendered. In 1886 B. was absorbed into the Indian dominion of the Brit. Empire. During the First World War there were instances of unrest, and even rebellion, but disaffection never became general and was comparatively easily suppressed. B. contributed generously towards war expenses, on the other hand, and a large number of men enlisted for service in the army and labour corps. A revolt, nationalistic and economic in origin, broke out in 1930 in Lower B., and spread the following year to Upper B., but was suppressed by some 9000 Brit. and Indian troops and police. In 1923 B. had been constituted a governor's prov. of Brit. India, but in 1937 it became a separate dependency from India, the executive authority being vested in a governor, acting on behalf of the Crown and an advisory council of ministers. Prior to the invasion of B. by the Jap. in 1941 there was a bi-cameral legislature, the Upper House or Senate of thirty-six members being partly elected (from the Lower) and partly nominated by the governor, and a Lower Chamber or House of Representatives of 132 members wholly elected. B. was divided into seven administrative divs. under commissioners, four being in Lower and three in Upper B. The Shan States in the E. of Upper B., the Arakan Hills, and some other dists. were under special administration. In Dec. 1942, the governor, by a proclamation under the Gov. of Burma Act, assumed full executive and legislative powers. Military administration of the areas liberated before the Jap. surrender ceased in Oct. 1945, when full civil gov. was restored. In May 1945 the Brit. Gov. reiterated their considered policy of promoting full self-gov. in B. and their pledge to assist her political gov. until she reached a status equal to that of the Brit. Dominions and of the United Kingdom (Cmd. 6635). In the meantime, pending a general election and the restoration of normal conditions, Parliament approved the continuance, until Dec. 1948, of the proclamation issued

E.N.A.

BURMA

Indian prov., even women in certain cases being permitted a vote. No other Indian prov. approached B., also, with regard to education. A univ. was founded at Rangoon in 1920, and at Insein, near by, is a veterinary school and technical institute; Mandalay has an intermediate college, an agric. college, and a research institute; and at Pyanmana is a forest school. Then besides gov. and locally controlled schools, there are the innumerable Buddhist monasteries, where elementary education is given. Rangoon is the cap. and chief port; and Mandalay, in the centre of the prov., comes next in importance. The chief means of communication are the waterways; there are about 2000 m. of railway and over 10,000 m. of road, metalled and unmetalled.

History.—The original inhab. are believed to have been Austronesian, displaced by successive waves of invaders

in 1942 whereby the administration is carried on by the governor in direct responsibility to the Brit. Gov. The Shan States, until recently, formed a minor administration distinct from that of B., though under the same executive gov. and not subject to the jurisdiction of the Burmese legislature. The Karenni States of Kantarawaddy, Bawlake, and Kyethogyi lying to the S. of the S. Shan States (4200 sq. m., pop. 59,000) were feudatory states, but not part of B. Under the Constitution of the Union of B. (1948) the former federated Shan States and the Wa States are combined as the Shan State; while the former three Karenni States are to be known as the Karenni State. Each of these two states, as well as the Karen State and the Chin, is represented in the Union Gov. by a minister chosen from its own members of Parliament, and enjoys a considerable measure of administrative autonomy. In Britain some held that the pledge given to B. in 1931 that her prospects of constitutional advance would not be prejudiced by her separation from India was amply fulfilled by the large measure of self-gov. conferred by the Act of 1935. But the Burmese themselves interpreted it to mean that their country had the right to advance *pari passu* with India. They resented the discretionary rule of the governor during the preparatory period, the provision that defence and external affairs should remain in his hands, the absence of any admission of B.'s right to leave or to remain within the Brit. Commonwealth, and the plan for an indefinite separation of the frontier regions from the rest of the country. Nationalism, now the driving force of Burmese opinion, was among the consequences of the Jap. invasion, while the creation of a nominally 'independent' B. was the outcome of a resistance movement, a 'patriot army,' and the Anti-Fascist People's Freedom League. The Brit. Gov., however, justifiably proceeded with caution following the expulsion of the Jap. For until the rudiments of an administrative structure could be restored, political advance would have been useless. But unfortunately the impression prevailed that Britain had no real intention of conferring autonomy on the country; and by the time Sir Hubert Rance became governor in the autumn of 1946 there was a dangerous gulf between the administration and the more progressive groups in the country. It was in those circumstances that Mr. Attlee in Dec. 1946 announced Britain's determination to extend to B. the policy adopted for India. Burma (he said) was to be free to choose whether or not to remain inside the Brit. Commonwealth; the executive council in B., as in India, was to carry on day-to-day administration without interference; and the approaching elections were to do duty, as in India, for the constituent assembly as well as for the legislature. In Jan. 1947 a delegation from the Burmese executive council came to London and concluded an agreement with the Cabinet under which the council became the

interim gov. of B. It was also agreed that the common objective of the Brit. Gov. and the Burmese executive council was a free and independent B., whether within or without the Brit. Commonwealth of Nations. The elections for a constituent assembly were held in April, the result being an overwhelming majority for the Anti-Fascist People's Freedom League. The assembly in June resolved that B.'s constitution should be that of an independent sovereign republic, and in the same month a Burmese goodwill mission, under Thakin Nu, president of the assembly, came to London to discuss the question of transfer of power. By a statement made in Parliament by the secretary of state for B. on July 24 the Brit. Gov. agreed to recognise the interim gov. of B. as a full provisional gov. until legislation for the transfer of government was completed. Thus Thakin Nu, the senior member of the interim gov., became by convention the first Prime Minister of B., and his colleagues in the council or Cabinet were henceforth to enjoy the status and powers of ministers. B.'s smooth approach to independence, however, was marred by the assassination a few days previously of no fewer than seven members of the Burmese executive council while in session at Rangoon, the assassins with Sten guns forcing their way into the council chamber and acting evidently at the instigation of the defeated U Saw, chief minister of B. in 1941, who was hanged for the murders in May 1948. The council, however, was at once reconstituted by the governor, Sir Hubert Rance. Among those murdered was U Aung San, only thirty-three years of age, who was one of 'Thirty Crusaders' who underwent military training in Japan. When B. was invaded by the Jap., these comrades were promised, in return for assistance, the reins of civil administration as various districts came into occupation. But they were tricked by the Jap., and Aung San then opened negotiations with the Brit., the upshot of these negotiations being that the Burmese Defence Army rose against the invaders (April 1945). A treaty making B. an independent state outside the Brit. Commonwealth was concluded on Oct. 17, 1947, and its terms were implemented in the Burma Independence Act which was passed by the Brit. Parliament on Dec. 10. The Union of B. came formally into existence on Jan. 4, 1948, and on that day Sir Hubert Rance, the last Brit. governor, handed over authority to Sao Shwe Thaik, the first president of B. The Act brings an end to the suzerainty of the king over the Karenni States, and under the Constitution of B. (passed on Sept. 24, 1947), all the frontier areas came within the federal framework of the union. See also SHAN STATES. See H. Fielding, *The Soul of a People*, 1998; J. Stuart, *Burma through the Centuries*, 1909; F. K. Ward, *In Farthest Burma*, 1921; Sir H. T. White, *Burma*, 1923; Sir G. Scott, *Burma: Handbook of Practical and Commercial Information*, 1924, and *Burma from the Earliest Times to the Present Day*, 1932;

Burma, Second World War, Campaigns in. The Jap. tide of invasion in 1941-42 soon overwhelmed Burma. The early surrender of Siam gave the Jap. forces a preponderating advantage over the Brit. defences. Very soon the Jap. had cut the Burma Road (*q.v.*) and thereby isolated China. Moulmein was evacuated in Jan. In Feb. Martaban, on the Salween R., was taken, and this was followed by heavy fighting on the Bilin and Sittang Rts. The Brit. forces, consisting chiefly of Indian troops, together with their Chinese allies, then took up defences on the Irrawaddy and Sittang fronts. But Rangoon had to be evacuated in March. Mandalay fell in the early days of May. A considerable part of Burma was thus soon in Jap. hands.

The Battle for Burma.—The resistance offered by Brit., Indian, Chinese, and Burman troops against an enemy whose numbers and equipment gave him the advantage and initiative make an epic of courage and devotion on the part of men of many races but one loyalty. In the early stages all was confusion. When Japan attacked the Brit. Commonwealth and the United States Burma was neither mentally nor materially prepared for war. Her premier, U Saw, was a traitor to the Brit. connection. But it was hoped that Malaya could successfully resist the invader and thereby render Burma immune. Most available troops, aircraft, and equipment were concentrated in Malaya and Singapore. In the whole of Burma, with a frontier bordering on potentially hostile ter. of 1600 m., there was but one diluted Burman div. guarding the long border of the Shan States, while the best part of another div. was spread along the 800 m. of the Tennesseerin from Moulmein to Victoria Point. The Jap. had sev. alternative approaches into Burma on which to concentrate their main drive; the defending forces had to disperse their scanty strength to guard against surprise at each of the approaches. The first serious contact was made E. of Tavoy (Dec.), after which the enemy attacked with a full div. through Siam on the Kawkairek Pass, which was guarded by an Indian brigade and the 7th Gurkhas.

Meanwhile troops which had put up a splendid resistance at Rangoon against air attacks were compelled to withdraw against combined land and air attack to Moulmein. Indian sappers rendering most effective help. It was then that Burmese 'fifth columnists' began to assist the invader by guiding him through the jungle, while a heavy attack was launched against Moulmein. Out-numbered and attacked on all sides, the garrison fought its way to the jetties and, after inflicting heavy casualties on the enemy, successfully embarked. The problem now was to defend the direct approaches to Rangoon and the rail and roadhead at Martaban, together with the

main crossings over the Salween R. and the low communications back to the Sittang bridge. The Jap. attacked Martaban on Feb. 10 by a coastal landing from Moulmein, but were fought with amazing tenacity by a Gurkha battalion and a battalion of the 10th Baluchis. By now the 17th Div., which had been reinforced by the King's Own Yorkshire Light Infantry, were concentrated behind the Bilin R., whence they fiercely counter-attacked two Jap. divs. The famous 5th Gurkhas of the newly arrived Gurkha Brigade drove the enemy out of Bilin vil. with a celerity which disconcerted the invaders. The defending troops were now getting more effective air support; but although they had inflicted serious casualties on the enemy, they were not sufficiently numerous to thwart a flanking movement, and further withdrawal to Kyaikto was unavoidable. Another Jap. div. was rapidly approaching the Sittang bridge with the object of getting in between the 17th Div. and Rangoon. Thus it was essential to keep the scanty imperial forces in Burma intact, for there were very few reserves. To protect the Sittang bridge were one battalion of the Frontier Force Rifles, the 3rd Burma Rifles, and a company of the Duke of Wellington's Regiment. The bridge was lost and retaken sev. times and the Jap. suffered 2000 casualties. Eventually the bridge was blown up by the Royal Engineers after a most heroic stand by the Duke of Wellington's Regiment and the Gurkhas. The loss of the bridgehead, however, was disastrous and a large part of the 17th Div. was cut off and trapped between two Jap. divs. Most of them fought their way back through the jungle and eventually swam to safety, abandoning all their heavy equipment. Thus the troops had to be re-equipped and reorganised at the very moment when Singapore had fallen and thereby released large Jap. reinforcements. Two Brit. battalions and some units of the Royal Armoured Corps had now reached Burma and the imperial forces were concentrated in new positions in more open country near Peco in the hope of covering Rangoon. Burmese guides, however, helped the invaders, who were cutting the lines of communication from Rangoon to the N. Already, too, the Jap. had won control on the side E. of the bay of Bengal and the cap. had to be abandoned. The Royal Armoured Corps, with the Cameronians and W. Yorks Regiment, fought their way out of the cap. with great gallantry after civil personnel had been evacuated into N. Burma by the Rangoon-Mandalay railway, while the Gloucester Regiment held fast to the city until everything of value to the enemy had been destroyed. The tired and harassed imperial forces now retired towards the semi-isolation of Upper Burma, but, in anticipation of the situation that had now arisen, the Chinese Gov., to whom the link with India through Burma was of vital importance, had dispatched some of their best troops to take over the left flank. But a serious threat developed late in April with the

fall of Lashio at the E. end of the famous Burma Road, and with this loss came a direct threat to Mandalay. By the end of the first week of May the Jap. took Mandalay and were able to continue their advance towards the N.E., the N., and the N.W. The Chinese were pushed back along the Burma Road as far as the frontier of their own country by a Jap. armoured force; while another Jap. column pushed into the highlands of the N., towards Myitkyina, with the object of cutting off all communications between China and India through Burma. Brit. and Indian forces, with some Chinese, then withdrew towards the Indian frontier along the Chindwin R. Immediately afterwards the enemy took Akyah, only 50 m. distant from the frontier of India. In this way Burma was lost to the Jap.—a grave misfortune, apart from the danger to India, owing to the possible reactions of the defeat upon Chinese sentiment and the Chinese war effort. For Burma was not only one of the richest countries in the world; it had valuable communications, land frontiers with countries in Jap. occupation, a series of magnificent aerodromes with hard runways, and it was a first-class point of re-entry into E. Asia for the Allies against the time when they would be able to concentrate armies and supplies for their counter-offensive. One, and perhaps the chief, reason for the defeat was that reinforcements for the defence of Rangoon arrived in too small numbers and arrived too late, and the fate of B. was sealed when the city fell in May. At that time there was no suitable road leading into B. from the N.; the roads over the jungle frontiers of India-B. were not in a fit state to sustain the army, and the dropping of supplies from planes was then practically unheard of. As it was, everything required by Gen. Alexander's forces had to be shipped through Rangoon; once that port was threatened allied supplies were abruptly cut off. When Rangoon fell Alexander had but one sensible course remaining, and that was to get out of the country with his army as intact as possible, covering the road to India. This was no easy task for the Allies, who were hopelessly outnumbered, and the Jap. were bent on annihilation. The fall of Rangoon fatally affected the ability of the commander-in-chief, India, to reinforce the defenders of B., and this inability cost the Brit. the Burmese campaign. Earlier circumstances contributed to the defeat. Pre-war preparation for the defence of the country was inadequate for the immensity of the task, and the last-minute transfer of the Burma Command to the India Command left no time for adequate preparations to be made. Moreover, the Brit. forces were insufficiently trained and organised for the kind of fighting they had to undertake; while the Jap., lightly equipped, were well trained for jungle warfare. The B. forces, as a whole, displayed in their resistance a tenacity, stubbornness, and gallantry which had in it a tragic element in view of the inevitability of the outcome. But the mixed Brit., Indian, and Chinese

forces held out for two months, and their delaying rearguard actions prove invaluable to the Allies in the preparations for the defence of Bengal and India generally.

Renewal of the Fighting in Burma during and after the Winter 1942-43.—No further operations of any note took place before the winter of 1942-43, when Brit. and Indian troops fought their way along the length of the Arakan peninsula, and Brig. Wingate raided hostile ter. with his long-range penetration columns. The Arakan campaign was a failure, partly owing to the lack of landing-craft for amphibious operations in support of the troops, and eventually the troops had to retire before the Jap. counter-attacks. But the Jap. were unable to make much impression on the Brit. positions at Maungdaw and Buthidaung and, perforce, spent the monsoon in malarial valleys while the Brit. and Indian troops camped in the comparatively healthy climate of the hills to the N. The 'penetration column' sorties or raids behind the Jap. lines were well conceived and executed. Wingate, who was the leader of the Abyssinian partisans during the reconquest of Abyssinia by the Brit. forces, went to Burma to take charge of guerrilla warfare there, his presence in Burma and the nature of his operations being a well-kept secret until, in May 1943, it transpired that his long-range jungle force, which received its supplies entirely by air, had arrived in India from N. Burma after spending three months as wreckers in the midst of Jap.-controlled country. His brigade, consisting of Brit. and Gurkha columns, with reconnaissance and intelligence detachments from the Burma Rifles, penetrated hundreds of miles across jungle ranges and valleys. The Ra. Chindwin and Irrawaddy were crossed and the Myitkyina railway was cut in a hundred places. Skillfully infiltrating through the chain of enemy outposts and garrisons, the force penetrated enemy ter. as far as the Shan States. Much destruction was done and the enemy was forced to divert troops from the more important and hard-pressed points. (Unfortunately Wingate was killed in an accident in Burma on March 24, 1944, during an operational flight.)

The first offensive, attempted after Lord Wavell (q.v.) was commander-in-chief, was directed towards Akyah. Its success would not have brought the Brit. forces much nearer conquering the rest of Burma, but the small port and its airfield would have been worth capturing to prevent enemy bombers reaching Calcutta from it. But the offensive failed, and a renewed attempt in 1944 under the supreme command of Lord Louis Mountbatten, who had been made commander-in-chief in S.E. Asia, soon came near to disaster; for in Feb. every Jap. soldier in the Arakan that could be spared was mustered for a violent counter-attack. This came in the form of a fierce punch, which drove straight through the front-line positions of the 7th Indian Div. in the Kalapanan valley, and encircled about 10,000 Brit. and Indian administration troops of 15th Corps and 7th Div.

headquarters. It was, however, saved by being supplied from the air and by the capture of Ngakyedauk Pass, linking the Kalapazin valley and the 5th Div. on the W. side of the Mayu range. Mountbatten ordered the 26th Indian Div., who were in the Chittagong area, to the rescue immediately, and after twenty days' bitter fighting the enemy encirclement was

SUPPLIES BY AIR TO WEST AFRICAN TROOPS IN BURMA

broken. The allied offensive was soon renewed, and the main operation of the campaign fought before the monsoon of 1944 was that which was conducted under the Amer. general, Stilwell, with the object of helping China by building a road through N. Burma to link Assam with the Burma road to Chungking. Opposing Stilwell's line of advance, the chief objective of which was the enemy base of Myitkyina, was the Jap. 18th Div.; but the deep penetration of Wingate's 'Chindits' enabled them to cut the enemy's

communications and so rule out the 18th Div. as an offensive factor against Stilwell. By way of further aid to Stilwell two diversions were conducted, one in Arakan and the other in the Manipur Hills. A force of Amer.-trained Chinese troops under Brig.-Gen. Merrill was also advancing, some 200 m. to the N.E., on a S. course parallel to that of Stilwell's forces. The enemy, however, countered these moves by an advance on the Arakan front with the intention of invading India through Chittagong; and when his forces were utterly defeated by the Brit. Fourteenth Army of seasoned jungle fighters, he attempted to force a passage through Manipur State to Assam, and here he came within measurable distance of success by attacking Kohima and so threatening the vital Brit. road and rail communications through Assam.

Gen. Stilwell actually began his N. offensive from Ledo late in Oct. (1943) and, in the ensuing six months, he led his very fine Amer.-trained Chinese divs., together with U.S. commandos, across the Patkoi Hills and through the Hukawng valley, over 200 m. of most difficult country, to push the Jap. 18th Div. to within 70 m. of Myitkyina, their main base and airfield in N. Burma. Wingate's Chindits (after his death they were commanded by Maj.-Gen. Lenthaigne) co-operated by cutting the supply lines of these Jap. to the S., killing thousands of the enemy and blowing up a dozen stretches of the key railway line to Mandalay and many sections of the Bhamo-Myitkyina road; while a force of Gurkhas and Kachins was advancing on Myitkyina from the N. All these forces, including the Chinese, were supplied by air. Meanwhile columns of the Fourteenth Army crossed the Chindwin R. in support of Stilwell's forces; but were driven back on Imphal, main allied base in the N.E. uplands of India and cap. of Manipur State, and Kohima, the important Brit. base in Assam, where the Jap. attacked strongly, and for some weeks there were fierce attacks and counter-attacks at both places.

At one time early in 1944 the Jap. military occupation of N. Burma seemed to be precarious, but their advance between the Fourteenth Army's forward positions and their base at Imphal relieved their position. Moreover the enemy's counter-attacks in Arakan resulted in the evacuation of Rethidaung, a sacrifice due to the efforts made to help Stilwell's advance. The Jap. command had decided that the proper riposte to Stilwell's thrust was a counter-thrust through Imphal at the allied railway communications rather than direct opposition. The enemy now launched a counter-offensive across the Chindwin R., and a struggle began for the Imphal plain, and for the military roads, constructed since the withdrawal from Burma, that converged upon it. Gen. Slim's Fourteenth Army troops were concentrated to deal with enemy attacks on Kohima. By early April the Brit. and allied forces were in possession of the

whole Imphal plain. But the enemy invaded Assam early in April and the Allies, unable to guard the Manipur road, running parallel to and behind the Burma mt. frontier, for all its course of 200 m., instituted the 'box' system of defence, under which strong points were organised for use later as bases of attack—the same system which had been successfully adopted in Arakan. The Manipur road position was the more difficult to defend from the fact that it was an outlying area dependent on a single line of communications from the railhead on the Assam railway at Dimapur. A week after the initial Jap. entry into Assam, a Jap. column thrust behind the Brit. positions guarding the N.E. approaches to Imphal; while another enemy force threatened Imphal from the S. The whole situation in Assam and Burma was confused owing to the complicated terrain and to the dropping of airborne troops behind the enemy lines. The year had opened with cautious allied thrusts on fronts at Ledo, N.W. of Imukawng valley, Imphal, and Arakan, but since then some four campaigns were superimposed on the strategic field, the Allies and the Jap. each striving to gain some definite advantage before the monsoon season should set in. The allied operations though offensive in spirit, were essentially preparatory; for entire reliance on a landward approach for the recapture of Burma would be too costly in men and material, seaborne invasion being an essential element in a decisive offensive. The Jap., however, had a great advantage in communications, for they held the Burmese waterways, railways, and roads, the Bangkok-Rangoon railway, and the supply lines into Siam and Indo-China. Against these, the Allies had their troop-carrier command—which had shown its value in relieving the Indians in Arakan and in carrying commando troops behind the enemy lines further N. (see above)—combined with the air supremacy maintained by tactical, strategical, and reconnaissance air forces.

The position in mid May (1944) was that Gen. Slim's Fourteenth Army held a line in the W. of Manipur state, before Imphal, with the Jap. line extending in an arc from near Kohima, round the E. part of Manipur state, to Tiddim. Far to the N.E. was Stilwell's Chinese army advancing on Myitkyina, with a Jap. div. near Mogaung between Stilwell and the Brit. airborne troops located on the Bhamo-Myitkyina road south of this enemy div. and in rear of the Jap. defending or counter-attacking near Imphal. The enemy, however, in attacking Slim's positions in Manipur, suffered disproportionately heavy losses and were now generally on the defensive. A forty days' pitched battle for Kohima ridge ended in the middle of May when the position fell to the Brit. forces, the enemy losing over 3000 dead, while Brit. casualties were not light. The main aerodrome at Myitkyina was captured by Merrill's force as the successful outcome of a daring march through rough and tortuous terrain in the mt. jungles of N. Burma to the

Mogaung valley. It was a fitting climax to operations which were part of a co-ordinated plan to the origin of which so much was owed to Gen. Wingate. While three enemy divs. were still knocking their heads against the wall in Manipur, the whole of the Jap. communications in N. Burma were now in jeopardy; besides which the allied jungle columns had now acquired habitable quarters against the monsoon rains. Soon afterwards Merrill's forces, with reinforcements of airborne troops from Stilwell, penetrated the outskirts of the tn. of Myitkyina (May 19).

The land fighting over the scattered Indo-Burmese fronts did not altogether cease with the monsoon, though the rains made new campaigns impossible. Gen. Stilwell had made valuable gains in N. Burma and allied air supremacy was further emphasised; but, on the whole, the pre-monsoon campaigns had been rather disappointing, especially on the Arakan front, which had now become a purely holding campaign to prevent Jap. incursions into Bengal. Moreover the transfer of troops to Imphal eliminated any large-scale offensive in Arakan, where the monsoon, if anything, favoured the Allies, though neither side could expect to make important gains. But at least the dangers to Imphal and Kohima, so acute in March-April, had passed, though all fighting remained on the Indian soil of Manipur state, and it was a question how far back towards their Chindwin R. bases the Jap. could be pushed with weather conditions steadily growing worse. Myitkyina, however, did not fall after the brilliant capture of its airfield, but there seemed to yards the end of June to be no doubt that it would soon be captured, provided it could be done without undue loss of life against long-prepared Jap. fortifications. The campaign here, however, had been fundamentally successful and, with the aid of the Chindits, had brought the season's only real gains. Other appreciable gains in this part of the country were the freeing of the Imphal-Kohima road, which resulted in the reopening to the Allies of the vital Dimapur-Imphal road; and the capture of Mogaung by Chinese troops and units of Gen. Leutalga's force, which comprised elements of Gurkha and Brit. county regiments (June 25).

The Road to Mandalay.—Chinese and Amer. troops had entered Myitkyina on May 18, but so fierce was the Jap. resistance that it was not until Aug. 3 that their garrison was destroyed. The capture of this great base was a triumph for Stilwell's Amer. and Chinese troops and for the Brit. penetration groups operating in the Jap. rear. Allied losses were light, but scarcely one Jap. soldier remained alive in the tn. The capture of Myitkyina increased the protection of the air routes to Chungking—the remarkable ferry service 'over the hump' of the Himalayas which was now transporting a great tonnage of supplies.

The victory won in Burma, notably by the magnificent defensive battle of Manipur, to which battle-ground the Jap.

were skilfully enticed with consequently enormously increased difficulties of communications, was scarcely realised at this time by the world which was preoccupied with the Homeric encounters in Europe. But if events had moved slowly in Burma the result of this defence was that by the beginning of 1945 more than a quarter of Burma had been liberated and the spearhead of the Fourteenth Army was only some 20 m. from Mandalay.

Gen. Slim's tactics in the battle of Manipur were essentially those of Wellington at Waterloo—the isolated defensive areas attacked on all sides by the Jap, being substituted for the isolated and always unbroken squares of Waterloo. The Jap. broke off the battle in July, retiring in disorder and dying of starvation and disease. It was vital that they should be given no chance to reorganise and make a stand on the Chindwin R. But the weather was terrible and roads were completely destroyed, while the Brit. and Indian soldiers were weary after their hard fighting during the monsoon. Yet they did not halt and in consequence Gen. Slim's army had, later, a much easier task than if they had delayed until Oct. before advancing on the Chindwin. The enemy were retiring by two main routes—the Tiddim road and the Kabaw valley, both running N. and S. Down the Tiddim Gen. Slim sent the 5th Indian Div. with orders to destroy the remains of the Jap. 31st Div. and get through to Kalemyo, and the manner in which this div. carried out its orders is one of the great stories of the war. With the monsoon at its height, amid mts. twice as high as Ben Nevis, with only a single narrow tortuous road to move along, the Indians never faltered. Kennedy Peak and Port White are battle honours which will rank with other names in the div.'s hist. like Keren and Amba Alagi. Down the Kabaw valley went the 11th E. African Div. (see KING'S AFRICAN RIFLES), which was new to campaigning outside Africa. Plunging through the jungle over roads a foot deep in mud, they never lost touch with the Jap., and finally joined up with the 5th Indian Div. at Kalemyo, forced their way through the gorge to Kalewa, took it, and were on the Chindwin. Thus by superb fighting Gen. Slim's forces had reached the riv., the enemy had no time to re-form, and there were fully five months to elapse before the monsoon would start once more.

While this was happening, Gen. Sultan—who had succeeded Gen. Stilwell—was pushing down from N. Burma. His 36th Brit. Div., having left Mogaung, was held up for some time short of the railway junction at Naba but had now resumed its southward march, relying solely on the air for its supplies. Further E. the Chinese 38th Div. had moved S. from Myitkyina, surrounded Bhamo, and pushed on, also in the direction of Mandalay. Bhamo fell on Dec. 15 after a month's siege. Of its few buildings still standing when the Chinese entered all were damaged.

Capture of Katha on the Irrawaddy—Fall

of Akyab.—It was at the end of Nov. that the campaign had taken a sudden change. The Fourteenth Army crossed the Chindwin and was committed to the daring manoeuvre of taking Mandalay from the N., an operation previously considered impossible owing to the poverty of communications. But the crossing of the Chindwin had an immediate result. Resistance crumbled before the 36th Div., which then captured Katha, the chief enemy base on the R. Irrawaddy. The speed of the advance increased on all fronts. The Indian corps swept over the mts. on the E. bank of the Chindwin, reached the railway, and joined up with the 36th Div. Ye-u and Shwebo were soon taken. The advancing forces now stood but 20 m. from Mandalay.

During these events in N. Burma Akyab in the far S., the chief Jap. base in Arakan, fell without a battle, though an elaborate small-scale amphibious operation had been planned. Air reconnaissance found only derelict defences. The capture of this, the third seaport of Burma, undoubtedly had some prestige value, but its strategic importance was not great, though it gave the Allies an advanced air-base. A poor port, it did not give what they urgently required—a way into central B. from the coast. Almost simultaneously Gen. Christison's amphibious forces landed at Myepon to get in the rear of the Jap. trying to escape southwards.

Fresh advances on Mandalay and Sagaing, two of the main enemy bases on the Burma front, began in mid Jan., following a terrible concentration of bombs dropped by the R.A.F. on military installations and troop formations in Mandalay. Indian troops from Nepal had struggled through 500 m. of Burmese jungle to reach the open country in front of Mandalay.

Ledo Road to China opened.—Thus, during Jan. the war in Burma went well for Adm. Mountbatten's forces, though it was evident that the battle for Mandalay would be a hard one. The outstanding event of the month, however, was the opening of the Ledo road to China. The Jap. cut the old Burma road, on which China was wholly dependent for war material, early in 1942. Towards the end of that year the Allies began the construction of a new road from Ledo, the railhead on the mountainous E. frontier of Assam. It was a vast undertaking, involving road construction over 300 m. of the most difficult country in the world, between Ledo and Myitkyina on the Irrawaddy; but it was accomplished by Brit., Amer., and Indian engineers with the help of African, Indian, and Chinese troops and labourers, and the new road was now open right through. Meanwhile the 26th Indian Div. of the 15th Corps were engaged in successful amphibious operations against Ramree Is. (Jan. 21). This was followed shortly after by a landing on Cheduba Is. by Royal Marines. Operations in the Arakan had been looking up four allied divs.; Gen. Sir Oliver Leese, commander-in-chief allied

land forces, saw a way of amending this by staging a series of landings in the enemy's rear along the Arakan coast while exerting pressure from the N. Further landings at Myebon, Kangaw, Ru-Ywa, and Lotpan followed, in which Commandos, infantrymen, tank crews, gunners, and naval and air forces all played a gallant part, and started a full-scale Jap. retreat southwards. Thus was achieved the second of Leese's aims—the release of the Arakan forces for other operations. The bloodiest battle of the whole war in Burma was now being fought at Kangaw (or Gangaw) in Arakan, where for three weeks thousands of Jap. had been trying to break southwards—their only road to safety—through the road block formed by the 15th Indian Corps. On Jan. 22 (1944) Brit. and Indian troops entered the large tn. of Monywa on the Chindwin R., 60 m. W. of Mandalay. The Jap., who were in strong stone-bunkered positions, included men of the 33rd Div., which had an estab. reputation for never yielding a position until physically compelled to do so. But Thunderbolts and rocket-firing Hurricanes accurately pin-pointed the enemy's positions and destroyed them, and infantry of the 14th Div. then took the tn. without meeting any further resistance. But the crucial point of the approach battles for Mandalay was 60 m. N. of the city, where Brit. and Indian troops held strong bridge-heads on the Irrawaddy in face of fanatically directed counter-attacks. These bridge-heads were the only point near Mandalay where the Brit. troops were on the same side of the riv. as the city; hence the fury of the Jap. resistance. Fourteenth Army troops, however, had full control of the N. bank of the Irrawaddy from Sagaing hills to where the Chindwin flows into the Irrawaddy and were as close as 17 m. to Mandalay. Fourteenth Army troops made a descent on the Irrawaddy, 110 m. S.W. of Mandalay, early in Feb., which brought them to the N. edge of the B. oilfields. Mid Feb. still saw the enemy fighting hard round Mandalay, but they were being steadily pressed back.

Battle for the Burma Oilfields—Mandalay Battle opens.—Fourteenth Army troops, on Feb. 14 (1945), crossed the Irrawaddy near the famous ant. city of Pagan (q.v.) which they seized. Here the riv. is more than a mile wide, being swollen by the waters of the Chindwin, and near the far bank the Brit. troops came under murderous fire from machine-gun nests in the caves and tunnels of the cliffs, which wrought great havoc until Thunderbolts and Mustangs were sent up to silence them. This gave the Allies a new bridge-head 4 m. deep, N. of Chauk, the second biggest oil-producing tn. of Burma. The battle for the great Burma oilfields was now beginning. The crossing of the formidable riv. barrier and the forcing of the enemy to conform to the Allied plan had been achieved and the real battle for Mandalay was on the point of opening. But the line of the Pagan force was fantastically

bad and most of the supplies had to be carried by air. It was a campaign for study by future students of military hist., in which the seemingly impossible was accomplished, the bringing to its logical sequel of the brilliant experimental work of Wingate's Chindits. In a surprise armoured thrust of 85 m., supported by airborne forces, the Fourteenth Army, striking E. from the Pagan bridge-head, virtually cut off the Jap. army of 40,000 defending the Mandalay area. In this thrust, after a five days' struggle, they captured Meiktila, the second largest tn. of central Burma, with eight airfields. Driving still further E. they took Thazi, and thereby captured the road and railway junction from Mandalay to Rangoon, leaving the enemy only an escape route over the difficult Shan hill country. The Jap., expecting a drive to the rich oilfields to the S., had ignored the desert country to the E.; and though they made a 'suicide' stand in the streets of Meiktila, at least 1200 were killed. An armoured column of the 19th Indian (Dagger) Div. swept through the city limits of Mandalay on March 8 and were soon only a mile from Fort Dufferin, the centre of the city. The walls of the city were pierced by men of the 15th Punjab, while other Punjabis stormed Mandalay Hill, the pagoda-covered landmark in the N. section of the city. Other forces of the div. were now fighting below Madaya, 13 m. N. of Mandalay, on the southward route from the Singu bridge-head E. of Shwebo. To the N.E. of Mandalay Lashio and its main airfield were captured by the Chinese First Army. Thus the whole Burma road from Lashio to Kunming had now been cleared, for Gen. Sultan's forces had advanced sufficiently far S. to protect the new overland supply route—the Stilwell road—opened six weeks ago.

The struggle for Fort Dufferin was long and bitter in the extreme. On March 10 Indian troops made a gallant but unsuccessful attempt to penetrate it. This fort is really the site of the old palace and inner city of the last Burmese kings, and it was named after the viceroy at the time of the annexation of Burma. The fort is a square with sides over a mile long, right in the middle of Mandalay, and it is surrounded by a rampart 30 ft. high of massive earthwork strengthened with rocks and faced with red brick. Outside the rampart is a moat 70 yds. wide, and there are five bridges leading into as many gateways in the wall.

Fall of Fort Dufferin—Triumph of Aerial Transport.—The occupation of Maymyo on the main road and railway between Mandalay and Lashio by Indian troops was another blow to the Jap. in central Burma. In peacetime it was Burma's most popular hill station and was the summer seat of the gov. When forced to evacuate in 1942, Gen. (later F.M.) Alexander moved his Headquarters there. Since the Jap. occupation it had been the headquarters of various Jap. military formations. Its capture sealed off Jap. routes from central

Burma into the Shan States and Siam. Other troops of the 19th Indian Div., fighting from pagoda to pagoda through the anct. city of Mandalay, were now meeting stronger opposition, chiefly because the Jap. were trying to get their supplies out of Mandalay and so fought hard to preserve the entrance to Fort Dufferin. The religious buildings on Mandalay Hill had suffered great destruction, but their exteriors were not badly damaged. On March 19, however, King Theebaw's palace went up in flames, despite Brit. efforts to preserve the famous monument with its spire of seven tiers. The Jap. were seen using a wooden building near the palace as an observation post. This post was shelled and destroyed and the wind blew the flames across the dry grass to the hmsv palace. On the same date Eng. and Scottish troops occupied Ava, the old cap. of Burma, opposite Sagaing on the Irrawaddy. Brit. troops also took Amarapura ('the immortal city'), yet another of the anct. caps. of Burma and rich in historical monuments, lying 6 m. S. of Mandalay. Fort Dufferin fell at last on March 20 to the 19th Indian Div. Thus fell Mandalay, second city of Burma, and its fall was an indication of the great progress made by the Allies in the liberation of the country. The campaign leading to this victory had involved great feats of military engineering and marching over what were, perhaps, the most difficult lines of communication in any theatre of war. The crossing of the Irrawaddy alone, at points where it is six times as wide as the Thames at Waterloo Bridge, was an epic achievement. All these great land advances were only made possible by the untiring efforts of the Brit. and Amer. airmen. In one year the 33rd Indian Corps under Lt.-Gen. Sir Montagu Stenford, from the time of the relief of Kohima and Imphal, cleared the enemy from 32,000 sq. m. of India and Burma, killed 20,000 Jap., and captured 251 guns. A vital factor in the success of the Allies in the Burmese campaign was the use of air transport, especially from the time when the campaign reopened in the autumn of 1943. Great experience had been gained in aerial transport, and the arrival of more transport squadrons allowed of much extended operations. The large-scale use of air supply in the Arakan operations was the turning-point in the war in Burma. So long as the allied forces stood their ground instead of trying to fight their way back past the road-blocks erected by the Jap. to cut them off, the supply problem of the enemy remained insoluble. Although the Jap. fought tenaciously without reinforcements of munitions, their fate was sealed. When the second Wingate expedition set out, its operations depended entirely on the weapon which had then recently thwarted the Jap. in the Arakan battle, namely air supply; and not merely did the allied troops establish themselves in the middle of enemy-occupied ter., but they built improvised landing-grounds for the reception of supplies, and it was during that campaign that gliders were so suc-

cessfully used to carry equipment. The climax of the campaign was the assault on Myitkyn, in which Gen. Stilwell used transport aircraft in a series of permanent advances in which forward landing-grounds were rapidly built to forestall all enemy counter attacks.

With the occupation of Chank (April 18), Magwe (April 19), and Yenauyaung (April 21) the capture of the Burma oilfields was complete. Yenauyaung was the main centre of production, and until this time that place had had the heaviest concentration of Jap. anti-aircraft guns in all Burma.

British capture Rangoon.—Battle of Burma ended.—Toungoo, 165 m. N. of Rangoon, and its three airfields were captured on April 26 by the Fourteenth Army, which had advanced 50 m. in a week. Dakotas with Amer. engineers were flown in with all the supplies needed to enable the columns to move forward with renewed impetus towards Rangoon. The dash of Brit. and Indian mechanised columns into Toungoo took the enemy completely by surprise and they fled precipitately to the foothills near by. Four days later the advancing columns had reached Pegu, junction of the railway to Siam, and were therefore through the last natural defensive position held by the Jap. before Rangoon, a defile through which runs the trunk road and railway. The powerful armoured columns were unable to deploy here and the defile was forced by the infantry. For some days past the enemy had been evacuating Rangoon. They fought well on the whole, and many suicide attacks were made on the tanks by men running up with magnetic mines, but mostly the Jap., armed only with rifle or machine-gun, were terrified of the tanks. The Jap.-sponsored army of Burma was now co-operating actively with the Fourteenth Army. The tables were turned on the Jap., who now found themselves in a hostile country with every man's hand against them. Pegu was attacked on May 1. A heavy barrage was laid down on the vil. by nearly 100 guns. Men of the W. Yorkshire and Border Regiments, with Punjabis, then mopped up the enemy holding force, which in fact consisted of the remnants of the evacuated Rangoon garrison. The last road usable by motor transport and the last railway by which the enemy in Lower Burma could escape to the E. were now denied them. The next task was to bridge the broad Pegu R. This accomplished, the armoured columns were soon thundering down towards Rangoon in a race as much against the approaching monsoon as against the Jap. After bomber raids on the Jap. defences, Brit. paratroops landed on May 1 S. of Rangoon, followed the next day by forces landed from Brit. ships on both banks of the Rangoon R. S. of the city. Any Jap. troops in the Rangoon area were thus trapped between two allied forces who were now carrying out a pincer movement, while other troops of the Fourteenth Army were fast moving on the cap. from the N. Troops of the allied land

forces entered Rangoon on May 2. The fate of the Jap. still resisting in W. Burma was sealed with this entry and with the capture of Prome on the Irrawaddy. 180 m. N. of Rangoon, which latter capture cut the escape route of the enemy into the Arakan area. So fell Rangoon. In a series of battles of great intensity over the previous fifteen months the Jap. armies in Burma had been so decisively defeated that they were unable effectively to defend Rangoon. Ninety-seven thousand of their dead were counted over that period, and their total casualties were 250,000. Allied total casualties, including Chinese, were not half this total. The fall of Rangoon, ten days before the monsoon broke, brought to an end the battle of Burma. For although pockets of enemy resistance remained their doom was certain. The occupation of the cap. by a combined operation was the culmination of a long series of concerted operations carried out by the Fourteenth Army, which crossed the Chindwin and Irrawaddy Rs. to break into central Burma; by the Amer. and Chinese forces of the N. area command which advanced from the N. to Lashio; and by the 15th Indian Corps which carried out a series of amphibious hooks down the Burma coast. All these operations were supported and supplied by air on a scale never attempted theretofore in any theatre of war.

Jap. forces E. of the Mandalay-Rangoon railway were now hastening their retreat over the Shan Hills to Siam, but were being constantly pounded by Brit. aircraft. Other Jap. remnants were being driven southward along the banks of the Irrawaddy by two Brit. columns which were seeking to trap them in S.W. Burma before the monsoon broke. Although from the strategical point of view the issue of the Burmese campaign had been settled, a large area of the country still remained to be cleared of the enemy. This area included the Shan Hills and the Salween R. basin, the S. part of the Arakan coast, and the area of the Pegu Hills between the old Burma road and the lower Irrawaddy valley. 'Mopping-up' operations, which had been intensified daily since the reoccupation of Rangoon, almost constituted a campaign in themselves, for there remained some 60,000 Jap. troops to be driven out of the country, of which over 40,000 were in the E. sector E. of the Mandalay-Rangoon railway, and some 15,000 W. of the Rangoon-Meiktila road. These were trying to avoid action and seeking to filter eastward by night in small bodies.

Japanese Forces marooned.—Gradually these forces were reduced, but in a country of such great distances, such difficult terrain, and during the monsoon it was not possible to drive the Jap. into restricted areas and annihilate them. To the N.E. of Mandalay they had been driven well back into the hills where they had next to no guns and but little equipment. Their line of communication was across the Salween into N. Siam, a long and difficult route, but the Jap. left their men to die, with orders to kill as many of the

allied forces as possible before being killed. In the S. the situation was different. Here the obvious land route of advance was from Pegu across the Sittang, Irlin, and Salween Rts. to Moulmein. Holding the line of the Sittang were the remnants of the Jap. armies from central Burma, very short of transport and with only a few mt. guns, but nevertheless a considerable obstacle. The Brit. Twelfth Army held the line of the road and railway from Rangoon to Mandalay. W. of this line was a force of about 10,000 Jap. cut off in the Pegu Yomas and made up of the remnants of the Jap. Twenty-eighth Army, with elements of the 54th and 55th Divs. The Jap. in the Yomas were trying to force a way back across the corridor, while their comrades on the Sittang tried to open a way for their escape. In this fighting the Gurkhas had a hard task to defend themselves—a reminder that even if the enemy had been driven out of most of Burma, the war in that country was not over. But by July 27 the Jap. had lost more than 5000 men in their desperate effort to break through the allied lines and across the Sittang into Siam.

Japanese Surrender in Burma.—The war with Japan, however, ended abruptly in mid Aug., following the dropping of atomic bombs on the Jap. homeland (see PACIFIC CAMPAIGNS IN SECOND WORLD WAR). It only remained for envoys to reach the various allied headquarters to sign instruments of surrender, a process delayed by distances, especially in Burma, where fighting went on in the Karen Hills despite the general surrender of Aug. 14. But acting on Adm. Mountbatten's orders Jap. representatives signed a preliminary agreement at Rangoon on Aug. 27 in order to enable relief to reach prisoners of war quickly and to facilitate the reoccupation of S.E. Asia when the general instrument of surrender was signed in Tokyo on Sept. 2. The final instrument for the surrender of Burma to the Brit. Twelfth Army was signed at Gov. House, Rangoon, on Sept. 13 by Jap. envoys acting in the name of F.-M. Count Terauchi, supreme Jap. commander of the S. armies. Thus ended the war in Burma, with a surrender signed, appropriately enough, in the building where Ba Maw's puppet gov. had treacherously declared war on Britain two years previously (Aug. 1, 1943). See *The Campaign in Burma* (H.M.S.O.), 1946; R. McKelvie, *The War in Burma*, 1948; A. Brett-James, *Report my Signals*, 1948.

Burma, or Burma-Yunnan, Road, runs between Lashio, N. end of the Burmese railway from Rangoon, and Chungking, Chiang Kai-shek's cap. in 1939-40. It was constructed between 1936 and 1938, after the Sino-Jap. war had been in progress for some time, with the object of providing the Chinese armies with an alternative route for supplies to that from the sea, which had been cut off by the Jap. advance southward. The chief use made

of the road was as a means of transport for Russian munitions to China and, in July 1940, the Brit. Gov., in view of its difficult position from the collapse of France, felt compelled to agree to suspend temporarily the transit of war material and certain other goods via Burma. To have agreed to permanent closure of the road would have been to default from obligations as a friendly neutral power to China. But the closing of the road for even three months was criticised in Britain as involving an example of the much-derided policy of appeasement, and it was with a sense of relief that the Brit. people learned that the road had been duly reopened after the expiry of the three months on Oct. 17.

Burma Star, decoration instituted in 1945 for service in the Burmese campaign beginning Dec. 11, 1941, until the end of the campaign. The ribbon is dark blue, with a central red stripe and in addition two orange stripes. A candidate who qualifies for both the B. S. and the Pacific Star is awarded the star first earned.

Burmman, Pieter (1668-1741), famous Dutch classical scholar, usually known as the elder to distinguish him from his equally famous nephew. He was b. at Utrecht, and commenced his studies at the univ. there. He was intended for the legal profession, but later became prof. of hist. and eloquence at the univ. of Utrecht. Next he became prof. of Gk. language and eloquence at Leyden, and finally prof. of hist. for the United Provs. and chief librarian. He was famous throughout Europe for his commentaries and eds. of the classics, and he took part in a number of the disputes which were waged between the men of letters of the period. Amongst his more important publs. may be mentioned eds. of Phædrus (1698), Horace (1699), Justin (1722), Ovid (1727), Suetonius (1736), and Lucan (1740).

Burmman, Pieter (1714-78), nephew of the above, b. at Amsterdam. He studied under his uncle at Leyden, and made a special study of law and philology. He became prof. of hist. and philology at the univ. of Amsterdam. He pub. many eds. of classics, together with an anthology of the Lat. epigrammatists, 1759-73. Authors ed. by him include Virgil (1746), Claudian (1760), Propertius (1780), and Aristophanes (1760).

Burmniaceæ is a small order of monocotyledonous plants found in tropical forests. The flowers are bright blue, and the plant is a saprophyte. The chief genus is *Burmnia*, of which there are some thirty species.

Burn, Richard (1709-85), Eng. legal writer, b. in Westmorland and educated at Queen's College, Oxford. He took holy orders and became vicar of Orton. But he devoted his life to a study of law. He was made chancellor of the diocese of Carlisle. His two most famous works were *The Justice of the Peace and Parish Officer* and *Ecclesiastical Law*, which was regarded as the standard authority on that subject for a great many years.

Burn, William (1789-1870), Scottish architect, native of Edinburgh. He was educated for his profession under Smirke. He was successful in Edinburgh and London, where he settled in 1844. He has left examples of his work in all parts of the country.

Burnaby, Frederick Gustavus (1842-85), Eng. traveller and soldier. The son of a clergyman, he was educated at Harrow, and entered the Royal Horse Guards in 1859. He acted as Carlist correspondent of *The Times* in 1874, and later went to Khartoum to investigate and report upon Gordon's expedition. He achieved fame through the travelling feat of crossing Russian Asia on horseback, which is described in his *A Ride to Khiva*. His love of excitement found vent in a series of balloon ascents, in one of which he crossed the Channel. Later he was wounded in action at El Teb in 1884. He d. fighting at Abu Klea.

Burnand, Sir Francis Cowley (1836-1917), Eng. humorist, was b. in London. His mother, Emma Cowley, was descended from the author, Hannah Cowley. Educated at Eton and Cambridge. He adopted law as a profession, though he had formerly studied first for the Anglican, afterwards for the Catholic, Church. He founded the Amateur Dramatic Club at Cambridge and made dramatic writing his work. *Black-eyed Susan* (1866), a burlesque, made a great hit. He succeeded Tom Taylor as editor of *Punch*, from 1880 to 1906. He pub. *Happy Thoughts* (1868), many other popular books, and an autobiography, *Records and Reminiscences* (1904).

Burne, Sir Owen Tudor (1837-1909), Eng. soldier, was drafted in 1856 to India with his regiment, the Lancashire Fusiliers, the mutiny having broken out. Owing to his knowledge of Hindustani, he was soon appointed brigade-major. At the assault of Kaisar Bagh he led the attacking column. Sir Hugh Rose, impressed with his work as adjutant, appointed him private secretary in 1862, and he held a similar position under Lord Mayo in 1868, and under the viceroy, Lord Lytton, 1876-78. F. was with the former when he was murdered in the Andaman Is.

Burne-Jones, Sir Edward Burne, Bart. (1833-98), Eng. painter, b. at Birmingham on Aug. 28. He was an only son, and of Welsh extraction, and the idealism of his character and his art has been attributed to this Celtic strain. He was educated at King Edward's School, Birmingham, and studied for the Church. His interest in classical studies was life-long, but it was classical mythology that chiefly attracted him. In Jan. 1853 he entered Exeter College, Oxford. Here he met Wm. Morris, who had joined the house on the same day, and the couple became fast friends. The two friends soon discovered their true bent, and relinquishing the Church, they devoted themselves to art. B. took Rossetti for his master, though he had not yet met that artist; in 1856, however, his dream was realised, and his acquaintance with Rossetti began. He left

college, and settled in London, and commenced his studies under the instruction of Rossetti. Morris soon joined him here. So apt a pupil did B. become, that by the end of the same year Rossetti was compelled to admit though without acrimony, that he was no longer able to teach the young artist more. Many branches of work were undertaken by the young man, among them being pen-and-ink work on vellum, oils, and cartoons for stained glass. In 1858 his deep admiration for Chaucer led him to execute a cabinet decorated with scenes from 'The Prioress's Tale.' His first journey to Italy was made in the following year, and in 1860 he executed two water-colours which show most strongly Rossetti's influence, and which rival, in a greater degree than that yet reached, that master's work. These works were 'Sidonie von Bork' and 'Clara von Bork.' He married Miss Georgiana Macdonald in the same year, and in 1862 the couple accompanied Ruskin on his tour to Milan and Venice. In 1864 he was elected an associate of the Society of Painters in Water Colours. He became A.R.A. in 1886, and in 1894 he was made a baronet. An attack of influenza resulted in his death on June 17, 1898. Among his masterpieces are 'King Cophetua and the Beggar Maid,' 'The Golden Stairs,' 'Pan and Psyche,' 'Chant d'Amour,' and 'The Annunciation.' B.'s influence has shown itself far less in painting than in the sphere of decorative design. Here it has been very marked indeed, particularly in designs for stained glass. Specimens of these executed from his cartoons are to be found all over the country. See M. Bell, *Sir Edward Burne-Jones*, 1892; A. Valsecchi, *The Decorative Art of Burne-Jones*, 1900; Lady Burne-Jones, *Memorials of E. Burne-Jones*, 1904.

Burnell, Arthur Coke (1840-82), Sanskrit scholar, went out to Madras in 1860. All his free time was devoted to Sanskrit, and in 1870 he generously gave his collection of 350 MSS. to the India library. Of his *Handbook of South Indian Paleography* (1874), Max Müller remarked: 'It opens an avenue through the thickest and darkest jungles of Indian archaeology.' But his chief work was his *Classified Index to the Sanskrit MSS. in the Palace at Tanjore* (1880). It is a compendium of the Sanskrit literature of S. India. Overwork and the hardships of the Madras climate were responsible for his early death.

Burnes, Sir Alexander (1805-41), Brit. soldier, traveller, and explorer. He was b. at Montrose, and at an early age entered the service of the E. India Company. He proposed the exploration of the N.W. Provs., which at that time were practically unknown, and in 1831 went to Lahore on a special mission. In the following year he started on the tour which took him across the Hindu Kush, to Bokhara and Persia. The book which he pub. on his return to England obtained for him the recognition of the Brit. and Fr. geographical societies. On his return to India he went on a special mission to Kabul, and was later political agent there.

He was assassinated by the Afghan mob in 1841, meeting his death bravely. His publications were *Travels into Bokhara* (1834) and *Cabool* (1842).

Burnet is the name given to various species of *Poterium*, a genus of Rosaceae found in N. climates. *P. Sanguisorba*, the salad B., is a unisexual plant with an indefinite number of long stamens; the flowers, situated at the top of the spike, are female, those below are hermaphrodite. *P. officinale*, the great B., has four firm and reddish-coloured stamens facing the sepals, the corolla is absent, but there is a nectary round the style.

Burnet, Gilbert (1643-1715), Eng. historian and divine, was b. at Edinburgh, of one of the anct. and distinguished houses of Scotland. He was educated at Marischal College, Aberdeen, and after studying law for about a year gave that up in preference for divinity. In 1661 he took orders in the Episcopal Church, which had just been restored in Scotland on the Restoration. Shortly after his return from a continental tour he accepted the living of Saltoun in Haddingtonshire. In 1669 he was appointed prof. of divinity in the univ. of Glasgow. In 1673 he pub. his *Indication of the Church and State of Scotland*, and in 1676 *Memoirs of the Dukes of Hamilton*, an account of the civil wars in Scotland. In 1674 B., not being able to accept Landerdale's solution of the Church question, came to London, where he was, on the whole, favourably received and given the chaplaincy of the Rolls Chapel, and later he became lecturer at St. Clements. Between the years 1679 and 1681 appeared his *History of the Reformation of the Church of England*, for the first two vols. of which he received the thanks of Parliament. He showed himself independent of court influence, and offended Charles II. by the attitude which he adopted over the execution of Russell. On the accession of James II. he left the country and travelled in Europe, but finally settled in Holland, and had considerable influence over William. He returned to England with him, and was appointed bishop of Salisbury. His pastoral letter claiming England for William III. by right of conquest gave grave offence, and was publicly burnt by the hangman. His work in his diocese was vigorous, and he gave great attention to his pastoral duties. He suggested the scheme which was afterwards adopted in the provision known as Queen Anne's Bounty. In 1699 he was appointed tutor to the duke of Gloucester. His *Exposition of the Thirty-nine Articles of the Church of England* was pub. in 1699, an exposition which met with much condemnatory criticism at the hands of the clergy. His influence declined with the death of Queen Mary. He d. in March 1715, and was buried at St. James's, Clerkenwell. His great work, the *History of my own Time*, was directed to be pub. six years after his death. It was actually pub. in 1723 (vol. i.) and 1734 (vol. ii.). This work was also bitterly attacked. Its most important parts are naturally the hist. of the Church in Scotland, the Catholic question

in England, and the negotiations previous to the Protestant revolution in 1688, all of which he was able to write on from his own actual experience. See T. E. S. Clarke and H. C. Foxcroft, *A Life of Bishop Burnet*, 1907.

Burnet, John (1784-1868), painter and author, b. at Fishermrow, near Edinburgh. His first-class engravings of the works of Wilkie first brought him renown. 'The Greenwich Pensioners' is the best and most popular of his own works, and was painted in 1837. He also wrote with authority upon art, his most important productions being *A Practical Treatise upon Painting* (1827), the editing of *The Discourses of Sir Joshua Reynolds* (1842), and *Rembrandt and his Works* (1849). He also wrote *Turner and his Works* (1852), to which Peter Cunningham (q.v.) contributed a memoir. He d. at Stoke Newington.

Burnet, John (1863-1928), Brit. Hellenist; regarded as the foremost Gk. scholar of his day in Great Britain. Born at Edinburgh and educated at Edinburgh and Oxford Univs. He was a master at Harrow (1888), and a fellow of Merton College, Oxford Univ. (1890). In 1892 he was appointed prof. of Gk. at St. Andrew's Univ., and remained there until his retirement as emeritus prof. in 1928. In the previous year he visited the U.S.A. as Sather prof. of Gk. at the Univ. of California. His publications include *Early Greek Philosophy* (1892), based on Zeller's *Philosophy of the Greeks*; *Greek Rudiments* (1897); *The Nichomachean Ethics of Aristotle* (1899); *Platonia Opera* (1899-1907); *Aristotle on Education* (1903); *Plato's Phædo* (1911); *Euthyphro, Apology and Crilo* (1914); *Greek Philosophy: Part I., Thales to Plato* (1914); *Higher Education and the War* (1917).

Burnet Saxifrage, see PIMPINELLA.

Burnet, Thomas (1635-1715), Eng. divine, was b. in Yorkshire, and educated at Clare College, Cambridge. He became a fellow of Christ's, and later senior proctor of the Univ. Later he became master of Charterhouse, and in this position he did his best to prevent the Catholic appointments of James II. He became clerk of the closet to William III., in succession to Tillotson, but by reason of the outcry raised by the publication of his *Archæologia Philosophica*, was forced to retire. He retired to Charterhouse, where he d. His two most famous publications were *Telluris theoria sacra* (1681), a work in which he put forward a fanciful idea of the structure of the earth, and which he afterwards trans. under the title of *The Theory of the Earth* (1684), and the book already referred to, *Archæologia Philosophica*, which he afterwards rendered into Eng. In this latter work he treated the Mosaic account of the creation as an allegory, with the result above mentioned.

Burnett, Frances Eliza Hodgson (Mrs. Stephen Townsend) (1849-1924), Anglo-Am. novelist, was b. at Chesham Hill, Manchester, daughter of Edwin Hodgson, house furnisher and decorator, who settled in Tennessee at the conclusion of the Amer. Civil war. In 1873 she married

Dr. Swan B. and toured Europe. She obtained a divorce from Dr. B. in 1898, and married again in 1900. Her first successful production was *That Lass o' Lowrie's*, which appeared first in *Scribner's Magazine* in 1877. *Ilworth's*, her next novel, was pub. in 1879. Her chief works following these two were *A Fair Barbarian* (1881); *Through one Administration* (1883); her most popular novel, *Little Lord Fauntleroy* (1886); and a host of short stories.

Burnett, George (1822-90), Scottish writer on heraldry, was called to the Bar in 1845. He early interested himself in Scottish genealogy, and wrote the greater part of an excellent *Treatise on Heraldry* (1892). His most valuable work is his *Erchequer Rolls, 1294-1307*, which he worked at from 1881 to 1890. Its twelve vols. contain much that is indispensable to the true appreciation of his country's hist. In 1866 he held the office of Lyon king of arms.

Burnett, James, see MONBODDO, LORD.

Burnett, Sir John James (1857-1938), Eng. architect, son of the Scottish architect, John B. Studied at Ecole des Beaux Arts, Paris. Entered his father's office in Glasgow and, later, founded his own firm in London. His most outstanding work is the King Edward VII. Memorial Galleries in the Brit. Museum, including the splendid N. front. Other buildings which he designed were, in Glasgow, the Royal Institute of Fine Arts and the Athenæum; in London, the Kodak building, Kingsway, and the General Accident, Fire, and Life Assurance Company's offices, Aldwych, and Adelaide House (London Bridge). His war memorials include the Cavalry Memorial, Hyde Park; the Jerusalem War Cemetery; and the Indian War Memorial in Port Tewfik, Egypt.

Burnett's Fluid, deodorant introduced by Sir Win. Burnett (1779-1881). It consists of a solution of zinc chloride which decomposes the strongly smelling ammonium sulphide, forming zinc sulphide and ammonium chloride, both of which substances are practically without odour. To burnettise wood or fabrics means to saturate the material with zinc chloride solution; this process prevents decay.

Burney, Sir Cecil (1858-1929), Brit. admiral, son of Capt. Charles B., superintendent of Greenwich School. Lieutenant of the *Carysfort* in Egyptian and Sudanese campaigns, 1882 and 1884. Rear-admiral, 1909; blockaded Montenegro and Albania, 1913. Vice-admiral, 1913. In Jutland fight on board the *Marlborough*. Second Sea Lord, 1917. Admiral, 1919. Admiral of the Fleet, Nov. 1920. Baronet, Jan. 1921.

Burney, Charles (1726-1814), Eng. doctor of music and writer, b. at Shrewsbury. Educated at the free school of that city and at Chester; for three years he was a pupil of Dr. Thomas Arne (q.v.) in London. He was an organist, a very minor musical composer, but a first-rate historian of music. Being threatened with tuberculosis, he accepted the position of organist at Lynn, Norfolk,

and here he conceived the general plan of his *History of Music*, which did not, however, begin to appear until 1776, or some six years after his travels (1770-72), to many of the prin. cities of the Continent to collect materials. Before the appearance of his *History* he pub. the results of his observations on contemporary music in three volumes—one in 1771 on the state of music in France and Italy, which was praised by Johnson, and the other on the state of music in Germany and the Low Countries (2 vols., 1773), the matter of both works being later incorporated in his *History*. The first volume of the *History* is a dissertation on the music of the ancients, and owes something to Padre Martini's similarly entitled *Storia della Musica* (Bologna, 1757-70). The great merits, however, of B.'s work have always been acknowledged, though the work did not escape some severe criticisms. Apart, however, from errors and omissions to be expected in a large scale and difficult work, the only really substantial faults are B.'s quite inadequate treatment of Handel and Bach in the fourth vol., a lack of appreciation of Bach which was shared by B.'s contemporaries. When, later, B. made the acquaintance of the '48' and other works his enthusiasm for Bach was as great as his previous indifference. Dr. Johnson was among his many admirers, whilst he owed to Edmund Burke his position as organist at Chelsea Hospital, 1783-1814. His life, written by his more famous daughter, Mme d'Arblay (see BURNLEY, FRANCES) appeared in 1832. See also P. Scholes, *The Great Doctor Burney*, 1948.

Burney, Charles (1757-1817), Eng. classical critic. His father was Charles B. (1726-1814). He was b. at Lynn in Norfolk, and was educated at Charterhouse and Caius College, Cambridge. He received at different times the honorary degrees of M.A. (Cambridge) and D.D. by the archbishop of Canterbury. He opened a school at Hammersmith in 1786 by which he became wealthy. He took orders in the latter part of his life, later becoming chaplain to the king. He d. at Deptford. His works include *Remarks on the Greek Verses of Milton* (1790); *Tentamen de Metris Æschyli* (1809). His valuable library was acquired by Parliament and deposited in the Brit. Museum as 'the Burney Library.'

Burney, Frances (Fanny) (1752-1840), novelist, was the daughter of Charles B., D. Mus. In 1761, a year after the family's removal to London, Mrs. B. d. Fanny was never 'placed in any seminary'; nevertheless, at the age of ten, she had already taught herself to read and write, and at once showed a delight in putting both the arts into constant practice. Her precocity as an authoress was probably due to the fact that, at her father's house, she was continually being introduced to the leading men of the day both in music and literature. Still, at the age of fifteen, she was induced to burn her MSS., as her step-mother considered the practice of scribbling unladylike. Her first and best novel,

Evelina, was actually pub. in 1778, but the story had been planned whilst Fanny was still in her teens. It was brought out in utmost secrecy, but the father was very proud of Fanny when she was admitted into the fellowship of the most distinguished literary people of the day. Johnson, who was her friend and admirer until death, declared that some passages in *Evelina* would do honour to Richardson. She received £20 in all for this novel. Burke, so the story goes, sat up all night to read it, and Reynolds would not touch his food until he had reached the end. For five years, 1786-91, Miss B. earned £200 a year as second mistress of the robes to Queen Charlotte.

FRANCES BURNLEY

She resigned this post when her health failed and accepted a pension of £100 a year, 'a munificence I had little expected or thought of' (*Diary*, June 4, 1791). She married a Fr. officer, M. d'Arblay (d. 1818) in 1793, and lived with him in France from 1802 to 1812. Their son was b. in 1794. Her other stories were *Cecilia* (1782), *Camilla* (1796), and *The Wanderer* (1814). Her famous *Mary and Lellers*, which extended over seventy-two years, appeared posthumously between 1842 and 1846. The property known as Camilla Lacey, in Surrey, destroyed by fire in 1919, was built out of the subscriptions (£2000) for the novel *Camilla*. It was always her ambition to write, as Sheridan suggested, for the stage, and shortly after her marriage, she wrote a tragedy, *Edwy and Elvira*, in the hope of increasing her then slender income, but the play was a failure. Much earlier in life she wrote a comedy, *The Wiltings*, but, by the advice of her father, it was not put upon the stage. Her only remaining work was a life of her father (1832), written

in an extraordinarily grandiloquent style. She d. in London on Jan. 6, 1840. She was by nature somewhat prudish and self-effacing quite unlike the *has bleus* of the day, yet authorities agree that her amazing egotism detracts from the charm of her autobiography. Some of her characteristics were family affection, loyalty to friends, a vein of snobishness and a curious insensitiveness. In the *Early Diary and Letters* and the remarkably fresh *Evelina* there is strong evidence of a great natural talent that promises a rich harvest. Yet her later novels, *Cecilia*, *Camilla*, *The Wanderer*, and even the *Memoirs* of her father, are all disappointments. She may have been intimidated by the praise and friendship of Johnson, Walpole, Burke, and Reynolds that resulted from so unattended a novel as *Evelina* or spoiled beyond recovery by five deadening years at a dull court as second Mistress of the Robes. She is too anxiously part of her life at court and too impressed by the idea of royalty, to use her experiences there as she used those of her youth. She becomes less interested and less interesting an amateur writer who never grows up. During her lifetime she was overestimated, but her work is still regarded as an invaluable link in the early hist. of fiction. See A. Douson, *Fanny Burney*, 1903; M. Macfield, *The Story of Fanny Burney*, 1927; C. Lloyd, *Fanny Burney*, 1936; Averyl Edwards, *Fanny Burney* 1948, and the *Diary* in Everyman's Library.

Burnham Beeches, wooded region of 425 ac. near Slough in Buckinghamshire, England. It is the remains of an ant. forest, and consists of a number of beeches of tremendous girth. Gray, in a letter to Walpole dated Sept. 1737, remarked on their picturesque beauty (Gosse's *Life of Gray*, 1882; Wm. Mason's *Life of Gray*, 1774). In 1879 the City of London Corporation acquired them for public use. B. itself is a township of 4000 inhab.

Burnham, Sir Edward Levy-Lawson, first Baron (1833-1916), was b. in London, eldest child of Joseph Moses Levy, printer, who d. 1888. Educated at Univ. College School, Gower Street, and, on leaving there, became dramatic critic to the *Sunday Times*, owned by his father, who in 1855 bought the newly estab. *Daily Telegraph and Courier*, dropped the last half of its title, and organised it into a paying concern. Edward Levy, with Cobden and Bright, agitated for removal of the newspaper duty, and on its abolition in 1861 the *Daily Telegraph* became extremely successful. Edward, who in 1862 had married a daughter of Benjamin Webster the actor, assumed by royal licence in 1875 the additional surname of Lawson under the will of his uncle Lionel Lawson. The direction of the *Daily Telegraph* came into his hands in 1885. On the appearance of Irish Home Rule on the Liberal programme in 1885 he and his paper adhered to the Unionist cause. He continued the paper's policy of helping exploring expeditions, was made a baronet Oct. 13, 1892, and was raised to the peerage and retired from control of the

paper in favour of his son, the first Viscount B. (q.v.).

Burnham, Frederick Russell (1861-1944), Amer. scout, b. at Tivoli in the wilds of Minnesota; son of Rev. Edwin Russell. In 1893 he first visited S. Africa, and at once entered the service of the Brit. S. African Company, which was at war with the Matabele. In the second rebellion of the same tribe, he gained distinction by killing M'limo, the Kaffir high priest, who was the instigator of the revolt. In 1899 he served in the Boer war. In 1900 he was captured at Sanna's Post, where Broadwood's convoy was surrounded, but made good his escape. At one time he destroyed the railroad between Pretoria and Johannesburg, and his last achievement in that region was the destruction of the line E. of Pretoria, his object being to prevent the Brit. prisoners from being taken away. He was made chief of the scouts of the Brit. army in the field, and received various decorations. He made surveys of the Volta R., W. Africa, 1902, and explored Congo basin, 1903-4. Made discoveries of Maya civilisation in Mexico, 1908.

Burnham, Sir Harry Lawson Webster Levy-Lawson, first Viscount and second Baron (1862-1933) (and Baronet), of Hall Barn, Beaconsfield, in the co. of Buckingham; b. in London; eldest son of Edward, first Baron, and grandson of Joseph Moses Levy, founder of the fortunes of the *Daily Telegraph* London newspaper. Educated at Eton and at Balliol College, Oxford. As a Liberal he represented W. St. Pancras in Parliament, 1885-92; he was called to the Bar at the Inner Temple, 1891; and he was on the London Co. Council, 1889-92 and 1897-1904. He was in Parliament again, as member for Mile End (Tower Hamlets), 1905-6; and again for same constituency, but as a Unionist, 1910-16. He was mayor of Stepney, 1908-9. In 1916 he succeeded to the barony, and was made a viscount, May 16, 1919. He presided at the International Labour third, fourth, and ninth Conferences at Geneva, 1921, 1922, and 1926. He was appointed a member of the Indian Statutory Commission, 1927. The 'Burnham award' as to school-teachers' salaries is the work of a standing committee of which he was chairman. The *Daily Telegraph*, of which he had the management since 1903, and the proprietorship since 1916, he sold in 1927.

Burnham-on-Sea, tn. in Somerset, England, on an estuary of the Parret with extensive sands, a lighthouse, a number of hotels, and an excellent golf course. Pop. 5600.

Burnie, post tn. and port of entry and clearance of Wellington co., Tasmania, on Emu Bay. It is 67 m. W.N.W. of Launceston, and the terminus of the railway to Mt. Bischof. Pop. 2500.

Burning, see COMBUSTION.

Burning Bush, or *Eumonymus atropurpureus*, is a species of Celastraceae found in N. lands. The seeds have a brightly coloured aril, which attracts birds, and thus plays its part in their dispersal.

Burning Glasses and Mirrors. A lens

may be used to bring the heat-rays of the sun to a focus in the same manner, though not quite at the same point, as the rays of light are focused. The heat thus brought to bear on a small area is sometimes used for fusing metals, etc. The effect may be produced by reflection through the use of concave mirrors or a concave system of plane mirrors. In the 'solar engine' the heat reflected from sev. thousand plane mirrors arranged on a huge concave frame is focused upon a small boiler and utilised in driving an engine for pumping operations, etc. Special machinery is provided to keep the apparatus facing the sun. Archimedes is said to have burnt the Rom. fleet of Marcellus before Syracuse by concentrating the heat reflected from sev. large burning mirrors upon it. See LENS, REFLECTION.

Burnley, mkt. tn., municipal co. and parl. bor. of Lancashire. It stands at the confluence of the Brun and Calder. Charles Towneley, whose collection of antique marbles and bronzes reposes in the Brit. Museum, was b. here. Besides the staple trade, cotton spinning and weaving, there are sev. large machine works, iron foundries, paper mills, and a hardware factory. Towneley Hall is now a museum and art gallery. The Paulinus Cross is said to have been erected to commemorate the preaching of St. Paulinus in this dist. about A.D. 600. Pop. 98,258. The damage suffered by B. through air raids was negligible.

Burnouf, Eugène (1801-52), son of Jean Louis B., famous Fr. orientalist, was b. in Paris on April 8. He collaborated with Christian Lassen in producing an *Essai sur le Pâli* in 1826. He undertook the great task of deciphering the Zend MSS., and through his instrumentality a knowledge of this tongue was first brought within the scientific world of Europe. He was a member of the Académie des Inscriptions and prof. of Sanskrit for twenty years. He also wrote a *Commentaire sur le Yacna. l'un des livres liturgiques des Parses* (1833-1835), and pub. (1829-43), in folio parts, a lithographed copy of the *Vendidad Sade* made from the Zend MS. of Zoroaster in the Bibliothèque Nationale.

Burnous, loose full cloak worn by Arabs, generally white, and with a hood resembling that of a Capuchin monk.

Burns and Scalds, destruction of tissue by dry heat in the former case, by moist heat in the latter; the general symptoms and treatment are the same in both cases. B. are usually classified according to the depth to which the tissues are affected. Dupuytren suggested the following classes: (1) Where the skin is reddened. A slight swelling is apparent which usually disappears quickly; there is considerable pain at first, but the condition is rapidly cured. (2) Where the outer skin is destroyed, more or less extensive blisters containing serum raising it from the true skin. A fair amount of pain is felt; the outer skin is cast off after the blister has been pierced, and a new skin forms without any scar remaining. (3) Where the true skin is partly destroyed. The pain is considerable, black or brownish sloughs

occur, and there is danger of septic poisoning. When the wound has healed, a slight scar or puckering of the skin is observable. (4) Where the true skin is wholly destroyed. The condition is serious, but is not accompanied by much pain, as the nerve-endings have been destroyed. After healing, a deep scar can be noticed. (5) Where the soft parts, muscles, etc., have been destroyed. (6) Where the bones have been charred, a very serious condition, which can usually only be met by amputation. The dangers from B. include shock, septic poisoning, inflammation of internal organs, and general exhaustion. The danger from shock depends upon the extent of the burnt area; it is estimated that cases in which over one-third of the total body-surface is seriously affected end fatally. The whole nervous system has functioned very rapidly and with great intensity, and cannot undergo repair sufficiently to keep the organism alive. The result is coma, leading to death. The danger of sepsis arises from the fact that the tissues beneath the skin have been laid open to the action of micro-organisms in the atmosphere. The extent to which the tissues have been laid bare determines the extent of the danger, the same precautions having been taken. Complications with respect to underlying or other organs may arise through the loss of the skin's functions, the disturbance of the blood supply, and the possible introduction of germs peculiarly harmful to those organs. Exhaustion of the system is a natural result of the strain occasioned by the healing process and interference with the nutritive functions, as in cases of scalds of the throat and stomach. The symptom demanding most immediate treatment is shock. Vitality should be preserved by wrapping the patient in hot blankets, placing hot-water bottles at the extremities, and administering stimulants. The condition of shock lasts from thirty-six to forty-eight hours. Local treatment of B. aims at preventing infection, relieving pain, and promoting healing with a minimum of deformity or scarring. If the burn be slight, the blisters may be pierced, their contents drained off, the outer skin cut off and the surface treated with a weak solution of picric acid. In dealing with severe B., care must be taken not to tear affected tissues by rough handling of clothing. The clothes should be carefully cut off, the whole surface should be treated with an antiseptic, and then the more permanent dressing adjusted. This usually consists of gauze soaked in picric acid solution and covered by antiseptic wool, the whole being lightly bandaged, as it is desirable to exclude all air, but without undue pressure upon the injured part. Two affected surfaces must not be placed in contact, as the result might be a union of the two surfaces. In cases where the destruction of the true skin has been extensive, skin-grafting has been adopted with satisfactory results. An aqueous solution of tannic acid (10 per cent) has recently been introduced for the treatment of B. with the object of forming a

protective surface; moreover, by promoting coagulation it helps to prevent the absorption of toxic materials produced by burnt tissues. It may, however, conceal the onset of sepsis; it is also liable to cause contraction and loss of function. Gentian violet (1 per cent aqueous solution) has also been used with success. Irrigation of the affected part with warm saline in the Bunyan-Stannard envelope is another method giving good results. The toxins cause damage to the cortex of the suprarenal bodies, which can be counteracted by injections of cortical extract, or preferably of synthetic corticosterone; the liver lobules are also affected adversely, calling for administration of glucose. Some surgeons give blood transfusions to counteract toxæmia. Sulphonamides and penicillin are useful in cases of severe infection.

Burns, Jabez (1805-76), nonconformist divine, educated at Chester and Oldham Grammar School. While a boy he joined Methodist New Connexion; 1826 came to London; compiled *Christian's Sketch-Book*, 1828 (second series issued 1835); *Spiritual Cabinet* (1829). B. did much mission work on behalf of Scottish Baptists, becoming pastor of a Perth congregation, 1830-35, 1835, pastor to Baptist congregation at Marylebone. He was said to have been the first clergyman to preach teetotalism from the pulpit. He delivered thirty-five ann. temperance sermons, beginning Dec. 1839. Member of the Evangelical Alliance, formed 1845; after 1847 travelled in America, Egypt, and Palestine. Among his works are *Notes of a Tour in U.S.A. and Canada in 1847* (1848); *Helpbook for Travellers to the East* (1870); *The Golden Pot of Manna, or Christian's Portion* (1848); *Preacher's Magazine and Pastor's Monthly Journal* (1839-44); *Sermons* (1842).

Burns, John (1858-1943), Eng. politician, was b. at Vauxhall, London, second son of Alexander B., an engineer of Scottish extraction. He received education to the age of ten at a national school; then he was sent to work, but continued study at night schools. He worked at first in Price's candle works; he was for a short time a page, and finally was apprenticed to an engineer, and whilst in his apprenticeship he adopted socialism. He worked at his trade on land and on board ship, and went for a year to W. Africa. He had in the meantime become known as a labour agitator. In 1886 he cleared himself of the charge of instigating the mob to violence on the occasion when the clubs of the W. End had their windows broken. In the following year, however, he suffered six weeks' imprisonment for his share in the Trafalgar Square riots. In 1885 he had been unsuccessful as the candidate of the Social Democratic Federation at W. Nottingham. He was a member of the Amalgamated Society of Engineers. He sat on London's first co. council as a Progressive member for Battersea, and in 1892, as the candidate put forward by a local 'Labour League,' he became member of Parliament for the same constituency. He was active in securing good conditions

of employment both in the L.C.C. service itself and in the undertakings of its contractors. The 'fair wages clause,' which became general in local gov., was his drafting. In 1889 he had, together with Mr. Ben Tillett, been the chief organizer of the London dock strike. He retained his seat for Battersea in 1895; and again in 1900. He continued to sit for Battersea until 1918. He was made president of the Local Gov. Board in Sir Henry Campbell-Bannerman's administration, 1906, being the first working man to attain to Cabinet rank, and became a Privy Councillor. By that time he had very largely lost popularity with the Socialist rank and file—partly on account of his having taken office with the Liberals, partly on account of the Puritan bluntness with which he rebuked the failings of his own class. He took an active share in social legislation during his period of office, introducing the House and Town Planning Bill in 1909. On the declaration of war, Aug. 1914, he was one of the three ministers who immediately resigned. He remained in that very long Parliament, till its close, a silent member. He would never join the rising Labour party, and retired into private life towards the end of the First World War, rather than stand for the general election of Dec. 1918. Though physically and mentally full of vigour he accepted retirement on a competence provided by Andrew Carnegie and lived to all appearance content among the books which filled his home. He passed completely out of public life, but by no means out of recollection. He was striking in appearance, with deep-set gleaming eyes under heavy brows, dark hair and trim beard, which turned with age to snowy white; an alert vigorous manner and a constitution inured to the hardest weather. A vigorous rather than a polished orator, he had command of apt citation and of epigram, if at times bordering on magniloquence.

Burns, Sir John, see INVERCLYDE, BARON.

Burns, Robert (1759-96), greatest lyric poet Scotland has ever produced, was b. Jan. 25, near Ayr. He was the son of a gardener, who later in life turned farmer, and in spite of a hard struggle with poverty, succeeded in equipping his children with a good education. Although Robert had perforce to assist his father in his humble vocation, he still found plenty of time to assimilate so much instruction and reading that by the age of sixteen years he had acquired the elements of what was then regarded as an 'elegant' education. This included the elements of astronomy, belles-lettres, and, of course, poetry, at that time in a transition state between the heavy fancies of the Popean school and the tinkling prettiness of the Della Crusceans. Neither of these schools was likely to assist a young singer whose native talent leant strongly towards the natural, and although we discover marked traces of the influence of both in his later work we must regard B. as among the first to free Eng. verse from the

shackles of formalism which had bound it so long. At the age of sixteen B. was already a minor celebrity in his dist., and his convivial and generous disposition speedily brought him into contact with the bolder spirits of the neighbourhood, who regarded him as a species of local laureate. In 1781 he entered with his brother upon the tenancy of a small farm, a venture which proved most unfortunate, so much so that embittered by his lack of success he resolved to leave his native land and take ship to Jamaica. With the object of purchasing his passage thence he pub. his poems at Kilmarnock in 1786. The result was a furore of appreciation which dazzled and somewhat unbalanced the young farmer. He was encouraged to proceed to Edinburgh and to publish a second ed. there. This he did, and met with a splendid reception from the *élite* of literary circles in the capital. At many of the houses of the great he was wont to recite his poems to a rapt audience, and his genius was fully recognised. But when a man is born with an utterance like swift fire he is not as a rule particularly zealous regarding the proprieties, and B.'s habits speedily marked him out as 'impossible' in the circles which he had once illuminated. A vigorous habit of speech and criticism of persons whom their equals had agreed to treat with respect by reason of qualities too subtle or too difficult of discernment by the Ayrshire farmer led him into disrepute, and the all too frequent occasions on which he transgressed against decency were too much even for an age of hard drinking, and social taboo was passed upon him with every show of reason. On the one hand B. was ignorant of the true reading of the term *noblesse oblige*. On the other his mighty soul soared high above the society folk with whom he was brought into contact, and whom, for the most part, he regarded with good-humoured contempt. Meanwhile the profits of his vol. of poems pub. in the cap. had brought in a very considerable sum, with which he was enabled to take the farm of Kilsland near Dumfries, where he settled in 1788, with his wife Jean Armour, the 'Bonnie Jean' of one of his most beautiful lyrics. Private interest had also brought him the position of an exciseman, or 'gauger' as they were then known in Scotland; but for a second time he found farming a failure, and retired to Dumfries, where he subsisted on his exciseman's salary, which never rose above £70 per annum. At this period of his life he enthusiastically embraced the principles of the Fr. Revolution, and many of his poems and songs exhibit his hatred of the 'lordlings' who at that period held the peasantry of Scotland in a condition approaching helotage. At the same time it must be recollected that he had not disdained patronage on sev. occasions, but had certainly accepted it in a spirit of generous faith. His dissipated habits rendered him obnoxious to the 'respectable,' and as these grew upon him he began to consort with people who, however interesting on occasion or during the hilarity of a drinking bout, were no

companions for a man of his exalted and generous spirit. Deeper he sank into the pit which his own natural, joyous, and trusting disposition had dug for him. Remorse gnawed at his heart and he became gloomy and sullen, with only occasional flashes of his old magnificence; and at the last his sun set in gloom and sadness, for with health and fortune completely broken, he sank to rest at Dumfries on July 21, 1796. Like Byron, B. was one of those poets who are as great as their songs. It was not his to create a social cult which might cluster around his personality, having for its basis the imitation of the mannerisms and idiosyncrasies

ROBERT BURNS

of its idol. His cult was greater. It was and is the cult of the expression of nationality, of all that is virile and spirited in that elder Scotland which sank in a blaze of glory to the sound of his songs. To his countrymen he has left the deathless heritage of a song-craft unequalled in the lyric hist. of mankind. His lyre has run the gamut of the emotions, from the whisper of love to the fire-filled chant of war and liberty. In the utterance of no poet have passion and simplicity been so truly welded. The simple, almost rustic, lines are fulfilled and suffused with a lofty genius which compels the tears of both simple and learned. So intimate is the combination of artlessness and genius in the songs of B. that in no poet is it so difficult to trace the true quality of that genius. In none is it so elusive. It is enwoven in the very fibre of the verse. The felicity of B.'s language is due not so much to his perfect mastery of his medium as to his brilliant poetic

penetration and his swift habit of intuition. But withal he exhibits no impatience with poetic rule, and nicely if naturally observes the proprieties of rhythm, diction, and metre. He divides the lyric crown with Shelley, with whom he is equal in ardour, intensity, and originality. If inferior in imaginative power and mental scope. B.'s system of composition consisted in selecting Scottish folk-songs, which he made the basis of new and more poetical versions. But besides this he composed scores of original verses. His purely lyrical work is too well known to require mention here. But his narrative and satirical work is by no means so widely read. Perhaps his greatest work, apart from his songs, is his *Tam o' Shanter*, which is almost epic in parts, exhibiting a felicity of phrase and an epigrammatic ability which are far above the subject handled. His *Twa Dogs* bristles with keen satire against the social and religio-political follies of the time. His *Cottar's Saturday Night* is truly national in spirit, and strikes the note of all that is exalted and noble in the Scottish character. It only remains to notice B. as a letter-writer. In an age when the epistolary art was at the height of its prolixity and formality, and when explicitness, clarity, and real beauty of phrase were sacrificed to pomposity, B. partook copiously of the faults of his time; indeed they appear in him almost exaggerated. But he did not, like so many of his contemporaries, sacrifice feeling to bombast, and his tenderness was too much the result of genuine human affection to degenerate into sentimentalism. These qualities of humanity and tenderness appear throughout his works to dominate even the waywardness which was perhaps his prin. characteristic. He was a great poet, a great lover of humanity, and a great natural man; and 'his faults were the faults of his qualities.'

Bibliography (only a small number of the numerous works on B. can be mentioned).—Works: R. Chambers (ed.), *Life and Works of Robert Burns*, 1851-52; W. S. Douglas (ed.), *The Works of Robert Burns*, 1877-79; A. Lang (ed.), *Poems and Songs*, 1896; W. E. Henley and T. F. Henderson (editors), *The Poetry of Robert Burns* (the *Centenary Burns*), 4 vols., 1896-1897; C. S. Douglas, *Robert Burns: The Poems, Epistles, Songs, Epigrams, and Epitaphs*, 1927; J. De L. Ferguson, *The Letters of Robert Burns edited from the Original Manuscripts*, 1931. LIVES: W. E. Henley (essay in *Burns, Life, Genius, Achievement*, vol. iv. of the above-mentioned ed. of B.'s poetry by Henley and Henderson), 1896-97; T. F. Henderson, 1904; L. M. Watt, 1913; Catherine Carswell, 1930; F. B. Snyder, 1932; J. Lindsay, *The Ranting Dog: the Life of Burns*, 1938.

Burnside, suburb of Adelaide, S. Australia; pop. about 1500.

Burnside, Ambrose Everett (1824-81), Amer. soldier, a native of Liberty, Indiana. He became a member of the Military Academy but resigned his commission in 1853 and adopted the manuf. of firearms. Three years later he invented

a breech-loading rifle. He took a prominent part in the first battle of Bull Run, and was appointed brigadier-general of volunteers in 1861. He sailed in the following year for the N. Carolina coast, and in the ensuing campaign won the victories of Roanoke, Newbern, and Fort Macon. Shortly afterwards he was made major-general, U.S.V. President Lincoln appointed him to succeed Maclellan to the army of the Potomac. He was thoroughly defeated at Fredericksburg in 1862, and aroused much criticism by his suppression of press opinion. The failure of the 'Burnside mine' at Petersburg (q.v.) caused his resignation in 1864. In 1866 he became governor of Rhode Is. He was a Republican member of the Congress till his death. He d. at Bristol, Rhode Is.

Burnside, Helen Marion (1844-1923), Eng. artist and poet, exhibited at the Royal Academy in 1863. From 1880 to 1889 she was designer at the Royal School of Art Needlework. For the next five years she was editor to Messrs. Raphael Tuck. She also wrote many songs and magazine stories, but she is known more especially as the writer of children's books.

Burnt-Ear, or *Uredo carbo*, a species of fungus of the order Uredineæ which is particularly destructive to corn. The seed-coat of the grain attacked is covered with a black dust, while the interior seems to be untouched, but is found to be abortive.

Burntisland, seaport on the firth of Forth, Scotland. Coal is shipped in considerable quantities. It has a ship-building industry and railway workshops. Rossum Castle is here, built 1119. The influence of the close intercourse which once existed between B. and Holland is expressed in the par. church, which resembles the North Church, Amsterdam. It was here that James I. pressed his proposals for a new translation of the Scriptures into Eng. Pop. par. 6500; burgh 3800.

Burnt Sienna, reddish-brown pigment. It takes its name from Siena in Italy, where an earth is found containing oxides of iron and manganese. The substance is brownish-yellow in colour, which deepens to a reddish-brown when the earth is burnt.

Burnt Stones, old cornelians possessing a glowing red colour when held to the light. They are found in ruins and have a dull appearance externally. They appear to have been acted upon by fire.

Burr, Aaron (1756-1836), Amer. legislator and native of New Jersey. At Princetown College, where his father and grandfather had occupied the presidency, he graduated. He joined the patriot army in 1775, and two years later was rewarded for his valour and abilities by promotion to lieutenant-colonel. He retired in 1779, and was called to the Bar, where he quickly assumed a prominent position. From 1788 to 1790 he was attorney-general; senator (1791-97); and vice-president (1801-5). He fought a duel with Alexander Hamilton, who was responsible for his defeat in obtaining the governorship of New York, and killed him.

Flight to S. Carolina was necessary till the excitement lessened, when he returned. An attempt to raise revolution in Texas in order to establish a republic there resulted in his arrest. He was acquitted, but was socially ostracised. A return to his practice failed hopelessly, and he *d.* miserably on Staten Is. During his last years he was maintained by a friend.

Burr, William Hubert (1851-1934), Amer. engineer, was *b.* at Watertown, Connecticut. He became prof. of engineering at Harvard Univ. in 1892, and at Columbia Univ. in 1893. In 1899 he was appointed a member of the Isthmian Canal Commission to report upon a route for the Panama Canal; in 1904 he was appointed a member of the commission to construct the canal; and in 1905 he was appointed a member of the international board of consulting engineers to determine the plan of the canal. In 1919 he was appointed a member of the board of consulting engineers for constructing a vehicular tunnel under the Hudson R. at New York city. Publications: *The Stresses in Bridge and Roof Trusses* (1881); *Elasticity and Resistance of the Materials of Engineering* (1883); *Ancient and Modern Engineering and the Isthmian Canal* (1902); *Suspension Bridges, Arch Ities, and Cantilevers* (1913).

Burra, see KOORINGA.

Burra-Burra, celebrated copper mine in S. Australia. It is situated N. by E. of Adelaide, and is 101 m. distant. Ore to the value of £4,000,000 has been mined, though operations are no longer so remunerative.

Burrard Inlet, narrow inlet of Brit. Columbia, situated at the S.W. extremity. It forms a magnificent harbour, and is the inlet on which stands Vancouver, the W. terminus of the Canadian Pacific Railway.

Bur-reed is the name applied in England to the species of *Sparganium*, a genus of plants of the order Typhaceae (Typhads or Bulrushes), common to Europe and Australia. Four species occur in Britain: the Branched (*S. ramosum*), Unbranched Upright (*S. simplex*), the Floating (*S. natans*), and Small B. (*S. minimum*). They occur in ditches and shallow ponds of Britain.

Burriana, Sp. tn. and seaport situated on the E. coast, in the prov. of Castellón de la Plana. Its pop. is 16,000. Oranges are the chief export, while there is some trade in oil, grain, and wine.

Burrillville, city of Rhode Is., U.S.A. Pop. 8000.

Burritt, Elihu (1810-79), Amer. philanthropist, commonly called 'the learned blacksmith.' He was a native of New Britain, Connecticut. His grandfather and father had served in the revolutionary army. His education was self-obtained from whatever books were available at home. He became apprenticed to a smith at the age of sixteen, and adopted smith work as his trade. He was able to indulge a passion for literature in any form in his spare moments at the forge, while for a short time he attended a school kept by his brother Elijah. In this desultory

fashion he conquered Lat., Gk., Fr., Sp., and Ger., and by the time he was thirty years of age could read nearly fifty languages. He gradually acquired fame with his increasing store of knowledge, and soon embarked upon a lecture tour to various places in U.S.A. and Europe on behalf of peace. He organised the Friends of Peace at Brussels, Paris, Frankfurt, London, Manchester, and Edinburgh, and pub. innumerable pamphlets. He founded the *Christian Citizen* at Worcester to advance his views. He returned to America and *d.* at New Britain.

Burroughs, John (1837-1921), Amer. essayist and authority on natural hist. He was *b.* at Roxbury, Delaware co., New York. Among his early callings were teaching, journalism, and farming. In the treasury dept. of Washington he served as a clerk for nine years. His early productions included *Wake-Robin* (1871), *Birds and Poets* (1877), *Locusts and Wild Honey* (1894), and *Ways of Nature* (1905), in prose; while in verse he pub. a vol. called *Bird and Bough* (1905). Other works: *Whitman: a Study* (1902); *The Summit of the Years* (1913); *The Breath of Life* (1915); *Under the Apple Trees* (1916); *Field and Study* (1919); *Birds and Bees* (posthumous) (1926). See Clara Barrus, *Life and Letters of John Burroughs*, 1925; C. H. Osborne, *The Religion of John Burroughs*, 1930.

Burrowe, Stephen, see BOROUGH, STEPHEN.

Burrowing Owl, or *Speotyto cunicularia*, is a native of America. It is about 9 in. long, has no ear-tufts, and its legs are long and poorly feathered. It inhabits burrows and holes of caves, lizards, foxes, squirrels, and other animals, and there it makes its nest.

Burrows, Montagu (1819-1905), Eng. historian, was *b.* at Hadley, Middlesex. He entered the navy, and rose to the rank of commander, 1852. He then went up to Oxford, taking a double first, and from 1862 till 1900 was Chichele prof. of modern hist. He became a fellow of All Souls in 1870, and pub. *Worthies of All Souls* in 1874. His other works include *Memoir of Admiral Sir H. Chads, G.C.B.* (1869); *Parliament and the Church of England* (1875); *Oxford during the Commonwealth* (1881); *Wicliff's Place in History* (1882); *Life of Admiral Hawke* (1883); *History of the Cinque Ports* (1888); *Commentaries on the History of England* (1893); *History of the Foreign Policy of Great Britain* (1895).

Burrows, Ronald Montagu (1867-1920), Eng. archeologist, was *b.* at Rugby, where his father, the Rev. Leonard Francis B., was a master; but he was educated at the Charterhouse and at Christ Church, Oxford. While assistant to Prof. Gilbert Murray in the Gk. dept. of Glasgow Univ. 1891-97, he excavated at Pylos at the S.W. extremity of the mainland of Greece, and in the adjoining is. of Spakteria, 1895-96; and the results, described in *Hellenic Studies*, cleared the credit of Thucydides as a historian. In 1905 and 1907, while he was prof. of Gk. at Univ. College, Cardiff (1898-1908), he excavated at Rhihtóna in Boeotia, with the object of

ascertaining the site of Mykalessos—in the latter year in conjunction with P. N. Ure. In 1907 he pub. *The Discoveries in Crete and their Bearing on Ancient Civilisation*. In 1908 he became prof. of Gk. at Manchester Univ. He was appointed principal of King's College, London, in 1913; and in the war years was a friend of Venizelos. He was well versed in the affairs of the Slavonic world.

Burrstone, see BURRSTONE.

Burrus, Sextus Afranius, native of Gaul who became a Rom. soldier of distinction. He was the trusted agent first of Livia and then of Tiberius and Claudius. He had a share in the education of Nero, and aided Agrippina in bringing him to the throne in preference to Britannicus. When the partisans of Britannicus were punished B. succeeded to the important command of the praetorian guard. He was put to death by Nero in A.D. 63.

Burry Port, urb. dist., Carmarthenshire, Wales, 4 m. W. of Llanelly. Pop. 6000.

Bursa, synovial sac or closed space containing liquid between two moving surfaces of the body. Its function is to lessen the effects of friction, and bursae may either be permanently situated for that end, or developed in a part where friction has caused a certain amount of irritation of the tissues. Bursae may be classified as (1) bursae between the covering skin and bony projections, as at the point of the elbow and at the knee-cap; (2) bursae between tendons and the surfaces they cross; (3) bursae between tendons and the walls of osteofascial tunnels.

Bursar, term used at Oxford and Cambridge Colleges for the official who keeps the college accounts. It is also used in the same sense in public schools, and in 1932 an association of these officials was founded. His office is called the bursary. This latter word is used in Scotland to denote a grant of money to be made to a student, the equivalent of a scholarship or exhibition in England.

Bursaria is a genus of ciliate Protozoa of large size, in which the body appears to be convex above and concave below. Lamarck described five species of these fresh-water creatures, of which *B. truncatella* was one.

Burscheid, tn. of the Rhineland, Germany. It is situated on the R. Wupper, and manufs. woollen goods and plush. Its pop. is 7000.

Burschenschaft, name of an association of students of the univs. of Germany, founded in Jena in 1830. It owed its inspiration to the national sentiment aroused in Germany by the war of Liberation and its object was to encourage and engender patriotism and a Christian bearing. Its chief patron was the grand-duke of Saxo-Weimar. It took a prominent part in the revolutions of 1830 despite the provisions of the Carlsbad decrees which, however, in 1833 secured its suppression. It was resuscitated in 1848 but gradually lost its political character. The B. is now extinct. See G. Heer, *Geschichte der Burschenschaft*, 1927-29.

Bursaceae is a natural order of di-

cotyledonous plants which are found in the tropics, and yield balsam, resin, and gum. The flowers are small and regular, with the disk usually annular, in parts of four or five, with a syncarpous gynoecium consisting of three to five carpels, with two ovules in each loculus. The fruit is a drupe or a capsule, and the bast contains resin passages. Two well-known species are *Boswellia serrata*, which yields olibanum, and *Commiphora abyssinica*, which yields myrrh.

Bursi, see BARSİ.

Bursitis, inflammation of a bursa. It may be acute, when pus forms after an injury or strain, as in the knee-cap. The joint should be cleansed and absolutely rested for some time. It may also be chronic, when a large amount of watery fluid collects at a joint, with possible formation of concretions within the bursa or thickening of its walls. This is usually due to pressure constantly applied to a joint as in 'housemaid's knee.' The joint should be rested and the bursa drained. The period of resting should be prolonged as much as possible, as there is always a likelihood of the condition being estab. again if the joint is subjected to the same usage as formerly. Surgical measures for removal of the thickening may be indicated.

Burslem, formerly bor. and nrkt. tn. of Stafford, England, is now included in the co. bor. of Stoke-on-Trent, of which it forms five wards. In the seventeenth century it was the prin. place in England for the manuf. of earthenware, and is still called the 'mother of the potteries.' Josiah Wedgwood was b. here in 1730, and the Wedgwood Memorial Hall was opened by the marquess of Ripon in 1869. The B. and Tunstall War Memorial Hospital commemorates the victims of the First World War.

Bürstadt, tn. in Hesse, Germany. Pop. 8000.

Burton, Sir Frederick William (1816-1900). Irish painter, b. in co. Clare. Educated at Dublin under the direction of Mr. Brocas. Elected associate of Royal Hibernian Academy when only twenty-one years of age. In 1842 he began to exhibit at the Royal Academy. He travelled much on the continent of Europe, where he gained an intimate knowledge of the works of the old masters. In 1874 he was appointed director of the Brit. National Gallery. Elected associate of the Royal Society of Painters in Water Colours in 1855.

Burton, John Hill (1809-81), Scottish historian, b. at Aberdeen. He graduated at Aberdeen Univ., and was articled to a writer, but his articles were cancelled, and he went to Edinburgh to qualify for the Bar. His practice was not large, and he had to devote himself to literature. During this time he wrote for the *Edinburgh Almanac*, *Westminster Review*, and contributed to the *Cyclopaedia of Universal Biography* and Waterton's *Cyclopaedia of Commerce*. In 1846 he achieved great distinctness with his biography of David Hume. In 1847 B. produced his interesting biographies of Simon Lord Lovat and

Duncan Forbes. In 1854 he was appointed secretary to the prison board of Scotland, and became a prison commissioner. He held office as historiographer royal for Scotland. His chief works are *Manual of Political and Social Economy* (1849); *Communism* (1854); *The Book Hunter* (1862); *The Scot Abroad* (1864); *The Cairngorm Mountains* (1864); and, above all, *The History of Scotland from Agricola's Invasion to 1688* (1867-70 and 1873).

Burton, Sir Richard Francis (1821-90), Brit. explorer, b. at Barham House, Hertfordshire. He spent most of his childhood in Italy and France. He was educated at Trinity College, Oxford, and entered the Indian Army in 1842. During his stay in

SIR RICHARD BURTON

India he studied assiduously the various oriental languages, and rapidly reached proficiency. He was appointed assistant in the Sind survey, which enabled him to mix with the people. He frequently passed as a native in the bazaars, and thus gained an excellent knowledge of E. life and customs. On his return home he pub. an important work on Sind, together with three other books. In 1853 he made a pilgrimage to Mecca, which was to make him famous. He went disguised as an Indian Pathan. The book he wrote, called *The Pilgrimage to El-Medinah and Mecca* (1855-56), contains a most interesting account of his journey and exploits. His next journey was into the Somali country in E. Africa. He went to Harar, the Somali cap., which had hitherto never been entered by a white man, and stayed there four days. Afterwards he vanished into the desert, and nothing was heard of him for four months. He next served on Gen. Beaumont's staff in the Crimea. In 1856 he went with Speke to Africa, and explored the lake regions of equatorial Africa. They discovered Lake Tanganyika in 1858, and Speke, during B.'s

illness, discovered Victoria Nyanza. In 1861 B. was made consul of Fernando Po, whence he was shifted successively to Santos in Brazil, Damascus, and Trieste, which post he held till his death. B. married Isabel Arundell in 1861, and she accompanied him henceforth on all his journeys. He received the gold medal of both Fr. and Eng. geographical societies. He was master of thirty-five languages and dialects. He was knighted in 1888. He wrote numerous books, chief of which are *First Footstep in East Africa: Harar*, (1856); *Abeokuta and the Cameroonian Mountains* (1863); *Wanderings in West Africa* (1863); *Explorations of the Highlands of Brazil* (1869); *Gold Mines of Midian and the Ruined Midianite Cities* (1878). His chief work is his translation with copious notes of the *Arabian Nights* (1885-88). He also trans. *The Lusads of Camoens* (1881). His wife built an Arab tent of stone and marble to his memory at Mortlake. See lives by Lady Burton, 1894; T. Wright, 1906; W. P. Dodge, 1907.

Burton, Robert (1577-1640), Eng. humanist and writer, famous for *The Anatomy of Melancholy*. He was b. at Lindley Hall in Leicestershire on Feb. 8, the fourth of a family of nine. He received his education at the free school at Sutton Coldfield and at Nuneaton Grammar School, and in 1593 entered Brasenose College. In 1599 he became an elected student at Christ Church, where he spent the remainder of his life. In 1616 he became vicar of St. Thomas's and in 1630 rector of Seagrave in Leicestershire (through the patronage of George, Lord Berkeley). He held both livings until his death. Some years previous to his death he predicted its occurrence in his sixty-second year by a calculation of his nativity. In appearance he was a thick-set, plumpish man, with dark brown beard of formal cut, a satiric glint in his large eyes, and a monumental forehead revealing intelligence and memory. In 1606 he wrote a Lat. comedy called *Philosophaster*, and rewrote it in 1615. It was acted by students in 1617; it was then for some considerable time lost, but was rediscovered in 1862. His book, *The Anatomy of Melancholy*, appeared in 1621, and the author signed himself Democritus Junior. In his very extensive preface he refers to the influence of Democritus and Hippocrates upon his proposed work, and also gives his reasons for writing it. In the book itself he first defines melancholy, and divides it up into its various kinds. He proceeds then to examine the causes of melancholy, and then goes on to give the methods by which it may be cured. The concluding section of the work deals with religious melancholy. B. had no intention of compiling a doleful work. He was a good-humoured pessimist. He is indeed somewhat of a paradox and not quite consistent. 'It is the most sententious book ever written, yet it reads trippingly as a novel. It is packed with common sense and uncommon nonsense. He mixes facetia with theology, is most frivolous when most earnest, and, when colloquial, is most

profound. He was first and last a bookman and his treatise is the legitimate offspring of a bookish mind, and although it is largely a distillation of authors it is an original work' (Holbrook Jackson). Sir Wm. Osler described the *Anatomy* as 'the greatest medical treatise written by a layman,' but apart from the main theme there are sections which, although organically related to it, are complete essays in themselves. To sum up, 'Burton is revealed as a sound political economist, a little-Englander, a protectionist, an opponent of monopolies, an enemy of war, an advocate of better highways, the extension of inland waterways, the reclamation of marshlands, the building of garden villages, and the granting of old age pensions' (Holbrook Jackson). The curious learning found in *Tristram Shandy* had been pilfered from this book, and it was Ferrier's ed. of *Tristram Shandy*, in which he pointed out Sterne's unacknowledged obligation to Burton, which drew attention once more to this almost forgotten book. There were revised eds. of the *Anatomy* in 1624, 1628, 1632, 1638, and 1651. It was reprinted in 1660 and 1676, and a 2-vol. ed. was pub. in 1800. Further eds. are those of A. R. Shilleto (1893, 1925), F. Dell and P. Jordan-Smith (1927, 1930), and H. Jackson (Everyman's Library, 1932). An Eng. trans. of *Philosophaster*, including B.'s minor writings in prose and verse, was pub. by P. Jordan-Smith in 1931.

Burton-in-Kendal, tn. and par. in the dist. of Kendal, adjoining Furness, and belonging to Lancashire. R. is 10 m. S. of the tn. of Kendal, and is situated on a limestone ridge with large pockets of iron ore in its vicinity. Pop. 500.

Burton upon Trent, co. bor. in E. Staffordshire, England, situated on the R. Trent and Trent-Mersey canal, W.S.W. of Derby. Area 4222 ac. It is a tn. rich in historical associations and was formerly the seat of a Saxon abbey. In 1801 the pop. was not much over 6000. Its rapid growth dates from the opening of the Midland railway in 1839. There are fifty-four important trades flourishing in Burton to-day, the largest of which, the brewing of ale, commenced in 1708. There are sev. breweries in the tn., those of Bass and Worthington covering an area of some 750 ac. The tn. hall, presented to the tn. by Lord Burton, was built in 1894, a modern extension being added in 1938. The corporation owns baths, gasworks, electricity works, omnibuses, markets, libraries, over 1000 houses, a cemetery, and a sewage farm. B. is a quarter-sessions bor., and for parl. purposes is in the B. div. of Stafford.

During the Second World War B. was subjected to four enemy raids, a total of twenty bombs being dropped, which caused eighteen casualties and completely destroyed eight houses. Pop. 46,900.

Buru Island, is. of the Dutch E. Indies, belonging to the residency of Ambon. Area 3400 sq. m. The surface is mountainous and the seaboard is marshy. The longest riv. is Kajeli. The highest mts.

are in the W., where they reach the height of 8530 ft. Most of the land surface is covered with forests and prairies. The only important exports are cajuput oil and timber. The inhab. are chiefly Malays on the coast, and Chinese and other races in the interior. Pop. about 15,000.

Burujird, important trading centre in Persia, in the prov. of Irak Ajemi. 70 m. S.E. of Hamadan, in fertile Silakhor plain with textile industries and carpet weaving. Pop. 35,000.

Burwood, municipality of New S. Wales, Australia, 7 m. W. of Sydney, on Great S. railway; pop. 16,000.

Bury, co. and parl. bor., is situated 9 m. N. of Manchester in the co. of Lancashire, England. It is 195 m. N.W. of London. Area 7434 ac. pop. 52,500. The tn. is situated on an eminence between the R. Irwell and Roch, and has a mean elevation of about 300 ft. above sea level. The coat of arms depicts four industries, cotton, woollen, engineering, and paper making. In addition, there is a large variety of industry in the tn., including bleaching, calico-printing, dyeing, iron and brass founding, felt manufacturing, hatting, boot and shoe making, and manufacturing of clothing. There are four large and sev. small recreation grounds. It has a new tn. hall. There are two direct grant grammar schools, a secondary grammar school, junior technical school, technical college, and school of arts and crafts. The depot of the Lancashire Fusiliers is in B. Two natives of B., Sir Robert Peel, three times Prime Minister of England, and John Kay, the inventor of the fly-shuttle, are honoured by statues.

Bury, John Bagnell (1861-1927), historian, was b. in co. Monaghan; a son of the Rev. E. J. B., afterwards canon of Clogher. He was educated at Trinity College, Dublin; became prof. of modern hist. at Dublin in 1893, regius prof. of Gk. in 1898, and regius prof. of modern hist. at Cambridge in 1902. His works included a highly esteemed ed. of Gibbon's *Decline and Fall* (1896-1900); eds. of Pindar's *Neemean and Isthmian Odes* (1890 and 1892); and sev. works dealing with the later Rom. empire—the last bringing the hist. down to the death of Justinian. He collaborated in the fourth vol. of *Cambridge Ancient History* which came out in 1926. He d. at Rome.

Bury, Richard de, see AUNGERVILLE, RICHARD.

Buryat Mongolia, autonomous Soviet Socialist republic of R.S.F.S.R., situated S. of the Yakutsk republic, in E. Siberia. It occupies a stretch of country along the frontier between the Soviet Union and the Mongolian People's Republic to the W. of the S. end of Lake Baikal and extends northward between the E. shores of the lake and the Yablonoi Mts., and also along the W. shores (excepting the area round Yakutsk). The coniferous forests which are so universal a feature of E. Siberia are in B. M. confined to the N. part of that country. In the S. they are interrupted by plateau and steppe vegetation, the home previously of Buryats

and Mongols who were almost exclusively nomadic stock-breeders and fishers. Under the Soviet regime a more settled life has replaced the nomadic. Large numbers of the people have joined the *kolkhozy* or collective farms and now dwell in vil. settlements of wooden houses. Even the nomadic herdsmen are organised in 'collective' farms, each of which has great numbers of cows, sheep, horses, and goats. Some of the Buryats and Mongols are fox and squirrel trappers. A state farm has been estab. for sable breeding. Lumbering is also carried on in the forests.

The Buryats early came under the influence of Mongol culture and language and, together with the Mongols, offered a strong resistance to the Russian penetration of their lands in the seventeenth and eighteenth centuries; but the Buryats were gradually forced out of their tribal pasture lands by peasant colonists from Russia. Between the close of the nineteenth century and 1917 the Buryats had lost nearly 5000 sq. m. of land and the pop. declined rapidly. In E. B. M. there was a great influx of lamas from Mongolia, who possessed themselves of large areas of good land. At this time the people of H. M. were entirely illiterate, disease-ridden, and superstitious. But in 1921 two Buryat autonomous regions were formed, and in 1923 these were joined together, and with the Baikal dist. formed into one autonomous republic, with its cap. at Verkhne-Udinsk (now called Ulan Ude). The pop. were, however, very backward, but were much helped in the arts of self-gov. by their Russian neighbours. By 1928 most of the people still remained nomad or semi-nomad. But an improvement began with the development of agriculture and the fisheries, literacy increased and the pop. grew. During the Five Year Plans from 1928 onward the economy of B. M. developed still more rapidly, and by 1937 most rural households were included within collective farms. Industry too expanded, and the nomadic Buryats began to enter the factories. In the second Five Year Plan the Verkhne-Udinsk railway and locomotive works were estab., with a large electric power station. A new modern tn. was built above the Selenga R., with public utility services, hospitals, and schools. There are now in B. M. nearly 500 schools, with about 90,000 pupils and a score of technical colleges and higher educational institutions. Near Lake Baikal there are sawmills, fish-canning factories, and tin mines. Coal, gold, and manganese are also mined. Tungsten and molybdenum mines and refineries are in operation at Djildinsk (W. of Kyatka). Lying between the Kuznetsk industrial region to the W., the new industrial centres of the Far E. and the gold-mining region of the middle Lena to the N., B. M. is an important food-producing region for the urb. pop. of these areas, as well as being a source for the supply of leather, glass, and other commodities manufactured from local raw materials. In 1938 a new railway was built between Ulan Ude (the

pop. of which is now 140,000) and Kiatka, on the Mongolian frontier. Pop. 500,000.

Burying Beetles, or *Necrophorus*, constitute a genus of the family of Silphidae. They are known also as carrion and sexton beetles, from their habit of burying small vertebrates by digging the ground from beneath the carcasses until it sinks; the female then lays her eggs in the decaying matter. They make a curious chirping sound by rubbing the abdomen against their wing-cases.

Bury St. Edmunds. Municipal bor. and mrkt. tn. of Suffolk, England, 27 m. E. of Cambridge. It owes its early importance to its famous abbey, which was built to contain the shrine of St. Edmund, king of E. Anglia, who was martyred in 870. Of the monastery there are some remains of the abbey church, 510 ft. long, the chapter-house, two gatehouses, and a bridge. The grammar school was re-founded in 1550 by Edward VI. Within the abbey precincts are the two great fifteenth-century churches of St. Mary, one of the largest in England, and St. James, nearly as large as St. Mary's, which was constituted the cathedral of the diocese of St. Edmundsbury and Ipswich, founded in 1914. Here were born Bishop Gardiner (c. 1483-1555), and Bishop Blomfield of London (1786-1857), and also Sir Nicholas Bacon, the eminent lawyer. Culford school, 5 m. N., is a public school for boys founded in 1881 and transferred there in 1935. The prin. industries are brewing and the manuf. of agric. implements. It is the depot of the Suffolk Regiment. Pop. 18,000.

Busaco, ridge about 1800 ft. high, N. of the R. Mandego, in the prov. of Beira, Portugal. Here the Brit. under Lord Wellington repulsed the Fr. under Massena in Sept. 1810.

Büsbach, tn. with coal mines and woollen manufs. in the Rhineland, Germany. Pop. 9000.

Busbecq, Augier Ghislen de (1522-92), Flemish diplomat and traveller, was b. at Commines, and received a varied education at the univs. of Louvain, Paris, Venice, and Padua. Though he held various offices at the court of Emperor Ferdinand I. and was employed in a series of important negotiations, he is now chiefly remembered for his two visits to the court of Soliman II., sultan of Turkey, at Constantinople. His invaluable letters dealing with these embassies, 1556-62, serve to illuminate the Turkish politics of the time. It seems likely that he intrigued further to embroil the sultan with the shah of Persia in order to stop the former from pursuing his aggressive operations near Constantinople. "It is only the Persian stands between us and rufu," he said; "the Turk would fain be upon us, but he keeps him back." In his journeys eastward he was accompanied by an artist who made drawings of rare animals and plants, and he came back to Europe with a fine botanical collection, besides many MSS. and coins. On his return to Vienna in 1562 he became tutor to the children of Emperor Maximilian II. His *Discourse of the State of the Ottoman*

Empire and his accounts of his travels in Turkey contain material that is of the utmost value to the historian of E. Europe.

Busby, head-dress of the hussars and horse artillery of the Brit. Army. It consists of a fur cap with an upright plume in front and a short bag of the same colours as the facings of the regiment hanging from the top down the right side. The name is also used for the rifle head-dress, a folding cap of astrakhan, and colloquially for the bearskin caps of the footguards and fusiliers. It is conjectured that the name may be of Hungarian origin, and the bag a survival of the Hungarian long padded bag which hung over the right shoulder to ward off sword-cuts; but according to a better opinion the origin of the word is unknown.

Busby, vii. in Lanarkshire, on the White Cart Water, 5 m. from Glasgow. Cotton mill, print-works. Pop. 750.

Busby, Richard (1606-95), noted Eng. schoolmaster, educated at Westminster and Oxford; from 1638 to 1695 he was headmaster of Westminster School; he is said to have educated more distinguished men than any other teacher; among his pupils were Dryden, Locke, Robert South, Atterbury, Henry, and George Hooper. A severe disciplinarian, his name has become a byword for harshness, but he was kind-hearted and charitable to the poor. At the Restoration he was made prebendary of Westminster. His works were mostly school eds. of the classics.

Busch, Julius Hermann Moritz (1821-1899). Ger. author and journalist, was b. at Dresden. He entered the univ. of Leipzig in 1841, and there studied theology and philosophy, but soon drifted into journalism and literature. When about thirty years of age he travelled extensively in America, Greece, Egypt, and Palestine, and pub. the results of his travels. He served under Bismarck, and pub. sev. books concerning the great Ger. statesman. In 1878 he pub. *Graf Bismarck und seine Leute während des Krieges mit Frankreich*, which, as the title indicates, gave an account of Bismarck's doings during the war of 1870-71. This and other writings were incorporated in his important *Life of Bismarck*, first pub. in 1898. In 1899 appeared his *Bismarck: some Secret Pages of his History*. His *Unser Reichskanzler* (1885) dealt mainly with the administration of foreign affairs. He d. at Leipzig.

Busch, Wilhelm (1832-1908), Ger. comic artist and caricaturist, was b. at Wiesen-tal, Hanover; studied at academies at Düsseldorf, Antwerp, and Munich. In 1859 he joined the staff of *Fliegende Blätter*, the leading Ger. comic paper. With Oberländer he was the founder of modern Ger. caricature. In 1865 he pub. the first of a series of humorous illustrated poems—*Max und Moritz*—followed by *Der heilige Antonius von Padua* (1870), *Die fromme Helene* (1872), *Hans Hucklebein* (1872), and others. His humorous drawings and caricatures are very clever, and are notable for their simplicity. The types created by him are familiar in every Ger. household. He enjoys the

same reputation for nonsense rhymes as Edward Lear in our own country.

Busching, Anton Friedrich (1724-93), Ger. geographer and theologian. Prof. of philosophy at Göttingen, 1759; minister of Protestant congregation in St. Petersburg, 1761; went to Berlin, 1766, as a director of a *Gymnasium*. One of the creators of modern geography, his *Description of the Earth* (1754-92) was the most complete and scientific work of the kind, and was trans. into many languages. Wrote also *Magazine of History and Geography* (1767-93); *Biographies of Celebrated Persons* (1783-89); *History of Lutheran Churches in Poland and Russia* (1784-87). See his *Lebensgeschichte* (1789).

Buschmann, Johann Karl Eduard (1805-1880), Ger. philologist, b. at Magdeburg. His philological researches were chiefly concerned with the languages of Central America, among his works being *Ueber die aztekischen Ortsnamen* (1853); *Die Völker und Sprachen Neumexikos* (1858); and *Die Spuren der aztekischen Sprache im nördlichen Mexico* (1859). He was associated in philological work first with Wilhelm von Humboldt, and afterwards with Alexander von Humboldt, assisting the latter in *Kosmos* and other works. He became librarian of the Berlin Royal Library in 1832.

Busenbaum, Hermann (1600-68), Ger. Jesuit, b. in Westphalia. Taught theology at Cologne; rector of Jesuit colleges in Hildesheim and Münster. He wrote *Medulla Theologicæ Moralæ*, a manual of cases of conscience, which went through forty-five eds., 1645-70. It roused no real opposition till it appeared in Lyons and Cologne, 1716-33; condemned to be burnt by parliaments of Paris and Toulouse, 1757, for countenancing regicide. New eds. appeared later, notwithstanding.

Bush, name, in Australia and S. Africa, for tracts of land covered with brushwood and shrubby vegetation.

Bush Antelope, **Bushbuck**, or *Tragelaphus sylvaticus*, is a species of horned antelope, but it has not the white stripes common to its relatives. It belongs to S. Africa, and is a member of the family Bovidae.

Bushel (from O.F. *boisset*, Low Lat. *buzellus*, a little box) is a dry measure used for corn, fruit, etc. The Imperial B., instituted in 1826, measures 2218.2 cub. in., and holds 80 lb. of distilled water (temp. 62° F.; barometer 30 in.). One B. is equal to one-eighth of a quarter and to eight gallons.

Bushey, civil par. and urb. dist. in Hertfordshire, near Watford. Pop. 11,000. The Royal Masonic Institution here has 400 boys in residence and the Royal Caledonian School was enlarged by two wings in 1927. Sir Hubert von Herkomer, who estab. the local art school in 1882, was buried here in 1914. B. Heath is an eccles. par. formed in 1889. Pop. 2500.

Bushey Park is a royal park on the R. Thames in the S.W. of the co. of Middlesex, England. William IV., when duke of Clarence, was made ranger in 1701, and his recently estab. mistress

Mrs. Jordan, lived there. The famous triple avenue of limes and horse-chestnuts one mile long, was planted by William III. The park contains a national physical laboratory.

Bushido ('military-knight-ways' or 'way of the warrior'), code of honour of the Samurai, or military class, of Japan. It corresponds to European chivalry and had a similarly feudalistic origin, coming first into prominence in the twelfth century. 'Poem-composing pastimes,' according to a sixteenth-century set of rules, 'are not to be engaged in by Samurai.'

Bushire, also written **Bushehr**, **Abu-shehr**, is a prin. seaport of Persia (Iran), situated on the N. shore of the Persian Gulf. It occupies the N. end of a peninsula, and is encircled on all sides except the S. by the sea. The climate is very hot in the summer months, and is unhealthy. The city is deficient in water, and that required for drinking has to be brought from wells two or three miles distant. At a distance the city presents a beautiful appearance, but on closer examination the streets are found to be narrow, filthy, and badly paved. Most of its export trade is with Britain and her colonies. Chief exports are opium, wool, dates, nuts, raw cotton, and cereals. B. is the land terminus of Indo-European telegraph, and the chief station of the Brit. India Steam Navigation Company. B. is on the air line from London to India and has communication by air with Shiraz and Teheran. It was occupied by the Brit. in 1915 during the First World War. At Kishore, in the vicinity, indistinct cuneiform inscriptions have been found, showing that the place was an old Elamite settlement. Pop. 18,000.

Bushman, or **Bosjemans**, nomadic people of S. Africa. Some connection has lately been estab. between the B. and the Pygmy peoples inhabiting forests of central Africa. The most primitive aboriginal race of S. Africa, they were once the only human inhab. of that vast dist., but, driven westward by more advanced later arrivals, they are now found mainly in the barren dists. extending from the inner ranges of the mts. of Cape Province, through the Kalahari desert, and thence to the dists. about the Orambo R., N. of Damaraland. Their language approaches that of the Hottentots, who are, indeed, thought to be a cross between B. and some Bantu-speaking peoples, and is monosyllabic. Its chief peculiarity is the curious 'clicking' sound. In appearance they are of very small stature, with a long and low skull, and large and prominent cheekbones. In complexion they are of a dirty yellow colour. Their only clothing consists of a piece of skin in a triangular form, which is passed between the legs and tied round the waist. The women wear long skin wraps. The dwelling-places of these people consist of low huts made of reed mats, or holes in the earth. Their household utensils are few and roughly made. The ostrich egg-shell is used for carrying water. The people live chiefly by hunting, using for weapons the primitive bow and poisoned

arrows. They eat practically anything, roots, game, insects, snakes, frogs, lizards, and honey being some of their delicacies; also ants' pupae, or 'bushman's rice,' which the women obtain by means of digging sticks. B. are intelligent, musical, and fond of dancing, and are passionate lovers of freedom. There is practically no tribal organisation. Sometimes individual families unite and choose a king, but this is only temporary. They have no concrete idea of God, though their legends indicate a vague belief in an 'All-Father'; they believe in evil spirits and supernatural beings; most B. carry charms. On the

E. N. A.

BUSHMAN

death of a tribesman a pile of stones is reared on the spot and then the whole family deserts the home. Northward the B. appear to improve both in stature and in general condition. There are said to be about 26,000 B. in S. Africa, but it is impossible to gauge their numbers with any certainty. The B. appear to have been the bringers of Palaeolithic culture to S. Africa from N. Africa or perhaps Europe. Their art, examples of which are found engraved in colours on rocks or cave walls in various parts of S. Africa, strikingly resembles the cave paintings perpetuated in E. Spain by Stone Age artists of the Aurignac culture. The art of the B. does not seem to have been practised within the last century. See M. C. Burkitt, *South Africa's Past in Stone and Paint*, 1928; J. Schapera, *The Khoisan Peoples of South Africa*, 1930.

Bushmills, small mkt. tn. near the Giant's Causeway, 5 m. E. of Portrush, N. Ireland. Pop. 970.

Bushnell, **Horace** (1802-76), eminent Amer. theologian, was b. at Bantam, Connecticut. He graduated at Yale in 1827, and in 1833 was ordained pastor of the N. Congregational church at Hartford, where he soon became famous on account of his remarkable power as a preacher and

for the depth of his theological writings. He took an active interest in the organisation of the college of California (afterwards a univ.). Some of his chief works are *Christian Nurture* (1847); *God in Christ* (1849); *Nature and the Supernatural* (1858); and *The Vicarious Sacrifice* (1866). For *God in Christ* he was charged with heresy, and unsuccessful attempts were made to bring him to trial. See M. B. Cheney, *Life and Letters of Horace Bushnell*, 1880.

Bushrangers, in Australia, a class of armed robbers, originally consisting of runaway convicts. They were a great scourge in the outlying dists., especially in Tasmania, during the first part of the nineteenth century. In 1815 martial law was proclaimed in this dist., and a determined effort was made to stamp them out. The desperadoes, however, banded together in large gangs, sometimes to the number of fifty, and fought pitched engagements with the police. The drastic Bushranging Act of 1830, renewed in 1834, at last succeeded in rooting them out. The most famous B. were the Kelly gang of four men. In 1879 they held up the vil. of Yerilderie, New S. Wales, but when repeating the exploit in the following year at Glenrowan, in N. Victoria, they were besieged in the hotel and three shot. All were heavy artillery. Ned Kelly, the sole survivor, was hanged at Melbourne.

Bush-shrike is the name given to species of Formicariide, a family of birds found in S. and Central America. The B. resembles the butcher-bird in its method of filling its larder by impaling victims on thorns.

Bustris, mythical king of Egypt, and reputed founder of Thebes. A seer told him he could only avert famine by sacrificing a foreigner yearly to Zeus. He commenced by sacrificing the seer, and afterwards seized Heracles for this purpose, but was himself slain by the hero.

Busk: 1. tn. of Ukraine in the region of Tarnopol, in a marsh by the R. Bug. Its numerous bridges cause it to be humorously styled the Galician Venice. Pop. 6000, of whom 1500 are Jews. 2. Tn. of Siberia with a pop. of 46,000.

Busk, Hans (1815-82), one of the chief originators of the volunteer movement. He was educated at King's College, London, and Trinity College, Cambridge. Called to the Bar in 1811; made high sheriff of Radnorshire in 1847. He founded a rifle club at the univ. and lectured on the volunteer movement. He helped to revive the Victoria Rifles. He was also familiar with naval construction, and was the first to advocate the estab. of life-ship stations. He helped to found the School of Cookery at Kensington.

Buskin, half-boot or high shoe lacing tight to the leg; in particular the thick-soled *cothurnus* used by anct. tragic actors in order to increase their height, in which sense it is opposed to *soccus* (sock), the light shoe worn by actors of comedy.

Busoni, Ferruccio Benvenuto (1866-1924), It. composer and pianist; his father was a clarinet player and his mother a

Ger. pianist. He first appeared in public at the age of seven, at Vienna. He studied there under Hans Schmidt, and under Meyer-Remy at Graz. When he was seventeen a gold medal in his honour was struck at Florence, and the Accademia Filarmonica of Bologna elected him a member. At the age of twenty he removed to Leipzig to devote himself to composition; in 1889 he accepted a post as teacher at Helsingfors; and in 1890, after winning the Rubinstein prize, he was prof. at the Moscow Conservatoire for a year. In 1891-93 he taught in the New England Conservatory at Boston. He then took up residence in Berlin, but made extensive concert tours, and was in the U.S.A. again 1910-11. As a pianist B. was considered to have the most powerful individuality and greatest technical mastery since Liszt and Rubinstein. As a composer the art of his earlier years is summed up in the monumental piano concerto, op. 34, which is notable for its grandeur of construction and wealth of musical invention. His style is neo-classical in the best sense of both words. It is a synthesis of composers as disparate as Bach and Rimsky-Korsakov. Specimens of his neo-classical style are to be found in his later sonatas, the *Divertimento* for flute and orchestra, *Sarabande* and *Cortège* from the *Faust* music. In dramatic art, he selected for treatment supernatural subjects, myths, or fantasies. *Die Brautwahl* (first performed 1912) takes its plot from a fantastic tale by E. T. A. Hoffmann; *Turandot* is from Gozzi's drama, and this and his *Alechin* (1918) belong to the old It. *commedia dell'arte* (q.v.). His third opera, *Doctor Faust*, was completed in 1924. He also wrote much orchestral and chamber music. B. was in the fullest sense both pianist and musician. Some rate his compositions very high and think that the rest of the world underestimates them. He wrote a number of essays which were collected under the title *Von der Einheit der Musik*. See life by E. J. Dent, 1925.

Buss, Frances Mary (1827-84), pioneer of higher education for girls. Founded the N. London Collegiate School.

Bussa, or Bussang, see BOUSSA.

Bussanga, see BORGU.

Bussirhat, see BASUTUAT.

Bussora, see BASRA.

Bussy, Roger de Rabutin, Comte de (1618-93), Fr. writer, b. at Epiry; entered the army and fought in sev. campaigns, and became notorious for his affairs of gallantry. In 1659 he was banished from the court; he then wrote for the amusement of his mistress the *Histoire amoureuse des Gaules*. This gave offence to the king and B. was sent to the Bastille, from which he was only liberated on condition that he retired to his estates. Here he wrote his *Mémoires* and *Correspondance*.

Bust (from Fr. *buste*, It. *busto*, origin unknown) is a head and shoulders representation of a person carved in the round. The Gks. used to carve ideal Homers and Sapphos, but the B. of Pericles is almost the earliest authenticated portrait. Life-like Bs. of the Rom. emperors, most of

them set on a pedestal, may be seen at the Brit. Museum. A B., of course, may be carried out in any material: marble, bronze, etc.

Bustamite, variety of the mineral rhodnite (MnO_3Sb_2). B., in addition to the silica and manganese, contains also from 9 to 15 per cent of lime. It is greyish-red in colour and crystallises in the triclinic system.

Bustard is a word derived from the Lat. *avis, bird, tarda, slow*, and is applied to the family Otididae. *Otis tarda*, the great B., is now found only in S. Europe, Morocco, and as far E. as Persia, but

BUSTARD.

was formerly the largest land-fowl of Britain. The male bird measures about 8 ft. across the wings and 1 ft. from its bill to its tail. It has been extinct in England since 1838.

Busti, see **BASTI**.

Busto Arsizio, tn. of N. Italy, situated 20 m. N. of Milan. It has an interesting old church and manufs. cotton thread. Pop. 28,000.

Butadiene, in chem. a di-olefinic hydrocarbon, which occurs in cracked petroleum and in the gases therefrom. Formula, $\text{CH}_2=\text{CH}-\text{CH}=\text{CH}_2$. It can be obtained synthetically, but is made in the laboratory by the thermal decomposition of fusel oil. It has been used for making synthetic rubber.

Butan, see **BHUTAN**.

Butane, name of two hydrocarbons having the formula C_4H_{10} . B., $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$, is an inflammable gas with boiling point 1°C , and isobutane, $(\text{CH}_3)_2\text{CHCH}_3$, is a gas of similar properties with boiling point about -11.5°C .

Butcher, Samuel Henry (1850-1910), classical scholar, was b. in Dublin, a son of Samuel B., bishop of Ncash. He was educated at Marlborough and Cambridge, and in 1882 succeeded Blackie as prof. of Gk. at Edinburgh, resigning in

1903. He was a Unionist M.P. for Cambridge Univ. from 1906 till his death. He collaborated with Andrew Lang in a translation into Eng. prose of Homer's *Odyssey* (1879). His works include *Some Aspects of the Greek Genius* (1891); *Aristotle's Theory of Poetry and Fine Art* (1895).

Butcher-birds, see **SHRIKES**.

Butcher's Broom, or *Ruscus aculeatus*, is a European species of Liliaceae which grows as a shrub in Britain. It is noted for its curious branches, which are phylloclades arising in the axil of a small scaly leaf. The phylloclade resembles a flattened leaf in the middle of which the flowers are borne in the axils of minute scaly leaves. The flowers are declinous, and the fruit is a berry.

Bute, John Stuart, third Earl of (1713-1792), was the son of the second earl of Bute, and of a daughter of the first duke of Argyll. He was b. on May 25, 1713, and succeeded to the title in 1723. He was elected as a representative peer of Scotland in 1737, but made no stir in the political world, and retired to his home in Bute, where he lived until, after the '45, he took up his residence in England. His introduction into a prominent part in Eng. court life was practically accidental. He was called upon to perform some trivial service for the Prince of Wales in a moment of emergency, and immediately became a great friend of the prince and princess. After this date, 1747, he was constantly in attendance on the Prince of Wales, and had great influence with him. On the death of Frederick his influence over the young Prince George was very great, and it was he who instructed the prince on the lines of Bolingbroke's patriot king and gave him his extravagant ideas of the powers and duties of the kingship. Between the year 1756 and 1760 he took a very active part in political negotiations, but was practically a political non-entity save for his influence when the death of George II. raised him to a position of permanent importance as the confidant of the new king in 1760. He immediately began to carry out the policy in which he had already instructed George III., of making the king of overwhelming importance, of lessening the authority of Parliament, and of breaking the Whig oligarchy. His methods were effective even though they were not on the surface apparent: the internal jealousies of the Cabinet were used to spread disruption. Pitt resigned, B. was given a place as secretary of state, and in 1761 he also became Prime Minister. The king and he desired peace with France; Pitt in 1761 had declared in favour of war with Spain, and on the refusal of the king to declare war had resigned. The desire for peace, the resignation of Pitt, and his own nationality, all combined to make B. unpopular. He was attacked in the street and his coach destroyed, a jack-boot and a petticoat (to represent the queen) were continually being burnt. He was scurrilously attacked in the press and by cartoons, his relationship with the princess mother was made the subject of vile scandals, in which there

was not an atom of truth, and to crown everything, in 1762, he was forced to declare war with Spain. Still he hurried on negotiations with the enemy for peace, and the desertion of his ally, Frederick the Great, was simply unforgivable, nor was it forgiven by Frederick. He was made a K.G., and in 1763 peace was made at Paris. Bribery and corruption had by this time obtained for him a majority in the House of Commons, but he still aroused the bitterest hostility by his policy, and he still continued his attacks upon the Whig oligarchy. Everywhere he was attacked, and the attacks did not spare him in any way; it is, in fact, safe to ignore the majority of the charges of malpractices which have been brought against him from so many sources. In April 1763, so bitter had the attacks become, and so much were they felt by B., that he resigned. He still attempted to retain his influence over the king, but was forced by Grenville to retire, and finally Grenville extracted a promise from the king that the influence of B. at court should cease, and after 1765 he had no longer any power over the king, resigning his positions and having his influence taken from him. He still took some slight interest in politics, and was again on two occasions a representative peer of Scotland, but he spent the greater part of the rest of his life in travelling, and *d.* in 1792, being buried at Rothsay in the is. of Bute. He was totally unfitted for the position which he had occupied, but in his desire to serve the king there was no more loyal subject. But his administration was one of the worst that have ever been known in Eng. politics, and indeed depended for its support entirely upon the confidence of the king and the corruption of Parliament. His family life, however, was above reproach, and by a circle of intimate friends he was greatly and justly admired.

Bute Island, in the firth of Clyde, separated from Argyllshire by the Kyles of Bute, a narrow channel less than 1 m. wide. The is. is 5 m. distant from the Ayrshire coast, and 6 m. from Arran. It is 16 m. long and 3 to 5 broad. The coast is rocky, and in the interior are sev. small lochs, the prin. of which are Lochs Fad, Aecog, and Quilen. The soil is light and gravelly, but produces excellent crops. There is no lack of soft red sandstone, slate, and whinstone, while grey granite is also found. The is. is celebrated for its salubrious climate, which makes it a favourite resort of invalids. Pop. 19,500. Rothsay, a popular seaside resort, is the chief tn. Mt. Stuart, 4 m. S. of Rothsay, is a seat of the marquess of Bute.

Butea is a genus of leguminous plants named after John, earl of Bute; the four species are natives of India and China. *B. frondosa*, the dhak, palas-tree, or bastard teak, is a native of mountainous dists. of Hindustan, and is noted for its great beauty. It yields lac and a bright red astringent juice known commercially as E. Indian kino, while the flowers yield a bright yellow dye. *B. superba* grows on the mts. of Coromandel.

Butera, tn. of Sicily, in prov. of Caltanissetta. Pop. 7500.

Buteshire, co. of Scotland, comprising the is. of Bute, Arran, Great and Little Cumbrae, Holy Isle, Pladda, and Inchmarnock. Area 220 sq. m. Pop. about 18,000. The people are chiefly agriculturalists, oats and potatoes being the prin. crops. Fishing and cattle rearing are other activities. The tns. and vils. are much favoured as holiday resorts. The is. were taken from the Norwegians by Alexander III., king of Scotland.

Butler, city of Pennsylvania, N. of Pittsburgh, U.S.A., with coal and oil fields. Pop. 24,000.

Butler, Alban (1711-73), the hagiographer, was *b.* in Northamptonshire, and at an early age was sent to college at Douay, where he became prof. successively of philosophy and divinity. He was sent subsequently on the Eng. mission, and was some time chaplain to the duke of Norfolk. At length he became president of the college of St. Omer. The chief of his works is *Lives of the Fathers, Martyrs, and other Principal Saints*. It cost him the labour of thirty years, and first appeared in five vols. in 1756-59. On account of B.'s strong eccles. bias and defect of scholarship and critical sagacity, his works cannot be regarded as authoritative.

Butler, Benjamin Franklin (1818-93), lawyer and soldier, was at one time one of the most execrated men in the S. commonwealths of the U.S.A., owing to his conduct during the Civil war. He was *b.* at Deerfield, New Hampshire, Nov. 5. On the death of his father, he removed to Lowell, Massachusetts. He was admitted to the Bar in 1840, and became noted as a criminal lawyer. He served in the Lower House of the State Legislature in 1853 and in the State Senate in 1859, being at that time a Democrat. When the Civil war broke out, he became a volunteer officer in the Union forces, and in 1862 led an expedition against the great S. seaport tn. of New Orleans, which he captured on May 1. As commander in charge of this big city, his rule was marked by the utmost severity. For neglecting orders given him by Gen. Grant in the attack on Fort Fisher, near Wilmington, he was removed, and that ended his military career. He returned to Massachusetts, and was sent as Republican Congressman to Washington from 1867 to 1878, except in 1875-77. He was elected governor of the state in 1882.

Butler, Charles (*d.* 1617), miscellaneous writer, was a native of Buckinghamshire, and was educated at Oxford. He spent most of his life at Basingstoke, first as a schoolmaster and afterwards, for nearly fifty years, as vicar of Wootton St. Lawrence, 3 m. from the tn. He wrote a work on bees (1609); a treatise on affinity as a bar to marriage (1625); a Lat. treatise on rhetoric (1629); a work on Eng. orthography (1633); and *The Principles of Mischance in Singing and Setting* (1638).

Butler, Charles (1750-1832), Brit.

lawyer and writer. He was educated at Douay, and in 1775 entered Lincoln's Inn. In 1791 he was the first to be called to the Bar under the terms of the Catholic Relief Act. He took silk in 1832, in which year he also d. He was a most prolific writer. Amongst the books, about fifty in number, which he pub., may be mentioned *Coke upon Littleton's Laws of England* (1775); *Reminiscences* (1821-27); *Book of the Roman Catholic Church* (1825).

Butler, Lady Eleanor (c. 1745-1829), lived in seclusion with Miss Sarah Ponsonby (1755-1831), at Plasnewydd in the vale of Llangollen for over fifty years. They were known as 'The Maids of Llangollen,' or 'The Ladies of the Vale,' and were visited by many distinguished people. Lady Eleanor belonged to the Irish house of Ormonde, and her brother succeeded to the earldom in 1791.

Butler, Elizabeth Southerden, Lady (1844-1933), Eng. artist, a daughter of T. J. Thompson and a sister of Mrs. Meynell, was b. at Lausanne, Switzerland. In 1877 she married Lt.-Gen. Sir Wm. Francis B. He d. in 1910. In early life she spent some years in the study of art at Rome and Florence. She exhibited 'Missing' at the Royal Academy in 1873, and this was followed by a succession of successful pictures, dealing chiefly with military subjects. Among them were 'The Roll Call' (1874); '28th Regiment at Quatre Bras' (1875); 'Balaklava' (1876); 'Inkerman' (1877); 'Scotland for Ever' (1881); 'Floreat Etona' (1882); 'Tel-el-Kebir' (1885); 'Evicted' (1890); 'A Cistercian Shepherd' (1908). She pub. *Letters from the Holy Land* (1903); *From Sketchbook and Diary* (1909); *An Autobiography* (1923).

Butler, Frances Anne, see KEMBLE.

Butler, George (1774-1853), headmaster of Harrow and dean of Peterborough, was b. at Pimlico, London, in 1774. Educated at Cheyne Walk School, Chelsea, and Sidney Sussex College, Cambridge. Elected a fellow of the college and acted for some time as mathematical tutor. In 1805 he became master of Harrow School, retaining this position until 1829. He then retired to his living at Gayton, Northamptonshire, and was appointed dean of Peterborough in 1842. He was a great mathematician, a distinguished classical scholar, and spoke sev. languages fluently. His later years were years of physical suffering. He d. at Peterborough. Chief works are *Extracts from the Communion Service of the Church* (1839) and *Statutes of Peterborough Cathedral* (1849).

Butler, Henry Montagu (1833-1918), Eng. clergyman and schoolmaster, was b. at Gayton, Northamptonshire, July 2. He studied at Trinity College, Cambridge, and was headmaster of Harrow School, 1859-85. In 1885 he was made dean of Gloucester, and in 1897 appointed honorary canon of Ely. In 1886 he became master of Trinity College, Cambridge, being vice-chancellor in 1889 and 1890. Among his pub. works are various sermons reprinted from 1866 onward, including *Belief in Christ*, and *other Sermons*

preached in the Chapel of Trinity College, Cambridge (1898) and *Public School Sermons* (1899)—also: the Romanes lecture for 1912, *Lord Chulham as an Orator*, and *Some Leisure Hours of a Long Life* (1914).

Butler, James, see ORMONDE, DUKES OF.

Butler, Joseph (1692-1752), Eng. divine, was b. at Wantage on May 18, being the son of a linen draper of that tn. His father was a Presbyterian, and Joseph was educated with the ultimate object of entering the Presbyterian ministry. He received his education at Gloucester and Tewkesbury. Whilst at the latter academy B., being dissatisfied with the principles of Presbyterianism, joined the Church of England. He entered Oriel College, Oxford, 1715. He took his degree in 1718, and was immediately appointed preacher at the Rolls Chapel, and was rapidly advanced in the Church, being given the living of Stanhope by Talbot, bishop of Durham, with whom he had been on terms of great friendship at Oxford. He resigned the preacher'ship of the Rolls Chapel in 1726, but it was while he was there that he preached his famous fifteen sermons. For some years, from 1726, he lived in practical retirement at Stanhope. In 1733 he was made chaplain to the lord chancellor, and in 1736 prebendary of Rochester, whilst in the same year he was attached to the service of the queen. In 1737 Queen Caroline d., and B. was appointed bishop of Bristol, then the poorest see; in 1740 he was made dean of St. Paul's (one of the richest deaneries in England), in 1746 clerk of the closet to the king. There is some evidence for the statement that in 1747 he was offered the primacy, which he declined. In 1750 he accepted the bishopric of Durham, and in 1752 he d. He was buried at Bristol, where so much of his life had been spent. In 1736 had appeared his great work, *The Analogy of Religion*. See Works, ed. J. H. Bernard, 1900.

Butler, Josephine Elizabeth (1828-1906), author and social reformer, was the daughter of John Grey of Dilston. In 1852 she married Dr. George B. (q.v.), a strong advocate of women's rights. She was at first chiefly interested in the movement for the higher education of women, but afterwards directed most of her energies to the reclamation of 'fallen' women. She took a prominent part in the campaign for the repeal of the Contagious Diseases Acts (1864, 1866, 1869; repealed 1883-86), which she held unjustly affected women, and she initiated a movement for the suppression of the White Slave traffic.

Butler, Nicholas Murray (1862-1947), Amer. authority on education, was b. at Elizabeth, New Jersey, son of Henry L. B. He was at Columbia College, 1878-1882; was fellow in philosophy there 1882-84, visiting Berlin, Paris, and Oxford, and returning to Columbia College as instructor in philosophy. He became prof. and first dean of the faculty of philosophy, ethics, and psychology in 1890, when the college was made a univ., of which he became president in 1901. He was the founder and first president of

the college for the training of teachers at New York. He founded the *Educational Review* in 1889, and ed. it until 1920. In 1912 he was candidate for the Republican nomination for vice-president, and in 1920 he was presented by the State of New York for the presidency of the U.S.A., but failed in both instances. He pub. various works on education, upon which subject he held the cultural as opposed to the vocational view. By his conduct of the affairs of Columbia Univ. for forty years he raised that institution and himself to a high position of independence and authority. He became a member of the Institut de France in 1923, and chancellor of the Amer. Academy of Arts and Letters in 1924. He was awarded the Nobel Peace Prize in 1931. He received the honorary doctorate of at least twenty-six univs., including Oxford, Cambridge, and Manchester. His publs. include *The Meaning of Education* (1898, 1910); *True and False Democracy* (1907); *Philosophy* (1911); *The International Mind* (1913); *Building the American Nation* (1923); *The Family of Nations* (1938); and an autobiography, *Across the Busy Years* (1939).

Butler, Samuel (1612-80), author of *Hudibras*, was a Worcestershire farmer's son. After being for some years page in the household of Elizabeth, countess of Kent, he became clerk to sev. Puritan justices of the peace, some of whom are believed to have suggested characters in *Hudibras*. Sir Samuel Luke, one of these justices, is supposed to be the original of Hudibras. In 1662 he was steward of Ludlow Castle. Aubrey, who describes him as 'strong-set, high-coloured, a head of sorrel hair, a severe and sound judgment; a good fellow,' lends no support to the stories of his neglect at court and miserable end. His *Hudibras* (pub. in three parts, 1663, 1664, and 1668) is a satire on the Puritans, and while it ridicules the extravagances into which many of the party ran, it entirely fails to do justice to their virtues and their services to liberty, civil and religious. Charles II. is said to have enjoyed the pungency of its wit, and the resistless power of its railleries, but, notwithstanding the contemporary popularity of the work, B. was neglected by the court and *d.* in poverty. Like Pope, B. is now more quoted than read. No doubt the story is but a bare framework, yet his mastery over rhyme and epigram, and his genius for making his characters depict themselves in the most contemptible light, form a splendid embroidery. Works: R. B. Johnson, *The Poetical Works*, 1893; A. R. Waller and R. Lamar, *The Collected Works*, 1905-28. Lives: J. Aubrey, in *Brief Lives*, 1898; J. Veldkamp, *Samuel Butler*, 1923.

Butler, Samuel (1774-1839), classical scholar, was educated at Rugby and St. John's College, Cambridge. At college his brilliance gained him many medals and prizes. In 1793 he secured the Craven scholarship with Samuel Taylor Coleridge and Keate, afterwards headmaster of Eton, as rival competitors. Three years

later he was senior optime in the mathematical tripos. From 1798 to 1836 he was headmaster at Shrewsbury School, which obtained a high reputation for scholarship and excellence of moral tone. His preferences in the Church were the living of Kenilworth, 1802; a prebendaryship of Lichfield, 1807; and the bishopric of Lichfield, 1836. His elaborate ed. of *Æschylus* was pub. 1809-26.

Butler, Samuel (1835-1902), Eng. author, b. Dec. 4, at Nottingham, son of the Rev. Thomas B., and grandson of Dr. Samuel B., headmaster of Shrewsbury and later bishop of Lichfield. B. was educated at Shrewsbury and St. John's College, Cambridge; he prepared for ordination but doubts led him to give up the idea, and in 1859 he went to New Zealand and became a sheep-farmer. *A First Year in Canterbury Settlement* (1863), composed of letters home, was his first publication, but he himself regarded *Erewhon* (1872) as his debut in authorship. A few passages in *Erewhon* are taken from *A First Year*, a few of its ideas from articles and letters by B. in the New Zealand press, and the Erewhonian scenery is drawn from that of New Zealand. *Erewhon* ('Nowhere' backwards) is a Utopian satire, depicting a people with customs and practices often the opposite of ours; thus machines have been abandoned out of fear that they may become masters of man, and crime is treated as illness, illness as crime. *Erewhon* shows a remarkable insight into the development of some phases of twentieth-century society, and its qualities of invention, wit, and grace, as well as its original ideas, have estab. its place among great satirical romances, together with its sequel *Erewhon Revisited* (1901). The latter work is a more polished story than *Erewhon*, and its dominating theme, the origins of a religious myth, gives it more cohesion; but it has not quite the spontaneity of the first work. Between these two books B. pub. at his own expense (for he was a commercially unsuccessful author) sev. works on a variety of subjects, but his posthumously pub. novel *The Way of All Flesh* (1903) overshadows all these. This autobiographical novel embodies some of his favourite notions, notably those on the causes and effects of the clash between generations; the painful relations between Ernest of the novel and his father, the Rev. Theobald Pontifex, are modelled on those of B. and his father, and sev. characters had their prototypes in real people in B.'s life. He began writing the novel in 1873, more or less at the instigation of Miss E. M. A. Savage, who read it in MS. as it progressed until 1885, when she *d.* and B. ceased work on it. Two sonnets on Miss Savage, whose opinion he took on his writings throughout their friendship, were printed in H. F. Jones's *Memoir*. It was following the pub. of *The Way of All Flesh* that B.'s work found an appreciative public. Bernard Shaw's note in the preface to *Major Barbara* having no doubt something to do with this: 'When I produce plays in which Butlers'

extraordinarily fresh, free, and future-piercing suggestions have an obvious share, I am met with nothing but vague cacklings about Ibsen and Nietzsche. . . . Ideally the English do not deserve to have great men." Shaw has acknowledged his indebtedness to B.'s theory of creative evolution as opposed to fortuitous natural selection, a theory expounded by B. in four straightforward books which followed *Erewhon: Life and Habit* (1878); *Evolution, Old and New* (1879); *Unconscious Memory* (1880); and *Luck or Cunning?* (1887), all concerned in controversy with Darwinism and the middle two involving a personal quarrel with Charles Darwin. These books have never been widely read, yet they have much of B.'s courage and humour, as indeed have his other writings, which include *The Fair Haven* (1873) ('a work in defence of the miraculous element in our Lord's ministry upon earth, both as against rationalistic impugnors and certain orthodox defenders'—an ironical 'defence' issued as by the late John Pickard Owen, with a delightful imaginary memoir of the author); *Alps and Sanctuaries of Piedmont and the Canton Ticino* (1881); *Ex Voto, an Account of the Sacro Monte at Varallo-Sesia* (1888); *The Life and Letters of Dr. Samuel Butler* (his grandfather) (1896); *The Authorship of the Odyssey* (1897); *Shakespeare's Sonnets reconsidered and in part re-arranged* (1899); and *The Iliad and The Odyssey rendered into English Prose* (1898 and 1900 respectively). To the wide range of B.'s interests, painting and music should be added. When he first returned from New Zealand he took up painting seriously, studying at Heatherley's art school and exhibiting at the Royal Academy, where his painting 'Mr. Heatherley's Holiday' (now in the National Gallery) was shown in 1874. He was an unsuccessful candidate for the Slade professorship of fine art in 1886. Ten years after B.'s death was pub. *The Note Books of Samuel Butler* (1912), now, after *Erewhon* and *The Way of All Flesh*, his best-known book. Ed. by his friend, Henry Festing Jones, the pub. note-books give a classified selection of B.'s carefully kept personal memoranda in which he recorded everything he wanted to remember of experiences, conversations, ideas and opinions, quips and jests. *The Note Books* also include his hitherto privately printed *Seven Sonnets and a Psalm of Montreal*. B. never married. From 1864 until the end of his life he lived in rooms at 15 Clifford's Inn, London, attended by his servant-secretary Alfred Cathie, and spending a part of almost every day in the Brit. Museum reading-room. He d. on June 18, 1902. Collected ed. of B.'s works, ed. by H. F. Jones and A. T. Bartholomew, 20 vols., 1923-26. See G. Cannan, *Samuel Butler, a Critical Study*, 1915; H. F. Jones, *Samuel Butler, a Memoir*, 1920; E. M. Joad, *Samuel Butler*, 1924; A. J. Hoppé, *A Bibliography of Samuel Butler*, 1925; Mrs. R. S. Garnett, *Samuel Butler and his Family Relations*, 1926; G. D. H. Cole, *Samuel Butler*, 1947; P. N. Furbank, *Samuel Butler*, 1948.

Butler, Sir Spencer Harcourt (1869-1938), Anglo-Indian civil servant. Educated at Harrow and Oxford Univs. Entered Indian civil service 1888. As deputy-commissioner of Lucknow he inaugurated many tn.-planning improvements and much reconstruction in the ant. cap. of Oudh, where, as also in Rangoon, a statue was raised to him by public subscription. In 1915 he became lieutenant-governor of Burma and, later, became lieutenant-governor of the United Provs., being designated governor when the diarchical system provided by the Act of 1919 came into operation. In 1923 he returned, as governor, to Burma, and in 1925 made a journey into the region of the Negas with the aim of ending slavery and human sacrifice there, near the Hakkwang valley. Chairman of the Indian States Committee, 1927. Pub. *India Insistent* in 1931.

Butler, or Buttler, Walter, Count (c. 1600-34), Irish adventurer, was descended from the third earl of Ormonde. He was present at the battle of Prague (1620), and accompanied James II., a kinsman, on his march to Frankfurt-on-Order (1631), at the siege of which he greatly distinguished himself. He then served under Wallenstein, and he was an accomplice in the murder of Wallenstein at Eger in 1634. For his share in this affair he was ennobled by the emperor.

Butler, William Archer (c. 1814-48), prof. of moral philosophy in the univ. of Dublin, was b. at Annerville near Clonmel. He was brought up as a Rom. Catholic, but became a Protestant. Educated at Clonmel School and Trinity College, Dublin, he joined the College Historical Society, and was appointed first prof. of moral philosophy at Dublin Univ. During the horrors of famine and pestilence in 1846-47 he laid aside all higher pursuits and toiled nobly among the poor as relieving officer. His chief works are *Sermons Doctrinal and Practical* (1855-1856); *Lectures on the History of Ancient Philosophy* (1856); *Letters on Romanism* (1858).

Butler, Sir William Francis (1838-1910). Brit. general, b. at Suirville, Tipperary. Educated at Dublin, he entered military service in 1858. Served in the Ashanti expedition in 1873, in Natal, 1879, and in the Sudan campaign of 1884-85. He was brigadier-general in Egypt until 1892, when he was promoted to the rank of major-general and stationed at Aldershot. He succeeded Gen. Goodenough as commander-in-chief in S. Africa in 1898. He acted as high commissioner during Sir A. Milner's absence in England. Before the outbreak of war B. was recalled because he expressed views on the subject of probabilities of war which were not approved of by the home gov. He married, in 1877, Miss Elizabeth Thompson (see BUTLER, ELIZABETH). He pub. *The Great Lone Land* (1872) and other works, and was the biographer (1890) of Sir George Colley. His *Autobiography* was pub. in 1911.

Butlerage was an ant. right of the Crown to buy up provisions and other

necessaries for the royal household at a valuation, even without consent of the owner. From this probably originates the custom of taking dues in return for protection of ports and harbours. B. ceased to be levied in 1809.

Buto, Egyptian goddess, whose earlier name of *Uto* became confused with the name of the city of B., in the N.W. of the Nile delta, where she was held in special honour. She was a 'cobra-goddess of the marshes,' and identified by the Gks. with *Leto*.

Butomaceæ is a very small order of monocotyledonous plants found in marshes of tropical and temperate lands. The flowers are regular, hermaphrodite, with two whorls of three in the perianth, nine to numerous stamens, six to numerous carpels, with numerous ovules. The inflorescence is usually an umbel and the fruit is a follicle.

Butomus, *Butomus umbellatus*, flowering rush, is the single species of its genus in the order Butomaceæ. It grows in Europe and Asia, and is accounted the handsomest herbaceous plant of the Brit. flora. The flowers are rose-coloured and the leaves are sword-shaped.

Buton (Dutch *Boeton*) Island, is. of the Malay Archipelago, separated from the S.E. ray of the Celebes and the is. of Muna by a narrow strait. It is high and wooded, and produces timber, rice, sago, &c. The pop. are Malays, mostly Buris (q.v.); the area is 1700 sq. m. Pop. 18,000.

Bütow, tn. in the prov. of Pomerania, Germany, 77 m. E. of Kolberg. Pop. 10,000.

Butrinto, small fort. tn., opposite Corfu, on the coast of Albania. Lake Vivari lies to its N. It has a little harbour, and is the seat of a Gk. bishop. The Venetians held the tn. till 1797, when it was occupied by the Fr., who in their turn gave it up to the Turks in 1799. The ruins of Butthrotum, a Rom. colony mentioned by Strabo, lie near at hand. They include a mile of old Rom. wall. Pop. about 2000.

Butt, measure of ale or wine. A B. of ale is usually 108 gallons, a B. of wine 126 gallons.

Butt, Dame Clara (1873-1936), contralto singer, was b. at Southwick, Sussex. She was trained in the Royal College of Music, and made her debut in Dec. 1892. One of the most conspicuous of her many successes was in Elgar's *Sea Pictures* (1899), specially written for her. In 1900 she married Kennerley Rumford, baritone vocalist, with whom she appeared on many concert platforms throughout the country. In 1917, on account of the devotion of the proceeds of her many concerts to war charities, she was made a dame of the Brit. Empire. D., after a long illness, at Oxford.

Butt, Isaac (1813-79), leader of the Home Rule party in Ireland, was b. in Donegal; educated at Trinity College, and took his degree with high distinction in 1835. In 1836 he was appointed prof. of political economy and was called to the Bar in 1838. He was a Conservative

in politics, and in 1852-65 was M.P. for Youghal. He changed his political opinions, and on his election for Limerick in 1871 he became leader of the Home Rule party. A Home Rule League was formed, but lasted only a short time. He lost hold on his associates, and was called a Tory in disguise and a traitor. His constitutional policy was abandoned by his successor, Parnell.

Butte, city and co. seat of Silverbow co., Montana, U.S.A., on the W. slope of a range of the Rocky Mts. Near it is the famous Anaconda copper mine, and B. produces about one-third the entire copper output of the States, besides producing large quantities of gold and silver. It is on five railways. Pop. 37,000.

Butter, article of food consisting of the fatty substances present in milk, together with some of the other constituents and a small proportion of salt. The general process by which B. is made involves separating the cream or fatty matter from the milk and churning the cream until the fat globules are burst and the fat particles adhere together in a fairly solid mass. The variations in particular methods consist in the employment of more or less elaborate machinery in the different details of the process, and the extent to which bacterial action is artificially aided. Cow's milk contains, on the average, about 3.75 per cent of fat, but the amount varies with the breed and individual, with the season of the year, and even with the day of the week—Monday's milk being usually deficient in fat as compared with the rest of the week, while the fat in Tuesday's milk is usually above the average. The fat is present in the form of globules varying in diameter from .0016 mm. to .01 mm. At temps. above 32° C. the fat is in a liquid condition, and slowly solidifies as the temp. is lowered. The gradual nature of the solidification is shown by the slow increase in the sp. gr. of the milk due to that solidification. As milk is cooled, therefore, the fat tends to rise to the surface, because the density of the serum or liquid portion of the milk increases practically in proportion to the decrease in temp., while the fat, being for the most part still in the liquid condition, has not increased in density in the same proportion. The most widespread manner of separating cream from milk is therefore to allow the liquid to stand in shallow pans in a cool room for about a day, when the particles of fat slowly ascend to the surface as the effect of the differing densities. This method is not only slow, but is also not economical, because a fair proportion of fat still remains in the skim milk. Various types of mechanical cream-separators are now widely used. The general principle underlying the action of all these machines is the same. The milk is swirled round a central feeding tube, so that the heavier constituents are projected by centrifugal force to the outer portion of the chamber, while the lighter fat may be collected at a point near the centre of the rotating piece. Milk placed in a separator at or above blood-heat is resolved into cream and

skim milk in a few minutes. The next operation is known as 'ripening,' and consists essentially in allowing the multiplication of lactic bacilli in the cream. The object of this process is to produce a more palatable article, and to shorten the operation of churning, as it is found that B. more readily forms in the churn when ripened cream is used. The popular and primitive method of ripening is to allow the cream to stand in a cool room, with occasional stirring, until the practised taste of the dairyman indicates that the process has sufficiently advanced. The work is expedited, however, by using a 'starter.' This consists of a pure culture of the lactic acid bacillus, and is stirred into milk which has been sterilised and brought to a temp. of 80° F. This temp. is maintained until the milk has become sour, when a portion is added to cream that needs ripening. In either method care must be taken to prevent other bacteria from having access to the cream. To this end all vessels and utensils are scalded before use, moistened muslin curtains are used to entrap dust, and the utmost cleanliness is enforced in all branches of the dairy work. When the cream has sufficiently ripened, it is placed in a churn and agitated until the B. forms. Many varieties of churns exist, both of the kind in which a number of blades are dashed or revolved in the contained cream, and of the kind where the vessel itself is turned end over end, the churning consisting in the liquid dashing against the sides of the vessel. The forming of the B. can easily be recognised by the different sound of the 'splash,' or by the different effort required if the churn is actuated by hand. After churning, the buttermilk has to be washed from the butter with cool water, and the solid product then presents an attractive granular appearance. To rid it of the excess of water, and incorporate the desired amount of salt, it is necessary that the B. should be 'worked.' This may either be done by hand, which should be quite cool and clean, or by one of the mechanical workers upon the market. The operation in any case consists in pressing the B. in as many different directions as possible, at the same time continually changing the relative positions of the different parts of the bulk. B., when ready for sale, contains on the average 84.91 per cent of fat, 13.05 per cent of water, 1.02 per cent of curd, and 1.02 per cent of salt. The fat consists of a mixture of glycerides, the glycerol base being united with oleic, palmitic, myristic, lauric, butyric, caproic, capric, steric, and caprylic acids in proportions roughly indicated by the order of the names. B. may be adulterated by the addition of other animal fats, and by the introduction of preservatives, as borax, formalin, etc. There are many methods of detecting B. adulteration, one of the most reliable being the determination of the refractive index of a layer of B. by a Zeiss refractometer. World production of B. was estimated in 1938 to be about 3,300,000 tons, imports into Great Britain and N. Ireland

for the same year were 9,416,366 cwt., an increase of 45 per cent in ten years. Home production, however, remained much the same, namely 892,850 cwt. The chief importing countries were New Zealand, 2,950,000 cwt.; Australia, 1,491,000 cwt.; Eire, 320,000 cwt.; Denmark, 2,254,000 cwt.; Netherlands, 718,600 cwt. Imports from the empire were duty free; those from foreign countries paid 15s. per cwt. The great increase in imports enhanced the difficulties of the home producers, but no agreements for regulation were made, though in 1932 Australia instituted a scheme for voluntary restriction of imports. The value of imports was nearly £50,000,000 annually. Restriction was, of course, unnecessary when the Second World War broke out, and B. was rationed. At the end of 1945 imports were only 3,750,000 cwt.; at the end of 1946, 4,338,000 cwt. The value of imports in 1945 was £31,000,000, in 1946 £38,000,000, and in 1947 £40,000,000. See also CHEESE; CREAMERY; DAIRIES; DAIRY FARMING; FAT; MARGARINE.

Butter, in chem., any substance having the consistency of B. The term is now antiquated. Examples are *butter of antimony*, antimony trichloride; *butter of tin*, stannic chloride; *butter of zinc*, zinc chloride.

Butter-bur, or *Petasites vulgaris*, is a species of Compositae often found in damp fields. The plant is dioecious, and only the male florets yield nectar. There are about thirty florets in the male inflorescence, and five times as many in the female. The leaves are large, about the size and shape of rhubarb.

Buttercup, see RANUNCULUS.

Butterfield, William (1814-1900), Eng. architect, b. in London. Educated at Worcester. Most of his buildings are in the Gothic style. He held quite original views as to colour in architecture, his view being that any combination of natural colours of the materials was permissible. His first important building was St. Augustine's, Canterbury. His reputation was made by All Saints', Margaret Street, London, and he also built St. Alban's, Holborn, Keble College, Oxford, the chapel of Balliol College (in modern Gothic), and the new parts of Merton. He executed many restorations.

Butterfish, name given to various kinds of fish on account of their slippery nature: *Coriodax nullax*, a species of Labridae or wrasse, known in New Zealand as kelp-fish or B.; *Centronotus gunnellus*, a species of blenny-fish, known in Britain as the gunnel or rock-fish; and *Poronotus triacanthus*, or dollar-fish, found on the W. coast of the U.S.A.

Butterfly is the name given to the Lepidoptera which are included in the series Rhopalocera, the order being completed by the other series, Heterocera, or moths. There is no definite div. between moths and Bs., but they are generally distinguished from one another by their wings and antennae. All the Rhopalocera have clubbed antennae and no frenulum, a coupling apparatus which projects from the hind wing and unites it with the fore

wing, while the Heterocera have antennae of various shapes, and when clubbed a frenulum is present; the former also are day-flying insects, while the latter are usually nocturnal in habit. Nearly all Bs. remain with their wings in an upright position when at rest, so that only the under surface is seen, but moths keep their wings expanded during repose. The species of Rhopalocera are nearly altogether vegetarian, living on nectar, but a few feed on animal matter, such as decayed fish, and the larvae of others prey on vegetarian insects. In coloration Bs. may be dingy white or yellow, or may be any brilliant colour, such as red, orange, blue, purple, and it is noteworthy that the males are usually brighter than the females; mimicry in colouring is frequently observed in different species, which resemble leaves in their greenness or bark in their brownness, and thus save themselves from being victimised by birds. The colours are caused partly by pigments, but partly also by interference phenomena on the scales, like those to be seen on a soap bubble. The distribution of Bs. is world-wide, but though they are found in almost the very coldest regions, they occur in greatest abundance in warm climates. In Britain there are about seventy native species, and the total number described throughout the world amounts to sev. thousands. In structure Bs. greatly resemble many other insects, but they are noted for the slenderness of their body, the length of their proboscis, their hairy legs, large eyes, and the breadth of their scale-covered wings. The mouth is a sucking organ, mandibles are rudimentary or absent, and the proboscis is formed by the maxillae, and in some species is ten inches long. The legs are always weak, merely supplying supports during rest, and in some cases the front pair is rudimentary. The metamorphosis of the insect is complete, but the life of the adult is usually very short, and seldom survives a single season, though sev. Brit. species, including the peacock and the small tortoiseshell, are able to hibernate in the adult form. In classification the Rhopalocera are divided into six families. The Nymphalidae is the largest of these, and none of the species included in it are capable of walking on the front legs owing to their reduced state. To it belong seven sub-families, and these include such well-known Bs. as the grayling, Scotch argus, dead-leaf, fritillaries, admirals, purple emperor, and the genus *Vanessa*. The family Erycinidae has two sub-families, and in Britain is represented by the Duke of Burgundy fritillary. The 'Blues' are small and slender Bs. comprised in the Lycaenidae, the species of which are usually blue on the upper surface, but many are also copper, white, and yellow. The Pieridae is a family which has sev. Brit. genera, and among the best-known members are brimstones, orange-tips, clouded yellows, and garden whites or cabbage butterflies (q.v.). The difference in form and colour of the sexes in Papilionidae has led to a good deal of confusion among entomologists; the

family has many members of S. America, and some of these are the most beautiful butterflies in existence. The Hesperidae, or skipper family, is characterised by having perfect legs; like the Papilionidae it is world-wide in distribution, but unlike that family its species have largish bodies of very dull colour, many have a jerky flight, but some are extremely rapid when on the wing. In habit they resemble moths, and many of them fly at twilight. Extensive migrations of Bs. belonging to many species are known to take place. The large cabbage white (*Pieris brassicae*) and the small white (*P. rapae*), for instance, have been observed over the

BRITISH BUTTERFLIES

A, cabbage white; B, pale clouded yellow;
C, red admiral; D swallow-tail.

Channel and reaching the S. coasts of England from the European mainland, sometimes in such numbers as to resemble a huge cloud obscuring the sun. See also CABBAGE BUTTERFLY; CATERPILLAR; CHRYSALIS; COCOON MOTHS. See F. W. Frohawk, *Natural History of British Butterflies*, 1924, and *The Complete Book of British Butterflies*, 1934; C. B. Williams, *The Migration of Butterflies*, 1930; E. Sanders, *A Butterfly Book for the Pocket*, 1939; R. South, *The Butterflies of the British Isles*, 1941; E. B. Ford, *Butterflies*, 1945 (where the literature is more fully quoted); Vere Temple, *Butterflies and Moths in Britain*, 1948.

Butterfly Flower, see SCHIZANTHUS. Butterfly Orchis, or *Habenaria bifolia*, and *H. chlorantha*, are beautiful species of Orchidaceae; they are found in Britain. The purple B. O. and white B. O. are *H. papilionacea* and *H. nivea* respectively.

Butterfly Weed, or **Pleurisy Root**, is the *Asclepias tuberosa*, a herbaceous plant of the family Asclepiadaceæ. It is a native of the U.S.A., and was formerly used in cases of pulmonary affections and rheumatism.

Butterine, food product prepared by mixing purified animal fats with genuine butter. By the Margarine Act of 1887 all such substances are to be termed margarine (*q.v.*), and must be so labelled.

Buttermere, Cumberland, England, once with Crummock Water formed one lake. The lake is 1½ m. in length by ¼ m. in breadth, and drains N.W. It is 7½ m. S.W. of Keswick, and is surrounded by superb scenery.

Buttermilk, the fluid residue after butter has been taken from cream. It is generally given to pigs as food, but makes an easily digested and nourishing drink. Some inferior kinds of cheese contain B.

Butternut is the name given to the fruit of the various species of *Caryocar*. It is a large drupe containing four seeds, and comes from tropical America. The term is also applied to the *Juglans cinerea*, the white walnut of N. America, the seeds of which are rich in oil.

Butters, Vegetable, substances having the consistency of butter, being vegetable fatty oils which are nearly solid at ordinary temps. Examples are cocoa butter, butter of almonds.

Butter-tree, or *Pentadesma butyracea*, is the single species of its genus in the family Guttiferæ, found in W. Africa. It yields a fatty substance, which is used as tallow and as a substitute for butter. *Bassia butyracea*, a species of Sapotaceæ, is the Indian B., from the seeds of which a fatty juice is obtained and used in soap-making.

Butterwort is the name applied to sev. species of *Pinguicula*, a genus of Lentibulariaceæ. Three of these plants grow in damp places in Britain, and are noted for their carnivorous habits. The rhizome has a rosette of greenish-yellow leaves which grow close to the ground and are covered with numerous small hairs secreting a sticky fluid. Insects adhere to the leaves, and the acid secreted by the hairs decomposes the bodies and gives the plants the nitrogen they require. *P. vulgaris*, *P. alpina*, *P. lusitanica*, and *P. grandiflora* are the species which are found in Britain.

Butterworth, George Sainton Kaye (1885-1916), Eng. composer, b. in London; killed at Pozieres in Somme battle, Aug. 5, 1916. His first serious composition was *Barcarolle*, orchestral piece, written while still at Eton. Studied music at Royal College of Music and also privately. Took a leading part in the folk-song and dance movement. His *Shropshire Lad*, a tone poem, raised high hopes which were frustrated by the war. His songs are regarded as amongst the finest of the twentieth-century composers. Compositions include *Two Folk-song Idylls* (1912); *The Banks of Green Willow* (1913); *Love Blows as the Wind Blows* (cycle of four songs) (1912); *Folk-songs from Sussex*; *Country Dance Tunes* (1906-

1916); *The Morris Book* (1907-13); *We get up in the Morn.*, a part song.

Buttevant, mrkt. tn. in Eire, co. Cork, 6½ m. N.W. Mallow, on the G.S. and W. railway. It has the remains of an abbey. Pop. 2000.

Butt-joint, joint (often in ironwork) in which the edges or ends of the pieces united come squarely together without overlapping.

Buttmann, Philipp Karl (1764-1829), Ger. philologist, b. at Frankfurt-on-the-Main. At the univ. of Göttingen he studied under Heyne. Admitted in 1806 to the academy of sciences, he became, five years later, secretary of the 'historico-philological dept. For some years he had ed. *Spenser's Journal*, but his fame rests on the encouragement he gave to the study of the Gk. language by his *Griechische Grammatik* (1792) (of which the 22nd ed. appeared in 1869), and his *Lexilogus* (1818-25), which is a scholarly discussion of certain difficult words in Homer and Hesiod. Both these works have been trans. into Eng., the translation of the latter having already passed through five eds.

Buttneriaceæ is a term which was formerly used for a group of dicotyledonous plants now included in the family Sterculiaceæ. *Buttneria* and *Theobroma* were two chief genera.

Buttler, Walter, see BUTLER.

Button, Sir Thomas (d. 1634), entered the navy in 1589, but did not rise to renown until in 1612 he was given the command of an expedition whose objective was the search for the N.W. passage. Accompanied by the pinnace *Discovery*, and himself captain of the *Resolution*, he explored the coasts, especially the W. coast, of Hudson Bay for the first time, and proved conclusively that the hoped-for passage did not exist. It was he who named the Nelson R., New Wales, and Button's Bay. Deficiency in equipment caused a high mortality among the crew. Later B. was admiral of the king's ships off Ireland, and did yeoman's service in suppressing piracy. Various disputes with the Admiralty, in which he was supported by the duke of Buckingham, embittered his closing years.

Buttons (Fr. *bouton*, from same root as Fr. *bouter*, to push). The hist. of button-making dates back to Elizabeth's reign. At first B. were only made for purposes of ornamentation. Bright, gaudy, and costly B. with numerous facets were worn in the last century, and similar B. have recently been made in Paris. Birmingham is the centre of the industry in Great Britain. The latter part of the eighteenth century and the early part of the nineteenth century have been called the 'Augustan age' of button-making in Birmingham, when it was the fashion to wear coats covered with gilt B. At the beginning of the nineteenth century B. Sanders, a Dane, introduced the cloth-covered button, in 1807, and his son in 1823 introduced the use of a canvas tuff instead of the metal shank. The mechanical manuf. of covered B. was first started in the U.S.A. in 1827 by Samuel Williston. B. are made of various

materials. B. of vegetable ivory or 'Corozo Nuts' (see IVORY), are largely used now. It is softer than true ivory and easily turned and dyed. Brass B. were first made at Birmingham in 1689. Ivory B. are among the oldest of all. Horn B. were made at Birmingham in 1777. Towards the middle of the nineteenth century Émile Bassot invented a widely used process for making them from cattle hoofs softened by boiling. Pearl B. are made from pearl oyster shells. Glass B. are especially made in Bohemia, and porcelain B. were first made in 1840 by an Englishman, R. Prosser. Bs. are now widely manufactured in plastic.

Buttress (O.F. *bouterez*, from *bouter*, to thrust) projection from a wall provided to give additional strength to the same. In classical architecture there were no visible Bs., their places being taken by pilasters, antæ, etc. The Bs. of the early Romanesque style frequently presented the form of a pillar. Bs. of Early Eng. style have a considerable projection with two or three set-offs sloped at an acute angle dividing the stages and crowned by triangular heads.

Buturlinovka, tn., with mills and tanneries, in the Voronezh region of the R.S.F.S.R., 85 m. S.E. of Voronezh; pop. 23,000.

Butyl Alcohol, one of the isomeric alcohols of the general formula C_4H_9OH . There are two primary, one secondary, and one tertiary forms. Normal B. A., $CH_3(CH_2)_3OH$, is a colourless liquid prepared by reducing normal butyl aldehyde with hydrogen and reduced nickel. Iso-butyl alcohol, $(CH_3)_2CH-CH_2OH$, is a disagreeably smelling liquid occurring in fusel oil. The secondary alcohol, methyl ethyl carbinol, $CH_3(C_2H_5)CHOH$, is a strongly smelling liquid boiling at 99° C. The tertiary alcohol, trimethyl carbinol, $(CH_3)_3COH$, is a crystalline solid prepared by the action of zinc methyl on acetyl chloride.

Butyl Chloral, $CH_3-CHCl.CCl_2-CHO$, an oily liquid prepared by the action of chlorine on acetaldehyde. It readily unites with water to form B. C. hydrate, $C_4H_9Cl_3O \cdot H_2O$, a crystalline solid used in medicine as an analgesic. It has similar properties to chloral hydrate, in the manuf. of which it occurs as a by-product.

Butyric Acid, $CH_3-CH_2-CH_2-CO_2H$, volatile fatty acid occurring in butter fat, in parsnip and other vegetable oils, and in the perspiration of animals. It is an oily colourless liquid with an unpleasant smell, solidifies at -19° C., boils at 162.3°, and has a sp. gr. of 0.974. It is miscible with water and alcohol, and forms salts and esters called butyrates. It may be prepared by adding putrid cheese to sugar or starch mixed with water, the cheese introducing the bacillus by whose agency the acid is formed. Chalk is usually added to bring off the acid in the form of the calcium salt.

Isobutyric Acid, $(CH_3)_2CH-CO_2H$, isomeric form found in some vegetable oils. It has an unpleasant smell, boils at 155° C., and has a sp. gr. of 0.969.

Butyric Ester, or Ethyl Butyrate, liquid obtained by distilling butyric acid, alcohol, and sulphuric acid. Unlike butyric acid it has a pleasant smell resembling that of pineapple. It is commercially known as pineapple oil, and is much used as a flavouring agent for sweets, etc.

Butzer, Martin, see BUCKER.

Butyrin, $C_4H_9(C_2H_5O)_2$, yellowish liquid with a bitter taste which forms about 3.8 per cent of butter fat. It is the glyceryl ester of butyric acid.

Butzow, tn. in Mecklenburg, Germany, 18 m. S.W. of Rostock, with which it is connected by rail; pop. 6000.

Buxa, or **Baxa**, name of a tn. and pargana (or dist.) in Jalpaiguri div. of E. Bengal and Assam, on borders of Bhutan, India.

Buxar, see BAKAR.

Buxbaumia, *Buxbaumia* or *B. aphylla*, is a moss of the order, Bryineæ and family Buxbaumiaceæ. It was named in honour of Buxbaum, the Ger. botanist, and is a rare plant occasionally found in Britain.

Buxina, alkaloid occurring in the common box-tree (*Buxus sempervirens*).

Buxtehude, **Dietrich** (1637-1707), Swedish composer and organist, b. at Helsingborg; organist of the Marienkirche, Lübeck, from 1668. As organ composer and player he had a great influence on J. S. Bach, who made a 200 m. journey on foot to hear him play. He composed many works for the organ, trio sonatas for violin, gamba, and continuo, and a number of church cantatas. *D.* at Lübeck. See life by A. Pirro and W. Stahl, *Franz Tunder und Dietrich Buxtehude*, 1926.

Buxton, watering-place and mrkt. tn. in Derbyshire, 36 m. N.W. of Derby, and 163 N.W. of London by rail, pop. 15,641. It is the highest tn. in England, 1000 ft. above sea level, is the centre of the Peak dist., and is remarkable for its very bracing climate. It has long been famous for its mineral waters, which were known to the Romans. The springs supply hot and cold water, though only a short distance apart; the hot springs have an even temp. of 82° F. The baths are the property of the duke of Devonshire. At the Devonshire Hospital over 3000 gouty and rheumatic patients are treated annually. There are excellent hotels, hydropathics, and the various estab. that are to be found in a favourite watering-place. In the vicinity is Diamond Hill, so named from its abundance of quartz crystals; also Poole's Hole, a remarkable stalactite cavern.

Buxton, Jedediah (1707-72), calculator, could work out the most elaborate problems in number, although he never mastered any arithmetical rules. By striding over the estate of Elinton, he gave its area accurately in ac., roods, etc., and even sq. in. At a performance of *Richard III.*, his one amusement was to count the words Garrick uttered. Another time he expressed in pounds, after mental reckoning only, the product of a farthing doubled 139 times. His result of thirty-nine figures is correct, as verified by logarithms.

Buxton, Sydney Charles, first Earl, of Newtimber, Sussex (1853-1934), Liberal statesman and author, son of Charles B., M.P., and Emily, daughter of Sir Henry Holland, Bart. He was educated at Clifton and Trinity College, Cambridge. His first attempt to enter Parliament was in 1880, when he contested Boston unsuccessfully. He became M.P. for Peterborough three years later, but failed to secure re-election in 1885. Next year he became M.P. for the Tower Hamlets (Poplar div.), and continued to hold the seat through successive elections. He was a member of the Royal Commission on Education, 1886-89, and a member of the Income Tax Committee in 1904. From 1892 till 1895 he was under-secretary for the colonies. From 1905 to 1910 he was postmaster-general, and in that capacity instituted the penny post to the U.S.A. 1908, and the Canadian magazine post 1907, and acquired the first wireless telegraph station for the post office 1909. In 1910 he became president of the Board of Trade, and was the author of the 'Fair Wages' resolution of the House of Commons: a resolution requiring a clause to be inserted in all gov. contracts to secure better payment for workers engaged in such work. Responsible for Copyright Act, 1911; Unemployed Section (Part II.) of the National Insurance Act, 1912; Pilotage Act, 1912. In 1914 he was made a viscount, and he was high commissioner and governor-general of S. Africa 1914-20. He received his earldom in 1920. He pub. *Finance and Politics* (1883-85); *Political Manual* (1886); *Handbook to the Death Duties* (1893); *Mr. Gladstone as Chancellor of the Exchequer* (1901); *Fishing and Shooting* (1902); *The Fiscal Question: Handbook of Political Questions* (1904); *General Rother* (1924).

Buxton, Sir Thomas Fowell (1789-1845), Eng. philanthropist, b. at Earl's Colne, Essex, was a brilliant student at Trinity College, Dublin, in spite of his very meagre groundings in academic work. In 1808 he entered Messrs. Truman & Hanbury's brewery. So wholehearted was his devotion to business that he became partner in 1811. His wife, Harriet Gurney, was a sister of the famous Mrs. Fry. People first recognised his talent as a speaker and his disinterested enthusiasm in his speech for the Spitalfields weavers, 1816. From 1818 to 1837 he represented Weymouth in Parliament, his sturdy opposition to bribery being responsible for the loss of his seat. Though he sacrificed many hours to the question of prison reform, and tried to carry a scheme for bettering the condition of the African Negroes, his life work was to promote emancipation of slaves throughout Brit. dominions. In this cause his activities were never relaxed, and he proved himself a worthy successor to Wilberforce as leader of the anti-slavery party, 1824. See R. H. Mottram, *Buxton the Liberator*, 1948.

Buxtorf, Johann (1564-1629), Ger. Heb. scholar, became prof. of Heb. at Basle in 1591. In his devotion to rabbinical literature he has hardly been surpassed. His

reputation depends chiefly on his *Lexicon Chaldaicum, Talmudicum, et Rabbinicum* and his *Concordantiae Bibliorum Hebraeorum*, both of which were pub. by his son, but his greatest work perhaps was his folio Heb. Bible, to which were added the Aramaic paraphrases, or Targums, and the commentaries of Ben Ezra, Rashi, and other rabbins, 1618. A fatal attack of the plague cut him off in the midst of his studies.

Buxtorf, Johann (1599-1664), son of the former, also occupied the chair for Heb. at Basle. Much of his public life was absorbed in an embittered and learned argument with a Frenchman, Louis Capel. B. maintained that the Massoretic text alone was the 'Hebrew Verity,' and that the vowel points and accents, as well as the letters, were possessed of divine authority, and were at least as old as the days of Ezra. Capel proved fairly conclusively that the vowels, etc., go back only to the fifth century A.D.

Buxus, genus of dicotyledonous plants of the order Buxaceae, of which the common name is box (q.v.).

Buxwiller, see BOUXWILLER.

Buys-Ballot, Christoph (1817-90), Dutch meteorologist, b. at Klootgen in Zeeland; studied at Utrecht, where he became prof. of mathematics, 1847, and of experimental physics, 1870, and in 1854 director of the Royal Meteorological Institute. He invented the aeroklinoscope and a system of weather signals which were a great aid to international uniformity in meteorological observations. His observations have been formulated in a general law of storms which may be put thus for the N. hemisphere, 'Stand with your back to the wind; the low-pressure area will be on your left hand. For the S. hemisphere the reverse will obtain.' This is known as B.'s law. His works include *Changements périodiques de la température* (Utrecht, 1847); and in Eng., *Suggestions on a Uniform System of Meteorological Observations* (1872-73).

Buyukdereh, vil. beautifully situated on the Bosphorus, about 10 m. from Istanbul. It is a favourite summer resort of Europeans.

Buzançais, tn. with textile industry in the dept. of Indre, France, on the R. Indre, 13 m. N.W. of Châteauroux. Pop. 4000.

Buzancy, tn. in France, 20 m. S. of Sedan. In the First World War it was the first objective of the Amer. Army under Gen. Pershing in the offensive against the Gers. In the autumn of 1918 to secure Mezères. Notwithstanding the skillful ruses employed by the Amers. to deceive the Gers., which they did to a great extent, little progress was made. The attack was renewed early in Oct. and B. was taken on Oct. 11.

Buzău, cap. of prov. of B. in Rumania, 42 m. N.E. of Ploesti; the seat of a bishop, and a market for grain, timber, and petroleum; pop. 30,000.

Buzuluk, tn. with tanneries, copper foundries, etc., in the Chkalov region of the R.S.F.S.R., 110 m. S.E. of Kulishev (Samara), near junction of R. Samara and R. B. Pop. 20,000.

Buzzard is the name given to sev. genera of birds of prey of the falcon family, Falconidae, to which belong also the kites. The species usually live on such small animals as mice, but they are known to carry off domestic fowls. They are cosmopolitan but for Australia. *Buteo vulgaris*, the brown or common B., and *Buteo lagopus*, the rough-legged B., are the only natives of Britain. *B. lineatus*, the red-shouldered hawk, and *B. borealis*, red-tailed hawk, occur in N. America. *Pernis apivorus*, the honey B., belongs to a different sub-family from *Buteo*, while *Cartharus aura*, the turkey B., is an Amer. vulture.

Buzzard Clock, see DOR-BEETLE.

Buzzard's Bay is a large inlet of the Atlantic Ocean on the S.E. coast of Massachusetts, U.S.A. New Bedford, the cap. of Bristol co., stands on the estuary at the mouth of Acushnet R., which falls, with other small streams, into this bay. Between B. B. and Plymouth is the largest stretch of untamed soil in the state.

Buzzer, device somewhat resembling the ordinary electric trembler bell with the gong removed. It is used to produce the intermittent excitation of an oscillatory circuit at its own natural frequency. If the circuit has been calibrated in frequency or wavelength, the attachment of a B. transforms it into a B. wave-meter, which is a convenient source of oscillations for calibrating the tuning circuits of a wireless receiver.

By, John (1781-1836), engineer and founder of Brytown, now Ottawa. He was a lieutenant-colonel in the Royal Engineers, and served in the Peninsular war. He constructed the Rideau Canal, 1827-32, in Canada, joining the Great Lakes with the St. Lawrence. The cost of over a million pounds came in for much criticism in the Brit. Parliament.

Byblos, or **Bylus**, anc. city of Phoenicia, the traditional bp. of Adonis. See JEBEL, of JEREB.

Bydgoszcz, see BROMBERG.

Byfleet, par. and vil. in N.W. Surrey, 22 m. from London. Pop. 4800.

Bygdea, tn. of Sweden in the prov. of Vesterbotten, on W. shore of gulf of Bothnia.

Byker, township in the bor. of Newcastle-on-Tyne (q.v.).

Byland Abbey, Cistercian abbey in Yorkshire, 6 m. from Easingwold. Founded 1177. The ruins were given to the nation in 1920 by Lady Julia Wombwell.

By-law, or **Bye-law**, is a private regulation generally made by councils, corporations, and companies for the control of order and fair gov. within some jurisdiction. Bs. are binding, unless contrary to the laws of the land, or to the act of any corporation, or unless they are obviously unreasonable. The power of Bs. extends to taxing, licensing, and the regulation of amusements. Fines and forfeitures may also be enforced by Bs. Corporate bodies also are empowered by their charters to make Bs. which are binding on their members. Every corporation can of necessity repeal or alter

any B. made by itself. By various statutes powers are given to bor., co., and dist. councils to make Bs. for the gov. of the said dists. Such Bs. are not enforced until after the expiration of forty days, or till a copy has been sent to a secretary of state, who has power to disallow or alter the Bs. Bs. must generally be submitted to some confirming authority for sanction and approval. For example, the Board of Trade regulates traffic on railways and tramways, the Board of Education makes Bs. compelling attendance at school, the Ministry of Health regulates, by means of Bs., the use of public baths and washhouses, lodging-houses, and slaughter-houses. Local authorities are apt to encroach on the powers of the central depts. of state by arbitrary use of Bs., but this tendency can be checked to a certain extent by the confirming authority of the appropriate gov. dept., e.g. the Bs. of co. councils must obtain the assent of the Ministry of Health, and those of a bor. corporation may be opposed by the Privy Council, while the courts also have power to pronounce on the reasonableness or otherwise of Bs. Bs. may also be made by societies, guilds, and companies.

Bylina (The Past), name given to epic songs of Russian popular poetry. Their heroes (*bogatyri*, or paladins) are mythical or historical persons, or types of the forces of nature. The mythical, or 'elder paladins', have but a small part assigned to them, the bulk dealing with the 'younger paladins' (historical figures such as St. Vladimir, Boris Godunov, Ivan the Terrible). These ballads have been collected from bards in N. Russia and Siberia, especially in the Olonetz, Archangel, and Tomsk dists. Like all poems dating from very early times, they were first handed down orally. Richard James, chaplain of the Eng. embassy in Russia (c. 1619), collected some of them, but interest was keenly aroused only in the nineteenth century. The poems are divided into sev. cycles: cycle of Kiev (chief figures Vladimir, Ilya Muromets); cycle of Novgorod, Moscow, Peter the Great, and others. Chief collections: Ribnikov, 1860-71; Kirelskii, 1868-74; Sobolenskii, 1895-1900; Avenarius's *Anthology*, 1885. Consult Ralston, *Songs of the Russian People*, 1872, and *Russian Folk-Tales*, 1873; Rambaud, *La Russie épique*, 1876; Wollner, *Untersuchungen über die Volksepik der Grossrussen*, 1879; Wesselsky, *Beiträge zur Erklärung des russischen Heldenepos* (Archiv für slavische Philologie, vol. III., 1879); *Epic Songs of Russia*, trans. by Hapgood, 1886.

Byng, George, Viscount Torrington (1663-1733), Brit. admiral, b. at Wrotham, Kent; went to sea at fifteen; was made captain by the prince of Orange in 1688, and in 1703 became rear-admiral of the Red. In 1704 he served under Sir Cloudesley Shovell, and distinguished himself at Gibraltar, and was knighted by Queen Anne for gallantry at Malaga. He was elected to Parliament in 1708, and represented Plymouth till 1721. In 1708 he was made admiral of the Blue and

defeated the Fr. fleet of the Pretender; in 1715 served against the Fr. in the Downs and was made a baronet; in 1718 dispersed the Sp. fleet off Messina, and was appointed treasurer of the navy and rear-admiral of Great Britain. In 1721 he became a Privy Counsellor, Baron Southhill and Viscount Torrington; in 1725 a Knight of the Bath, and in 1727 First Lord of the Admiralty.

Byng, John (1704-57), son of Lord Torrington, and a Brit. admiral. His father, who was most influential in naval matters, used his influence to further the interests of his son. The result was that B. received rapid and not altogether merited promotion. He entered the navy in 1718, became a captain in 1727, a rear-admiral in 1745, a vice-admiral in 1747, and an admiral in 1755. He was never given dangerous employment, but was always chosen for the more comfortable work in the navy. In 1756 he sailed from Gibraltar to relieve a garrison that was besieged in St. Philip in Minorca. When he sailed he was a man with a grievance, and he notified the ministry that he would not attempt to relieve the garrison in the face of any difficulties. He fought an ineffective naval battle with the Fr., hung round Minorca for a few days, and then returned without having done anything. The fort surrendered, and B. was brought home, tried by court-martial, and executed for not having done his utmost. As Voltaire remarked, he was shot *pour encourager les autres*.

Byng of Vimy, Julian Hedworth George, first Viscount (1862-1935), Brit. soldier. Seventh son of the second earl of Strathford. Governor-general of Canada 1921-26. Began army life as a subaltern in the 10th Hussars. 1883, reaching the rank of Lieutenant-general. 1916, and full general. 1917. He served in the Sudan expedition, 1884, including El. Teb and Tamai; in S. African war, 1899-1902, being mentioned in dispatches. Commanded 1st Cavalry Brigade, 1907-9, and the E. Anglian Div. in 1910-12, and, from 1912 to the outbreak of the First World War, he was general officer commanding in Egypt. In the First World War he commanded the 3rd Cavalry Div. of the Brit. expeditionary force till May 1915; the 9th Army Corps Mediterranean expeditionary force, 1915-16; the 17th Army Corps during 1918; the Canadian Army Corps in France, from May 1916 to June 1917, and finally the Third Army in France, from June 1917 to the end of the war. At the conclusion of the war he received the thanks of Parliament for his services and a grant of £30,000 and was by letters patent dated Oct. 7, 1919, created Baron B. of Vimy of Thorpe-le-Soken. Held many foreign decorations. In the First World War his outstanding successes were the capture of Vimy Ridge on April 9, 1917, by his Canadian troops; the execution of a brilliant piece of work in Nov. 1917 near Cambrai; and his resistance to the Gers. in their spring attack of 1918. Later, when the allied armies began the final advance to victory, his army broke the Hindenburg line (q.v.).

For the greater part of the war he commanded the Canadian Corps, and was made governor-general of Canada in 1921. Commissioner of the Metropolitan Police in 1928-32.

Bynkershoek, Cornelius van (1673-1743), Dutch jurist, b. at Middelburg, Zeeland; studied at the univ. of Franeker, and took a doctor's degree in 1694, settling down to an advocate's practice at The Hague. In 1703 he became a member of the Supreme Council of Holland, Zeeland, and W. Friesland, and in 1742 became its president. Author of numerous works on international law.

By-pass Condenser, electrical condenser used to separate alternating currents (q.v.) of any frequency from direct currents.

By-pass Valve (engineering), valve by which the flow of a fluid in a system is carried past some particular plant in operation. It is fitted in a pipe connecting the pipes leading to and from the plant and is normally closed. Where a fluid is passed through a number of filters, a B. V. is usually provided at each filter, so that any filter may be opened up for cleaning without interfering with the flow in the system.

By-products, goods of commercial value which occur in the manuf. or preparation for the market of some other commodity which is looked upon as the main product. B. have always been considered in the economic adjustment of agric. and pastoral enterprises, but it is only within recent years that their great importance in various forms of manufs. has been recognised. B. not only mean additional profit in the ordinary course of a particular business, but they also represent a means of insurance, or of levelling up the various risks; for it often happens that the markets supplied by the different products are independent, so that the dangers of a movement disastrously affecting the value of one product may be counteracted, or at any rate mitigated, by a profitable treatment of another. It may thus happen that what was considered the main product at the beginning of an enterprise may become secondary, and a former by-product may become the prin. article dealt with. Where B. have gained enhanced importance in this way it is more convenient to speak of all the marketable goods as joint products. At the present time, when chemical science enables us to treat profitably what were formerly called waste products, and when businesses design to keep many stages in the production of an article under one control, the treatment of B. makes the question of estimating costs and values an important one. The matter is fairly simple when the various products occur in a fixed and invariable ratio of quantity and quality, because the total income will be the sum of the amounts realised by each of the joint products, and an increased outlay should bring profits in roughly the same proportion. It occurs much more often, however, that certain products may be developed at the expense of others, either as regards quantity or quality

A farmer, for instance, may rear sheep principally for meat or principally for wool, but also with a view to profit by both. His methods will vary according to which he regards as the main product, and it may be a matter of somewhat nice adjustment to arrive at the more profitable of the two courses. The farmer would no doubt decide from experience, and might even experiment with different breeds and in different seasons. The case of the big manufacturing concern is often much more complex. Where the B. are numerous and valuable, it may be that the correct adjustment of the proportions of the cost allotted to the various products may make the difference between success and failure. That is to say, the particular advantage which enables a business to operate as a profit-making concern, and to keep its place among its competitors, may be the development of a by-product in a particular way. Sometimes the retention or disposal of a waste product is more expensive than its conversion into something marketable, or may constitute such a nuisance that the legislature insists upon a new method of disposal. An instance of the latter is supplied in the Leblanc process of alkali manufacture: the hydrochloric acid generated was formerly allowed to escape into the atmosphere with some danger to public health, and the manufacturers were consequently compelled to dissolve it in water in the acid towers. An interesting feature of the compulsory change was that the old Leblanc process could compete with more modern processes only in virtue of the profit gained by the sale of what was formerly a noxious waste product. However, as a process for the manufacture of soda, the Leblanc process has now been superseded by the ammonia-soda process.

Some Important By-products.—In the alkali process already referred to, another former waste product, 'alkali waste,' composed mainly of calcium sulphide, was treated for the recovery of the sulphur. In most chemical works an effort is made to utilise or render marketable all the products of the chemical action; the pyrites burnt in sulphuric acid manufacture is treated to recover the copper and iron. Soap works produce glycerine, which is often purified for sale by the soap manufacturers themselves. Brewing yields an excess of yeast which is sold to bakers and others, and the spent malt is prepared as a cattle food. In the great canning industries of the U.S.A. all the animal products, hide, hair, bones, horns, hoofs, are dealt with as near the factory as possible. Molasses and syrup are B. of the sugar industry. The oil-cake produced from the pressed seeds in linseed-oil factories is used as a cattle food. In gas-works the most notable of all illustrations of the utilisation of B. occurs. Not only is the coke sold for fuel, but the liquid or coal tar produced during the dry distillation of coal yields a variety of useful products. When subjected to fractional distillation, benzene derivatives are separated which are the basis of many different dyes, drugs used medicinally, flavouring agents,

and volatile benzols which are used as solvents and motor fuels. The ammoniacal liquor is worked up into ammonium sulphate for use as a fertiliser and formerly represented a considerable revenue. Its value as a by-product has practically disappeared owing to the extensive production of synthetic ammonia by nitrogen fixation processes. Thus, some apparently waste products become valuable B., while others, once valuable, become of little account. One example may be given: as mentioned above, in the early days of the Leblanc process, it was helped considerably by the value of the by-product hydrochloric acid, while in the early days of the electrolytic process for soda compounds chlorine was a great nuisance. To-day the situation is reversed.

Byrd, Richard Evelyn, Amer. explorer, b. at Winchester, Virginia, Oct. 25, 1888; second son of Richard Evelyn B., lawyer, member of an old Virginian family. It appears that when he was twelve he visited the Philippines, and there learned to rough it. He was educated at Shenandoah Valley Military Institute, Virginia Military Academy, and Univ. of Virginia. As a result of two accidents—one at football, the other in a gymnasium—he became lame in his right leg; yet he graduated at U.S. Naval Academy 1912, and became an ensign in the U.S. Navy. He was employed on suitable duties, rose through various grades to lieutenant-commander, and, on account of his leg, was retired on three-quarter pay, 1916. He began aviation at Pensacola in 1917, and joined the U.S. Air Force manœuvring over Canadian waters. He was in England in 1921, and narrowly missed being in the airship disaster of Aug. 23. He next entered the aviation unit of the MacMillan polar expedition of June to Oct. 1925; and then, in a Fokker three-engine monoplane with 200-h.p. Wright air-cooled motors, accompanied by Floyd Bennett, he flew to the N. Pole and back to his starting place, King's Bay, Spitzbergen, on May 9, 1926—covering 1360 m. in 154 hrs. He was then raised to the rank of commander. He also flew from New York to France in 42 hrs.—June 29 to July 1, 1927. Flew over S. Pole, 1929. Explored Antarctic (q.v.) in 1935. In 1939 he was made commander of U.S. Antarctic service, an expedition by the gov. to the Antarctic. Patron's medal Royal Geographical Society, 1931; congressional and two special congressional medals, and many other awards. (On Dec. 2, 1946, he led a new Antarctic expedition, consisting of thirteen vessels, including the flagship *Mount Olympus*, an ice-breaker, a seaplane tender, and a destroyer. The plan of the expedition was to plot as much as possible of the Antarctic continent and map the interior as far as long-range seaplanes and ice transport could penetrate. *Pub. Little America: Aerial Exploration in the Antarctic* (1931); *Discovery* (1935); *Exploring with Byrd* (1937); *Alone* (1938). See also ANTARCTIC EXPLORATION.

Byrd, or Byrde, William c. 1542-1623) Eng. musical composer, b. probably at

Lincoln and d. probably on his estate at Stondon, Essex, describing himself in his will as being 'in his eightieth year.' According to Anthony Wood B. was 'bred up to music' under Thomas Tallis, a gentleman of the Chapel Royal. About 1563 he was appointed organist of Lincoln Cathedral. In Queen Elizabeth's Chapel Royal he shared the post of organist with Tallis and about 1575 the two composers secured a licence giving them the sole right to print and sell music and in that year they pub. a collection of Lat. motets for five and six voices; but the monopoly would not appear to have been very remunerative. About 1581 B.'s name figures in lists of recusants, and though he remained at the Chapel Royal he was all his life a Catholic. In 1588 he pub. *Psalmes, Sonets, and Songs of Sadnes and Pietie* and in 1589 *Songs of Sundrie Natures*—of which a second ed. was pub. in 1610—and *Liber Primum Sacrarum Canticorum* in two series. B. was the earliest Eng. composer of madrigals and most of them were pub. in his lifetime. Two of them were included in Thomas Watson's *First Set of Italian Madrigalls Englished* in 1590. At about this time he became involved in a long law-suit over the lease of the property of Stoudon Place, which had been the estate of one Wm. Shelley from whom it had been sequestrated on conviction for treason. B. was upheld in possession by James I., even though it had been confiscated by a recusant and even though B. himself had been excommunicated. In 1607-11 he pub. *Psalmes, Songs and Sonnets: some solemn, others joyfull; Parthenia*, a collection of virginal music (in collaboration with John Bull, a noted keyboard player, and Orlando Gibbons, organist of Westminster Abbey); and two books *Gradualia* in 1607, of which a second ed. was issued in 1610. In addition to the above works B. also composed three masses, for three, four, and five voices, respectively, pub. about 1588. All of them have appeared in modern eds. and enhance B.'s claim to rank as the greatest Eng. composer of his age. He composed sacred music and secular choral music of the highest quality, in some instances reaching the sublime. He was one of the founders of the Eng. madrigal school and was a madrigalist of charm and individuality though opinions differ on whether he was in this respect the equal of Gibbons, Thomas Morley, or John Wilbye. See lives by W. H. Haddow, 1923, and E. H. Fellowes, 1929.

Byrgius, Justus (1552-1633), inventor of various astronomical instruments, was b. at Lichtensteig, canton St. Gall, Switzerland. He served under Wilhelm IV. of Hesse and Emperor Rudolf II. His first work was a celestial globe on which the stars were placed according to his own observations. He also invented a system of logarithms and some proportional compasses, but reliance cannot be placed on these.

Byrlaw is the name given to a sort of popular jurisprudence formerly in use in Scotland, in vills., and among husband-

men. As the B. was formed by common consent of the villagers or neighbours, so it was administered by judges chosen from among and by themselves. These judges were called 'B. men,' a phrase still in use in parts of Scotland to denote a judge or umpire.

Byrne, Donn (Brian Oswald Donn-Byrne) (1889-1928), Irish novelist, b. in New York. He wrote three vols. of short stories and eleven novels, the best of which are about Ireland. He estab. his reputation with *Messer Marco Polo* (1922). B. was killed in a motor accident. There is a biography by Thurston Macanley, 1930.

Byrnie, ringed shirt of mail (A.-S. *byrne*), reaching first to the knees, later only to the hips, with wide, short sleeves. Worn by ant. Scandinavian warriors.

Byrom, John (1691-1763), poet and stenographer, b. at Manchester. After studying at the Merchant Taylors' School he entered Trinity College, Cambridge. He graduated B.A., and was chosen fellow in 1714. In the same year he contributed to the *Spectator*, as John Shadow, two papers on dreams, and also his first poem, a pastoral entitled *Colin and Phoebe*. He took his M.A. in 1715 and resigned his college preferment in 1716. He went to Montpellier and there began a study of medicine. Soon after his return he married his cousin, Elizabeth B., and under pressure of necessity began to teach an improved system of shorthand in Manchester and afterwards in London. In 1740 he came into possession of the family estate at Kersall, gave up teaching, and employed his time in versifying in genial satire on topics of the day. He was a friend of John Wesley, but in 1729 he became a disciple of Wm. Law, and an ardent high Churchman. His epigram, 'God bless the King, I mean the Fifth's Defender' shows that he was a Jacobite in his political sympathies. His remarkable *Diary and Remains* were pub. in 1854-57 by the Chetham Society.

Byron, George Gordon, sixth Baron (1788-1824), son of Capt. John B. of the Guards, grandson of Adam John B. (q.v.), and great-nephew of the fifth Lord B., who was usually designated the 'wicked lord.' The future poet was descended from a race who had for generations past been noted for the looseness of their living and their lack of morals. Especially were these traits emphasised in the character of the father of the poet. B. was the son of the second marriage of Capt. B., his mother being Catherine Gordon, of Gight in Aberdeenshire, an heiress whose fortune her husband squandered. George Gordon B., so called after his maternal grandfather, was b. in Holles Street, London, on Jan. 22, 1788. His early life was passed in the tn. of Aberdeen, where he also received the first part of his education, and where he imbibed his love for the grandeur of mt. scenery, and also his knowledge of the Scriptures, a knowledge which he tells us he received at the hands of his nurse, May Gray, to whom he was devotedly attached. The future poet, who was b. with a malformation of his feet that

rendered walking distinctly arduous, could not roam about the country as he would have wished, but still seems to have spent a good deal of his time in the open. He was sent for sev. seasons to the neighbourhood of Ballater. In May 1798 his great-uncle d., and B. succeeded to the title and the estates. He and his mother immediately came S. from Aberdeen and took up their residence at Newstead. From this place B. was sent to a preparatory school at Dulwich, and later, in April 1801, he entered Harrow. There he stayed for four years, his greatest contemporary being Sir Robert Peel; his school work

LORD BYRON

showed no signs of brilliance and his reading was desultory, but his strongest point was his declamation. His friendships at school, he tells us, were passions, and altogether he was a very queer kind of boy. He was known throughout the school as the ringleader of any possible mischief, and yet he was at other times serious and thoughtful beyond his years. His lameness prevented his giving full vent to his passion for active games, yet he made a reputation as a swimmer, and he also played cricket. During his schooldays he had his first *grande passion*, the object of it being Mary Chaworth, a distant relative, and his senior in age. His first love, he tells us, was an abiding attachment on his part, and certainly a number of his early poems have his object of adoration as their theme, whilst the subject often occurs in his later poems. In Oct. 1805 he entered Trinity College, Cambridge, but his residence there is simply one long record of high living, though he formed friendships and attachments there which were worthy of his

future greatness. During the year 1806 appeared the first of his juvenile poems. *Hours of Idleness* appeared in 1807, whilst *Poems Original and Translated* appeared in 1808. The adverse criticism which the *Edinburgh Review* gave to his *Hours of Idleness* provoked the pub. In March 1809 of *English Bards and Scotch Reviewers*, which satirised the editor (Jeffrey) and the patron (Lord Holland) of the *Edinburgh Review*, but is chiefly concerned with the bards, both those he admires and those he despises. Coming of age in 1809, he immediately decided to fulfil the project which he had long had in mind of taking a prolonged tour in the E. He had already taken possession of his inheritance, and had also in the March of the year of his coming of age taken his seat in the House of Lords. Now, together with Hobhouse, his closest friend, he set out for a prolonged tour. This tour lasted for about two years. He left England in July 1809, and returned in July 1811. *Childe Harold's Pilgrimage* describes more or less accurately the events of the first year of his travels. He visited Spain and Portugal, from thence he proceeded via Malta to tour Albania and Greece. In the next year he visited Asia Minor and later Constantinople. The second year of travel is not so well known as the first, but during it the first two cantos of the *Childe Harold* were written, as were also the *Hints from Horace* and *The Curse of Minerva*. These poems were pub. on his return to England in July 1811. In the meantime his mother had d., and although he did not entertain whilst she lived a high affection for her, his grief on her death was very real. The pub. of his new poems on his return to England, and his general prominence, for on his return he took an active part in political work in the House of Lords, made him the hero of the town. He could go everywhere, he was received rapturously wherever he went, his fame sprang into existence apparently in a single night—or, as he himself says, he 'awoke one morning and found himself famous.' He was known as a rising statesman too. His output of poetry still continued to be great; in the year 1813 he pub. *The Giaour*, *The Bride of Abydos*, and wrote *The Corsair*, which was pub. at the beginning of the next year. The poems raised him to a still higher level in the ranks of poets, and increased an already great reputation. In 1813 he again met his half-sister, Mrs. Leigh, and if the stories which were currently believed are true, the new influence was not altogether for good; it is in any case well known that he always had a greater affection for his half-sister than for any other person. He was now at the height of his reputation, he was the lion of society, and he had permanently estab. his reputation as a poet. He still continued to write, and in 1814 appeared the stanzas on the abdication of Napoleon, and the sequel to *The Corsair*, *Lara* (Aug. 1814). In the same year he engaged himself to Anne Isabella Milbanke, the heiress to a peerage in her own right, and his marriage to her

took place in the Jan. of the following year. Husband and wife finally settled down in Piccadilly Terrace, London. From his correspondence, the early days of his marriage seem to have been spent quite happily, but there is no doubt that his conduct was often eccentric even to the verge of madness. He wrote but little poetry. *Hebrew Melodies* appeared in April 1815. Almost immediately after the birth of their child, Lady B. fled from her husband's house and claimed the protection of her father, and the couple separated. The exact reason for the separation is unknown. The work *Astoria*, pub. in 1805, attempted to prove the charge of incestuous intercourse with Mrs. Leigh, whilst *Byron, the Last Phase*, 1909, by Robert Edgecombe, defended the poet on that charge. The separation was the talk of London for a considerable time, and B. came rapidly down from his high position. He was now the most unpopular man in town. He fled from social ostracism, and immediately the articles of separation were signed he started on a European tour. He spent the early part of his tour with Shelley, and his poetry pub. at this time shows obviously the influence of Wordsworth, which had affected him through Shelley. Among the poems written in 1816-17 were *Siege of Corinth*, *Parisina*, *Prisoner of Chillon* (and other poems). *Childe Harold's Pilgrimage*, cant. iii., *Monody on the Death of Sheridan*, *Manfred*, and *Lament of Tasso*. From 1816 to 1819 B., who was accompanied by Hobhouse, lived near Venice. His life at Venice was one long deliberate attempt to forget the past in an orgy of profligacy, but during the whole of the time his active mind was at work, and he was continually busy with his poetry. The fourth canto of *Childe Harold* was worked up at this time, and pub. in 1818, and in the Sept. of the same year he started *Don Juan*. The process of his composition and of the publication was slow. Cantos i. and ii. appeared in 1819, iii., iv., and v. in 1821, and cantos vi.-xiv. in the years 1823-24. *Don Juan* was intended to be his great poem with a plan setting forth the ideas, morals, and principles of his school of poetry. In 1819 also had appeared *Mazeppa* and an ode on Venice. In 1819 B. met an It. countess, Teresa Guiccioli, who for the next four years remained B.'s mistress, and was rewarded with his fidelity and constancy. He was politically the friend of freedom, the champion of liberty on the Continent, and on the Continent he earned both influence and power. In 1819 B. left Venice and went to Ravenna. Here in 1821 appeared *Sardanapalus*, *The Two Foscari*, and *Cain* (pub. together). *The Prophecy of Dante*, cantos iii.-v. of *Don Juan*, *Marino Faliero*, and *Doge of Venice*, were also pub. in 1821. In 1822 appeared the *Vision of Judgment*. In the following year appeared *Heaven and Earth, a Mystery*, and the same year was pub. *The Island, or Christian and his Comrades*, a poem suggested by the mutiny of the *Bounty*, *Age of Bronze*, and *Werner*. In 1823, hearing that he was elected

a member of the Gk. Committee, he hastened to the help of Greece and of Grecian independence with money, advice, and finally his presence. Arriving at Missolonghi in Jan. 1824, he was accorded the welcome of a king, and took an active part in the councils of the Gks. He does not seem, however, to have realised that his health was breaking down, but by the beginning of April it was obvious to all that his days were numbered, and on the 19th of that month he d., in his thirty-sixth year. His poetry has been accurately described as the poetry of glory and passion. His love of liberty characterised his poems also, and certainly in the desire to see the fettered nations of Europe free he was in the forefront of his times. Works, ed. by G. E. Prothero (Letters and Journals) and E. H. Coleridge (Poetry), 13 vols., 1898-1904; W. M. Rossetti and T. Secombe, 1911. See also L. Hunt, *Lord Byron and some of his Contemporaries*, 1828; E. J. Trelawney, *Recollections of the Last Days of Shelley and Byron*, 1838; J. Nichol, *Byron*, 1880; A. Brecknock, *The Pilgrim Poet*, 1911; E. C. Mayne, *Byron*, 2 vols., 1912; H. Nicolson, *Byron: the Last Journey*, 1823-24, 1924; A. Maurois, *Byron*, 1930; I. C. Clarke, *Shelley and Byron*, 1934; C. E. Villiamy, *Byron*, 1948.

Byron, Henry James (1834-84), Eng. dramatist, was b. at Manchester. He entered the Middle Temple in 1858. He was the first editor of *Fun*, and for many years was a popular writer of burlesques, comedies, etc. He leased sev. theatres, and appeared on the stage of them himself sometimes. For instance, in 1869 he appeared in his own drama entitled *Not such a Fool as He Looks*. His best known and most popular work is *Our Boys*, which appeared in 1875. His other works, which were numerous, include *An American Lady* (1874); *Old Sailors* (1876); *A Fool and his Money* (1880); *Cyril's Success* (1868), his best piece from a dramatic point of view; *War to the Death* (1866); and *£200,000 Sterling* (1867).

Byron, John (1723-86), Eng. vice-admiral, grandfather of the poet. As a midshipman he was shipwrecked on the W. coast of Patagonia, and was a prisoner for three years, returning to England in 1745. Having distinguished himself in the wars against France, he was put in command of an expedition of discovery to the S. seas. In the course of this voyage he explored the coasts of Patagonia, the Falkland Is., and the strait of Magellan, discovered sev. new lands, and sailed round the world. B.'s Isle, named after him, he discovered in the track from King George's Is. to Tinian. He was made a vice-admiral in 1776. Commanded the Brit. squadron in the W. Indies during the Amer. war. His *Voyage round the World in the Years 1733-48* (1767) was trans. into Fr. in 1769 and ed. by Hawkesworth (q.v.) in his *Voyages* (1773). Dr. Johnson's successor on the *Gentleman's Magazine* in 1773. He d. in London.

Byrsonima, tropical Amer. shrub of the

family Malpighiaceæ. The bark of all the species yields a brilliant red dye, and is used for tanning. Its fruit is edible.

Bysmalith, body of igneous rock which has the shape of a cone underground. Vertical displacement accompanied by faulting characterises this method of intrusion of a molten mass. Mt. Holmes, in the Yellowstone Park, U.S.A., is a good example of a B.

Byssus, group of silky fibres secreted by the foot of the mussels and molluscs, as a means of attachment to rocks. The

Bytown, former name of the city of Ottawa, Canada, under which it was founded in 1829. It became Ottawa on its incorporation in 1834.

Bytownite, rare felspar containing 14 to 18 per cent CaO and intermediate between labradorite and anorthite. Seldom occurs in crystals, but usually found in greenish-white massive, as from the original locality, Bytown (q.v.). A component of basic igneous rocks and sometimes the chief constituent of anorthosite.

B. of some rock creatures can be woven into fabrics. A delicate silk called B. is made from the B. of mussels found in the Mediterranean.

Byström, Johan Niklas (1783-1848), Swedish sculptor, b. at Philipstad. He went to Stockholm, studied for three years under Sergel, and visited Rome, 1810. His 'Reclining Bacchante' (half-size), sent home from there, won him recognition as one of the foremost Swedish sculptors. In 1816, on returning home, he brought with him a portrait statue of Bernadotte as Mars. He was prof. of sculpture at the academy, Stockholm. His best works are his female figures: 'Hebe,' 'Pandora,' 'Juno suckling Hercules,' 'Girl entering the Bath.' His huge statues of Swedish kings (Gustavus Adolphus, Charles X., XI., XII.) won great admiration. B. also did the altar decorations in Linköping Cathedral, and 'Linnæus' at Upsala.

Bytom, see BEUTHEN.

Byzantine Architecture, style developed in the E. Empire after the settlement of Constantine at Byzantium. It continued with full vigour until the capture of Constantinople by the Turks in '1453, and its influence on Mohammedan architecture in the E. has since been very great. The style is of great interest as showing the Gk. spirit working on Asiatic lines. At the founding of Constantinople in the fourth century, Rom. art was in its decadence. Already the signs of breaking up are visible, but even in the V. there are signs of the development of a new style, as in the palace of Diocletian at Spalato. At the new cap., a field was provided for the exercise of the arts, and the union of two different schools produced a new architecture. The plan remained either round or basilican in form, but the arch replaced the line of the architrave, and the dome was adopted, this last becoming the leading constructive feature. Domes were now placed over

square apartments, whereas in the old Rom. style they had only been placed over circular apartments. The square was brought to the circle by 'pendentives' which brought the four corners of the square up to form a circular base for the dome. Smaller domes are frequently grouped round a large central dome which rises from four great piers at the corners of a square. In the church (later, a mosque) of St. Sophia at Constantinople, this central square is 107 ft. long, and the length of the church is increased by the addition of semi-domes at each end. Round the lower part of the dome a

O. Demus, *Byzantine Mosaic Decoration*, 1948.

Byzantine Art. By B. A. is meant the characteristic art of the Byzantine Empire (q.v.) We can affix no absolutely definite date for its commencement, but we can practically take the period which saw the separation of the E. and W. empires as the period of the beginning of this art. It had enormous influence both upon the E. and the W., being itself also influenced by E. and W. Up to the period of the separation of the empires we may regard art as that of the classical period, and B. A. may to a very great

BYZANTINE CAPITALS FROM SAN VITALE, RAVENNA

row of windows is placed. The classical columns were also developed, no less than seven kinds of capital being evolved: the Byzantine Ionic, Byzantine Corinthian, impost, melon, bowl, bird, and basket, and wind-blown acanthus. Four of these types are found in St. Sophia. A great feature of B. A. is the internal ornament. After construction, the walls were sheathed internally with marble, the vaults being covered with coloured mosaics on a golden background. Glass, rendered opaque with oxide of tin, was generally used for this purpose. The golden period of B. A. was reached in the reign of Justinian (A.D. 527-65), when the churches of St. Sophia, SS. Sergius and Bacchus, and the Holy Apostles were erected. B. A. was carried W. by the medieval merchants, and the style is found in the churches of St. Mark at Venice, San Vitale at Ravenna, St. Front at Périgueux, etc. The Rom. Catholic cathedral at Westminster is a modern building erected in this style. See also ARCHITECTURE, *Byzantine*. See

extent be regarded as Rom. art under the influence of the E. It reached its highest point in or just after the reign of Justinian, after which it sank slowly into decadence, to rise again for a short time into prominence during the eleventh and twelfth centuries. The dominant form is essentially the characteristic of Byzantine architecture (q.v.). This was a development of the Rom. art influenced largely by Persian architecture and by Gk. culture, both of which found a common meeting-ground in Constantinople. The two chief types are the basilican type and the circular or central type. Of the latter type the chief examples are SS. Sergius and Bacchus (Constantinople) and San Vitale (Ravenna), whilst the outstanding example of the magnificence of Byzantine architecture is to be found in the church of Holy Wisdom (St. Sophia) at Constantinople. Byzantine decoration differs from that of the W., especially from that of Gothic art, since it is always flat and incised and contrasts with the bold, outstanding decoration of the Gothic

type. That B. A. had a great influence upon the W. cannot be doubted, since the influence of St. Mark's (Venice), which is essentially Byzantine, has been very great; and undoubtedly not only in architecture, but also in painting the E. was responsible for the revival of interest which culminated in the Renaissance movement. Other great features of B. A. were the mosaics and paintings. These have been condemned because of the lack of expression of the faces and the rigidity and fixity of the figures. But it is necessary to remember that it was almost impossible to represent the great scenes and topics usually depicted by B. A. in any other manner, and that the characteristic types of B. A. are also characteristic of the topic which they represent. Byzantine metal-work and carving also hold a unique place in the hist. of the art of the world. This came under very great influence from the E., and in time came to be regarded almost as a barbaric art. Ivory carving and silk pattern weaving also were developed under Byzantine influence, and reached a great pitch during the period of Byzantine greatness. See D. T. Rice, *Byzantine Art*, 1935, and C. Stewart, *Byzantine Legacy*, 1947.

Byzantine Empire. This empire is often distinguished by various other names, such as Gk. Empire, Later Empire, E. Empire, or E. Rom. Empire, and may be said to have sprung into existence with the founding of the city of Constantinople by the great Constantine. It is necessary, however, to emphasise and to keep in mind always the fact that the B. E. was essentially Rom., and carried on the ideas and ideals of the Rom. Empire for a thousand years after the empire in the W. had perished. The adoption of Christianity by Constantine and the founding of the great city of Constantinople made the B. E. essentially Christian and Rom.; it gave the new ideals of the empire a permanent abode, and for centuries, even when the B. E. seemed at its weakest, it formed the bulwark of Christian resistance to the attacks of paganism. The div. of the Rom. Empire during the fourth and fifth centuries did not add to its strength, and during this period we see the two divs. brought frequently into hostile relations with each other. Both suffered from the attacks of barbarians, and often it seemed that both divs. would succumb to the onslaughts of the vigorous races which at this time were threatening the empire. The last emperor of the W., the usurper Romulus Augustulus, was deposed by the Teutonic general Odoacer, who set up for himself a kingdom in Italy, divided the land amongst his soldiers, and intimidated to the emperor at Constantinople (Zeno) that it was unnecessary to have two rulers of the empire, and that in future Italy would look to the emperor at Constantinople as its head. Perforce Zeno had to be content. During the period which had just passed, and in the years which immediately followed, the W. Empire had been broken up. Britain was abandoned, Spain was in the hands of the Visigoths,

Gaul was being conquered by the Franks, N. Africa was in the hands of the Vandals, Rome itself was ruled by the authority of a barbaric and vigorous Ger. soldier.

In the E. affairs had not assumed a much lighter hue, the Balkan peninsula was inhabited by Slavonic tribes, the Ostrogoths threatened the cap. itself, but the danger passed. The Ostrogoths migrated under their great leader Theodoric to Italy, the fields of Italy were their share of the spoil, the Ger. kingdom was replaced by the rule of Theodoric and his Ostrogoths. Theodoric, although nominally the subject of the emperor, was essentially independent. Under his guidance Italy flourished, and it would probably have been better for Italy had a strong line of Ostrogothic kings been able to follow Theodoric and carry out his policy. But Theodoric d. to all intents and purposes, without heirs, and the kingdom fell swiftly before the attacks of the E. Empire and the Lombards. The emperors at Constantinople were once again able to assert their sway over Italy, and indeed actually to rule part of it. Zeno had been succeeded in 491 by Anastasius, and he was in turn followed by the founder of the Justinian dynasty in 518. Justinian I. succeeded in 527 and ruled until 565. He had to the full the ideas and ideals of the great Rom. Empire. He aspired to restore some of her original boundaries, to make her great in war and peace, in art and commerce, in extent and religion. On every side during his reign we see considerable progress. The kingdom of the Vandals, weakened by the excesses of a barbaric race new to civilisation, fell before the vigorous onslaught of the Rom. general Belisarius, the resistance of the Ostrogoths was overcome and a large part of Italy restored by the feats of Belisarius and Narses, part of Spain was reconquered, and on the whole it appeared that the greatness of the Rom. Empire would be restored. In the realm of law Justinian was equally famous, and his Code is in itself enough to perpetuate his name. But during his reign faction fights came to a climax and were waged more fiercely than ever. The great work of the rebuilding of the empire commenced by Justinian was undone by his successors, and it must be conceded that the weakness of the empire immediately after the death of Justinian was due to a great extent to the policy of that emperor. His schemes were magnificent, his ideals mostly good, but the empire could not bear the expense of continual war and conquest. The period which falls between the death of Justinian (565) and the succession of Heraclius (610) is the darkest of all periods in the hist. of the empire.

In that time the Lombards conquered part of Italy, continual war took place with the Avars, war was almost continuous with Persia, and the gates of empire were about to be threatened by a worse foe than the Persians—the Saracens. In the time of Phocas and Heraclius the Asiatic provs. were slowly but surely falling into the hands of the Saracens. The strain of gov. broke Heraclius, and then

followed a period of almost complete anarchy. The empire was beset with enemies, the Saracens conquered most of the Asiatic provs., the Bulgars brought the empire to her knees and extracted tribute. Syria had fallen long before. Egypt was conquered, N. Africa fell into the hands of the all-conquering Saracen. The power of Islam seemed to be irresistible; the struggle of Cross and Crescent appeared to be on the verge of being settled in favour of the Crescent, but on two occasions, when the danger seemed the greatest, the empire was saved by her cap. Twice was the cap. besieged by the Mualims, and twice were the attacks beaten off; on both occasions Gk. fire helped largely in the saving of the city. The Heraclian dynasty came to an end in blood and anarchy, and the Syrian Leo III. became emperor (Leo the Isaurian). It is necessary to point out here that by this time the B. E. had become essentially Gk. The institutions were still Rom., but the prevailing spirit was Gk., and had been so almost from the time of the end of the reign of Justinian.

With the beginning of the Isaurian dynasty we see the commencement of better times for the empire. The iconoclastic policy of the emperor, however, has overshadowed his greatness. The army and the finances were reorganised, and the Saracens were repulsed. But the exarchate of Ravenna was lost, and some more provs. fell into the hands of the Saracens, but on the whole the rule of Leo was good. Unfortunately the controversy which for one hundred years was to shake the empire began. This was the question of image-worship. The hist. of the period of Isaurian rule is the hist. of constant struggle with Bulgar, Saracen, and Russian, and also of continual religious dispute. Under Constantine VI., the great-grandson of Leo III., the power passed from the hands of the emperor to the hands of his mother Irene. She caused her son to be blinded and usurped the power. She d. in 802, after she had vainly attempted to negotiate a marriage with Charles the Great, who by his restoration of the W. Empire in 800 had finally and irrevocably separated the two empires. The war with the Bulgars and with the Saracens continued. Constantinople was again besieged in 815, and Crete and Sicily passed into the hands of the Saracens. Under Theodora, the widow of Theophilus, the iconoclastic controversy was brought to an end by the Council of Nicea in 842: image-worship was recognised and restored. In 867 the Isaurian dynasty finally came to an end, and Basil I., the Macedonian, founded the Macedonian dynasty, which lasted until almost the end of the eleventh century. The rule of the Macedonian emperors was noted for its vigour and ability, and during this period the Gks. more than held their own with Saracen, Bulgar, and Russian. At the beginning of the eleventh century (1028) the power of the empire passed into the hands of the Empress Zoe, the wife of Romanus III., who caused her husband to be assassi-

nated, and raised in rapid succession to the imperial throne Michael IV., Michael V., and Constantine IX. In 1054 Theodora, the sister of Zoe, was made empress. Michael VI. was chosen by Theodora as her successor shortly before her death in 1056. He was forced to abdicate by Isaac I. (Comnenus), who had defeated his army in Phrygia (Aug. 1057), and spent the rest of his life in a monastery. New enemies now appeared, however. The It. possessions of the empire were being attacked by the all-conquering Normans, whilst on her E. frontiers a more formidable enemy than the Saracen appeared. The Saracens had been driven out in turn by a fierce, warlike tribe from the interior of Asia—the Seljukian Turk. The destined conquerors of the E. Empire had at last reached the frontiers. The appearance almost at the same time of the Normans and the Seljukian Turks boded ill for the empire. The emperor appealed to Europe for help against the Seljukian Turk, and his answer was to him at least unexpected and unwelcome—the first crusade. Conquests made in Asia Minor were restored to the emperor, but the foundation of the Lat. kingdom of Jerusalem was a crushing blow to the empire of the E. The emperors saw full well that a Lat. kingdom in the E. meant that the chief routes to that kingdom would lie in their ter, or over their seas, and that it would be necessary now to protect the empire from the W. as well as the E. The hostility thus engendered between the E. and the W. was made much worse by the continual quarrel between the Rom. and the Orthodox churches. The papacy aimed at unity of empire and church—by peaceful means if possible, but if not by any or all means. The emperors themselves began to revive the old ideals of a universal empire, which they hoped to establish by means of the hostility of the papacy to the empire (W.). The policy of the Normans was undisputedly that of the overthrow of the E. Empire. The W. policy of the Emperor Manuel Comnenus was very unpopular in the E. Empire, and he was overthrown. The empire was not strong, taxation and oppression had permanently weakened it, the Bulgars were strong enough to reassert their independence, and with the beginning of the thirteenth century came the overthrow of the empire. Isaac Angelus and his son, who had been driven from Constantinople, came westward and joined the forces who were preparing for the fourth crusade. They persuaded the leaders, in spite of the opposition of the papacy, to turn aside to Constantinople and to restore them to the throne of the empire. Isaac Angelus was restored, but the newly restored emperor was unable to fulfil his promises to reconcile the Gk. and Rom. Churches and to aid the crusaders. The partition of the empire was agreed to by the crusaders, and a Lat. Empire was set up, an empire founded on purely feudal lines, which did more than anything else to disintegrate the E. Empire and to prepare it for its ultimate fate at the hands of the Turks.

Venice, a rising and increasing power, had seen that the newly estab. empire should not be a menace to her own power, and the decline of the Lat. Empire was remarkably rapid. The crime of the sacking of Constantinople, and the breaking up of the empire, was, however, unpremeditated; circumstances had played into their hands, and the leaders of the fourth crusade merely took advantage of that fact. The empire was divided up, and all the states were made subordinate to the Lat. emperors, the first of whom was Baldwin of Flanders. Opposition to the Lat. Empire was quickly organised. Ten years after its commencement it had begun to decline, and in 1261 Constantinople was captured by the Gk. emperor, Michael Palaeologus. The next century and a half marked the increase in power of the Turk and the Serb. The Serbs, after crushing the Bulgars, were themselves finally crushed towards the end of the fourteenth century by the Turks. The Turks gradually won possession after possession of the E. Empire in Asia Minor, and then, about 1360, crossed over to the mainland of Europe, and gradually conquered the whole of the Balkan Peninsula and threatened Hungary. At the beginning of the fifteenth century the Mongol defeat of the Turks checked their career, but by 1420 they had recovered, and Constantinople was again attacked. In 1443 the Christians, who had rallied to the help of the empire, won a victory which, however, was fully avenged in 1444 at Varna. In April 1453 began the final siege of Constantinople, and in May the walls were breached and the city taken, the Emperor Constantine XI. falling in the final assault. The city was captured on May 29, 1453. With the fall of Constantinople we can say that the E. Empire fell. By 1460 the whole of the Balkan Peninsula was in the hands of the Turks—an inevitable sequel to the Norman expansion eastward and the Turkish westward.

Bibliography: J. B. Bury, *History of the Later Roman Empire from the Death of Theodosius I. to the Death of Justinian*, A.D. 345 to A.D. 565 (2 vols.), 1923; C. Diehl, *History of the Byzantine Empire* (Princeton), 1925; N. H. Baynes, *The Byzantine Empire*, 1925; S. Runciman, *Byzantine Civilisation*, 1933.

Byzantine Literature, literature written in Gk. from the period when Constantine moved the cap. of the Rom. Empire to Byzantium until the fall of the city in 1453. This literature is vast in extent, and its value in many depts. of learning is considerable. The exact period of its birth is unknown, as its earliest works almost fall in with the Graeco-Rom. period, but its beginning may be placed about the reign of Justinian. The architects of this period were mathematicians, and produced sev. works on mechanics. In hist., though no great genius appears, there is an innumerable host of small historians and chroniclers who wrote not only on the hist. and customs of their own city, but also universal hist. Beginning with Agathias

in the sixth century, some names of these are Anna Comnena, Cinnamus, Nicephorus Gregoras, Michael Ducas, Georgius Phrantzes, and Laonicus Chalcoylites. In addition to these, Procopius wrote a Byzantine hist., Eusebius a universal hist., Proxagoras a hist. of Constantinople, Nicetas Acominatus a hist. of the Byzantine emperors. These are but a few of a host of writers, many of whose works were collected by Niebuhr and others and pub. in 1828–53 as the *Corpus Scriptorum Historiae Byzantinae*. Rhetoric was also cultivated, the chief names being those of Johannes Doxopater, Alexis Comnenus (emperor), Georgius of Cyprus, and Demetrius Cydones. The study of the philosophies of Plato and of Aristotle never ceased from Proclus in the fifth century till the great Michael Psellus in the eleventh, though this study was not a favourite one. The discussion of theological problems engaged most of the great intellects of all ages. The well-known names of Chrysostom, Cyril, Photius, and Gregory of Nazianzus rank first, and in the fourteenth century come those of Nicephorus Gregoras, Johannes Cantacuzenus, and Cyparissiotis, and this list might easily be added to. Some original poetry was written, though not of a high order, by Psides, Theodosius, Prodomus, Philus, etc. The study of the anc. authors was carried on with great vigour, but hardly anything of great value was written in any of the commentaries. Among Byzantine scholiasts may be named Tzetzes, Eustathius, Moschopoulos, Thomas Magister, and Triclinius. See C. Krumpholtz, *Geschichte der byzantinischen Literatur*, 1897.

Byzantium, an-t. Gk. city on the shores of the Bosphorus, occupying the most easterly of the seven hills of modern Istanbul (Constantinople). It was founded by a body of Megarians about the year 657 B.C., and quickly, owing to its position, became a settlement of considerable importance. The settlement was destroyed by the satrap Otanes, in the reign of Darius Hystaspes, but was recolonised by Pausanias the Spartan, who took it from the Medes after the battle of Plataea (479 B.C.). A few years after this second settlement, Cimon (son of Miltiades) seized it from the Spartans, but in 440 B.C. the city revolted and returned to its former allegiance under the Athenians. When Pausanias founded the second settlement there flocked to the city a mixed pop. of Athenians and Spartans—whence the subsequent conflicts. During the Peloponnesian war (431–404 B.C.) the city was a constant source of contention between the Athenians and the Spartans, falling into the hands of each party in turn, and continuing to change hands even after that war and until it achieved its independence of both, only to fall into the hands of the Macedonians. Before this, however, it passed through many vicissitudes. Clearchus, a Spartan general of the fifth century B.C., became harvest of B., but in his absence the city was surrendered to the Athenians. Subsequently Clearchus (q.v.)

was sent into Thrace to protect the Gk. colonies, but was recalled by the ephors. He refused to obey and made himself master of B., ruling as a despot and thereby alienated the sympathies of the Athenians. Alcibiades, after a close blockade, won the city through the treachery of the Athenian party, and thereafter B. remained the ally of Athens until it was recaptured by Lysander (405 B.C.). Under the Spartans it was in danger of pillage by the Ten Thousand (see TEN THOUSAND, EXPEDITION OF THE), who were, however, repressed by Xenophon. In 390 B.C. Thrasybulus, the Athenian, succeeded in wresting the city from the Spartan oligarchy and in restoring democracy and the Athenian influence there. After resisting an attempt by Kpanimondas to restore it to the Spartans, the city co-operated with Rhodes, Chios, and other Ægean is. states in securing their independence of Athenian suzerainty; but, on the advance of Philip of Macedon against B., the city quickly sought the help of Athens. Under Phocion, the Athenian statesman and general, Philip was forced to raise the

siege. The deliverance of the city through the 'miraculous' flash of light, which revealed the advancing Macedonian host, so appealed to the imagination of the Byzantines that they erected an altar to torch-bearing Hecate and impressed a crescent on their coinage as a symbol of the portent. B. struggled against and repelled threatened invasions of the Gauls, and for some time enjoyed a certain amount of independence. It became an allied city of Rome, but was later reduced to the position of an ordinary Rom. colony. Severus attacked and captured it, levelling it to the ground, and afterwards rebuilding a considerable portion of it. Constantine, seeing the advantages of the natural position of the city, made it his new cap., and built a magnificent city there. The new cap. of the Rom. Empire was inaugurated in A.D. 330. The emblem of the crescent was adopted by the inhab. of B., and was afterwards adopted by the Turks during their possession of the city. The tn. received the name of Constantinople when it was rebuilt and occupied by Constantine.

C, third letter of the Rom. alphabet, had originally (in the Semitic, Gk., and Etruscan alphabets) the shape of 4 (Semitic), 7 or 7 (Gk.), and > or < (Etruscan), becoming rounded in the Etruscan and Rom. alphabets, 3 or C. Its sound was originally (in the Semitic and Gk. alphabets) that of *g*. The Etruscans, knowing no distinction between *k* and *g*, employed the letter C both for *g* and *k*. When the Romans adopted this letter they continued to employ it for *g* and *k*, but in 312 B.C. they created a new letter for the sound *g* (adding a bar to C: G), retaining the letter C for the sound *k*. Consequently, when the letter C was introduced into Britain, it was used only to represent the hard sound of *k* (cf. O.E. *cyn*, *brecan*, *rōc*, with Mod. E. *kin*, *break*, *rock*). In It., Fr., and Eng., C retained the sound *k* when followed by *a*, *o*, *u*, or a consonant other than *h* (cf. O.E. *call*, *corn*, *cuman* (come), *clēw*, with their modern equivalents); ... before *e*, *i*, *y*, it tended to become palatalised to a sound resembling *sch*, *sch*, and finally *ch* (cf. Lat. *castra*, a camp, with O.E. *ceastre*, Mod. E. *Chester*). When, in Eng., C retained the *k*-sound before *e*, *i*, and *y*, it was written *c* to avoid confusion. The palatalised C before *e* and *y* was written *ch*, as in Fr. *thus*, O.E. *rice*, *cild*, developed into Mod. E. *rich*, *child*. O.E. *cw* was abandoned, and the Fr. *qu* or *qu* adopted (cf. O.E. *cwēn*, M.E. *quene*, and Mod. E. *queen*; O.E. *cweðan*, Mod. E. *quoth*). See also ALPHABET.

C, in music, is the name applied to one of the notes of the gamut. The scale of C major is called the natural scale, because it has neither sharps nor flats. The scale of C minor has three flats, E, A, and B. C is also used to represent common time, i.e. four crotchets in a bar.

Caaba, see KAABA.

Caating Whale, see CA'ING.

Cab, form of horsed vehicle, with two or four wheels, for carrying passengers. At the beginning of the nineteenth century the *cabriolet de place*, invented about 1660 by Nicholas Sauvage, was introduced into London from Paris. The first eight licensed cabs—this shortening was adopted as early as 1825—appeared on London streets in 1823. Besides the driver they could carry two passengers inside and were run for fares which were one-third less than those of the hackney coach. A contemporary newspaper refers to the fact that 'cabriolets were in honour of his majesty's birthday introduced to the public this morning' (April 23, 1832). These Cs stood for hire in Portland Street, W., were painted yellow, and were limited in number to twelve. But the limit to their number was soon removed in spite of vested interests, as their popularity

increased so fast. The cabriolet which had superseded the old hackney coach (Peppys's 'hackenée') was in its turn supplanted by a new kind of C. invented by M. Boulton. In this vehicle the occupants faced one another and the driver sat on top. Finally in 1836 a larger C., a cheaper imitation of the brougham, came into use. The Clarence four-wheeler was only an improvement of this design. As a rival to the 'growler' the 'hansom' (invented by Joseph Hansom) was patented in 1834. This consisted originally of a square framework on two wheels with a 7½-ft. diameter (see illustration, p. 84). Its good speed, due largely to its lightness, and its spruce appearance and pleasant bounding motion, made it a matter of regret to many when this means of street locomotion was superseded in the metropolis by the taxi-C. (motor). In 1886 there were 3997 four-wheelers and 7020 hansoms in London. The advent of the petrol-driven vehicle discouraged manufacturers from putting further improvements such as india-rubber tyres, etc., for horse-drawn Cs. Cabmen's shelters, first estab. in 1875, by providing accommodation for drivers on the stands did much to encourage sobriety. Taximeters have been widely extended to ordinary hackney carriages. These are mechanical contrivances which register the fare—the calculation of the amount being made on a combined basis of time and distance. The Acts which regulate the traffic of hackney carriages or Cs. in London are the Hackney Carriage Acts, 1831-53; the Metropolitan Public Carriages Act, 1869; the London Cab Act, 1896; and the London Cab and Stage Carriage Act of 1907. These Acts protect drivers against fraudulent passengers, regulate the licensing, lighting, and stand for the Cs., and also state the just fares and the rules for hiring. Licences, which are only granted to men of approved character who have satisfied the authority that they have studied the topography of the place, are issued by the commissioner of police, who is authorised to do this by the home secretary.

Cabal (Fr. *cabale*, Heb. *kabālāh*, something received with an idea of secrecy). The word 'cabal' with the meaning of 'club' or 'association of intriguers' had been popularly applied to the secret councillors of the king even under James I.; and the accidental coincidence that, in 1671, the Cabinet consisted of the five unprincipled ministers of Charles II., Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initials of whose names made up the word cabal, caused the latter designation to be used for some years as synonymous with cabinet, and did much to bring the cabinet system of

government into disrepute. Moreover, though convenient and even necessary for administrative purposes, cabinet government, in the form it assumed at this period, was unquestionably fraught with dangers, because it deprived the Privy Council of all power to check the actions of the king, and vested the real government of the country in a clique of ministers practically irresponsible to the nation. The word *cabal* is now applied to any intriguing faction that works in secret for private or political ends.

HANSOM CAB

E.N.A.

Caballero, Francisco Largo (b. 1869), Sp. republican leader; was a mason by trade. Prominent in trade union organisation. Chairman of the Sp. Socialist party. Frequently imprisoned for his advanced political activities and sentenced to death in 1917, but released. From 1931 to 1933 he was minister of labour in the gov. of Azana (*q.v.*). Arrested temporarily by the Lerroux Gov., 1934. In Sept. 1936, during the Sp. civil war, he became Prime Minister of the Republican Gov., and it was in him that all hopes of Republican victory were centred. The Cortes unanimously granted to C. and his colleagues dictatorial powers to work for the final triumph of the Republican cause and suspended its sittings *sine die*. C. introduced conscription for all areas under the gov.'s control and launched an offensive against Franco's forces N. of the cap., and for a time those forces were held in check. But Franco, helped by Germany and Italy, was stronger at sea, and when, in Feb. 1937, Málaga fell, the gov.'s chances in the whole war were fatally prejudiced. In the late spring of that year C. was superseded by Dr. Negrín, his fall being due partly to the disaffection of the Communist party and partly to Azana's dislike of extremism. On the fall of the republic he took refuge abroad.

Cabanatuan, cap. of the prov. of Nueva Ecija, Philippine Is., and one of its chief commercial centres. Pop. 15,000.

Cabanel, Alexandre (1823-89), Fr. painter, b. at Montpellier and studied under Picot. Attention was first called to him by his 'Death of Moses' (1852), and

his reputation was thoroughly estab. by the works which followed: 'St. Augustine and St. Monica' and 'The Florentine Painter.' C. distinguished himself in *genre*, historical, and portrait paintings. Other works of his are 'The Christian Martyr,' 'The Birth of Venus,' and 'Adam and Eve.'

Cabanis, Pierre Jean Georges (1757-1808), Fr. physician and writer, b. at Cosnac, Corrèze. During the revolution he acted as physician and friend to Mirabeau; in 1797 he was made clinical prof. in the medical school at Paris, he was elected to the Five Hundred, and, under Napoleon, became a member of the Senate. C. wrote extensively on medicine and on metaphysics. Consult Dubois, *Examen des doctrines de Cabanis*, 1842, and Labrousse, *Quelques notes sur Cabanis*, 1903.

Cabaret, Fr. word which in its original signification meant simply a booth or wooden shelter. Its use to-day is restricted to that of a small tavern or wine-shop. In a more popular sense it denotes the entertainment—singing and dancing—in hotels and restaurants after theatre hours.

Cabatuan, municipality in the Philippine Is., 15 m. N. of Iloilo. Pop. 15,000.

Cabbage (*Brassica oleracea*), native to Britain, though it has been said by Alphonse de Candolle that it is in reality descended from the one or two species still to be found growing wild on the Mediterranean coast. In any case the cultivated varieties now differ very much from the original kind. The wild C. is a somewhat insignificant plant, growing from 1 to 2 ft. high, resembling in appearance the corn mustard, the only difference being its smooth leaves. The following is a classification of the sev. kinds of cultivated Cs.: (1) All the leaf-buds active and open, as in the wild C. and kale. (2) All the leaf-buds active, but forming heads, as in Brussels sprouts. (3) Only the terminal leaf-bud active, forming a head, as in common C. (4) The terminal leaf-bud alone active and open, with flowers abortive and succulent, as in cauliflower and broccoli. (5) All leaf-buds active and open, with the flowers abortive and succulent, as in sprouting broccoli. A very interesting variety of C. is grown in the Channel Is., known as the Jersey C. Its usual height is about 8 ft., but it has been known to reach a height of 16 ft. The central stem is so woody that it is used for the making of walking-sticks. Some varieties are even cultivated as ornamental plants on account of the beauty of their leaves in form and colour. Brussels sprouts resemble miniature Cs. Nothing seems to be known as to the origin of the plant, but according to Van Mons (1765-1842) it was heard of in 1213 by the name of *spruyten*. It is most hardy and productive, and ready for use in Nov., and lasts till the following March. The savoy is a hardy green variety, with the characteristic of producing very crinkled leaves. The cauliflower is said to have been brought from Cyprus, where it appears to have been cultivated for ages. It grows well in a

rich soil, with a sheltered position, and is a vegetable with a most delicate flavour. Broccoli is a variety of cauliflower. The earliest sowing of C. should be made early in March, to be ready for use in July and Aug., and another sowing should take place at the end of March, to ensure a supply from Aug. to Nov. The most important of all is the autumn sowing, which should be made the last week in Aug. Kohl-rabi cabbage (*Brassica oleracea caulorapa*), with a turnip-shaped stem, is used in England as food for cattle. The C. is a biennial, and to obtain seed for future use plants should be left until the second year.

CABBAGE

Left: Wild cabbage. Right, upper: Garden cabbage
Right, lower: Savoy

Cabbage-bark Tree (*Andira inermis*), evergreen tree of the order Leguminosae, indigenous to the W. Indies. It has leaves about 12 in. long, with purple flowers. Its bark is useful as an antidote to intestinal worms.

Cabbage Butterfly is a name common to sev. species, the larvæ (caterpillars) of which feed on the leaves of cruciferous plants, especially of cabbages. The large white (*Pieris brassicae*) is a very common species in Great Britain. The expanded wings measure 3 in. across, and are white with black edgings. The female, which is the prettier, having black spots on the upper surfaces of the wings, lays her yellow eggs in clusters on the leaves of caterpillar food. The fully grown caterpillar sometimes measures 1½ in., and will eat twice its own weight of leaf in twenty-four hours. After it has hung for some time by its tail from a ledge, it is changed into a shining pale green chrysalis. The butterfly, which, in the case of the autumn brood, waits till winter is past before coming out, lives daintily on nectar. The small white, or turnip butterfly (*P. rapae*), has a wing expansion of about 2 in., lays its eggs singly on the

under side of vegetable leaves, and produces a velvety caterpillar which devours the hearts, instead of merely the leaves, of cabbages. It is often, therefore, a still more dangerous pest than the large white. The chrysalis is brownish-yellow with black spots. The third species, the green-veined white butterfly (*P. napi*), which is similar to the small white, cannot multiply so fast, because both the butterfly and its caterpillar are a favourite food of small birds. A watch should be kept for eggs of cabbage whites, and when found they must be destroyed. Cabbages should be dusted with Derris, or other insecticide, prevention of an attack being easier than a cure. Ichneumon flies parasitise the caterpillars and help to control them.

Cabbage Palm, or Cabbage Tree. There are many different species, the prin. being the *Areca* (or *Roystonea*) *oleracea*. It is a native of the W. Indies, where it often grows to the height of 100 ft. It owes its name to the fact of the terminal bud being edible and in form resembling a cabbage. The removal of the terminal bud quite destroys the tree.

Cabbage Wood, see PARTRIDGE WOOD.

Cabbala (Heb. *kabbālâh*, something received, hence tradition), the designation of a mystic system of philosophy, theosophy, and magic, once prevalent among the Jews. Its popularity began in the twelfth century and continued till the sixteenth. It has now few adherents—these for the most part in E. Europe. The Cabbalists taught a pantheistic doctrine that there was one Being and that nothing existed but this one Being and its manifestations. God, therefore, was an Absolute Being, and from Him emanated ten attributes—wisdom, understanding, mercy, and the like—that as this Being became conscious of its existence, it poured itself through 'channels' into the world of pure spirits and angels, and into the lower world, which thereupon came into existence; that the soul of man passed from body to body, till it finally returned to and became absorbed in God. Their teaching was obviously influenced by the idealistic philosophy of Plato, combined with the degenerate philosophies of the Neoplatonists. The Cabbalists attached much significance to numbers. The fact that every letter in Heb. stands for a number enabled them to read into the Scriptures many strange doctrines. Every passage was regarded as symbolic. It was claimed that their doctrine had been revealed, according to some, to Abraham, and, according to others, to Adam; the tradition was passed on by word of mouth until it was felt necessary to put the mystic lore into written form. The authoritative documents of C. are (1) the *Sefer Jezirâh*, 'Book of Creation,' supposed to have been written by Rabbi Akiba (d. A.D. 135). (2) The *Sefer Hazzohar*, 'Book of Light,' commonly called Zohar. It is written in a form of Aramaic which shows it to have been composed in the twelfth or thirteenth century, and some have suggested that the author might have been Moses de Leon of Spain.

Other Cabbalistic writers were R. Moses ben Nachman, better known as Ramban (1195-1270); Pico della Mirandola (*Conclusiones Cabbalisticæ*, 1517). See K. von Rosenroth, *Kabbala Denudata*, 1677-78, and C. D. Ginsberg, *The Kabbala*, 1865.

Cabeiri, *Tha*, see **CABIRI**.

Cabell, James Branch (b. 1879), Amer. novelist and genealogist, b. at Richmond, Virginia. He was teacher of Fr. and Gk. at William and Mary College, 1896-97; graduated 1898. Considerable journalistic experience. He first came into notice with his novel *Jurgen*, attacked for immorality, and temporarily suspended. The background of sev. of his stories is the fanciful country of Poictesme, notably the series referred to as the 'Biography of Manuel,' purporting to trace the lineage of its nobility from Dom Manuel, count of Poictesme, to his Virginian descendants. He has been criticised for 'the opulent monotony of his decorative manner.' Among his romances are *Gallantry* (1907); *Chivalry* (1909); *The River in Grandfather's Neck* (1915); *Jurgen* (1919); *The Silver Stallion* (1926); *Something About Eve* (1927); *Townsend of Lichfield* (1930); *These Restless Heads* (1932); *Smirt* (1934); *Preface to the Past* (1936); *The King was in His Counting House* (1938); *The First Gentleman of America* (1942). See C. van Doren, *James Branch Cabell*, 1925, and G. Holt, *Bibliography of the Writings of James Branch Cabell*, 1924.

Caber, **Tossing**, is especially a Scottish sport—a conspicuous event in most Highland games. It consists in throwing a slim tree-trunk, often 20 ft. long, in such a way that, after spinning in the air, it will fall in a straight line with the 'tossler,' the smaller end being farthest from the thrower. The C., the diameter of whose thin end should not be more than 3 in., must be hurled as far as possible from the thrower.

Cabes, or **Gabes**, oasis of date palms in Tunis with 20,000 inhab., including 1500 Europeans. It exports dates.

Cabet, Etienne (1788-1856), Fr. Communist and a leader of the Carbonari, was the son of a cooper of Dijon. Under Louis-Philippe he became procureur-général of Corsica. Bitter attacks on the gov., made in the Chamber of Deputies of which he was a member, led to his voluntary exile in England (1834). On his return to France in 1839, after the declaration of a general amnesty, he pub. a fierce hist. of the Fr. Revolution in four vols. (1840), and later, in his *Voyage en Icarie*, a romance wherein he expressed his communistic ideals. Determined to put some of them into practice, he sent out in 1848, with the approval of Robert Owen, a colony of 1500 'Icarians' to a tract of land in Texas. But the community of property, which was to have been the special feature of the settlement, proved an utter failure. In 1849 C. himself sailed to America and transferred the settlers to Nauvoo in Illinois. For a time he ruled his little band like an autocrat, but was finally banished in 1856, the year of his death at St. Louis.

Cabeza del Buey (head of the bullock),

tn. of Spain, in the prov. of Badajoz, 86 m. E. by S.E. of that city. There are manufs. of linen and woollen goods. Pop. 12,000.

Cabildo, or **Ayuntamiento**, corporation of old Spain which has been likened by some writers erroneously to the municipal councils of England, but which in no way resembled them. The Cs. owed their creation to the desire of the Sp. monarchs to curb the power of the nobles, and if an illustration be sought more fully to explain their nature, it may be looked for in the medieval It. republics. The 'illustrious Cabildo' existed throughout the Sp. Empire, and under Sp. rule Trinidad too had its C. The C. played so prominent a part in the hist. of Trinidad, not only under the former rulers of the colony but even after Abercromby had captured it for England, that its minutes are still valuable records of events in the former administrative life of the colony. The term *cabildo* signifies a 'congress or assembly,' composed of the chief magistrates, aldermen, and others, charged with the administration and internal gov. of a tn.; and it appears that the Cs. date from a period in the hist. of Spain when the grandes, taking advantage of the great judicial powers conferred on them at the foundation of the monarchy, began to tyrannise over the middle and lower classes, and to aspire to entire independence and even to usurp the rights of the monarch himself. In order to prevent the evils resulting from this state of things, the Sp. kings, in the eleventh and twelfth centuries, estab. the Cs., or councils of the people, confiding to them civil and criminal jurisdiction, as well as all matters of municipal gov., but reserving to themselves the right of hearing appeals and complaints from persons dissatisfied with the decision of these tribunals. In each tn. the C. was composed of the heads of families or notables—persons who, either from social standing or wealth, wielded a certain influence—and in it were discussed and regulated all questions touching the public weal. The alcaldes or magistrates for the year, as also the other officers of civil and criminal justice, and all the functionaries charged with the internal administration of the tn., were also elected from, or appointed by, the C. Cs. existed in all the Sp. colonies, but of course had to undergo certain modifications, rendered necessary by circumstances. S. America, for instance, was governed by viceroys having under them provs. ruled by captains-general, whilst colonies like Trinidad were placed under governors, supreme in military matters, but who, for purposes of civil gov., were only corregidores of their Cs. See L. M. Fraser, *History of Trinidad*, 1891.

Cabin (It. *capanna*, Sp. *cabuña*): 1. Small room in a ship used as a sleeping apartment. A swinging hammock or cot is sometimes called a hanging C. 2. Rude shelter or hut, small house or cottage. Also a temporary shelter for stores.

Cabinda, or **Kabinda**, cap. and the name of a ter. in Portuguese W. Africa, in the dist. of Angola, N. of the Congo. Has

a coast trade and builds boats. Pop. over 9000.

Cabinet, term recognised by the conventions of the Brit. Constitution, but not by the law, applied to the body of men who are chosen from the political party in power to fill the highest executive offices in the state, and who, by their apparently or really unanimous policy, direct the gov., and are collectively responsible for every act of the Crown.

History of the Cabinet.—There were indications of an inner council of the state before the Tudor period, but they are of an indefinite nature. Even before the Conquest there always existed a body of advisers of the Crown distinct from the General Assembly. After the Conquest that body was known as the Continual Council or Concilium Ordinarium, and was in effect a permanent committee of the National or Common Council which became merged in the larger assembly whenever it was convened. Nominally, this committee was the instrument of the royal prerogative. Under the weaker monarchs it was virtually independent. Then the Common Council gradually evolves itself into the National Parliament, and the Concilium Ordinarium becomes a strictly official body distinct from it and wielding enormous executive powers, its members being bound by a special oath of fidelity and secrecy. During the reign of Henry VI. a nucleus forms within the Concilium Ordinarium called the Concilium Privatum, or Privy Council, constituting the king's constitutional body of advisers, while the Concilium Ordinarium, no longer consulted on executive matters, lapses into a body of legal advisers or figures in the Star Chamber. The Privy Council continued to be the king's advisers down to the reign of Charles II. That monarch found its numbers too large and the restraints it imposed on his actions irksome. He therefore resorted to the practice of confiding in a 'cabal' or clique of confidants. Sir Wm. Temple eventually persuaded him to agree to the alternative plan of forming a select committee of the Privy Council, called the C. Council. This distinction between the C. and the Privy Council has existed ever since that time, although the C. Council, or C., in its present form dates rather from the revolution of 1688 or shortly after. The Privy Council has at the present day no executive or deliberative functions, but is really that part of the constitutional machine which exists for the purpose of carrying into effect the decisions of the C. The Cs. of William III. and Anne were chosen from both Whigs and Tories for the most part. William III. was strongly opposed to gov. by party, but from force of circumstances began after 1693 to entrust the chief administrative offices to the Whigs. The resulting body was popularly known as the Junto. When the Whigs went out of power the ministry did not feel compelled to resign. Queen Anne was especially averse from party gov., and it was only after the accession of George I. that party gov., or parl. gov. by means of a ministry com-

posed nominally of king's servants but actually of an executive committee representing the will of the majority in the House of Commons, becomes finally and firmly estab., a result due rather to the fortuitous circumstance that both that monarch and George II. acquiesced in the domination of their ministers, and absented themselves from the deliberations of the C., partly because they could not understand Eng. and Eng. affairs, and partly because they preferred to devote their energies to Hanover. Finally, on the advent of Pitt's ministry of 1783, the idea of a C. consisting of men willing to serve under a Prime Minister, and to adhere to a definite programme, became an estab. necessity.

Characteristics and Nature of the Modern Cabinet.—The C. or ministry of the day is a committee of leading members of the two Houses of Parliament nominated by the Crown, but consisting exclusively of statesmen whose opinions on the most important questions of the time agree in the main with the opinions of the majority of the House of Commons. The C. now invariably includes the six secretaries of state, the first lord of the treasury, the chancellor of the exchequer, the lord chancellor, and the president of the Council (until the formation of the Irish Free State (Eire) it also included the now defunct lord-lieutenant of Ireland or his chief secretary). In recent years the secretary for Scotland, the minister of agriculture, the president of the board of trade, and the ministers of health and labour, together with the secretary of state for dominion (now commonwealth relations) affairs, have been members. A novel feature in 1912 was the inclusion of the attorney-general, Sir Rufus Isaacs (Earl Reading). Nearly all the members of the C. are chiefs of depts., but frequently one or two experienced ministers are included for the sake of their advice, and to these are assigned such offices as Lord Privy Seal or chancellor of the duchy of Lancaster. The postmaster-general and the first commissioner of works are sometimes but not necessarily members of the C.

The result of the estab. of our system of gov. upon a representative basis is that the C. is collectively responsible to Parliament for the policy it pursues, and, in theory, the members of the C. are obliged to stand or fall together, and to act as one man on all questions relating to the executive gov., so that if one of them dissents from the rest on a question too important to admit of compromise, it is his duty to resign. When the policy of the C. no longer commands the approval of the majority of the House of Commons, the ministers are in duty bound to resign *en bloc*.

The C. is presided over by a chief who is conventionally known as the Prime Minister or Premier, but is unknown to the law except in his capacity of first lord of the treasury, or as holder of some other executive office, and as a member of the Privy Council, which latter body by a legal fiction is the constitutional advisory

council of the king. The Premier now has, however, a definite precedence allotted to him. The C. or Ministry (the terms being almost synonymous) is called into existence by the sovereign, generally taking the advice of the outgoing Premier as to who shall be sent for and asked to form the new ministry. In practice the sovereign's choice is really limited to some two or three names at most, for political usage has estab. the claim of the leader of the dominating party or coalition of parties to be sent for by the monarch. According to Bagehot, if any one else were sent for it would be his duty to press the claims of the true leader, and he cites the case of Lord Granville being invited in the first place to form a new ministry instead of Mr. Gladstone. The new premier then chooses his fellow C. ministers, but, till recently, custom did not permit him to exclude ex-ministers belonging to his party. In theory all members of the C. should defer to the Premier, and if they differ on a vital question of principle, they ought to resign. Differences of opinion when publicly manifested bring the C. to an end, because by the conventions of the constitution all the members of the C. are jointly and severally responsible for all its measures. A definite split in the C. makes it incumbent on the Premier, after endeavouring to bring his colleagues into agreement, to seek as a last resource an interview with the king.

The relations of the king and the C. are such that the king is constitutionally obliged to take the C.'s advice, lend it his moral and social support, and dismiss any high gov. official who opposes its wishes. The C. is bound, as is each individual member, to inform the king on all important measures of the executive, but the Premier has the exclusive right to approach the sovereign personally on all important matters of state. Other ministers, however, have a right to discuss with the king matters merely departmental.

The phrase 'ministerial responsibility,' which is intimately bound up in treatises on the constitution with the nature and functions of the C., and which, in its strict sense, denotes the legal responsibility of every minister for every act of the Crown in which he takes part, is a convention resulting from the theory that 'the king can do no wrong,' and from the refusal of the courts to recognise any act as done by the Crown which is not done in a particular form—a form in general involving the affixing of a particular seal or the counter-signature of a minister (Dicey). Ministerial responsibility in the sense that ministers are liable to lose office if they are unable to retain the confidence of the House of Commons is a theory depending on the conventions of the constitution, with which the law has no direct concern.

No C. can take or retain office without a working majority, though it is difficult to state precisely what would constitute such a majority. A modern C. would not retain power for a week if a vote of cen-

sure were passed by a newly elected House of Commons. The king can, if he chooses, dismiss the C., but such conduct, though legal, would generally be unconstitutional. To dismiss a C. which commanded the confidence of the House of Commons for the time being would only be justified by the return of a majority for the opposite party at the ensuing election.

The C. is a wholly secret body. Its meetings are in theory and in reality secret. Nor is any non-member allowed to be present at its sittings, except on rare occasions, when some departmental official is summoned to give special information. Since the First World War there has been estab. a secretariat, with secretary and assistant secretary, the former official holding also the office of clerk to the Privy Council. Disclosures of C. decisions are made only with the permission of the sovereign, such permission in practice being obtained through the intervention of the Premier. The result of the evolution of the powers of the C. Council is that that body is *de facto* the gov. of Great Britain, the king being but the visible symbol of power. It is true that it is necessary to consult the sovereign before any definite step is taken, even though that step is in the direction of legislation. But practically all the powers by law vested in the sovereign are in practice exercised by the members of the C. Whatever in legal theory the Brit. polity may be, this in reality is the form of the active governing machinery of the Brit. Constitution.

While the foregoing is the generally accepted view of the position and functions of the C., it is to be observed that Bagehot, in *The English Constitution*, acutely defines the C. as a combining committee—a hyphen which fastens the legislative part to the executive part of the State; that while in its origin it belongs to the one, in its functions it belongs to the other; and that though it is a committee of the legislative assembly, it is a committee which can actually dissolve the Parliament which appointed it, and appeal if it chooses to the next Parliament. His theory is a refutation of the dogma that in our polity the legislative and executive powers are entrusted to separate sets of persons, each independent of the other, and asserts that the peculiar excellence of the Eng. Constitution is the practical fusion of the executive and legislative powers through the C. In comparing the C. with the presidential system of the U.S.A., in which latter system the legislative and executive powers are independent of each other, Bagehot comes to the conclusion that the C. system is superior in that it facilitates administration, obviates the disadvantage of making the people the real executive-choosing body, eliminates corruption, and gets rid of the antagonism between the legislature and the executive which, springing from the fact that the House of Representatives is elected by one process and the president of another, ends in the impairment of each. The delicate relations of the C. to the Crown on the one hand and to the

Houses of Parliament and the people on the other, as well as the internal relations of its members to each other and to the premier, are clearly expressed by Gladstone in *Gleanings of Past Years* thus: 'The association of the Ministers with the Parliament and through the House of Commons with the people is the counterpart of their association with the Crown and the prerogative. The decisions they take are taken under the competing pressure of a bias this way and a bias that way, and strictly represent what is termed in mechanics the composition of forces.' Such a description could not be applied to a presidential system like that of the U.S.A., where the president is elected for a fixed term. Dicey, however, justly doubts whether the Eng. Constitution may not be undergoing an insensible change due to the increasing authority of the electorate. He believes a general election may in effect be a popular election of a particular statesman to the premiership, and that the time may come when, though all the forms of the constitution remain unchanged, an Eng. Prime Minister will be as truly elected to office by a popular vote as is the Amer. president.

In substance, the C. is the directing body of the national policy, or at least until very recent times it has been generally so believed. On the other hand it might appear to-day that a party caucus is the real directing power behind the C., a position that might be difficult to sustain. The main functions of the C. were set out in the report of the Machinery of Gov. Committee (C. 9230 of 1918) as: (a) the final determination of the policy to be submitted to Parliament; (b) the supreme control of the national executive in accordance with the policy prescribed by Parliament; and (c) the continuous co-ordination and delimitation of the authorities of the sev. depts. of State. Rightly this statement draws no distinction between legislation and administration. In the modern State, most legislation, indeed, is directed towards the creation or modification of administrative powers. The C. is a general controlling body. Many of its members are departmental ministers. It neither desires nor is it able to deal with the multiple details of gov. It expects a minister to take all decisions which are not of real political importance. Certain matters are conventionally regarded as being outside the C.'s competence. Lord Oxford and Asquith said that, speaking generally, the exercise of the prerogative of mercy, the personnel of the C., and the making of appointments, are not discussed in the C. But the question of the reprove of Sir Roger Casement in 1916 was brought before the C., though normally the prerogative is left to the home secretary. Again the personnel of the C. has often been discussed by the C. In the past, though usually in exceptional circumstances. Another matter which is seldom discussed in C. is the conferment of honours. Yet another, which to-day is never discussed in C., is the exercise of

the prerogative of dissolving Parliament. This is, however, a recent development, and if the Prime Minister wants the advice of the C. there is nothing to prevent him from raising the question. Until 1916 there was no C. office and no secretary, and there were, therefore, no formal agenda. This unbusinesslike system completely broke down under the stress of war. One of the first acts of Lloyd George was to set up a C. secretariat to organise the business of the War C. This secretariat was the secretariat of the committee of Imperial Defence. On the formation of the War C. in 1916 Lloyd George attached the war committee's secretariat to the C. Thus, the secretariat of the committee of Imperial Defence became the secretariat of the C. The C. secretariat and the secretariat of the committee of Imperial Defence are now administratively distinct, though there are important elements of contact. The C. takes decisions by a majority whenever it cannot reach an agreed solution. It seems that the practice of taking votes and deciding by a majority did not originate until 1880. The decision to arrest Dillon in 1881 was carried by Gladstone's casting vote. The question of the removal of the duke of Wellington's statue from Hyde Park Corner in 1883 was decided by a show of hands. In any case, the taking of votes is exceptional. It is said that on the Education Bill in 1901 the C. divided sev. times, a practice which, according to Fitzroy (*Memoirs*), large Cs. have rendered unavoidable. The C. itself is a committee, and it reaches its conclusions in much the same way as other committees—discusses a subject from various aspects until some compromise emerges. A minister who resigns from the C. usually desires to make an explanation in Parliament, and since this involves an explanation of C. discussions, he must get the king's consent. For this purpose he asks permission through the Prime Minister. But this rule is not always obeyed, and generally speaking it is difficult to prevent revelations of C. discussions when they are matters of political controversy, nor is the press left entirely without guidance through the usual 'understood' formula. The taking of notes by any minister other than the Prime Minister was for long forbidden. Since 1916, however, there have been formal C. minutes. Unless the C. otherwise directs, the secretary to the C. or his deputy is present at every C. meeting. He takes no part in the discussion unless his opinion is asked on a particular point (such as a point of procedure), but merely makes a note of the C.'s decisions. This note is known officially as the C. 'conclusions,' though more popularly as the C. 'minutes.' The C. secretariat is not in any sense an advisory body. It does not make recommendations. It does not interfere with departmental responsibility. As to C. solidarity or collective responsibility, the precedents are unconvincing. 'It may be said, first, that the Prime Minister is frequently in a position to pledge his

colleagues' support, because the only alternative is his own resignation. Secondly, a minister should not announce a new policy without C. consent; but, if he does, the C. must either support him or accept his resignation. Thirdly, a minister ought to be chary about expressing personal opinions about future policy except after consultation; and if the circumstances are such as to pledge the gov., the Prime Minister has a real cause for complaint. Any statement in advance of a C. decision is dangerous to the stability of the gov.' (W. Ivor Jennings, *Cabinet Government*, 1936).

One of the most notable changes produced by the First World War was the creation of the Imperial War C., which first met in 1917, under the presidency of Lloyd George, the Brit. Prime Minister. It consisted of the members of the Brit. War C. sitting with the representatives of the dominions and India who were attending the Imperial Conference of 1917. While the Imperial War C. was in session the overseas members had access to all the information at the disposal of the home gov. and had a status of absolute equality with the members of the War C. of Great Britain. The Imperial War C. sat during the whole period of the Imperial Conference of 1917, and in 1918 it was in session from June to Aug. At the conclusion of this session it was announced that, in view of the success of the experiment, the Prime Ministers of the dominions should, in future, have the right, whenever they deemed fit, to communicate on matters of C. importance direct with the Prime Minister of the United Kingdom. Although the dominions were fully consulted by the home gov. in all the peace negotiations, the termination of hostilities saw an end to the Imperial War C. as such.

The War C. of the United Kingdom had, of course, no formal existence. In the early days of the war it was felt strongly that the normal C. of twenty-one or twenty-two members was ill adapted to the requirements of war, when speedy decisions are often necessary. Even in normal times there is a kind of inner C., of five or six of the prin., or strongest, ministers who really formulate policy. When under the stress of war the Coalition Gov. came into being, it naturally followed that the leaders of the constituent parties were stronger than others of the ministers, and were more frequently consulted by the Premier. As these others were content to leave matters in safe hands, the War C. was gradually evolved. As in the case of the Imperial War C., this war creation died a natural death on the cessation of hostilities. On the outbreak of the Second World War in 1939 a War C. of nine members was formed, consisting of the Prime Minister, chancellor of the exchequer, secretary of state for foreign affairs, minister for co-ordination of defence, first lord of the admiralty, secretary of state for war, secretary of state for air, lord privy seal, and minister without portfolio. The C. secre-

tariat previously referred to, also a product of the war days, still survives. See also succeeding article.

The Cabinet in the United States.—The development of the C. in the U.S.A. took quite a different turn from that of Great Britain which has served as the model for most of the European countries. In Great Britain the Prime Minister is the chosen leader of the political party which has the largest representation in the House of Commons, and his colleagues in the C. usually belong to the same political faith, and have to be members either of the Commons or of the Lords. In the U.S.A. the C. is named by the President. It consists of the heads of the great governmental depts., and serves as his advisor. It meets with him every week and discusses questions of policy, the President's being the final word. C. ministers are not members of the Amer. Congress. In fact, if a congressman or senator is named to a C. post, he resigns his position in the Congress. It is the usual thing for the President, when he is sworn into office on inauguration day, to transmit to the U.S. Senate his list of C. officers. These have to be confirmed by a majority vote of the Senate, and this is usually done as a matter of course.

Again, in the Brit. Gov. C. ministers, being members of Parliament, sit in the sessions of the House to which they belong, submit to questions by members, and take an active part in the debates, particularly in matters affecting their respective depts. No Amer. C. minister has the right to take part in Congressional debates. He can be asked for information by a congressman or senator by letter, or personal interview, or he can be summoned before a Congressional committee and asked questions. But even then he can refuse if the answer is deemed 'incompatible with the public interest.'

The Amer. C., as to size, is a matter of gradual growth corresponding to the increase in power, wealth, and business of the country. Under George Washington, the first President, it consisted of the secretary of state (corresponding to the minister of foreign affairs in Great Britain); secretary of the treasury, secretary of war, attorney-general, and postmaster-general. Under President John Adams, the second chief executive, the C. was increased by a secretary of the navy in 1798. Under President Taylor in 1849 there was added a secretary of the interior. In 1889 under President Grover Cleveland the farming interests of the country were considered so important that a secretary of agriculture was named. Under President Theodore Roosevelt in 1903 the new post of secretary of commerce and labour was created; but under President Woodrow Wilson in 1913 their duties were separated, and he named a secretary of commerce and a secretary of labour. Each new C. post is authorised by an Act of Congress (see under ACT). The position of secretary of state is considered the greatest post within the President's gift, although the salary is the same as that of the other C. ministers.

He not only handles foreign affairs, but is also the medium of correspondence between the President and the governors of the various states in the union; has the custody of the great seal of the U.S.A. and countersigns and affixes such seal to all executive proclamations, and is the custodian of the treaties made with foreign nations and of the laws of the U.S.A.

There is also this notable difference from the Brit. C. system; in Great Britain, Premier and C. ministers only hold their posts so long as they have command of the House of Commons. In the U.S.A., just as the President is immovable for the four-year term for which he is elected (unless impeached and removed), so are his C. ministers unless he asks them to resign. Thus it has often happened in the hist. of the U.S.A. that the majority in one or both houses of Congress belonged to one political party, while the President and his C. belonged to another.

Cabinet, Imperial War. The I. W. C. was instituted in 1917 for the purpose of giving dominion statesmen a direct, continuous, and effective share in the decisions taken by the Brit. Gov. on questions relating to the foreign policy of the empire as a whole. The Premiers and other leading ministers of the dominions were convened with Brit. ministers on a footing of absolute equality, in a Cabinet which not only discussed but decided the main questions of the conduct of the war, both military and diplomatic. Prior to 1917 arrangements had been made through Imperial conferences to bring dominion statesmen into consultation with the Brit. Gov., but constitutionally speaking, this position was not satisfactory, for the reason that the dominion representatives had no direct share in the decisions taken. In 1918 it was decided, with a view to the War Cabinet meeting continuously, that dominion ministers should be appointed to reside permanently in London as members of the Cabinet. Meantime the dominion premiers were to continue to be *ex officio* members of the Cabinet and, when unable to attend personally, communicated directly with the Brit. premier on Cabinet matters. Thus at last the "equal nationhood," to use Sir Robert

Borden's phrase, of the dominions and the United Kingdom within the empire came to be recognised. But the system, if better than the old arrangement of conferences, was faulty in that the Imperial Gov. was not a gov. in the constitutional sense; it did not possess the unity and coherence of a gov. answerable to a single Parliament and electorate; its members were responsible to six different parliaments and electorates and might, obviously, be individually removed and replaced at different times and for different reasons as a consequence of political changes either in the United Kingdom or in the dominions which might conceivably have no sort of bearing on the imperial questions falling within the purview of the Imperial Cabinet. On the outbreak of the Second World War, in Sept. 1939, no arrangements were made for including dominion ministers in the War Cabinet. After two months, however, one minister from each of the four dominions (Canada, Australia, New Zealand, and the Union of S. Africa) came to London for a brief stay in order to co-ordinate the war efforts of the dominions with that of the United Kingdom. But they did not become members of the War Cabinet and, indeed, it may be observed that the development in the dominions in the previous twenty years of an ever more independent outlook on foreign affairs has probably precluded the likelihood of the experiment of 1917-18 being repeated. Whether the solidarity and unity of the Empire or Commonwealth in foreign policy, or whether the efficacy of the conjoint or co-ordinated war effort would be prejudiced by the omission to form an I. W. C., may be very much doubted; for experience in the Second World War showed that the conventional system of frequent consultation by an exchange of visits, coupled with the appointment of high commissioners in the United Kingdom and in the dominions, effected the same purposes and the war found the empire fully united on its policy (Eire alone remaining neutral).

Cabinet Noir, special secret dept. of the postal service, in which letters may be opened and read, then resealed and sent on. This system was first organised in France under Louis XIV., and was destroyed with all systems of the same nature at the revolution. It was again estab. under Napoleon, but was given up on the formation of the republic.

Cabiri (Cabeiri), The, group of mystic deities in Gk. mythology who have been variously identified with Demeter, Persephone, and Rhea; with the Dioscuri; and with Dionysus and Hermes.

Cable, large rope or iron chain used on ships to hold the anchor. CAs. are made of hemp or jute, of galvanised or zinc wire, and of chain. Rope CAs. vary from 3 to 25 in. in circumference. Hemp and wire ropes are used for towing and mooring purposes, whereas chain ropes are used on steamships, where they can be moved and manipulated by steam engines. Steam CAs. are made in links in 12½-fathom lengths.

In the mercantile service the chains are made to 15-fathom lengths.

Submarine Cables.—A submarine telegraph C. consists of a central stranded copper conductor covered by sev. layers of insulating material such as gutta percha, parra gutta, or polythene. A comparatively weak electric current is employed for transmission, because the preservation of the C. from both internal and external injury is necessarily of the first importance, a weak current not being liable to

and Japan. The last Brit.-owned C. laid was the long-projected Pacific C. connecting Vancouver with Australia, which was completed in the opening years of the present century.

As regards make, the principles underlying the design and manuf. of Cs. had by the beginning of the twentieth century become so well estab. that the recent years have witnessed but little alteration, except in the direction of improvements effected in materials and in the application of

Postmaster-General

REPAIR WORK BY A BRITISH POST OFFICE CABLE SHIP

The cable has been hooked up from the sea-bed by the grapnel.

eat the wires so as to injure the insulating material. Furthermore, the receiving instrument must be so sensitive that it can be operated by the weak current, hence neither the sounder nor ordinary register, which need much stronger currents, can be used.

Up to comparatively recent years Britain enjoyed a monopoly in respect of Cs., but later both France and Germany made some progress towards rendering themselves independent of the Brit. Cs. Both these countries have for many years past been linked with America by Cs. owned by themselves, though the manuf. and laying of those Cs. were effected by a Brit. company.

The spread of the C. system has naturally followed the trade routes, and hence their trend has, apart from the C. to America, been eastward as far as Australia

more rigorous tests. As protection against submarine animals (e.g. toredo worm), the core has been protected with a thin layer of brass tape, while to secure the detection of masked faults after submergence some manufacturers have adopted the practice of subjecting the core to a hydraulic pressure of 4 tons to the sq. in. and an electric pressure of 5000 volts from an alternating current transformer. Finally, it is to be observed that the open type of sheathing adopted in the early Atlantic C. has been abandoned, the deep sea portion now being sheathed with tempered galvanised steel wires, offering a breaking strain of over 80 tons per sq. in. It is difficult to estimate the life of a C., so much depending on the nature of the sea-bed, but the limit may be placed at up to fifty years. See C. Bright, *Submarine Telegraphy*, 1898, *Story of the Atlantic*

Cable, 1903, and *Life of Sir Charles Tiltton Bright*, 1908; C. Baines, *Submarine Cables, Testing and Working*, 1932; S. Garham and R. Hadfield, *Submarine Cable*, 1934.

Cable, George Washington (1844-1925), Amer. author, was b. at New Orleans, Oct. 12, his father being of an old Virginian family, and his mother a New Englander. He became a clerk at the age of fourteen, entered the 4th Mississippi Cavalry of the Confederate Army in 1863, and at the close of the war (in which he narrowly escaped death) began his journalistic career in his native city. His *Old Creole Days*, which is a series of sketches of the old Fr.-Amer. life of New Orleans, first appeared in *Scribner's Monthly*, and served to introduce to the public a writer peculiarly gifted with descriptive powers and with a sympathetic insight into both the humorous and pathetic sides of life. His first novel, *The Grandissimes* (1880), gives an accurate picture of Creole life in Louisiana a century ago. *The Creoles of Louisiana* (1884) was a hist. of the people, and roused considerable indignation among the Creoles themselves. In his *Dr. Sevier* (1883), which is probably his finest work of fiction, he reproduced with remarkable success the gentle Fr.-Eng. dialect of Louisiana. Life in the marshy lowlands at the mouth of the Mississippi is faithfully depicted in his short stories, *Belles Demeiselles Plantation*. Other books are *Bonaventure* (1885), *The Cavalier* (1901), and *Kincard's Battery* (1908). For some time also he ed. *Current Literature*, a New York monthly. In literature C. suggested fresh and higher ideals for the historic novel. He d. at St. Petersburg, Florida.

Cable Ducts, see under SUBWAY.

Cable Ways, in civil engineering, overhead cables, used for the transport of goods, though also used in some mt. dists. for passenger traffic. Also called aerial ropeways. The cable and hauling gear are carried on trestles, which may be erected on irregular ground or carried over streams and ravines. The C. W. system has been developed in recent years owing to the increased use of electrical power for industrial purposes. Thus, at the Penmaenawr quarries, in Wales, where quarrying is carried on at heights up to 1500 ft. above sea level, this system of transport of materials is of the greatest use.

Cabot, John (Caboto, Giovanni) (1450-1498), discoverer of N. America, was a Genoese who became a naturalised Venetian and finally settled as a merchant in Bristol. News having reached England that Columbus had discovered a vast new ter., C., in 1497, set out in the *Mathew*, and after fifty-two days' sail landed on Cape Breton Is., where he planted the royal flag. His name is associated with the earliest attempts to reach India by the N.W. Passage; in 1496 Henry VII. granted letters patent to C. and his sons to fit out ships for the exploration of that route. C. and his sons failed, but they discovered Newfoundland and sailed along the coast of Labrador to Virginia. This was C.'s second voyage of discovery

and was begun at some date between 1497 and 1498. He had heard from João Fernandes about Greenland, and thinking it part of the Asiatic continent made his way in that direction. But once more, though he explored E. and W. the coasts of Greenland, reached Baffin Land and lighted on Newfoundland and Nova Scotia, he was obliged at length to return home, baffled in his search for Cipangu, or Japan, which was to have been the open door through which England passed to reach spices and the fine merchandise of the E. To C. must be credited the discovery of Newfoundland and other fisheries.

Cabot, Sebastian (c. 1474-1557), navigator and cartographer, son of John C.; probably b. at Venice, but the place and date of his birth are alike uncertain. He has often been confused with his father; it appears more likely that it was John who undertook the voyage to the N.W. Passage about 1496-98, although his son may have accompanied him. In 1512 Sebastian won a reputation in England as a cartographer. He appears to have prepared maps of Gascony and Guenne for Henry VIII., and later in the same year to have been commissioned by Ferdinand V. of Spain for a similar purpose. On the death of Ferdinand in 1516, C. abandoned his projected voyage to the N.W. and returned to England in the following year. He again entered the service of Henry, and on his behalf set sail from Bristol on a voyage of discovery to Hudson Bay and Hudson Strait. (Doubts have been raised as to whether this voyage ever took place.) In 1519 C. was appointed pilot-major by the Sp. king, Charles V. In 1526, after a dispute between Spain and Portugal regarding their respective trading rights with the Moluccas, C. was sent out by Charles V. to explore the coast-line of Brazil. He entered the R. La Plata and sailed up its trib., the Paraguay, but his attempt to make colonies was a failure. Consequently, on his return in 1530, he was imprisoned for a year and exiled to Oran in Africa for two years. He was subsequently restored to his former post of pilot-major, but in 1517 resigned, and soon after was welcomed in England by Edward VI. C. was chiefly instrumental in promoting and directing the Company of Merchant Adventurers (1553), which opened up Brit. trade with Russia. He was appointed governor to this company and inspector of the Eng. Navy (1547). C.'s map, showing the discoveries of himself and his father, can be seen in the Bibliothèque Nationale. See C. R. Beazley, *John and Sebastian Cabot*, 1898; H. P. Biggar, *The Voyages of the Cabots and Corte-Reals to North America*, 1903.

Cabourg, Fr. vil. in Normandy, in the dept. of Calvados on the Dives, 11 m. distant from Trouville. It is a favourite watering-place on account of the excellent sea-bathing and the good sands. Amongst other attractions there is a fine casino. Pop. 2000.

Cabra, tn. 28 m. S.E. by S. of Cordova

on the Jaen-Málaga railway, in the prov. of Cordova, S. Spain. Its old castle and mosques, converted into churches, are interesting remains of the Moorish settlement. Pop. 14,000.

Cabral, Pedro Alvares (1460-1526), Portuguese navigator, who was sent in 1499 by the king of Portugal to establish a factory on the Malabar coast in India, and to win the friendship of the rajah of Calicut. C. took a westerly course, landed on the coast of Brazil, and took possession of part of the neighbouring country. He sent one of his ships back to Portugal to announce his discovery, and with his other ships he set sail for India. During the voyage four of his vessels were lost, and among those who perished was Diaz. C. reached Calicut, and after several encounters with the natives established a factory there. He continued to explore the Malabar coast, and returned to Portugal in 1501 with rich cargoes.

Cabrera, anc. Capraria, small is. of the Balearic group in the Mediterranean Sea. Goats are numerous, and fishing is an important industry. After the capitulation of Baylen in 1808, many Fr. prisoners were sent to C., where they were cruelly treated.

Cabrera, Ramón (1806-77), Carlist leader, was educated for the Church, but on the death of Ferdinand he instantly joined in the civil strife which broke out, as a staunch ally of the pretender Don Carlos, who was supported by the absolutist party. During the war which followed he distinguished himself no less by his cruelty than by his bravery. It is said that he shot 100 officers and 1100 prisoners of war to avenge the murder of his mother. In 1839 Don Carlos rewarded him with the governor-generalship of Valencia, Murcia, and Aragon. Driven across the frontier to France in 1840, he was indignant when in 1848 his leader abdicated his rights. After a futile campaign in the absolutist cause he returned to France. In 1875 he issued a manifesto counselling the rebels to submit to the restored monarchy of Alfonso XII. His marriage with a rich Eng. wife and his absence from his native land were the causes of this signal act of disloyalty.

Cabriole, word applied to the legs of tables, chairs, or other pieces of furniture, shaped as the legs of a goat, with knee and cloven foot, or merely having a double curve. The fashion was introduced in France in the seventeenth century; and it was prevalent in England from the close of that century until the reign of George II. The term is also applied to chairs with stuffed shield or oval backs by Heppelwhite.

Cabul, see KABUL.

Cabuyas (formerly Tabuco), tn. on the is. of Luzón, in the Philippines, situated near the lake of Bay. The cultivation of rice is carried on. Pop. 9500.

Cacao, see COCOA.

Caccamo, tn. in the prov. of Palermo, Sicily. It lies 22 m. S.E. by E. of that city. Precious stones, such as agate, beryl, and jasper are mined in the neighbourhood. Pop. 10,300.

Caccia, Guglielmo (1568-1625), Piedmontese painter, called 'Il Moncalvo' from his long residence there. Probably a pupil of Soleri. He painted in fresco and oil; his manner partakes more of the Rom. than the Bolognese school, but he has something of the energy of the Carracci. The church of Sant' Antonio Abbate, Milan, has frescoes of his; another work in fresco is the cupola of San Paolo at Novara. His works were known and prized in many It. cities. The Chiesa de' Conventuali at Moncalvo has a regular gallery of his pictures. Among his best oil-paintings are 'St. Peter' and 'St. Theresa,' in Turin; the 'Taking down from the Cross,' at Novara; 'Raising of Lazarus' and 'Miracle of the Loaves,' at Chieri. Two of his daughters were painters.

Caccini, Giulio (c. 1546-c. 1615), called Giulio Romano, It. musician, was b. at Rome and studied under Scipione della Palla. About 1565 he went to Florence, where he remained as singer to the Tuscan court till his death. To him are due those first attempts at dramatic music which culminated in the opera. His most famous of these are *Il combattimento d'Apolline col serpente* (1590), where the libretto is by Bardi; *La Dafne* (1594), and *Eurydice* (1600), opera by Rinuccini. It is said that Jacopo Peri, the Florentine musician (1561-1633), produced the world's first regular operas. These were *Daphne* (or *La Dafne*), now lost, but which is said to have included some of C.'s music, and *Eurydice* (1600). Another important production was the *Nuove Musiche* (1602), a collection of songs and madrigals, with instructions in the art of singing.

Caceres, prov. and tn. of Spain in Extremadura. Belongs to the Tagus basin, in a rich agric. dist. It is noted for bacon; exports wool, red sausages (*embutidos*), and olives, and manufs. leather and cork goods. Also produces phosphates. The prov. contains two bishoprics—Coria and Plasencia. Pop. (1944) 535,000. The tn. was founded c. 74 B.C., and taken from Moors, 1225. It is on a branch line meeting the more northerly of the two Madrid-Lisbon railways at Arroyo. It had an old Jesuit college, later turned into a hospital. There are numerous remains of Rom. buildings and there are mediaeval palaces in the Old Tn. Pop. (1944) 30,000.

Cachalot, or **Sperm Whale** (*Physeter macrocephalus*), the only representative of its genus, is a huge toothed whale, measuring as much as 60 ft. in length. It is found in all tropical and subtropical seas, being usually met with in a herd or 'school,' consisting often of some hundreds. The bulk of head, which takes up a third of its body, is made up of tough fat or 'junk,' round which is a great 'case.' The refined oil from this case yields spermaceti. This substance is still used in ointments, and twelve barrels can be obtained from one fish. Verging to the left, at the anterior extremity of the head, is the blow-hole, whilst the mouth, which is some way behind the end of the snout,

is ventral. Excellent ivory in small quantities may be obtained from the teeth (about twenty-two in number), which line each side of the lower jaw. This jaw, which is very narrow, may be let down so as to make an enormous gape. The throat is said to be wide enough to allow the whale to swallow a man, and it is thought to be this species which swallowed Jonah. The head is very massive, high and truncated in front; the flipper is short and broad, and the dorsal fin merely a low protuberance. In colour it is black above and grey beneath. Sperm whales feed chiefly on squid and cuttlefish and are rarely seen in European waters.

CACHALOTS

Ambergris, which is used in perfumes, is an intestinal secretion of this species; it is often found on the sea.

Cachar, dist. of Pakistan in Assam, connected politically with C. Hills tract. It borders on Manipur. Area over 2000 sq. m. The C. valley is narrow, with many long minor valleys from the Lushai hills. It produces tea for export, also rice and cotton, and sends timber to Bengal. Pop. 500,000.

Caché (Fr., a hiding-place) is a word used in Canada and W. U.S.A. for a hole dug in the earth to conceal food and other things too heavy to carry.

Cachet, *Lettres de*, see *LETTRES DE CACHET*.

Cachexia (Gk. for an evil condition) is a term used in medicine to express a thoroughly unhealthy condition of the body, such as that occasioned by insufficient feeding and above all by chronic maladies. Doctors thus speak of lead C. (resulting from lead-poisoning), gouty and cancerous C.

Cachoeira (waterfall), city of Brazil, in the state of Bahia, 80 m. N.W. of Bahia, on the R. Paraguassu. It has a considerable export trade in coffee, sugar, and tobacco. Pop. 78,000.

Cachoeira da Itapemirim, tn. in the

Brazilian state of Espírito Santo on the Leopoldina railway. Grows coffee and exports timber. Pop. 65,000 (many Gers.).

Cacholong is a beautiful mineral, looked upon as a variety of semi-opal. Usually it is milk-white in colour, but it sometimes has pale red and yellow tints. It is porous, and has a lustre rather like that of mother-of-pearl, whence it is often called pearl opal. The word is likely to be of Tartar origin, but it is popularly supposed to have been named after the R. Cach in Bokhara.

Cachucha, Sp. dance of an oriental nature, of pronounced national character, written in 3-4 time. The dancer holds castanets, and the dance, which is graceful and voluptuous, gradually increases in speed. The head and shoulders play an important part.

Cacique, or **Cazique**, title equivalent to lord or prince, borne by native chiefs of Mexico, Peru, Haiti, Cuba, and the W. of S. America at the time of Sp. exploration. More recently the title has been given to chiefs of independent Indian tribes. It is the title given to Arawak chiefs in the W. Indies in the accounts of the journeys of Columbus by Bernaldoz and Peter Martyr.

Cacodæmon, see *DEMONOLOGY*.

Cacodyl ($As_2(CH_3)_4$), or tetramethyl diarsine, is a colourless liquid boiling at $170^\circ C$. It is very poisonous, and its smell is so offensive that it was named by Berzelius from a Gk. word meaning stinking, a trace of the vapour in a room being sufficient to render it intolerable. It is derived from a product known as 'Cadet's fuming liquid,' first formed by Cadet in 1760 by distilling white arsenic and potassium acetate. This liquid is fuming and spontaneously inflammable, consisting among other things of C. oxide and a little C., the latter causing the spontaneous combustion. This liquid is distilled with hydrochloric acid and corrosive sublimate and C. chloride is produced, whence C. is obtained by heating with zinc. The true nature of C. and its derivatives was discovered by Bunsen in a prolonged research about 1840. In chemical action it acts like an electrically positive element, forming an oxide, chloride, iodide, and cyanide. An acid called cacodylic acid is formed when the oxide is acted upon by mercuric oxide, and the salts are sometimes used for skin diseases. C. cyanide is a colourless liquid obtained by distilling the oxide with mercury cyanide. The operation must be performed with extraordinary care in the open air, since the volatile vapour is among the most poisonous substances known.

Cacongo, small dist. of W. Africa, to the N. of the mouth of the Congo, between Kullu and Chilongo. It now forms part of the Congo Free State and Fr. Congo, and its name has fallen into disuse.

Cactus, prickly exogenous plants, varying in form and size, and often of abnormal shape, which with few exceptions are natives of Mexico, S. America, and California. They are grouped together in the natural order *Cactaceæ*, which comprises some twenty-five genera. The

number of species of *C.* approaches approximately to 1000. They are very curious both in structure and growth. They are specially suited to desert wastes and dry arid hillsides. They have thick juicy stems which hold large quantities of water, and as only a very small part of the surface of the whole plant is exposed, in addition to which it is completely covered by a thick skin, transpiration and evaporation are reduced to a minimum. Sometimes there is only the one thick cylindrical prickly stem, in other

CACTI

specimens the plant also bears fleshy leaf-like appendages, also covered with spines or prickles, and forming a very extraordinary-looking member of the vegetable kingdom. The spines are modified leaves. The stems are fitted with wholesome though insipid fluid and, occurring as they do in situations where ordinary vegetation could not exist, they may be regarded as one of the means which nature has provided for the benefit of men and beasts where other means of subsistence fail. The flowers of the *C.* are mostly very large and brilliantly coloured. The genera most familiar to horticulturists are *Mamillaria*, *Phyllocactus*, *Cereus*, *Opuntia*, *Epiphyllum*, *Echinopsis*, and *Echinocereus*.

In the cultivation of these plants the soil should consist of a mixture of fibrous loam, lime rubbish, broken bricks, and sand. A good drainage is essential when in pots. March is the best time for potting, and the soil should be rather dry and no water given for four days. They should be re-potted at intervals of two or three years. During the winter they should be kept exceedingly dry, and only watered about once a fortnight, but in summer they may be watered every four days. Cacti may be grown either from seed or by cuttings. The latter process is done by means of taking a cutting from an old plant with a sharp knife, and then

placing it in a dry place till roots have sprouted. The process of growing from seed is not a difficult one. The common prickly pear, a species of *Opuntia*, belongs to this family; a spineless variety, used as fodder, has been produced by Burbank. Many species of Euphorbiaceæ (spurge) are of succulent habit, and bear a superficial resemblance to Cacti, but the two families are actually not closely related. See H. M. Roan. *Cactus and other Succulent Plants*, 1948.

Cacus, son of Vulcan, the Rom. god of fire, son of Jupiter and Juno, was a notorious robber and giant. His home was in a cave on Mt. Aventine, where he stored the proceeds of his raids. Having stolen and dragged into his cave some of the cattle which Hercules had carried away from Spain, he was killed by that hero. Hercules discovered the hiding-place by the lowing of the cattle within the cave in response to the lowing of the remainder of the herd as they were passing the entrance of the cave.

Cadamosto, or **Ca' da Mosto**, **Alvise (Luigi) da** (1432-77), explorer, was b. at Venice. In 1455 he undertook a voyage to the Canaries, and as far as the mouth of the Gambia. In 1456 he made a voyage to Senegambia. His account of his discoveries was pub. in 1507.

Cadaverine, or pentamethylenediamine; formula $C_5H_{12}N_2$, a colourless liquid of ammoniacal odour, which occurs as a product of putrefaction in rotten meat and other foods which contain the amino-acid lysine. Also occurs to some extent in cheese. It is isolated by extracting the putrefaction mixture with alcohol and by precipitation with alcoholic mercuric chloride solution.

Cadbury, George (1839-1922), Quaker cocoa manufacturer, philanthropist, and Liberal, was b. at Edgbaston, Birmingham, son of John C., tea and coffee merchant, and cocoa naker in a small way. In the 1860's George and his elder brother Richard took over their father's cocoa and chocolate factory. They introduced into England the modern method of producing cocoa powder by extracting part of the natural oil of the raw bean, greatly extended the range and variety of confectionery chocolate, and introduced the first British-made decorated boxes. In 1879 they moved to Bournville, then outside the city. Here George carried out his experiments in housing and town planning. In 1900 the estate was made over to a trust under the Charity Commission. In 1901 George became part-owner of the *Daily News* (now the *News Chronicle*); and later he was chief proprietor of that newspaper, and for some years directed its policy. Of a public-spirited nature, C. interested himself in social questions; particularly housing, old age pensions, and the Adult-School Movement. He died at Northfield, Birmingham. See A. G. Gardiner *The Life of George Cadbury*, 1923.

Caddis Flies, family of insects allied to the dragon-fly. The grub or larva is aquatic, feeding on water plants, and living enclosed in a sheath of stick and

gravel, held together by silk. This protection is necessary, as the body is long and soft and much sought after by fish. The adult is a four-winged, air-breathing insect not unlike a dull-coloured dragonfly with a sucking proboscis instead of jaws. It feeds on the juices of plants. Its chief characteristic features are a small head, compound eyes, hemispherical in shape, three eye-spots, and few or no transversal veins; the wings are covered with hairs. Adults are particularly active at night. Eggs are laid in gelatinous masses on plants, stones, or in water. The larvæ build cases or tubes in which they live, composed of minute fragments of wood, grass, leaves, or shell. Within these sheaths the larvæ are both sheltered and protected. When the time for pupation arrives, the C. worm closes the ends of the tube with silk, or by attracting small stones. The pupa metamorphosis then begins, and at an advanced stage the pupa burst their prisons and swim or creep about for a while before undergoing the change into aerial life. Some float on the top in their cases and then take flight. They occur chiefly in Europe, and a large percentage of species may be found in Great Britain. Some of the most noted genera in Britain are the *Phryganea*, *Umnophyllus*, *Brachycentrus*, *Apatania*, *Mollusca*, and *Setodes*. The larvæ are common in ponds and streams in spring, and are used as bait by anglers.

Cade, John (d. 1450), Eng. rebel of Irish birth, noted as leader of the Kentish rising of 1450, called Jack C.'s Rebellion. The early facts are obscure. It is supposed by some that he was banished for murder, 1449, served in the Fr. wars, and returned under the name of Aylmer, a physician. The more usual story is that, when the country was suffering from the bad government of Henry VI. and his friends, C., who was a man of substance in Kent, gave himself out to be Mortimer, the duke of York's cousin (for a different view on this see Gairdner), and captain of Kent and headed a rebel march on London. When the court demanded reasons for the insurrection, C. issued a paper, *Complaint of the Commons of Kent*, objecting to the king's favourites, excessive taxation, and general misgovernment. Protest was made that free election of knights of the shires had been hindered, and the rebels encamped on Blackheath. Another paper, *Requests by the Captain of the Great Assembly in Kent*, demanded the dismissal of certain ministers of Henry VI. The king's troops were defeated in a skirmish at Sevenoaks, the rebels pressing on to London. C. had Baron Say and Sele and Crowmer, sheriff of Kent, beheaded. Then, retiring, he was repulsed at London Bridge. Terms of peace were arranged, but C. broke open the prisons, withdrawing to Rochester. At Queenborough he was repulsed, and quarrels over booty lost him supporters. C. was finally killed at Heathfield. See J. Gairdner (editor), *Three Fifteenth-Century Chronicles*, 1880; J. Clayton, *The True Story of Jack Cade*, 1909.

Cadell (d. 1175), S. Welsh prince, son of Gruffudd, whose rule extended over part of Ceredigion and the valley of Towy. He captured the castle of Carmarthen in 1145. He went on a pilgrimage to Rome (c. 1160) and on his return became a monk in the abbey of Strata Florida, where he d.

Cadenabbia, beautiful health resort on the shores of Lake Como in Lombardy, Italy. It is surrounded by orange and citron groves. Its chief feature is the Villa Carlotta, which contains valuable works of art by Canova and Thorwaldsen. 'The Triumph of Alexander' (Thorwaldsen) is one of its priceless gems.

Cadence (Lat. *cādere*), the 'fall' or close of a musical phrase or period (often applied to last two chords). Term applies both to melodic and harmonic endings, and need not imply a fall in pitch. Cs. are like punctuation marks in the language of music. They may give an effect of finality, of mere pausing, or of questioning. The varieties are known as perfect, imperfect, and interrupted. A *perfect C.* must have its final chord on the tonic. If the penultimate chord is on the subdominant, the C. is called plagal; if on the dominant, authentic. The former occurs chiefly in sacred music. The harmony of the *imperfect C.* is often that of the perfect reversed, ending on a dominant chord preceded by the tonic (half close, incomplete like a semicolon). If any except the tonic follows the chord of the dominant, the effect is that of avoiding or postponing. This is known as *avoided*, *deceptive*, or *interrupted C.* The chord substituted for the expected tonic often gives a charming effect.

Cadency, see HERALDRY, *Differencing*.

Cadenza, in music signifies an ornamental flourish introduced by a soloist near the close of a piece or section of a piece. Cs. were formerly improvised, and those of Handel, when playing his own organ concertos, were especially renowned; but now the C. is nearly always written by the composer or some other musician, and affords the executant an opportunity of showing his ability.

Cadereita, or **Cadereyta**, tn. of Mexico in the country of Hidalgo and state of Queretaro, 42 m. E. of the tn. of that name. There are silver mines in the dist. Pop. 4200.

Cader Idris (Chair of Idris), picturesque mt. in Merionethshire. It is composed of basalt and porphyry with beds of slag and pumice. The highest peak is 2914 ft. Length 10 m., and breadth 2 m. (See illustration, p. 98.)

Cadet (military) (Fr. from O.F. *capdet* = Lat. *caput*, with dimin. -*eti*), signifies a youth studying for the army at one of the recognised military colleges. In France any officer junior to another is a C. in respect to him. The military colleges in England are at Sandhurst and Woolwich. The latter is for those destined for the engineers and artillery, and the former for other branches of military service.

Naval Cadet signifies the lowest rank of officer in the military branch of the R.N.

Entry is made by competition. Nomination is in the hands of the Admiralty board. There is a two years' course on the training ship *Britannia*, after which they become midshipmen.

Cadet Force. The cadet movement in Great Britain was inaugurated in 1859, when a few units were formed, but a great impetus was given to it in the following year when a great patriotic wave spread over the country and brought into being the Volunteer Force. These two forces grew up side by side, the C. F. for boys and Volunteer Force for adults.

the Prince of Wales became colonel-in-chief of the force. On Nov. 1, 1930, when a Labour Gov. was in office, the grant from public funds was withdrawn and the force entirely separated from the army. Later, when the National Gov. came into office, the army connection was restored. In 1939, on the outbreak of the Second World War, there were various cadet corps for the training of officers.

Cadi, or Kadi (Arabic, judge), title of an inferior judge among Moslem nations. Possesses civil and criminal jurisdiction, his powers including infliction of the

British Railways

THE LOWER SLOPES OF CADER IDRIS AND CORRIS, MERIONETHSHIRE

The public schools were largely responsible for fathering the C. F., but the social advantages inherent in physical training, discipline, etc., soon appealed to those interested in the welfare of boys in tns., and units sprang up everywhere. The movement made an appeal to religious workers, and before the end of the century such excellent bodies as the Church Lads' Brigade made their appearance. Although most units were modelled on the infantry arm, a cadet battery with 9-pounder guns was formed at the Royal Naval School, Eltham, whilst the cadet units at Reading and Tonbridge schools specialised in field engineering. At a later date the movement spread to the dominions. In 1908 the public schools unit became the junior div. of the Officers Training Corps, and a monetary grant was made from public funds, and the units were affiliated to units of the Territorial Force. In 1914 the strength of the force was over 40,000. During the First World War the cadets performed a variety of duties at home, and the strength rose to over 120,000. In 1922

capital penalty. Originally also a theologian, as all Muslim law is based on the Koran. A court of appeal, originally presided over by the caliph, revises the judgments of the C.'s court. In Turkey he is appointed by the head of the Muslim Church and known as 'Nalb,' receiving a fixed salary. In Persia (Iran) and the Middle E. the office is more of a private nature.

Cadillac: 1. Small tn. of France, in the dept. of Gironde, situated on the R. Garonne, 16 m. S.E. of Bordeaux. Pop. 3000. 2. City of Michigan, U.S.A., E. of Lake Michigan. Pop. 9,800.

Cádiz: 1. Prov. in Andalusia, Spain, formed 1833, including commercial centres such as Jerez, San Lucar, San Fernando. Chief exports, wine, fruit, fish, olive oil, and salt. It practically supplies the world with sherry. Pop. 506,000. 2. The most beautiful of all the tns. of Spain, its white walls rise out of the sea. It is, or was, the gateway of the W., and was probably the first Phœnician settlement on the shores of the Atlantic, yet it has the appearance of the newest city in Spain.

About 1720 it was almost the exclusive entrepôt of trade between S. Europe and America. C. was sacked by the Eng. under the earl of Essex in 1596, but in 1625 the Eng. fleet was repulsed with heavy loss. The old cathedral was almost entirely burnt by the Eng. patriotic pirates and the new building was only begun in 1722 (completed between 1832 and 1838). It is majestic and classical. No other church merits attention except the Capuchinos, where Murillo met his death by falling from the scaffold while painting the reredos on April 3, 1682. C. is enclosed by walls and surrounded on three sides by the sea and has a fortress opposite that of Ceuta. A naval wireless station is installed at San Fernando. There is a medical and science faculty at C. in connection with the univ. of Seville. An explosion in the submarine depot on Aug. 18, 1947, caused the deaths of 500 persons, with 5000 injured, the explosion being felt 60 m. away. Hardly a house was left standing in the San Serverino and San Jose dists. It exports salt, fish, fruits, cork, wine, oil, etc., and transports coal, machines, and textiles. The pop. is 75,000.

Cadman, Charles Wakefield (b. 1881), composer, specialising in Amer. Indian music, b. Johnstown, Pennsylvania, U.S.A. Studied music in Pittsburgh, Pennsylvania, where he afterwards served as musical critic on the local papers and organist in various big churches. Later he went to Denver and finally settled at Los Angeles. He became an authority on the music of the Amer. Indians. Lillian Nordica first made him popular by performing his song, *The Land of the Sky-Blue Water*. In 1909 he visited the Omaha Indian reservation and secured gramophone records of their songs and flute pieces, thus preserving them for all time. Among his better-known compositions are *Four Indian Songs* and an Indian song-cycle, *From Wigwam and Teepee*; and a cantata for male voices, *The Vision of Sir Launfal*. His *Shanewis*, produced at the Metropolitan Opera House, New York City, in 1918 and 1919, is the first strictly Amer. opera to have lived beyond one season. His opera, *A Witch of Salem* was produced in 1926 by the Chicago Civic Opera Company. His *Thunder-Bird* suite for orchestra is based on melodies of the Blackfoot Indians.

Cadmium, metallic chemical element (symbol Cd, atomic weight 112.41, atomic number 48), discovered in 1817 by Strohmeyer in a sample of zinc oxide. It occurs as a constituent of most zinc ores and in the form of the sulphide in the mineral greenockite, found near Greenock in Scotland and in Bohemia and Pennsylvania. In the smelting of zinc ores the vapours of C. come off at an early stage, so that the metal can be extracted from the first portion of the condensed dust. C. is a tin-white metal and takes a good polish. When sublimed in a current of hydrogen it forms octohedral crystals, and when formed by electrolysis the sulphate and subliming the vapour in a vacuum it

crystallises as flat needles. It melts at 321.7°, has a boiling point of 778°, and a sp. gr. of 8.6. Wood's metal, which has a melting point of 60°, contains C. in alloy with lead, tin, and bismuth. C. is also used in electro-plating. A coating of C. is very resistant to sea-water. C. oxide, CdO, is the 'brown blaze' of zinc smelters, and is also found as a mineral. C. hydroxide, Cd(OH)₂, is formed as a white precipitate on adding potassium hydroxide to the solution of a salt of C. C. chloride is prepared by evaporating a solution of the metal or oxide in hydrochloric acid. C. iodide is obtained by dissolving the metal in hydriodic acid. C. sulphide is the mineral greenockite, and can also be produced as a yellow precipitate by passing H₂S into a cadmic solution. It is used as a pigment. C. sulphate is used medicinally in eye diseases. C. is bivalent, and the so-called cadmous salts are probably mixtures of bivalent C. compounds and the finely divided metal.

Cadmus (Κάδμος), in Apollodorus and later mythographers said to have been son of Agenor of Phoenicia, and Europa's brother. After Zeus carried Europa off C. was sent to bring her back, but failed. The oracle at Delphi bade him give up his quest, follow a cow he was to meet, and build a city where she lay down. He followed her from Phocis to Boeotia, becoming founder of Thebes, the acropolis being called the Cadmeia (Καδμεία). C. then slew a dragon, at Athena's command sowing the teeth, from which sprang armed men, Sparti (Ἐσπάρτοι, sown), who fought together till only five remained, from whom the Thebans claimed descent. C. married Harmonia, daughter of Aphrodite and Ares, and finally retired to Illyria as king. This story is compiled from local legends. Probably C. was originally a Boeotian hero. The introduction into Greece from Phoenicia or Egypt of an alphabet of sixteen letters is ascribed to him, and he was considered the inventor of useful arts and of civilisation generally.

Cadmus of Miletus, perhaps the oldest of the logographers (λόγος, word, γράφω, write), a name applied now to Gk. historiographers before Herodotus. Unless a purely mythical person, he lived about 550 B.C. A confused notice in Suidas mentions three of the name, two probably being identical with the Phoenician C. (q.v.). The writer is supposed to have written a hist. of Ionia. See G. Busolt, *Griechische Geschichte*, 1893; J. B. Bury, *The Ancient Greek Historians*, 1909 (lecture 1).

Cadoc the Wise (Cattwg Ddoeth) (d. c. 570), noted Welsh martyr, who founded the abbey and school of Llancarvan, in Glamorganshire. According to the account in Rees's *Lives of Cambro-British Saints*, he prayed for a martyr's death, and was stabbed while at mass by a soldier the next day. Certain old proverbs and fables, *Doethineb Cattwg Ddoeth* (*Wisdom of Cadoc the Wise*) and *Damnegion Cattwg Ddoeth* (*Fables of Cadoc the Wise*) have been ascribed to him.

Cadogan, William, first Earl (1675-1726), Brit. general. It is thought that

he took part as a boy cornet at the battle of the Boyne in 1690. He fought with Marlborough as a quartermaster-general in all his great battles from 1701 to 1711, and was colonel of 'Cadogan's Horse,' 1703-12. C. was sent on a diplomatic mission to the Netherlands (1707-10); appointed lieutenant of the Tower, 1709-1715; and governor of the Isle of Wight, 1716. M.P. for Woodstock, 1705 and 1714. He rose to the rank of general in 1717, and was created earl in 1718.

Cadore, Venetian com. in Italy, some 20 m. distant from Belluno, and celebrated as the bp. of Titian. During the First World War It. troops assumed the offensive in C. on Sept. 8, 1915, but found the Austrian position too strong to be forced. Pop. 4000.

Cadorna, Marshal Count Luigi (1850-1928), It. soldier, b. at Pallanza, son of Gen. Count Raffaele C., a famous soldier who fought beside Brit. and Fr. troops in the Crimean war. Early showed such high military talent that he was appointed to the general staff even before passing out of the Military Academy. He was a profound student, not merely of military subjects, but of science and topography. Promoted captain in 1875; then commanded the 10th Bersaglieri; and, in 1898, became major-general, with so good a reputation as a director of military training and as a leader in the field that in 1907 he was marked out as future chief of the staff. But it was not until 1914 that he reached this post, the appointment being of good augury for the allied cause in the world war, because his whole upbringing made C. an admirer of England and opposed to a policy of military co-operation with the Central Empires. In the conduct of the operations on the It. frontier he displayed his undoubted powers of leadership and sound strategical judgment; and if his tenure of the command was clouded by the disaster of Caporetto (q.v.) there is much evidence that he was the victim of circumstances, and that had the Allies followed his advice he might have been able to resist the Ger.-Austrian offensive. The fact that he was created a Marshal of Italy simultaneously with his successor, Marshal Diaz, is some indication of the esteem in which he was held by his countrymen. It is probable that C. risked too much in advancing eastward while ignoring the importance of the Trentino front. Indeed, the Austrian offensive in the ensuing year (1916) might have had the effect of compelling him to withdraw his E. armies but for Brusilov's (q.v.) remarkable attack on the Austrian rear (see RUSSIAN FRONT, FIGHTING ON THE). What is clear is that Italy was quite unprepared for war in 1914-15, her armies being ill disciplined and anti-militaristic. It has been suggested that the allied leaders, at a conference at Rome in 1917, showed an inability to appreciate the importance of the It. front, and that they declined to help C. with reinforcements. C. felt impelled to make the best of the situation by launching a series of forlorn assaults on the Isonzo, which, while weakening the

Austrian armies most appreciably, so undermined the morale of the It. troops by the protracted nature of the operations that Caporetto was the result. The Allies then made all possible sacrifices to strengthen and reorganise the It. front. C.'s command, however, came to an end, but at Versailles, where he had been transferred to the Allied Military Council, his military insight greatly impressed his colleagues. As the consequence, however, of the Caporetto inquiry, he was removed from the council and retired (Aug. 1918). All the points in his campaign and its results are brought out in his book *La Guerra alla Fronte Italiana*, which he pub. in 1921.

Cadoudal, Georges (1771-1804), distinguished leader of the Chouans, was b. near Auray, Lower Brittany. He was among the first to take up arms against the republic, and acquired great influence among the peasants. He was captured in 1794, escaped, and organised a wholly peasant army, which could never be subdued. After a period of apparent submission, he revolted again in Brittany in 1799, and was compelled to submit. Bonaparte recognised his ability, activity, and character, and endeavoured to solicit his services, but was unsuccessful. C. crossed over to England. He was made lieutenant-general by the Comte d'Artois, and in 1802 conspired to overthrow the first consul. He went to Paris with this design, but was captured and guillotined. His family was ennobled after the restoration.

Cadoxton, tn. in Glamorgan, S. Wales, 2. m. E. of Barry, whose inhab. are chiefly engaged at the docks. The church of St. Cadoc in the old vil. is amalgamated with Barry (q.v.). Pop. 6500.

Cadre (Fr. frame), military term which denotes the 'framework' of any regiment or corps, i.e. the permanent commissioned and non-commissioned officers, such as the drummers, subalterns, etc. Round these the rest of the regiment may be gathered, as it were.

Caduceus, name applied originally to an enchanter's wand, but afterwards also given to a herald's staff. Hermes, or Mercury, is always depicted carrying such a staff. In form it had three shoots, one of which made the handle, the other two being intertwined at the top.

Caduceus' Wand, see DIVINING ROD.
Cadwalader, spelt also *Cædwalla* (d. 634), king of Gwynedd, S. Wales. He invaded Northumbria in 629, and was driven to Ireland by an Anglian king, Radwine. He defeated Radwine at Hatfield and ravaged Northumbria. He was defeated and slain near Hexham by Oswald, nephew of Radwine.

Cadwgan (d. 1110), Welsh prince, son of Bleddyn ap Cynvyn, king of Gwynedd. C. beat back the invasion of William Rufus in 1097, but was defeated by the earl of Shrewsbury two years later at Anglesey. He paid homage to the earl, and helped him against Henry I. in 1102, but was ultimately subdued and deposed by that king.

Cadzand, or **Kadzand**, vil. situated in Zeeland, Holland, 14 m. from Bruges, near the mouth of the R. Scheldt. Sir Walter Manny and the earl of Derby defeated the count of Flanders here in 1337.

Cæcilia (Lat. *cæcus*, blind), kind of serpent-like amphibian, of the order Apoda, about which little is known. It has a worm-like body, without tail or limbs, with transversely furrowed skin of a scaly nature. These worms inhabit warm countries and damp places, and burrow like earthworms. They are 20 in. long, with the thickness of a large worm, and are found in America, India, and Africa.

Cæcilius Statius (d. c. 168 B.C.), popular Rom. comic poet and dramatist, b. at Milan; a slave when young, he became a friend of Ennius. He is mentioned by Cicero (*De Optimo Genere Oratorum*, l.; *Ad Atticum*, vii.; *De Finibus*, ii. 7) and Horace (*Epistles*, ii. 1). Only short fragments of his works remain, chiefly in Anlus Gellius.

Cæcum (Lat., for *intestinum cæcum*, the blind gut), sac perforated at one end only, situated at the point of junction of the smaller with the larger intestine. It is not connected in man with any process, but in herbivorous animals it is probably an aid to digestion, secreting a gastric fluid. It is attached to the vermiform appendix and is subject to inflammation, a condition known as typhilitis.

Cædmon (d. c. A.D. 680), earliest Eng. Christian poet, 'father of Eng. song.' The only trustworthy information about him is in Bede's *Ecclesiastical History*, iv. He was a servant at Whitby monastery, where one night he had a vision, and a voice bade him sing 'the origin of created things.' 'Thus sang he of the creation of the world, and the beginning of the race of men, and all the history of Genesis . . . also of the terrors of the future judgment and the horrors of hell-punishment, and the sweetness of the heavenly kingdom' (Bede). C.'s *Paraphrase*, as described by Bede, was thought to be embodied in a MS. of sacred epics, now in the Bodleian Library, Oxford (titles of poems being *Genesis*, *Ereodus*, *Daniel*, *Christ*, and *Satan*), but the best critics reject them, though they are possibly by later disciples. The theme anticipates that of Milton's great epics. The hymn which C. was supposed to have composed in his dream is in Northumbrian dialect, and is preserved in a MS. of Bede's *History* now at Cambridge. A memorial cross was erected at Whitby, 1898. For the text of the poems see the trans. by B. Thorpe, *Cædmon's Metrical Paraphrase of Parts of the Holy Scriptures*, in *Anglo-Saxon*, 1832; W. H. F. Bosanquet, *The Fall of Man or Paradise Lost in Cædmon*, 1860; R. Wülker, *Bibliothek der angelsächsischen Poesie*, ii., 1894; C. W. Kennedy, *The Cædmon Poems*, 1916. Consult H. W. Longfellow, *The Poets and Poetry of Europe*, 1849; H. Morley, *English Writers*, vol. ii., 1868; S. Brooke, *English Literature to Norman Conquest*, 1898; W. P. Ker, *The Dark Ages*, 1904; E. Pons,

Cælius Antipater, Lucius, see **CELIUS**.
Cælius Aurelianus, eminent Lat. physician and medical writer, b. at Sicca in Africa (fl. end of the fourth century A.D.). He was an exponent of the 'methodic' school of medicine. He has left two valuable Lat. works (trans. from the Gr. of Soranus of Ephesus), *De Morbis Chronicis* and *De Morbis Acutis*. There are also fragments of his *Medicinales Responsiones*, a general treatise on medicine, in which his *Gynæcica* is abridged from Soranus's *Περὶ γυναικείων παθῶν* (eds. Amman, 1709; Haller, 1774; Rose, *Anecdota Græca et Latina*, ii., 1870). His writings were considered more practical than those of any other medical authority of antiquity. See Kuehn, *Programma de Cælio Aureliano*, 1816.

Cælum Sculpioris, the Sculptor's Tool, a constellation of Lacaille. It is situated below Columba Noachi and Canis Major, low enough not to rise in this country.

Caen, tn. of Normandy, Franco (Lat. *Cadomum*), cap. of dept. of Calvados. Among its pre-war manufs. were lace, crape, cotton yarn, and cutlery; it had also breweries, shipbuilding industry, and dyeworks, and, in later years, metallurgy had made C. a great tn. A maritime canal connects the port with the sea, and the railway connections are good. The port is admirably equipped for handling cargo from small tramp steamers, coasters, and landing craft. It has three basins, with extensive and well-equipped quays, and two shipbuilding yards; but the lack of a dry dock is a major handicap. Near by is the 'Prairie' with its well-known race-course, and also the celebrated subterranean stone quarries, from which comes the C. stone, so largely used in England from the eleventh century onwards. Cologne, Winchester, and Canterbury cathedrals are built of it, also Henry VII.'s Chapel at Westminster, and it is still much used. The tn. dates at least from the ninth century. It is on the R. Orne, about 7 m. from the Eng. Channel and 124 m. by rail from Paris. C. is in the midst of a fertile plain and, before the Second World War, had good streets, fine squares, and many noble specimens of architecture. St. Etienne Church (also known as the Abbaye aux Hommes) was founded by William the Conqueror. A monument there set up to him by William Rufus was destroyed in 1562 by the Huguenots, the church also being much damaged. It was restored early in the seventeenth century, a marble slab still marking William's former resting-place, with the inscription: 'Here is buried the unconquerable William the Conqueror, Duke of Normandy, King of England.' This fine church was only slightly damaged in the 1944 bombardments. William's wife Matilda founded La Trinité, and was buried in the choir of that church (also known as the Abbaye aux Dames), which has also survived. St. Pierre, 'the most beautiful church in C.', stood in the chief street, rue St. Jean, but it perished in the 1944 bombardments,

together with St. Sauveur and St. Jean. C. Castle (William's anct. château), begun by the Conqueror and finished by Henry I. of England, was partly destroyed in 1793, and the rest of it was destroyed in 1944. C. contained a univ., which was founded under an Eng. regent, a museum, a fine public library, and many other public institutions, but none of their buildings remains, for the centre of C., its shops and industrial quarter, were demolished in the tremendous bombardments of June-July 1944 which came upon the tn. in two great waves, the first soon after the allied landings in Normandy, and the second on the eve of the battle that brought the inhab. their liberation. Yet nearly 30,000 inhab. remained in the tn. during the bombardment, 2000 losing their lives (see WESTERN FRONT IN SECOND WORLD WAR). There were monuments to the natives of Calvados, killed in 1870-71, and to the lawyer Demolombe, besides statues of Louis XIV., Auver, and Malherbe, but few of these survived the bombardments.

C. was finally lost to England in 1459. It was much damaged during the civil war between Protestants and Catholics. In 1685 the greater part of the lending pop., being Protestants, were forced to fly by the Revocation of the edict of Nantes. Pop. 54,000 (1939). See L'Abbé de la Rue, *Essais historiques sur la Ville de Caen*, 1820-42; E. de R. de Beaurepaire, *Caen illustré*, 1896.

Caerdydd, see CARDIFF.

Caerlaverock, in the co. of Dumfriesshire in Scotland, stands on the Solway Firth about 6 m. from Dumfries. It is famous for its ruined castle, the seat of the Maxwells. Pop. 800.

Caerleon, tn. of Monmouthshire, 2 m. from Newport, possesses the remains of the largest Rom. amphitheatre in the kingdom, with an arena of about 20,000 sq. ft. The fortress covered 50 ac. The gems of the museum include two ivory plaques and an enamelled fibula. The coins found include one of the Emperor Quintillus who reigned for seventeen days. A tablet records that the barracks were rebuilt about 260. King Arthur was said to have spent five Christmases in C. In excavations in 1939, gold coins were found: Nero and Agrippina (A.D. 55), Nero (A.D. 61), Vespasian (A.D. 72), Titus (as Cæsar, A.D. 74), and Domitian (as Cæsar, A.D. 73). The site excavated, known as Myrtle Cottage Orchard, Cross Street, included a short stretch of the N.E. defences of the Rom. legionary fortress and a portion of the *prætorium* of the fortress. The defences comprised the primary clay bank and ditch, built when the second Augustan Legion made C. their base for the conquest of Wales about A.D. 75 and the foundations of the massive stone wall and one of its internal turrets, set up about A.D. 100 at the time when the early timber buildings within the fortress were likewise reconstructed in stone. Within the fortress were found the remains of nine barrack blocks; their walls were built of coursed masonry with earthen floors and they were roofed with red tiles

made in the legionary tiler. Among interesting relics found in one of the centurion's quarters were a moulded base (with counters), used as a gaming table. Pop. 2300.

Caermarthen, see CARMARTHEN.

Caernarthenshire, see CARMARTHENSHIRE.

Caernarvon, see CARNARVON.

Caernarvonshire, see CARNARVONSHIRE.

Caerphilly (fort of the trench), eccles. par. and mrkt. tn. in Glamorganshire, 7½ m. from Cardiff. Large collieries and ironworks near by. Manufs. linsey-woolsey, shirtings, blankets, checks, and shawls. Has ruins of C. Castle, once one of the largest strongholds in the kingdom. Pop. 36,000.

Caer Taff, see CARDIFF.

Cæsalpinia is a tropical genus of Leguminosae consisting of trees and shrubs, many of which are hook-climbers, and several being of commercial value. *C. pulcherrima*, Barbados pride, is cultivated for its beautiful flowers, as are *C. sepiaria*, Mysore thorn, which bears yellow flowers, and *C. japonica*, which will flourish out of doors. *C. brasiliensis* yields Fernambuco or Brazil wood, valuable for its red dye, while *C. sappan* yields sappan-wood or hukkum wood. *C. coriaria* is known as the divi-divi tree and *C. Bonduella* yields bonduc seeds.

Cæsalpinus, Andreas (Latinised form of Andrea Cesalpino) (1519-1603), botanist and physiologist, b. at Arezzo in Tuscany. He studied at Pisa and afterwards became a prof. there, where he had charge of the botanical museum. His chief work was pub. in Florence in 1583 under the title of *De Plantis Libri XVI*. This work commenced a new era in systematic botanical research.

Cæsar, title usually borne by the Rom. emperors and by the heir apparent to the imperial throne. It was in its origin the name of the patrician family of the Julii gens. This family was one of the oldest families in Rome, and had a long and proud descent, claiming lineage with the son of Æneas, the founder of the city. By Augustus it was adopted, since he was the adopted son of the great Julius Cæsar, and by him it was passed on to his adopted son Tiberius. It was borne by successive emperors even after the direct line of the Julian family had become extinct. It represented the *second* title of the emperors, who still of course bore the title Augustus. By the heir of Adrian it was adopted as the title of the heir-apparent, and was borne by the heirs of the emperors throughout the succeeding ages; the name Augustus still continued to be the title of the emperors. The name, or derivatives of the name, was used until recently, e.g. by the tsar or king of Bulgaria, and in the title Kalsar-i-Hind (the emperor of India), a title borne by Brit. sovereigns.

Cæsar, Gaius Julius (102-44 B.C.), the greatest of Rom. soldiers and statesmen. In spite of the evidence which can be brought to the contrary, there is little doubt now that C. was b. in the year 102, on July 12 of that year. Descended from a patrician family, members of which had long been

identified with the senatorial party, C. himself from the very beginning of his political career identified himself with the democratic party. This was, no doubt, due to his connection by marriage with the famous C. Marius, who was the husband of C.'s aunt, and who had taken a special interest in the boy who had been born in the year of Marius's great victory. His early political career was highly dangerous, and at a very early age he incurred the anger of the great Sulla by his marriage to the daughter of Cinna. On Sulla's return he was degraded from his position of priest of Jupiter, and deprived of his

British Museum

GAIUS JULIUS CÆSAR

property, but his life was spared owing to the influence of his aristocratic relations and the pleadings of the college of vestal virgins. At this period he deemed it wise to leave Italy, and he saw his first military service in Asia (81 B.C.). Three years later we find him back again in Rome, the news of the death of Sulla having recalled him. In Rome there was a great democratic reaction on the death of Sulla, and although C. refused to identify himself with the party of Lepidus, he showed his active democratic sympathies by prosecuting two of the Sullan governors for extortion in their provinces. Both prosecutions failed, and C. retired for a while to Rhodes in order to study rhetoric. He took part in the third Mithridatic war, and in 74 was elected a pontifex on the death of his uncle, C. Aurelius Cotta. He almost immediately became noted as one of the democratic leaders, and took a leading part in the events which led to the sweeping away of the safeguard to senatorial rights and the partial restoration, at any rate, of the popular liberties.

Gradually he was becoming more and more friendly with Pompey. In 69 he served in Spain as a quaestor, and in the following year returned to Rome. The departure of Pompey for the E. marks the real beginning of the career which was ultimately to lead C. to the dictatorship of Rome. From this time forward he is always to be found advocating the principles of the democratic party. During this period of his life, however, he was principally noted in Rome for the number and variety of his amours, for his extravagance, and for his life of pleasure. He was, perhaps, not regarded seriously as a coming statesman, since it appeared to be almost impossible that a man of pleasure such as C. should ultimately become the master of the Rom. Empire. His extravagance and the licentiousness of his life are two traits which are characteristic of the man, and which are to be found without much seeking during every part of his career. In 65 B.C. he was elected curule ædile, and two years later he became pontifex maximus. In the same year (63 B.C.) the Catilinian conspirators were accused by the consul Cicero. The name of C. was freely mentioned as one of the conspirators, and, in fact, the senatorial party tried hard to get his name included in the list. However much C., or his friend Crassus, knew of the plot, there is no doubt but that they were both opposed to it, although they were probably bound to have known of its existence. In 62 Pompey returned from the E. to find himself in opposition to the senate, which had opposed many of his proposals, and in alliance with C., whose opposition to the senate made him a natural ally. In the next year C. went to the prov. of Further Spain, and remained there until the following year (60), when he returned to Rome.

On his return to Rome C. endeavoured successfully to reconcile the two rivals, Crassus and Pompey. In the same year (60) he became consul, and his legislation during his term of office was very favourable to the remaining two members of the Triumvirate. He ratified the acts of Pompey in the E., he gave grants of land to Pompey's disbanded veterans, and he reconciled the capitalists as well. He, however, clearly foresaw that his importance as a power in the Rom. republic must be strengthened by military force, and that it was necessary to obtain for himself the command of a prov. where he could train the legions to follow him. During his period of office he caused legislation to be passed which gave him the command of Cisalpine Gaul and Illyria, and the overawed senate added also the command of Transalpine Gaul, in order that this prov. should not be given him by the popular party. The next nine years of C.'s life are taken up with his famous campaigns, from which he was to emerge as the dictator of Rome, the founder of the Rom. Empire, and the hero of a Rom. populace. Before setting out from Rome he realised that the time had arrived when it was necessary that Rome should crush the ambitions of the Ger. tribes, or herself

fall beneath them. Already the Gers. had shown that they intended to contest with Rome the possession of Gaul; the Ædui had been defeated, the Sequani molested; it was high time that the Rom. appeared to defend these allied tribes. The first victory of C. was over the Helvetii, who were driven by the incoming Gers. from Switzerland. They demanded a passage through Rom. ter. and were refused. Forced by C. to march down the r. b. of the Rhone, they succeeded, while C. was hurrying back for reinforcements, in crossing the R. Saône, only to be defeated, crushed, and driven back to their original homes. He next succeeded in defeating the Gers. under Ariovistus, and followed this blow up by defeating the Belgæ, whose fears had been aroused by the success of C. He then marched against the neighbouring tribe, the Nervii, and defeated them at a bloody battle on the Sambro, and in this way gained for the Rom. republic dominion over the whole of Gaul save the S.W. In the following year C. was hastily recalled from Illyria in order to undertake the task of overthrowing the Veneti of Brittany, who had broken out into revolt, and this, after some little difficulty, he was successful in performing. In the meantime another of his officers had subdued the Aquitani of the S.W., so that by the end of the year the whole of Gaul lay subject to Rome. In 50 B.C. he attacked and destroyed two of the Ger. tribes who had crossed the lower Rhine, and on this occasion built the famous bridge across the riv. in ten days. In the same year he made his first expedition to Britain, actuated probably by the fact that the tribes of N. Gaul received assistance from their kinsmen in Britain. This first expedition was little more than exploratory, and accomplished nothing. The Britons of the S. coast were reduced to a nominal vassalage, but this had practically no effect. In the following year another expedition to Britain took place, and on this occasion C. stayed longer and accomplished more. He penetrated Middlesex and crossed the Thames into Essex. He defeated Cassivelaunus, who, however, was able to cause him considerable trouble. He imposed a tribute on the Britons before he finally left that country to wait for another century before the hand of Rome would be stretched out to add them to the empire. In the meantime C.'s term of office had been lengthened, and the Triumvirate had agreed that it should not terminate until 49 B.C.

The campaigns of the years 53 and 52 were of vital importance. During this period the Gers. made their last great struggle for independence. C.'s legions suffered a reverse in Gaul, a reverse which was speedily and heavily paid for by the practical annihilation of the Eburones. The following year saw the final attempt under the great leader Vercingetorix, who at the head of the Arverni rose in revolt. Successful at first in driving away the Ger. chieftain, C. suffered a severe check at Gergovia, where he was obliged to raise the siege. However, at Alesia he besieged

the successful leader, and forced him to surrender in spite of the attempts made to release him. Having conquered Gaul, C. could afford to be lenient, and he therefore imposed no hard tasks upon the defeated tribes; he allowed them to retain their customs and manners, imposed a fixed tribute, and made Gaul into a prov. Then he turned his attention to the affairs of the Rom. republic itself, where things had been taking place which demanded his immediate attention. As has been pointed out previously, the meeting of the Triumvirate in 56 B.C. had fixed the policy to be followed by the three leaders for some considerable time. But in 54 B.C. the ties that bound C. and Pompey had been somewhat loosened. Julia, daughter of C. and wife of Pompey, had d. Crassus had d. in the same year. Pompey no longer felt either bound or inclined to follow out the policy of the Triumvirate. Naturally he tended towards the senatorial party, and by 52 he had practically become the leader of that party. The agreement made with C., that he should be allowed to retain the *imperium* until he obtained the consulship in 48, was now to be broken. In order to strengthen Pompey, it was necessary to weaken C. Arrangements were made for C.'s successor to be appointed by 49, so that C. might be persecuted for some time. Negotiations were opened between the two leaders. C. came into residence on the borders of Italy proper, so that he could the more easily obtain information of what was happening in the Rom. senate. This information came chiefly through a senator whom he had bribed. C. was called upon to resign his command, and martial law was proclaimed. The two tribunes, Marcus Antonius and Cassius, fled to C. The senatorial party led by Pompey were now face to face with their greatest enemy, C. C. immediately took measures to out-manoeuvre his enemies. Pompey had the command of many more legions, but the legions were scattered. C. therefore crossed the Rubicon and marched against Pompey, who withdrew his men from Italy and took them eastward, where his name was greatest, and where his chief victories had been won. C. had reached Brindisi before Pompey and his army had embarked, but had been unable to prevent the embarkation. He now turned his attention to Spain, which he reached in June and had reduced by Aug. In that month he returned to Rome and was made dictator, a post which he only occupied for eleven days. He was elected consul for 48, and then set out for Greece to attack the army of Pompey. He first attempted to besiege the army of Pompey at Dyrrhachium (Durazzo), but was repulsed with heavy loss. Pompey, having obtained reinforcements, marched down into the plains of Thessaly, and a battle was fought at Pharsalla, where Pompey's army was completely overthrown. Pompey fled to Egypt, and was murdered there while disembarking. C. followed him, only to learn of the fate of his enemy when he landed.

C. was now appointed dictator for a year and consul for five. He did not immediately return from Egypt, but stayed there for some months, fascinated, it is said, by the charms of Cleopatra, for whose sake he embarked on the Alexandrine war, a war which he brought to a successful issue in 47. In the same year he overcame the son of Mithridates, a victory which C. commemorated in the phrase, 'I came, I saw, I conquered.' After this victory he returned to Rome. Here he first put down a mutiny of the legions, and then crossed over to Africa, in order to crush the last members of the Pompeian party. In the great victory at Thapsus he practically annihilated the leaders of the party, and one of the generals, Cato, committed suicide. In the same year he was made dictator for ten years, and towards the end of the year sailed for Spain, to put down the sons of Pompey, who still held out there. The battle of Munda. In the following year crushed that rebellion, and C. returned to Rome. On March 15, 44 B.C., he was murdered in the senate-house at the foot of the statue to Pompey. During the period that he had held the dictatorship he had exercised his authority on the whole for the good of the people. He had not had recourse to any of the atrocious massacres of Marius or Sulla. When his enemies lay crushed at his feet, he had been noble enough to raise them to a position of equality with his supporters. He had put forward many schemes which were obviously for the well-being of the republic. He reformed the calendar, he proposed to make a digest of the Rom. law. He enfranchised the Transpadanæ. He promoted schemes for the draining of the Pontine marshes, for the enlargement of the harbour of Ostia, and for the construction of a canal through the isthmus of Corinth. He was distinguished in every way; he was a great statesman, soldier, and orator. In addition, he can claim a place in hist. as a brilliant mathematician, a jurist, and an architect, together with a very high position indeed as a writer and historian. His character as a man and as a statesman has led to much discussion. On the one hand, many historians hold the view that the creation of a policy, for want of a better name known as Cæsarism, was very necessary, that the tradition and method of gov. applied to the city Rome could not be equally applied to the Rom. Empire. On the other hand, many think that C., in overthrowing the constitution and traditions of Rome, destroyed liberty, and this view has much to be said for it. The open and obvious contempt with which C. regarded the traditions of Rome cannot be passed over easily. Not that he attempted to destroy, but that by the additions which he made, for example, to the senate, he held up to open contempt the greatest of Rom. ideals. Throughout the ages the name of the pagan C. has been held up to admiration. The dark and mediæval ages brought with them a regard for C. and Cæsarism which amount to hero worship. The greatest name to

them in the pages of hist. was that of the founder of the Rom. empire. But with the Renaissance came a change in thought. C. no longer was regarded as the founder of an empire, but as the destroyer of liberty, and the names of the conspirators who overthrew him were held up to admiration. In this diversity of opinion it is impossible truly to appreciate his work and character without reference to the political ethics and manners of his age. The older authorities for the life of C. are his own *Commentaries*; biographies of Plutarch and Suetonius (*Lives of the Cæsars*); Sallust's *Catiline*; Lucan's *Pharsalia*; Cicero's letters and speeches; and, of much less importance, Appian's *History*. The *Commentaries* relate the hist. of the first seven years of the Gallic war in seven books, and the hist. of the Civil war, down to the commencement of the Alexandrine, in three books. Neither of these works completed the hist. of these two wars. The hist. of the Gallic war was completed in an eighth book, which is usually ascribed to Hirtius, and that of the Alexandrine and other wars in three separate books of which the authorship is uncertain. Appian's *Roman History*, written in Gk. (Ρωμαϊκά), in twenty-four books, treats of the Civil war in books xiii. to xxi. (Eng. trans., 1578). Shakespeare's authority for his *Julius Cæsar* was North's *Plutarch*. Later authorities include T. Mommsen, *History of Rome* (vol. iv.); J. A. Froude *Cæsar: a Sketch* (brilliant but biased), 1879 (2nd ed., 1896); Sir C. Oman, *Seven Roman Statesmen*, 1892. To these may be added E. Stoffel, *Histoire de Jules Cæsar et la guerre civile*, 1887. Reliable recent works include the *Commentaries (Cæsaris Commentarii rerum in Gallia gestarum)*, trans. by T. Rice Holmes, and the same editor's *Cæsar's Conquest of Gaul*, 1901, *Ancient Britain and the Invasion of Julius Cæsar*, 1907, and *The Roman Republic and the Founder of the Empire*, 1923; also E. Meyer, *Cæsars Monarchie und das Principat des Pompeius*, 2nd ed., 1919. On the Gallic war may be mentioned *Gallie War* (7 vols.), ed. by T. Rice Holmes, 1914; *Gallie War and other Commentaries*, trans. by G. W. A. McDevitte (Everyman's Library), 1915.

Cæsar, Sir Charles (1590-1642), Eng. judge, third son of Sir Julius C. (q.v.), was educated at Magdalen College, Oxford; fellow of All Souls, 1605; entered the Inner Temple in 1611. He was appointed master of chancery, 1615-39, and judge of the court of audience, c. 1626-42. He paid James I. £15,000 for the mastership of the rolls in 1639. D. of smallpox. His epitaph magniloquently designates him 'an equal distributor of unsuspected justice'; but George Gerrard, master of the Charterhouse, in a letter to Lord Conway, March 28, 1639, describes him as 'a very ass . . . the very anvil on which the doctors of the law of his society played.'

Cæsar, Irving, b. New York city, July 4, 1895, of Rumanian emigrant parents. Educated in New York schools and colleges, at twenty he was attached to

Henry Ford's famous peace ship, whose mission it was 'to get the belligerent soldiers out of the trenches by Christmas' (this was in 1915). He afterwards travelled through the European neutral countries as one of the secretaries of the Ford Peace Conference. C. has written hundreds of songs, among them his lyrics in *No, No, Nanette* and *Tea for Two*.

Cæsar, Sir Julius (1558-1636), Eng. lawyer, noted for his great generosity, was the son of Cesare Adelmare, physician to Queen Mary, and a descendant of the It. dukes de' Cesarini. C.'s father migrated to England, about 1550, and began practice in London as a physician, being elected fellow in 1554. He obtained letters of naturalisation from Queen Mary with immunity from taxation in 1558. On one occasion he received the magnificent fee of £100 from her for one single attendance. Queen Elizabeth also consulted him and rewarded him with leases of eccles. lands at low rents. The son, who was b. at Tottenham, was educated at Magdalen Hall, Oxford, and took degrees both there and in Paris. He was called to the Bar in 1580; became judge of the admiralty court, 1584; chancellor of the exchequer, 1606; master of the rolls, 1614. He was a friend of Whitgift and of Bacon, and had a high reputation for integrity. He wrote a treatise on the Privy Council, and other papers. He collaborated with Lord Keeper Coventry in drawing up ordinances of procedure intended to correct abuses which had grown up in the court of chancery.

Cæsarea: 1. Anct. name of Kaisárich, a coast vil. of Palestine, 27 m. from Nazareth, 30 m. from Jerusalem. Founded by Herod the Great, a very important city often mentioned in the Bible. After A.D. 70 it was the cap. of Rom. Palestine and residence of the procurators, and the eccles. cap. until A.D. 451. St. Paul was a prisoner in C. for two years. The tn. was taken by the crusaders under Baldwin I. in 1101, when the booty included the green crystal vase supposed to have been used at the Last Supper and, later, celebrated in medieval legend as the Holy Grail. C. was destroyed by Bibars in 1265. Very little remains to-day of the anct. city. The ruins are surrounded by a low grey stone wall. Coasting vessels often put in as water is good and abundant. Bosnian colonists now have a settlement there. 2. C. Philippi, now Baniás (Panaes), vil. of Palestine, near R. Jordan below Mt. Hermon, 29 m. from Tyre, 45 m. from Damascus. Founded by Philip the Tetrarch, 3 B.C. Prominent in time of the crusades. 3. Anct. name of Cherchel, a seaport tn. of Algeria, 55 m. from Algiers. Ruins are still left. The port is shallow and exposed to N. winds. Near by are large marble quarries, and mines of silver, iron, and lignite. Pop. about 4000 (com. 8000). 4. Anct. name of Jersey.

Cæsarean Operation, liberating a child from the womb by cutting through the walls of the abdomen and uterus. The name is derived from that of Julius

Cæsar, who is said to have been brought into the world in this manner.

Cæsarion (47-30 B.C.), son of Cleopatra, who declared that Julius Cæsar was his father. Though this has been denied, it is said that Antony once said in the senate that Cæsar had acknowledged the relationship. In 34 B.C. he received from Antony the title of king of kings, but four years later he was put to death by order of Augustus.

Cæsium, metallic chemical element usually associated with rubidium. It was the first metal discovered by spectrum analysis, in the mineral spring at Dürkheim and, later, in those of Frankhausen and Wheal. It occurs in the rare mineral pollicite, a hydrated cæsium aluminium silicate; in minute amount in a number of continental mineral springs; and in carnallite (hydrated chloride of potassium and magnesium). It is a silvery white metal, inflamm. in air when heated, melts at 26°, boils at 670°, has a sp. gr. of 1.85, and is poisonous to vegetable life. Chem. symbol Cs; atomic weight 132.8; atomic number 55.

Cæsius Bassus, Rom. lyric poet of Nero's reign; friend of Persius, whose works he ed., and whose sixth satire is addressed to him (*Schol. on Pers.*, vi.). Said to have lost his life in the eruption of Vesuvius, A.D. 79. Quintilian (*Inst.* x. 1) praises him highly. Fragments of his works are in *Corpus Poetarum Latinorum*. He is identified with the author of a treatise, *De Metris*, of which fragments remain (ed. Keil, 1885). *The Ars Cæsii Bussi de Metris* (Keil, *Grammatici Latini*, vi.) is not his, but chiefly borrowed from above-mentioned treatise.

Cæsura (a 'cutting'), a metrical rest or pause usually about the middle of a line, not necessarily coinciding with a grammatical stop. The word has been taken from the classics, and is most common in Eng. heroic verse after the fourth or sixth syllable. More than one C. in a line is allowable, or again verses shorter than the decasyllable need have none. A variety of usage produces the best results. In Gk. and Lat. hexameters the best and most frequent C. is after the fifth half-foot (penthemimeral); the same is also used in the pentameter line of *ægeios*. Of course variations may occur. See also *VERSE*. See W. Christ, *Metrik der Griechen und Römer* (2nd ed. 1879), W. R. Hardie, *Res Metricæ*, 1920.

Café, see *COFFEE HOUSES*.

Caffa, see *KAFFA*.

Caffeine ($C_8H_{10}N_4O_2$) is a vegetable alkaloid of the xanthine group. Its chemical name is 1:3:7-trimethylxanthine, and it has been synthesised in the laboratory. Its occurrence in beverages in common use makes its study important. Thus it is the same as theine, which exists in tea-leaves to the extent of 3-2 per cent, in coffee 1.5 per cent, in Paraguay tea or maté, and beverages concocted from the kola nut. It may be procured from a strong infusion of tea in the following manner: The tannin is precipitated by means of lead acetate, the excess of which is precipitated by passing through

it hydrogen sulphide. On filtration the liquid is evaporated down and neutralised with caustic potash, when on cooling the C. will crystallise out. The crystals are colourless, long, and silky, with one molecule of water of crystallisation. They are only slightly soluble in cold water, but easily soluble in hot water or alcohol and in chloroform. The salts are decomposed by water, but the citrate, produced by adding C. to a hot solution of citric acid and evaporating, is widely used, having the same properties as C. C. is a product of xanthine and they are both products in the breaking down of the nucleo-proteins of the plants, the final product being uric acid. In the human body uric acid is not produced by C., so that there is no danger to be feared from it by people with gouty dispositions. C. is primarily a stimulant. It stimulates the reasoning powers as well as others and prevents sleep. Unlike alcohol, its action is not followed by a sedative effect, and hence it may be termed a true stimulant. In medicine it is used as a heart stimulant, also as a diuretic. *Caffeic acid* is obtained by boiling with caustic potash caffeinnic acid, which occurs to the extent of 4 per cent in coffee berries. It crystallises in yellow monoclinic crystals, and has the formula $C_6H_3(OH)_3CH=CHCOOH$.

Caffraria: Caffra, see KAFFIR.

Caffristan, see KAFFIRI-TAN.

Calfyn, Matthew (1628-1714), Arminian Baptist minister. He was expelled from Oxford Univ. for his beliefs, and became minister at his native place, Horsham, in Sussex, where he was five times imprisoned for unlicensed preaching. His Arian doctrines led to a split in the Baptist Church (1701). But the two dissident parties came together again in 1704. There was the first deliberate endorsement of latitudinarian opinions in the article of the Trinity by the collective authority of any tolerated section of Eng. dissent. C.'s works are very rare. They include *Envy's Bitterness corrected* (c. 1674), *A Raging Wave foaming out of its Own Shame* (1675), *The Great Error and Mistake of the Quakers* (no date); *Baptist's Lamentation* (no date); and numerous polemical tracts. See T. Crosby *History of English Baptists*, 1740.

Calla, or **Calla**, is a term used for a company of travellers or a caravan in Arabia, Persia, and N. Africa.

Caftan, national dress of the Turks. It is usually made of woollen or silk material, and is white in colour, with a yellow flowering design. Cs. are frequently used as gifts, by the Turkish court, to Christian ambas. The term caftan is also applied to procurers of women.

Cagayan, large prov. at the extreme N. of the Is. of Luzon, in the Malay Archipelago, the largest is. of the Philippines. It is extremely fertile, and rice (the staple food), sugar-cane, cotton, coffee, and cinnamon are grown. C. is also the name of the largest riv. of the Is. Pop. 200,000. C. is also the name of a tn. in Mindanao Is. Pop. 28,000.

Cage-birds. From earliest times birds that are notable for their plumage, their

song, or their interesting ways have been kept in confinement as pets. The favourites among the songsters are the nightingale, blackcap, thrush, blackbird, skylark, woodlark, and starling; while the linnet, goldfinch, bullfinch, siskin, and canary are also popular. The last-named is one of the commonest C. in this country, and, though really a foreign bird, has become thoroughly acclimatised. Siskins and redpolls, and also linnets and goldfinches, have been made to draw their water and food in miniature buckets from wells beneath their bucket-board. It is, unfortunately, also the case that birds have had their eyes 'bleared' with a hot iron to make them sing better. Of other Brit. birds, the common jay and the jackdaw are often kept as C. for the sake of their entertaining ways and their powers of mimicry. Foreign C. are more sought after for their plumage than for their song, though the canary, shama, Amer. mockingbird, Virginian nightingale, Peking nightingale, bulbul, and bluebird are all good songsters. The Australian budgerigar (*q.v.*) is also popular. Parrots are much in request as C., and parakeets and cockatoos are also kept, though the latter are somewhat noisy for the house. Of the parrots, the yellow-faced Amazon is the best talker. The greys from S. and W. Africa are not acclimatised at all easily; of the two species, that from W. Africa is the hardier. Care has to be taken in the feeding of C. The soft-billed songsters, such as the thrush and the lark, should be fed on crushed hemp, bread-crumbs, and insects, and a spider is one of the best of tonics for them. The nightingale requires special attention, being difficult to feed and rear properly. Some birds, such as the finches, linnets, and canaries, eat mostly grain, while others, such as starlings, redbreasts, and wrens, feed mostly on insects or berries. Canary seed and rape seed are chiefly used for the grain-eating birds, and canary seed is the best food for all species of parrots. The ailments of C. are mostly due to excessive or otherwise improper feeding, combined with their lack of exercise in confinement. The most universal remedy is a drop of castor oil, administered with a quill or a camel-hair brush. Birds are more sensitive to draughts than human beings, and should never be placed in a window for that reason. Nor should they be kept in conservatories, or other places where the temp. is variable. Birds kept under bad conditions in this respect are always in bad health, and pulmonary troubles sometimes result. Epilepsy, due to overfeeding, constipation, and diarrhoea are also necessary when the birds are moulting. A rusty nail in the drinking water is a good thing at such times, and stimulating food should be given. See W. A. Blakston, *W. Swainsland and A. F. Wiener, Illustrated Book of Canaries and Cage-birds, British and Foreign*; C. Rogers, *Budgerigars and How to Keep Them*, 1936; L. P. Luke and A. Silver, *Aviaries, Bird-Rooms, and Cages*, 1939; C. St. John, *Canary Breeding for Beginners*, 1947.

Cages have frequently been used in the past for the imprisonment of human victims. The philosopher Callisthenes was kept in an iron cage for seven months by Alexander the Great for refusing to pay him divine honours. Catherine II. of Russia imprisoned her wig-dresser for three years in an iron cage lest people should know that she wore a wig. Edward I. confined the countess of Buchan and a sister of Robert Bruce in a similar way. The former, whose offence was placing the crown of Scotland on the head of Bruce, was placed in an iron cage on one of the towers of Berwick Castle. Similarly, Tamerlane made a public show of the Ottoman sultan, Bayazid I. Louis XI. confined Cardinal Balue, grand-almoner of France, in an iron cage in the castle of Loches for eleven years. The bodies of the Anabaptist leaders, John of Leyden, Knipperdolling, and Krechting, were exposed in iron C. at Munster, Westphalia, in 1536.

Cagliari (anct. *Carales*) is both the cap. of the prov. of C. and of the whole is. of Sardinia. Distant 375 m. S. of Genoa by water, its fine harbour is situated in the centre of the S. coast of Sardinia, at the head of the gulf of C. The course of its hist. is chequered. At first a Rom. colony, it has been successively occupied by the Vandals (A.D. 485), Justinian (A.D. 533), the Saracens (twelfth century), the Pisans, the kings of Aragon (1326-1714), Austria, and the duke of Savoy, who became king of Sardinia (until 1861). Whilst the medieval tn. ran along the topmost ridges of a hill running N. and S., the modern tn. has grown up on the lower slopes and along the coast. Strong breezes blow through the tn. in winter, but in summer the climate is African. The chief exports, are zinc, lead, and salt (obtained from a lagoon to the E.). N. of the W. lagoon, where there is a good fishing trade, stretches a fertile plain, which is, however, still cultivated in very primitive fashion. There is a tramway to Quarto S. Elena, and two railways, including the main N. line, have their termini in C. Besides the modern citadel, barracks, and archaeological museum—the best in Sardinia—there are many buildings of great historic interest, including a domed church of the eighth century, the cathedral (built by the Pisans in 1257-1312), two great towers of the medieval fortifications, one of which commands a splendid prospect, and a univ. (dating from 1764). In the Second World War the It. base at C. was hard hit on sev. occasions, particularly in a daylight raid on March 31, 1943, when 100 Flying Fortresses destroyed or damaged upwards of twenty-five ships in the harbour and many planes at three adjacent airfields. The cathedral was damaged but has been repaired. A number of other churches were destroyed or damaged: Chiesa del Carmine, S. Caterina, and S. Domenico were destroyed; S. Agostino, S. Anna, S. Saturnino (twelfth century) were badly damaged; and the Teatro Civico was destroyed. The damage was all done by air raids, for there was no ground fighting and the enemy evacuated

the is. as soon as their position became evidently untenable. Pop. 111,000; (of the prov.) 475,000.

Cagliari, or **Callari**, Paolo, *see* VERONESE, PAUL.

Cagliostro, Alexander, Count de (1743-1795), arch-impostor of Palermo, whose real name was Giuseppe Balsamo, gave a foretaste of his vicious propensities during his education at the monastery of Calta-girone, where he horrified the monks by narrating the adventures of immoral women. Expelled from the monastery, he began by forging a will and committing a murder. For this latter crime he was imprisoned. On his release he inveigled a goldsmith, Marono, into paying away his money to discover a fictitious treasure. When Marono reached the treasure cave he was set on by six ruffians, hirelings of Balsamo, who beat him into insensibility. Dreading vengeance, Balsamo went abroad, travelling, it is said, in Greece, Egypt, Arabia, Persia, Rhodes, and Rome. In Rome he met and married a beautiful girl, Lorenza Feliciani, who proved an astute confederate in her husband's trickeries. At the monastery Balsamo had acquired a smattering of chem. and medicine, and later in Rhodes had proved a ready pupil to the Gk., Althotas, in the mysterious art of alchemy. Thus he is next found touring triumphantly through Italy and Germany, posing alternately as necromancer, physician, and freemason. At Strasburg, he grew rich with the profits of his 'elixir of immortal youth.' The count would solemnly declare he was a century and a half old, and his wife, who was only twenty, would lovingly refer to an imaginary son who was a veteran Dutch naval officer. The credulity and multiplicity of his dupes seem in these sceptical days truly remarkable, but the upper classes, from whom his victims were drawn, were at that time ill educated, superstitious, and sensual. Thus they trusted him equally as the inventor of an 'invaluable pentagon for abolishing original sin,' or the preacher of a miraculous moral regeneration, or as an Egyptian freemason who could rouse spirits from the dead, or, finally, as an advocate of altruism and a practical philanthropist. But his quackeries were one by one exposed. The Scottish physician to Catherine, at St. Petersburg, pronounced his celebrated 'spaginic food' unfit for dogs: in Paris he was deeply involved in the affair of the diamond necklace and thrown into the Bastille; in England lawyers succeeded in confining him in the Fleet. Finally, after further degradations and compulsory wanderings, this 'bull-necked forger' underwent a sentence of perpetual imprisonment at Rome for freemasonry. He d. in the fortress prison of San Leone, whilst his wife found refuge in a convent. An excellent account of this prince of charlatans will be found in Carlyle's *Miscellanies*. *See also* W. R. H. Trowbridge, *Cagliostro: the Splendor and Misery of a Master of Magic*, 1810.

Cagnola, Luigi, Marquess (1762-1833), It. architect, was a native of Milan, where

stands his splendid triumphal Arco della Pace, of white marble. Like Palladio, his predecessor, he strove to imitate the simple grandeur of classical architecture, as may be seen in his Porta di Marengo and his chapel of Santa Marcellina, also at Milan.

Cagots, name of a distinct and formerly outcast people living in the Basque provs. of the W. Pyrenees. The name is also applied to similar peoples in Béarn, Gascony, and Brittany. The origin of the C. is uncertain. Some have declared them to be descended from the Visigoths, who remained in France after their defeat at Clovis in the fifth century. Their name is explained as a corruption of *Canis gothus* (Gothic dog) or Fr., perhaps containing *-guth* (cf. *bigot*). Others have held them to be descended from the Saracens conquered by Charles Martel. Most credence is now given to the belief that they were ostracised on account of their leprosy, and have since thrown off the disease. It appears that they were formerly compelled to wear a peculiar dress and to follow certain menial occupations. They were forced to enter the churches by special doors, and in the churches they were separated by a rail from the other worshippers. They were not even allowed to walk on the high road with bare feet. There is no evidence to show that they ever used a separate language. At the time of the Fr. Revolution they were given equal rights as citizens, and they have since become more or less merged in the general peasantry.

Cagsand, see **DARAGA**.

Cahan, Charles H., Canadian statesman, was b. in Nova Scotia in 1861, and graduated at Dalhousie Univ. He began as a journalist on the staff of a Halifax (Nova Scotia) newspaper, and was then called to the Bar. Entering politics, he was elected in 1890 as a member of the Nova Scotia Legislature, and was soon made leader of the Conservative party. Two years later he was offered a portfolio in the administration of Sir Charles Tupper, but declined when he was defeated for Parliament. He moved to Montreal, became a K.C. and one of the leading lawyers in the dominion. After sev. defeats for Parliament, he was elected to the Dominion House of Commons in 1925 for St. Lawrence and St. George. When R. B. Bennett (q.v.) became Prime Minister in 1930, he made C. secretary of state in his Cabinet. Senior Canadian delegate to the League of Nations Assembly, 1932.

Caher, or Cahir, tn. with trade in corn and flour, in co. Tipperary, Eire, 11 m. W. of Clonmel, beautifully situated on the R. Suir, at the foot of the Galtee Mts. O. Castle stands on a rocky is. in the riv. Pop. 1900.

Cahors, cap. of the dept. of Lot in S.W. France, on the railway between Limoges and Toulouse, which lies 70 m. to the S. It has a trade in nuts, wine, and tobacco, and tanning and wool-spinning industries, besides manufs. of farm implements. Its importance rests largely on its antiquities, which include the cathedral of St. Etienne

(twelfth century), the Maison d'Henri VI. (fifteenth century), and the Pont Valentré over the Lot, a fine fortified fourteenth-century bridge. Pop. 12,000.

Caibarien, or Puerto de Caibarien, tn. and seaport situated on the N. coast of Cuba, W. Indies, 5 m. from Remedios. It possesses a good harbour, and railway communication with Espritu Santo and Remedios. Pop. 12,000.

Caicos, or Cayos, or The Keys, group of is. lying to the S. of the Bahamas, W. Indies, but placed under the gov. of Jamaica in 1874. The group consists of eight inhabited is. and sev. uninhabited rocks numbering about thirty in all. The total area is 165 sq. m. The largest, Grand C., is 25 m. long by 12 broad. The seat of gov. is at Grand Turk, 7 m. long by 2 broad. (Pop. 1800.) The inhabited is. are wooded and fairly fertile, and the climate is enervating. The chief industries are the exportation of salt, sponges, and turtle-shell, the cultivation of sisal hemp (on W. C.), and fishing. The total area (including that of Turks Is.) is 223 sq. m. There is an important cable station on Grand Turk. Turks Is. were discovered about 1512, but no attempt at occupation was made until 1678, when their value for the production of salt was recognised by the colonists of Bermuda. The first royal regulations for the gov. of the salt-ponds show that down to 1781 no permanent settlement or idea of fixed property in the ponds was entertained. There existed a 'head right' system by which one-third of the ponds was reserved for gov. expenses while the remainder was shared among the inhab. Every adult was entitled to a full share, children being allotted tenths in proportion to their height. Some of the public officials and ministers of religion received their salaries in bushels of salt, which recalls the ant. *salarium* or salt allowance of the Rom. soldier. Towards the end of the eighteenth century the Bahamas Gov. laid claim to the Turks and C. Is., and despite the vigorous protests of the Bermuda salt-rakers, it was determined by Order in Council in 1804 that the legislation of the Bahamas Gov. should extend to them. At the end of a struggle lasting fifty years, in which it was eventually recognised that conflicting interests and communication difficulties rendered common legislation impossible, a further Order in Council placed Turks and C. Is. as an independent administration under the supervision of the governor of Jamaica. Meanwhile the 'head right' system was replaced by a leasehold system. C. Is., which in 1848 were appended to Turks Is. for governmental purposes, were formerly occupied by loyalist refugees from Georgia after the declaration of independence by the U.S.A.; but the white owners, owing to losses and destruction from hurricanes and insect pests, lost heart and departed, abandoning their lands to their slaves. After incorporation with Turks Is. the exploitation of the group for salt production was mooted and in 1850 Cockburn harbour was laid out in salt

ponds on more modern lines than those of Grand Turk or Salt Cay. The hurricane of 1866 left both the gov. and the pond owners in a state of financial embarrassment and, after sev. years of hopeless struggle, the export tax on salt was abolished, drastic retrenchment effected, the elective system of legislation abrogated, and the Is. became in 1873 a Crown colony and a dependency of Jamaica. Pop. 5300.

Caillard, Sir Vincent Henry Penalver (1856-1930), political and financial expert. Educated at Eton and R.M.A., Woolwich. Received commission in Royal Engineers in 1875; attached to headquarters staff, and received medal and bronze star in Egyptian campaign, 1882. President Ottoman Public Debt Council, 1883. He became chairman of Joseph Chamberlain's 'Tariff Commission' in 1904; president, 1920. President, Federation of Brit. Industries, 1919. Pubs.: *Report on the Revenues Ceded by Turkey* (1888); *Imperial Fiscal Reform* (1903).

Caillaux, Joseph Marie Auguste (1853-1944), Fr. statesman, b. at Le Mans. was educated for the law; became inspector of finances in 1883, and in 1892 prof. in the *École des Sciences Politiques*. Elected deputy for Sarthe in 1898, in 1902, and in 1906—when he became vice-president of the Chamber. Minister of finance under Waldeck-Rousseau 1899-1902. Clemenceau 1906-8, Monis 1911. In July 1911 he became Premier and minister of the interior with a Conservative ministry, but resigned over disapproval of his conduct of negotiations with Germany concerning Morocco, Jan. 10, 1912. In 1913 he again became finance minister, in the Doumergue Cabinet. The editor of *Figaro*, Gaston Calmette, having threatened to publish letters written by C. to Mme C. while she was another man's wife, was murdered by her. C. resigned, and defended her on her trial, when she was acquitted. During the First World War he was at first paymaster-general of the forces; then he went on a mission to S. America—returning 1915. Suspected of defeatism, he was arrested Jan. 4, 1918, but not put on trial until Feb. 1920. Although the case against him collapsed, he was condemned to three years' imprisonment and to ten years' loss of civic rights and other disabilities, but he was released next day, and in 1924 received the benefit of the general amnesty. He was for a little while minister of finance under Poincaré in 1925; and again in 1926 he held that office for a few weeks. Two years later he brought about the fall of the Poincaré Gov. President of finance committee of Senate, 1932. Last appearance as minister of finance was in 1935, in Bouisson's short-lived gov. He remained chairman of the Finance Committee of the Senate until the collapse of France in 1940. C. was a politician of continental repute, but his arrogance and insincerity made him enemies in the world of politics. He was from the beginning an expert in taxation, and in his time effected reforms in many depts. of tax-

tion. His income-tax proposals excited violent opposition, but his system remained in principle substantially as he fashioned it. Pubs.: *Les Impôts en France* (1904); *Agadir—the History of a Policy* (1919); *Whither France? Whither Europe?* (1923); *Mes Mémoires* (1942-47).

Caillé, or Caillie, René Auguste (1799-1839), Fr. traveller, was b. at Mauzé in Poitou, the son of a baker. Having gone to Senegal while still a youth, he learned in 1826 that the Paris Geographical Society had offered 10,000 francs to the first traveller who should reach Timbuktu. Attired in Moorish dress, he set out from Kakouy in Sierra Leone on April 18, 1827, and reached Timbuktu on April 20, 1828, proceeding thence across the Sahara to Tanguier, which he reached only after great privations. He received the 10,000 francs, and also the order of the Legion of Honour and a pension. He pub. an account of the journey, ed. by M. Jomard. See also F. Dubois, *Tombouctou la Mystérieuse*, 1887.

Cailliaud, Frédéric (1787-1869), Fr. explorer in Egypt and Nubia, was b. at Nantes. A goldsmith by trade, he was led to examine the mineral resources of Egypt, and, in so doing, located the site of the anc. emerald mines of Jebel Zabara. He made important discoveries in Siwah, his report thereon leading to its annexation by Egypt in 1820, and he also made a notable journey of discovery to the White Nile, in company with Ibrahim Pasha's expedition, and pub. the results in his *Voyage à Méroé au fleuve Blanc* (1826). He pub. other works of travel, and d. at Nantes.

Caillin, also Kallin, Irish saint, around whose name many legends have clustered. He probably lived in the second half of the sixth century. Of a peaceable nature. The anc. *Book of Fenagh* (about 1400) furnishes the materials of St. C.'s life. C. procured a country for his kinsmen, the Commaicne, to live in. He converted Prince Aedhdubh, who gave him the fortress of Dunbaille, or Fenagh, in which to build his monastery.

Caïman, or Cayman, name given to sev. species of alligator found in Central and S. America. The C. differs in some points from the alligator of China and also of N. America, but only in minor details. Except for one Chinese species, the alligator is peculiar to America.

Cain, first-born of Adam and Eve, who slew his brother Abel, because Abel's sacrifice was accepted and his was not. A curse was pronounced upon him for this deed, and he went to live in the land of Nod. A curse was pronounced on any one who should kill him, but there was a tradition that he was slain accidentally. A sect of the Ophite Gnostics (A.D. 130) were called Cainites, as they held peculiar views of the significance of C. and Abel as types.

Caine, Sir Thomas Henry Hall (1853-1931), novelist, was b. of Manx and Cumberland parentage, at Runcorn, Cheshire, and was educated in the Isle

of Man and at Liverpool. After studying as an architect, he became leader writer on the *Liverpool Mercury*, and gradually took up literary work. He went to London on the invitation of D. G. Rossetti, and wrote for the *Athenæum*, the *Academy*, and other periodicals. After publishing *Recollections of Rossetti* (1882); *Sonnets of Three Centuries* (1882); and *Cobwebs of Criticism* (1883), he began a successful career as a novelist with *The Shadow of a Crime* (1885). His subsequent novels included *A Son of Hagar* (1887); *The Deemster* (1887); *The Bondman* (1890); *The Scapegoat* (1891); *Capt. Davy's Honeymoon* (1892); *The Manxman* (1894); *The Christian* (1897); *The Eternal City* (1901); *The Prodigal Son* (1904); *The White Prophet* (1909); *The Woman Thou Gavest Me* (1913); *The Master of Man* (1921); and *The Woman of Knockaloe* (1923). He ed. *King Albert's Book* (1914-1915); in 1928 issued an enlarged version of his *Recollections of Rossetti*. His *Life of Christ* was pub. after his death, in 1938. *The Deemster* was dramatised as *Ben-my-Chree* in 1889, *The Manxman* in 1895 (new version, *Pete*, 1918), *The Christian* in 1898, *The Eternal City* in 1902, and *The Prodigal Son* in 1905. *The Christian* is his most famous novel, though its theme is somewhat ambiguous. This novel has been trans. into most of the European languages. A dramatic work, *Mahomet*, was withheld from the stage at the request of the Turkish ambas. *The Bishop's Son* (1910), *The Eternal Question* (1910), *The Iron Hand* (1916), and *The Prime Minister* (1918) have been put upon the stage. He went to Poland in 1891 at request of persecuted Jews there, and described his experiences in *The Times*. In 1895 he went to Canada for the Society of Authors and the Colonial Office to negotiate terms of copyright. He was elected to the Manx House of Keys in 1901, and was made a K.B.E. in 1918 and a C. H. in 1922. He d. at Greeba Castle, Isle of Man, leaving a fortune of £250,000. See C. F. Kenyon. *Hall Caine: the Man and the Novelist*, 1901; D. MacCarthy. in *Portraits*, 1931.

Ca'ing Whale (*Globicephalus melas*), cetacean of the dolphin family, is variously known as the Pilot-whale, the Black Fish, or the Social Whale. The name 'ca'ing is derived from a Scottish word, *ca*, to drive. These whales, which feed chiefly on cuttle-fish, are mild in disposition, and are not only very gregarious, but are also more often stranded than any other species. Except for a white streak under their stomach the C. Ws. are black; their skin is quite smooth. At the tail there is a big fork. The fore limbs, which are about 5 ft. long, join the body very low down. The front of the skull is nose-shaped, and above and below the blow-hole are some dozen small conical teeth. In front of the blow-hole is a lump of fat. Generally speaking, the head is flat and broad. This genus of whale is found in almost every sea.

Cainozoic Period, see TERTIARY.

Ca ira (*It will go on*), a popular song of

the Fr. Revolution, so named from its refrain:

Ah! ça ira, ça ira, ça ira!
Les aristocrates à la lanterne.

The words, by Ladré, a street singer, were put to an older air, *Le Carillon national*. The song was prohibited by the Directory in 1797.

Caird, Edward (1835-1908), Brit. theologian and philosopher, brother of John C., was b. at Greenock, and was educated at Glasgow Univ. and Balliol College, Oxford. After a brilliant course at the latter univ., he was, from 1864 to 1866, fellow and tutor of Merton College. In 1866 he returned to Glasgow and became prof. of moral philosophy, and, in 1893, he became master of Balliol. In 1892 he had received the honorary degree of D.C.L. Through his pupils he has exercised a great influence on Eng. philosophy, and may be considered to have founded a school of neo-Hegelianism. His works include *A Critical Account of the Philosophy of Kant* (1877); *The Social Philosophy and Religion of Comte* (1885); *The Evolution of Religion* (1893), *The Evolution of Theology in the Greek Philosophers* (1904).

Caird, John (1820-98), Scottish divine, was b. at Greenock, and entered the ministry of the Church of Scotland in 1845. He preached a notable sermon before the queen at Craffie in 1855, afterwards pub. under the title *The Religion of Common Life*. In 1862 he was appointed prof. of theology at Glasgow Univ., becoming vice-chancellor and prin. in 1873. He delivered the Gifford lectures in 1892-93 and 1895-96, ed. and pub. in 1900 as *The Fundamental Ideas of Christianity*. His other works include *Sermons* (1858); *Introduction to the Philosophy of Religion* (1880); and *Spinoza* (1888).

Cairn, or **Carn**, is a Celtic word signifying an artificial heap of stones. Prehistoric Cs. are usually sepulchral monuments or tribal cemeteries, like that of Talten, and are found usually in some place of eminence. Cs. of the Stone Age, such as those of Maeshowe, in Orkney, or of New Grange on the Boyne, near Drogheda, are chambered, with a circular, oval, or oblong ground plan. The chambers, in which burnt and unburnt human remains are found, are small, that at Gavrinis in the Morbihan measuring 9 ft. by 8 ft., but they are usually approached by a long passage, often covered with incised zigzag or spiral designs. The passage at New Grange is actually 63 ft. in length. The chamber roof is beehive-shaped in the Brit. Isles, but in Scandinavia it consists of huge blocks resting on the side walls. Cs. of the Bronze Age are smaller and of circular construction. Besides the central cist of unhewn slabs, which is the actual place of burial, they often contain neolithic implements and tall, flat-bottomed and richly ornamented bronze vessels. In medieval times Cs. were often used as the meeting-places of tribes, and in 1225 it is recorded that the inauguration of the new chief, O'Connor, took place at the O. of Fraech. In a charter of 1231 the

'Carne of the Pecht's Fieldis' is mentioned as a boundary to the lands presented to the monks of Kinloss, and in the Highlands it was long the custom to pile small Cs. where the coffin of a famous man was 'rested' on the way to the graveyard. Where stones were scarce, the earthen barrow, as in England, replaced the C. See also BURIAL CUSTOMS; EARTH-HOUSE.

granite running through the coarser granite of the main mass. The stone is a special favourite in Scotland (sometimes called Scotch topaz), and is used for various ornamental purposes, e.g. set in the lids of snuff-mulls, in the handles of dirks, in brooches for Highland costume, in pins and bracelets. Its value depends on transparency and colour. Quartz of

THE STONE AGE CAIRN OF MAESHOWIE, ORKNEY

E.N.A.

The cairn is 300 ft. in circumference, and contains stone chambers with rude carvings and runic inscriptions

Cairn Terrier, small, short-legged breed of dog, sandy-grey or brindled in colour, some being almost black. The C. T. has a foxy head and small pointed ears. It is a good sporting as well as a good house dog. The name is due to the fact that these dogs were employed for driving foxes out of cairns.

Cairnes, John Elliot (1823-75), Irish political economist, began life in his father's brewery, but proceeded to Trinity College, Dublin, and graduated in 1848. He was called to the Irish Bar, but turned his attention to social and economic questions, and in 1856 became Whately prof. of political economy at Dublin. Three years later he became prof. of political economy and jurisprudence at Queen's College, Galway, and in 1866 he succeeded to the chair of political economy at Univ. College, London. He belonged to the same school of thought as John Stuart Mill. His works include *The Slave Power* (1862); *Political Essays* (1873); *Some Leading Principles of Political Economy newly expounded* (1874).

Cairngorm Stone (Cairngorum) (Gaelic *caru*, heap, *gorm*, blue), name of yellow and brown varieties of quartz, called after one of the peaks of the Grampians in Banffshire, where it was found originally. This mineral occurs in crystals lining the cavities in highly inclined veins of a fine-grained

yellow or brown is known as 'false topaz.' It is found also in Brazil, Russia, and Spain. The yellow, used in jewellery is often called burnt amethyst, or citrine. The pale brown is also called smoky quartz, and when almost black the stone is known as morion. The colour is probably due to an organic pigment. The mineral is also found in the mts. of Mourne, Ireland, in Arran, and other parts of Britain, and very fine specimens in Switzerland and Colorado, U.S.A.

Cairns, municipality and seaport of Queensland on Trinity Bay, Nares co., 100 m. from Cooktown. It has a fine harbour, and is in a sugar dist. with the Mulgrave gold-fields and Herberton tin-mine near. Pop. 14,000.

Cairns, Hugh McCalmont, Earl (1819-1885), Brit. statesman, educated at Belfast Academy and at Dublin. Called to the Eng. Bar, 1844. M.P. for Belfast, 1852; solicitor-general under Lord Derby, 1858; attorney-general, 1866. He was created Viscount Garmoyne and Earl C., 1878. Lord high chancellor in the Disraeli ministry, 1868. One of the finest parl. orators of his time, his best-remembered speech being the 'Peace with Dishonour,' after Majuba. See Lord Malmesbury, *Memoirs of an Ex-Minister*, 1884; J. B. Atlay, *Victorian Chancellors*, 1908; Lord Birkenhead, *Fourteen English Judges*, 1926.

Cairns, John (1818-92), Scottish Presbyterian divine, b. at Ayton, Berwickshire. He studied at Edinburgh (1834-1841) and Berlin Univs. (1843-44), and at the Presbyterian Secession Hall from 1840. Minister of the United Presbyterian church, Berwick-on-Tweed, 1845-76; prof. of apologetics in the United Presbyterian Theological Hall, Edinburgh, 1867; principal of the Theological College, Edinburgh, 1879. C. was an excellent linguist, and travelled widely on the Continent at different times. Among his works are *Examination of Ferrier's 'Knowing and Being,'* and *The Scottish Philosophy: a Vindication and a Reply* (1856); *Life of John Brown, D.D.* (1860); *Liberty of the Christian Church,* and *Oxford Rationalism* (1861); *Thomas Chalmers* (Exeter Hall lecture) (1864); *False Christs and the True* (criticism of Strauss and Renan) (1864); *Outlines of Apologetical Theology* (1867); *The Doctrine of the Presbyterian Church* (1876); *Unbelief in the Eighteenth Century* (Cunningham lecture) (1881); *Christ the Morning-star, and other Sermons* (1893). C. also contributed to various periodicals, and wrote articles on 'Schottland' and 'Kirchliche Statistik' in the second of Herzog's *Realencyclopädie*; on 'Infidelity' in *Schaff-Herzog Encyclopædia*; on Kant in eighth ed. of *Ency. Brit.* See D. Masson, *Recent British Philosophy*, 1875; A. R. MacLewen, *The Life and Letters of John Cairns*, 1895.

Cairo is the cap. of modern Egypt and the most populous of African cities. Situated on the Nile, 12 m. S. of the head of the delta, and 148 m. of Suez by rail, it extends over an area of some 10 sq. m. Whilst the S.E. portion, including the citadel, rises on the rocks of the Mokattam Hills, the greater part of the city is built over the alluvial plain in the riv. valley. C., the fourth Moslem cap., was founded in A.D. 968 by Jauhar el-Kald, who called it El-Kahira ('the victorious'), a name which was gradually corrupted into C. The ruins of the first cap., Mæra, estab. in A.D. 641, together with some towers of the Rom. fortress of Babylon, a colony founded in 325 B.C., may still be seen at Mæra-el-Atika, or old C., which lies a mile to the S. of the modern tn. Shortly after A.D. 1176 Saladin erected the citadel and a portion of the city walls. Under the dynasty of the Mameluke sultans the cap. prospered, and the tn. of Bulak was founded, which is now the flourishing port (and suburb) of C., and which lies at its N.E. extremity. Sultan Selim overthrew their sovereignty in 1517, and from this date until 1798, when the city passed by conquest into the hands of the Fr., C. was the conservative metropolis of Turkish Egypt. Three years later it was wrested from these conquerors by the Eng. and Turkish forces combined, and once more was obliged to submit to Ottoman rule. In 1811 Mehemet Ali, the Turkish viceroy, by his massacre of the Mamelukes, acquired a mastery over the city, which became the cap. of an independent kingdom. During his reign, and still more under Ismail Pasha, who ruled from 1863, rapid changes took place, fresh

quarters were designed and new thoroughfares opened out, and following the Brit. occupation in 1882 improvements multiplied thick and fast. It is to this occupation that C. owes its excellent water supply and drainage system. Formerly the death-rate was abnormally high owing to the prevalent insanitary conditions. During the First World War, C. became the administrative headquarters of the allied campaigns in Egypt and Palestine; it was also an important centre for Brit. troops, and a Red Cross base. In 1919 serious anti-Brit. outbreaks occurred in the city; demonstrations against the gov. were made, Brit. officers were fired on, and strikes took place. The military was forced to intervene to restore order. Even when the Brit. protectorate was abolished, however, and Egypt became independent, C. did not lose its rebellious spirit. Serious outbreaks occurred, for instance, in 1930. During the Second World War C. was the Middle E. G.H.Q., with great numbers of allied troops living in sprawling desert camps around the tn. Prominent allied personalities would be seen riding in the morning at the Gezira sporting club or on the famous terrace of Shepheard's Hotel. In the six months prior to the Brit. evacuation of the citadel (July 1946) 20,000 Brit. troops were moved from C. to Alexandria (see below). A N. wind and the Nile floods help to moderate the summer heat: the mean temp. for the year is 68°. After the ann. inundation has subsided, damp exhalations from the riv. keep the surrounding country moist during the late autumn months, even though hardly any rain falls. Mehemet Ali estab. cotton weaving and printing factories in Bulak, and there are a few paper mills and gunpowder works, but, speaking generally, the only commercial importance of C. is that it is a depot for the transit of goods of every variety from the Sudan, Upper Egypt, India, Persia, Asiatic Turkey, and also for many European manufs. The modern city is the fourth founded in succession on the same site, and remains of the former cities are included in it, old walls and gateways, narrow streets and latticed houses, together with many mosques. Place Atabet, to the S.E. of the Esbekiya gardens, is the central point for the electric tramways. The fine boulevard Mohammed Ali runs S.E. as far as the citadel, whilst on the S.W. the *sharia* Kasr-en-Nil leads down to the Great Nile bridge, which connects the is. Gezira Bulak, now given over to amusements, with the mainland. To the N. of the bridge are the large barracks of Kasr-en-Nil and the splendid museum of Egyptian antiquities, erected in 1902. Originally founded at Bulak by Mariette, it contains the finest collection in the world of Pharaonic relics. The national library and Arab museum, opened in 1903, lie off the boulevard Mohammed Ali. The former contains some 100,000 vols., the majority being of E. literature, and is quite unique, whilst the latter encourages the preservation of the monuments of Arabic art, which were for centuries

neglected. In 1918 a law was passed giving greater powers to the dept. charged with the preservation of anct. monuments, and many excavations and restorations were carried out. C.'s earliest Arab building is the mosque of 'Amr, dating from A.D. 643. From Place Atabet the Muski runs straight into the oriental city, which lies to the E., whilst the W. quarters are occupied by gov. offices, European public buildings, luxurious hotels, and the residential flats and villas. In this E. portion, besides the Arab city, there are the quarters of the Copts or Christians, of the Jews, and of the Franks. The streets are narrow, the overhanging upper storeys almost shutting off the blue sky overhead. Wealthy

Hasan (1358). The three gates of the city, Bab-en-Nasr, Bab-el-Futuh, and Bab-Zuweyleh, are splendid examples of the massive yet simple effects which the Mohammedan architects knew so well how to produce with the fine ashlar masonry. Beyond the E. wall of the city lie the so-called tombs of the caliphs with their graceful networks and traceries, their shining minarets and gilded domes. They are really the mausolea of the Mamelukes, whom Mehemet Ali slew. It was the latter who built the alabaster mosque in the citadel, whose dome and slender minarets are one of the picturesque landmarks of C., and in the centre of which is the celebrated Joseph's well. Among

CAIRO: THE CITADEL

Canadian Pacific

Cairenes live in modernistic apartments and fine private houses in Garden City, a residential plot on the banks of the riv.; in Gezireh, a long, thin is. in the Nile; or in the suburbs of Heliopolis, Maadi, and Helwan. The poor live around and among them, in dirty, anct. tenements and mud-brick houses, all of flimsy construction. The bazaars are always interesting, especially the Khan-el-Khalili, the Hamzawi, and the Brass Bazaar, though the Muski, which leads to them, is gradually losing its oriental character. The Anglican cathedral of All Saints overlooks the riv. and occupies a site presented to the Brit. colony by the Egyptian Gov. Azhar Univ., estab. in 971, is the great centre of Moslem intellectual life, whither 2000 students gather together annually from every E. land. C. is a city of many churches: Coptic, Gk., Maronite, Armenian, Syrian, and Rom. Catholic, besides mosques, some of which display such purity of taste, such grandeur and withal simplicity of conception, and such delicate arabesque, that they rival the Sp. palaces as specimens of the finest Arab art. Among the most beautiful are the mosques of Tulun, Kalaun, Barbuk, Wai-Bey, and especially that of Sultan

improvements and alterations carried out of recent years may be mentioned the erection of two new bridges over the Nile, the extension of the tramway system, the construction of new motor roads, and the enlargement of the suburbs. At one of these, Heliopolis, an aerodrome was erected during the First World War, and it later became the chief air station in N. Africa. The most N. part of the city consists of broad boulevards, with European-built villas, hotels, etc. The first experimental flight from C. to the Cape was made in 1920 by Lt.-Col. Pierre van Ryneveld and Capt. Brand, but it was not until April 1932 that the Brit. air route between C. and the Cape became available to passengers, the first experimental air mail being operated at Christmas 1931. To-day all the Far E. services of B.O.A.C. are operated through C., but the service to S. Africa, via C., terminates at Johannesburg, the rest of the flight to Cape Town being operated by S. African Airways. A regular air service between C. and Iraq and Persia is operated by Iranian Airways. Within the nineteenth century the pop. of C., including its suburbs, Abbasia and Mataria to the N.E., and Helwan, 14 m. to the S., more than

trebled itself. The total in 1907 was 654,476, of which some 40,000 only were Europeans. In 1937 the pop. was 1,312,000. The weird fascination of C. falls alike on European and Arab, but perhaps more on the former because of the very strangeness of all he sees. One would hardly call C. a beautiful city, yet this is the extravagant description of an Arab: 'He who hath not seen Cairo hath not seen the world; its soil is gold, its Nile is a wonder; its women are like the black-eyed virgins of Paradise; its houses are palaces; and its air is soft—its odour surpassing that of aloes wood and cheering the heart; and how can Cairo be otherwise, when it is the mother of the World?' It is oriental enough to come up to the westerner's idea of what the E. should look like, and yet sufficiently occidental to make a European or Amer. feel at home. To the newcomer it is a confused jumble of smells, flies, and noises—the last mostly Arabic music issuing from open-front cafés. Every main street is crowded with persistent hawkers, selling everything from socks, fly-whisks, and cigarettes to dubious pictures or magazines. Beggars walk the streets carrying babies, often not their own, which can be hired from poor families. Pedlars used to offer lottery tickets and even dope on the streets. Organ grinders work the streets from sunrise to sundown, accompanied by jugglers, acrobats, and gag men who put on shows especially for the benefit of foreign soldiers. The foregoing is at least a picture of what C. seemed like to the allied troops during the Second World War, and during that war C. was the most cosmopolitan city in the world, with members of the forces of all nations in every variety of uniform, while at all times there were always thousands of troops on leave in the city. The first visible step in the Brit. evacuation of Egypt was taken in C. on July 4, 1946, when the citadel was handed over to Egypt in a simple ceremony lasting half an hour. Egyptian troops took over the barracks in the historic fortress, built in the twelfth century, which had been occupied by the Brit. for sixty-five years. See S. Lane-Poole, *The Story of Cairo*, 1906; R. C. Devonshire, *Some Cairo Mosques and their Founders*, 1921, and *Rambles in Cairo*, 1939.

Cairo Declaration, made on Dec. 1, 1943, committing the U.S.A., China, and Great Britain to definite terms which fixed new boundaries for Japan on the assumption of her defeat. Japan was to be compelled to return to China all Chinese ter., including Manchuria. She was to be ousted from Korea, which 'in due course' was to become free and independent. China was to recover Formosa, conquered by Japan in 1895, and the Pescadores. These provisions achieved the objective of Amer. policy in the Orient, set fifty years previously, to re-establish the territorial integrity of China as it was before the First World War waged against her by Japan. Japan was also to be 'stripped of all the is. in the Pacific' which she occupied during the First World War. These were the

Carolines, Marshalls, and Marianas, which Japan had been allowed to retain by the Versailles settlement of 1919, nominally under mandate from the League of Nations. Japan was also to be ousted from all the ter. she had dominated or occupied since the summer of 1940. This meant Indo-China, Thailand (Siam), Burma, and Malaya; the Philippines, the Dutch E. Indies, and all the is. of the S. Pacific. In short, Japan was to be expelled from the Asiatic mainland and to lose her sea power in the Pacific. She was to revert once more to the condition of an is. nation as she was before her first conquests of Chinese ter. The U.S.A. were the more ready to impose these salutary terms from the realisation that for decades the existence of an independent China had been a major interest of the Amer. people, together with all that was implied by the 'open door' policy for commercial interests, a policy which John Hay, secretary of state under President McKinley, declared as early as 1900, and a policy to which Britain had always subscribed (see on this Sir John Pratt, *War and Politics in China*, 1943).

Cairo (pronounced Cäro), city of Illinois, U.S.A., co. seat of Alexander co., is situated at the junction of the Mississippi and Ohio Rs. about 130 m. S.S.E. of St. Louis, and 360 m. from Chicago. In 1858 C. was nearly destroyed by flood, now it is protected by 4 m. of levees. In 1883 a steel railway bridge was built across the R. Ohio. C. is a shipping port for grain and oil, and trades in manufactured goods. In the Civil war it was a depot for supplies. A marine hospital is there. It is the 'Eden' of Dickens's *Martin Chuzzlewit*. Pop. 13,500. Also the name of numerous post-vils. and banking tns in U.S.A.

Cairolì, Benedetto (1825–89). It. statesman and soldier, was b. at Pavia. He accompanied Garibaldi to Sicily in 1859, where he fought at Calatafimi and at Palermo; and to the Tyrol in 1866, where he fought at Montana. In 1870 he conducted the negotiations with Bismarck. In 1876 the Left came into power, and C. became leader of his party, and in 1877 formed a cabinet with a Francophile and Irredentist policy, on the fall of the ministry of Depretis, Nicotera, and Cisspi. General indignation was caused by his policy at the Berlin Congress, where Italy secured nothing, and the attempt of Passanante to assassinate King Humbert at Naples (1878) was the signal for his decline. In spite of his personal bravery in defending the king. In 1879 the Cairolì-Depretis ministry was formed, C. holding the office of premier and foreign minister, but his failure to foresee and intervene in the Fr. occupation of Tunis led to his final downfall.

Caisson is, in engineering work, a chamber of sheet iron, or sometimes wood, used in laying the subaqueous foundations of piers of bridges, quay walls, or dams. They are an integral part of, and permanent shell for, such foundations, and in this way they differ from coffer dams.

One type consists of a strong timber platform, to which sides are attached. One or two of the lower courses of masonry are built on to this, whilst it stands near the shore, and it is then floated out and sunk over the site of the pier, already levelled by dredging or otherwise. Previous to this, however, the detachable sides are removed. The C. of another type is bottomless, but provided with a cutting edge which digs into the earth on the application of weight. When enough earth has been excavated to allow the C. to sink to the required depth, concrete is shot into it to make the foundation solid. If the soil is hard and stony a different structure is used. The lower part of the C. is turned into a water-tight compartment, whose basis is the riv.-bed, which may be duly levelled by hand excavation. This air chamber communicates with the outer atmosphere by an air-lock, which serves as the means of entry and exit of both workmen and materials. Air is pumped down the metal column at a pressure corresponding to the depth below the surface of the water. When the men want to come out, the air of the lock is lowered to atmospheric pressure; in the same way it is raised to the pressure of the compartment when they want to return to work. The latter pressure is sufficient to counteract the tendency of the water to rise in the compartment. When the men have excavated down to a reliable stratum—the foundations of the piers of Forth Bridge reach down to the rock 75 ft. below high water—their working chamber is filled with concrete through the shafts, and the bottomless C. is thus left embedded in the work. Before such a C. is floated out, plate-iron walls are fastened round the strong roof of the working compartment, to form an upper, open box, in which the pier or quay wall is built up as the C. sinks lower and lower. The foundations of Brooklyn suspension bridge and Antwerp quay walls were both prepared by Cs. of this description. In more recent times the process has been made cheaper by the use of screw-jacks to raise the C., once the solid rock or bed has been reached. It is then available for the construction of the superimposed portion. The lifting continues till the pier rises above the water level, when the C. is ready for use elsewhere. Graving docks are often closed by means of closed iron or 'ship' Cs. These rise when the water level inside is the same as that without, and can then easily be floated to recesses at the side. That at Toulon has an area of 57,218 sq. ft., and is 62 ft. deep. Sliding or rolling Cs. are similarly used. Pneumatic Cs. may be described as a structure open at the bottom and shut at the top, in which compressed air is used to prevent external mud and water from penetrating the box. The working chamber in these Cs., forming the lower part of the C., must be practically entirely air and watertight. The opening for workmen and for materials and tools are vertical shafts fitted with air-locks, the air pressure in which may be gradually altered from that of the atmosphere to that

of the working chamber. Pneumatic Cs. can be used in depths up to over 100 ft., of water, but for depths over about 110 ft., the dredging well system is used. In shipping, a C. is a contrivance consisting of a hollow structure, provided with an air chamber, for lifting a vessel out of the water for repairs. It is sunk by being filled with water, hauled underneath the ship, and then raised by being pumped dry again. In military language a C. is an ammunition wagon. See D. H. Lee, *Sheet Piling, Coffor Dams, and Caissons*, 1945.

Caisson disease is the name given to the group of morbid changes suffered by C. workers and divers. The symptoms include obstructed respiration, vomiting, pains in the joints or muscles, deafness, and paralysis, and even death may supervene. These symptoms do not appear while the pressure is being increased nor during its continuance, but only after it has been removed; and they are due to effervescence of gases absorbed during exposure to pressure. The disease is best circumvented by preparing for the immersion gradually, and leaving it gradually.

Caistor, small tn. in N. Lincolnshire with fish-rearing ponds. Pop. 1600.

Caltness, co. in the extreme N.E. of Scotland, whose boundaries are Pentland Firth on the N., which separates the mainland from the Orkneys, the N. Sea on the E., and Sutherland to the W. and S. The chief promontories of the bleak rugged coast are Ord, Ness, Duncansby, Dunnet (316 ft.), the most northerly headland of Great Britain, and Holburn. The Rts. Forss and Wick Water drain Lochs Shurrery and Watten respectively, and the Thurso empties itself into Thurso Bay. The highest mt. is Morven in the S. (2313 ft.). The is. Stroma and the Pentland Skerries belong to this co. Wick and Thurso are the chief tns. C. shares a sheriff with Orkney and Shetland, and a member of parliament with Sutherland. In spite of the severity of the winter storms and the prevalence of northerly gales, the great belt of the Atlantic prevents excessive or continuous cold. The soil is poor and the moorland barren, yet good crops of barley, oats, potatoes, etc., are grown. The wool of the native sheep is in high demand, but the inhab. live chiefly by the cod, lobster, and especially the herring, fisheries. The salmon fishing of the Thurso and the shooting preserves are excellent. Flagstones are quarried at Thurso and Halkirk. Though there are rocks of quartz-schists, the chief strata belong to the Old Red Sandstone age. The 'stacks' or detached sandstone pillars by the cliffs are very impressive. Area 438,833 ac. Pop. 26,000.

Caius, see **GAIUS**.

Caius, Dr. John (1510-73) (also known as Dr. John Kaye—C. being the Latinised form of his surname), the second founder of C. College, Cambridge, entered what was then Gonville Hall in 1529, and four years later was elected fellow. After gaining his M.D. at Padua in 1541 and travelling in

Europe, he returned to England, where he gave anatomy lectures in London and became a favourite physician of Philip and Mary. Made fellow of the College of Physicians in 1547, he was, during his membership, nine times president. In 1557 he built a new court to his old college, endowed it with sev. estates, and in 1559 became master, and as a staunch Catholic put his Protestant fellows in stocks for burning his vestments. He obtained permission for C. College to have the bodies of two malefactors each year for dissection, and may therefore be regarded as a pioneer in the cause of anatomy. Edward VI., Queen Mary, and Queen Elizabeth all employed his services as physician.

Caius College, Cambridge (pronounced Keys), was refounded in 1558 by Dr. John Kaye (see CAIUS, DR. JOHN). The name Gonville commemorates the original founder, who was rector of Terrington, Norfolk. His college was removed to the present site in 1535. The first court was rebuilt in 1668, so that the college is no longer entered by the Gate of Humility in Trinity Street. In spite of extensive alterations, this famous gate, together with the Gates of Virtue and Honour, have all been preserved. Indeed the last has been spoken of as one of the most pleasing specimens of early Renaissance work in England. The stained glass of the chapel, which contains the splendid tomb of the founder, represents miracles by healing. C. is still, as always, the great medical college of the univ.

Caivano, com. of Italy in Campania, 7 m. by rail from Naples. Pop. 15,000.

Cajababa, tn. of Peru, S. America, dept. of Cajamarca, cap. of prov. of C., 350 m. from Lima. Also a tn. of Ecuador (Kibamba or Bolivar), cap. of Chimborazo prov., 85 m. from Guayaquil, on the railway from Quito to Guayaquil. The modern tn. dates from 1797, when the anct. one was destroyed by earthquake.

Cajamarca, or **Caxamarca**: 1. N. dept. of Peru, S. America, bordering on Ecuador, crossed by the Andes. Area, about 12,550 sq. m. There are four provs., C., Cajabamba, Chota, and Jaén. Pop. 450,000. 2. Tn., cap. of above dept., 365 m. from Guayaquil. Ruins of anct. Peruvian architecture remain; the 'house of Atahualpa,' and the 'seat of the Inca' on Santa Apolonia Hill above the tn. Near by are the warm, sulphuric, mineral baths, 'Baños del Inca' (Inca's thermal baths), which are still frequented. C. is an important seat of trade and manufs. on the Pacific coast, producing textiles, straw hats, and steel. There are gold and silver mines near. It was prominent in Peruvian hist. Pop. about 15,000.

Cajanello, Duchess of, see EDGREN, ANNA CARLOTTA.

Cajazzo, tn. of Italy, in the prov. of Terra di Lavoro, situated on the Volturno, 11 m. from Capua. It is a bishop's see, and is notable for the ruins of the Rom. Calatia. Pop. 6000.

Cajeput-tree is the name given to *Melaleuca Leucodendron*, a species of Myrtaceae, and occasionally to *Litsea cal-*

fornica, a species of Lauraceae. *M. Leucodendron*, a native of Asia and Australia, is a small evergreen tree, with spikes of white flowers, which is often cultivated in bothouses. An aromatic oil, known as oil of cajeput, is distilled from the leaves.

Cajetan, Jacopo (Tommaso de Vio) (1469-1534), It. theologian, surnamed C. from his bp., Gaeta (Caieta). He entered the order of St. Dominic, 1484, studying at Naples, Padua, and Ferrara. Prof. of theology and philosophy at Brescia, Pavia, and Rome; general of his order, 1508. Leo X. made him a cardinal in 1517, sending him soon after as legate to Germany, to urge the emperor and Scandinavian kings to form a league against the Turks, and to bring Luther back into fellowship with the Church. 1523, legate to Hungary, recalled by Clement VIII.; 1527, prisoner at the sack of Rome. His works were collected in 1639. They include trans. of the Bible; *Commentary on the 'Summa' of Thomas Aquinas*; *On the Authority of the Pope*, a work censured by the Sorbonne. See Ekerman, *Dissertatio de Cardinali Cajetano*, 1761; Schilback, *De Vita ac Scriptis de Pio Cajetani*, 1881.

Cakile is the generic name of four cruciferous plants found in Europe and America. The tap-root is very long, the shoots are prostrate, the leaves fleshy, and the fruit is a two-jointed silicula in which only one seed comes to maturity. *C. maritima* is the common sea-rocket, *C. americana*, the Amer. sea-rocket.

Calabanga, or **Calabangan**, tn. on the is. of Luzon in the Philippines, situated on a small riv. which runs into the bay of San Miguel. The weaving of hempen material and the manuf. of hats are the prin. industries. Pop. 6000.

Calabar: 1. Prov. of Nigeria with 980,000 inhab. It has extensive palm oil plantations. 2. Old C., seaport on the C. R. above C. estuary, and the cap. of the E. prov. of the Brit. protectorate of S. Nigeria, W. Africa. The pure Negroes, the Efiks, who migrated to C. about 1725, live in Duke Town in the valley, whilst the prin. buildings are on the hills. The vegetation is luxuriant, and palm oil and kernels are the chief export. There are steamers to Liverpool and Amsterdam. Pop. about 15,000. 3. New C., name of a port and riv. 100 m. to the E.

History of Calabar.—The early story of C. is a story of black bondage. Its prosperity was based on the slave trade. With the abolition of the overseas trade in slaves the dominant tribe, the Efiks, were secure in their strategic position near the coast, and as the oil traffic grew they consolidated their power and wealth. But they were a degraded people. Any purity of race which may at one time have been theirs had been obliterated by concubinage with slaves of other tribes. There was no Efik man who had not slave blood in his veins. But they were important to the European traders, for whom they acted as middlemen in getting oil from inland. Hence the ship's captains and traders clothed the headmen with authority and styled them 'kings,' but

were careful to appoint those who could be relied upon to favour them in trade. These 'kings' or chiefs were further flattered by the payment of certain dues such as 'comor', a customs tax on the produce which passed to the hulks through the hands of the chiefs. Much good was effected by the Scottish mission which went out to C. in 1846 under Hope Waddell, whose most able coadjutors at this time were Hugh Goldie and Wm. Anderson. The mission soon found that the fight against cruelty and superstition would be slow and bitter. Magic was the keynote to which native life was attuned. Ekpo, lord of mysteries, was more powerful than any individual king or chief. The Ekpo Society was a secret association, initiation into whose every grade had to be purchased with money and the blood of sacrifices. To the common people Ekpo was a dread being who lived in the forest. To the chiefs Ekpo was a useful political power which they used to enforce their own authority. Ekpo laws were inviolate. Ekpo was called in for all the important ceremonies of a primitive society. The savagery of this heathenism was never more apparent than at the death of a chief. Countless victims were slain to keep him company on the dark way, or give him consequence on his arrival in the ghost-land. Frightful scenes were witnessed by members of the mission at Duke Town on the death of King Eyamba and they were powerless to stay the hands of the butchers. Gradually, however, the Scottish mission won the heathens over to different ways, and when Hope Waddell retired in 1856 the C. mission had laid the foundations of its splendid record. Trips were made up the Cross R. in search for suitable out-stations for native teachers, and for many years the Cross R. was to remain the highway for Christian advance, the explorer of the C. mission being Samuel H. Edgerley, a son of one of the pioneers who had accompanied Waddell in 1846. In 1884 a Brit. consul estab. himself at C. But the up-riv. tribes cared nothing for consular authority, and in 1889 a protectorate was proposed with consular jurisdiction for Brit. subjects, its headquarters to be at Duke Town. The most remarkable of all the women missionaries was Mary Mitchell Slessor, after whom is named the Slessor Memorial Home at Ikot Obong. The story of this quiet, fearless woman of indomitable character has been told by W. P. Livingstone in his classic of missionary biographies, *Mary Slessor of Calabar*. After her arrival trade with C. was opened up, and this left less time for drinking and intertribal fighting. In 1891 Maj. Claude Macdonald, the previous consul, was made commissioner and consul-general of the Oil Rivs. Protectorate, with headquarters at C. For years the missionaries had striven to break down the intertribal barriers which closed the Cross R. to trade and civilisation. But now the riv. was declared free, and vast areas into which none but the missionary had ventured were opened up. The C. mission

was now anxious to add industrial training to its expanding school work, and the Hope Waddell training institution soon became one of the foremost training centres in W. Africa. This centre to-day is the goal of boys from the whole mission area who seek higher education, and in its highest class students can sit for the school certificate examination, which admits them to further training at Yaba Higher College, Lagos, or for the technical depts. of gov. service. But in the 1890s the further gov. officers penetrated into the interior, the more they realised the lawless state of the country. One of the most important events in the hist. of W. Africa from the religious and political point of view was the destruction of the Long Juju at Arochuku, for this freed the country for ever from the evils of slave raids and slave-dealing on an organised scale. To break the unholy influence of the Aros, a military expedition converged on the Aro strongholds in 1901. Its work was completed by March 1902, and thereby an important new area was opened up to mission work. With the coming of the gov. and the development of trade, C. had now become a prosperous port. A considerable European pop. was now resident in Duke Town and native staff for the gov. offices had been brought in from other parts of Brit. W. Africa. Mention should be made of Dr. J. W. Hitchcock's work in starting the Uburu hospital, which to-day is one of the best-placed mission hospitals in Africa. Here was begun the use of neo-salvarsan on every case of yaws brought in, with great benefit to the victims of that disease. A new and considerably enlarged hospital was opened at Idu in 1927 by the governor of Nigeria. At the same time was begun an organised effort to deal with lepers, the bulk of the patients being employed on some beautiful outdoor occupation. There is a girls' boarding school at Asaga which is managed by the Slessor Memorial Mission. See D. M. McFarlan, *Calabar: the Church of Scotland Mission, 1846-1946*, 1946.

Calabar Bean, or the ordeal bean of Calabar, is a species of Leguminosae, *Physostigma venenosum*, found in tropical Africa. It is a perennial climbing plant with a slender stem which attains a height of 50 ft.; the flowers are peculiarly formed and have a spurred keel. The dried seed was used formerly by the natives of Africa to test people accused of witchcraft, and it possesses very dangerous poisonous properties; guilty persons were supposed to succumb to its action, and innocent ones to escape. It is of great value in ophthalmic surgery, as its application to the eye contracts the pupil, and frequently relieves pain, e.g. in glaucoma; in tetanus and other nervous diseases it is also of value. The bean owes its importance to the presence of eserine, an alkaloid which it contains.

Calabash, hard shell of the fruit of the C.-tree, or bottle-gourd, the epicarp of the *Crescentia Cujele* (Bignoniaceae) being used in tropical America, that of the *Lagenaria vulgaris*, of the order Cucurbitaceae, in

India. The common bottle-gourd is a native of India, but the C.-tree grows in W. Africa, tropical America, and the W. Indies. The shell of the fruit is extremely hard, and is made by the natives into all kinds of cups, basins, jars etc., for holding liquids. The plant is a creeping one, and it has white flowers which produce this extraordinary fruit. Sometimes one may see a specimen of C. highly polished and elaborately carved. At one time C. pipes were extremely popular.

CALABASH PLANT AND FRUIT

Calaber, Gk. poet, see QUINTUS CALABER.

Calabozo, tn. of Venezuela in the midst of a cattle-raising country. Pop 7000.

Calabria: 1. In Rom. hist. is the name of the modern prov. Leuce in the heel or S.E. extremity of Italy. The peninsula was flanked W. and E. by the gulf of Tarentum and the Adriatic Sea. From 272 to 266 B.C. there were six triumphs over the Tarentini, but Tarentum was not finally subdued till 209 B.C. In Strabo's time Tarentum and the colony of Brundisium (founded in 245 B.C.) alone retained their importance, probably because of their excellent harbours, although C. had once boasted of thirteen populous cities. In spite of the lack of rivers, its soil was fertile, and in anct. writers there is constant mention of its pastures, olives, vines, and fruit trees. There were famous dye-works at Tarentum. The great artery of traffic the Via Appia, passed through this port, and was prolonged to Brundisium. These places were also connected by a coast road passing through Manduria, Aleium, Veretum, and Lupiae. The name C. was transferred to the ter. of the Brutii on its subjugation by the Lombards in A.D. 688. 2. In modern times is the 'toe of the boot,' that is, the S.W. extremity of Italy. It has an area of 5819 sq. m., and is bounded by the sea on three sides, and on the N. by the prov. of Basilicata. All the rivers are short, except the Crati, that waters the plain of Sibari, and this is 58 m. long. In the extreme N. Monte Pollino (7325 ft.) concludes the

Apennine chain proper. The granite mts. of C. fall into two groups. The northerly, of which Botte Donato is the highest peak, is terminated by the Isthmus made by the gulfs of S. Eufemia and Squillace. Aspromonte (6420 ft.) belongs to the S. range. In summer the climate is very hot, and there have been some disastrous earthquakes. The terrible 'Messina' earthquake of 1908 destroyed Reggio. Rain torrents also cause much damage, especially now that ruthless deforestation has removed a natural protection. The coast strips are fertile. Olives, vines, fruit, and also wheat, rice, cotton, and tobacco, are cultivated, but many economic disadvantages, such as the deficiency of railways in the interior, the lack of any middle class, and the proponderance of officials, have hitherto militated against industrial organisation. The inhab. of the Albanian colonies (estab. in the fifteenth century) still preserve all their national characteristics. Reggio di C., Catanzaro, Nicastro, Calabro, and Monteleone are the chief tns. On 3rd Sept. 1943 the spearheads of the famous Eighth Army (G.V.), including Canadian troops, crossed the strait of Messina to invade the It. mainland; the initial landings took place along the coast from Catona to Reggio di C. They were covered by air and naval bombardment and by a barrage from hundreds of guns massed along the strait; but it was apparent that no serious effort was being made to defend either S. C. or Apulia. Pop. 1,772,000. See further under ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS ON. See E. Lear, *Journal of a Landscape Painter in Southern Calabria*, 1852; C. T. Ramage, *The Nooks and Byways of Italy*, 1868; N. Douglas, *Old Calabria*, 1915.

Caladium is a genus of Araceae, and includes sev. species of S. Amer. plants, cultivated on account of their spotted skins and variegated leaves. *C. Seguinum*, the dumb-cane, grows to a height of five or six ft., and secretes an acrid poison which swells the tongue and destroys power of speech. *C. sagittifolium*, the Brazil cabbage, and *C. esculentum*, Indian kale, are both edible.

Calafatu, or Kalafat, tn. of Rumania, situated on the l. b. of the Danube, almost opposite the Bulgarian fortress of Vidin (Viddin). It is connected with Craiova by rail, and has a large grain trade. It is of historical interest, having figured in many wars. Pop. 7600.

Calahorra (anct. Calagurris), city on the l. b. of the Cidacos, in the prov. of Logroño, N. Spain. The cathedral was first restored in 1485. Thousands of pilgrims visit the shrine at Casa Santa every year. Wine, oil, and grain are brought to the markets from the Ebro valley. In 76 B.C. Sortorius defended Calagurris against Pompey. Quintilian was b. here.

Calais, seaport in the dept. of Pas-de-Calais, N. France, 185 m. N. of Paris by rail. It has a modern part to the E. of the railway, and the medieval tn., laid in ruins during the Second World War, is on an is., surrounded by the harbour basins

and the canal which connects the navigable river of the dist. with the harbours. Its Place d'Armes contains busts of Cardinal Richelieu and Eustache de St. Pierre, who with six other notable citizens prevailed on Edward III. not to massacre the inhab. when in 1347 they were forced to surrender. A fourteenth-century gateway is a relic of the Hôtel de Guise, formerly the guildhall of the Eng. wool merchants, but presented to the duke of Guise in 1558, when he recovered the city from the Eng. Rodin's famous group, 'The Burghers of Calais,' was completed in 1895. C. is the chief centre for the manuf. of lace and tulle, which is carried on in the quarter of St. Pierre. Its exports, most of which are sent to the Brit. Isles, are wines, spirits, woven goods, fruits, and lace, whilst cotton goods, minerals, and timber are its chief imports. During the First World War the port equipment was much improved to cope with the military needs. C. was one of the chief objectives of the Ger. invasion of France. In the Second World War, C. was the scene, from May 22 to May 27, 1940, of a most heroic defence by 3000 Brit. and 800 Fr. troops, assisted by two patrolling Brit. destroyers, against the Ger. army. The main object of the defence was to give time to the allies to prepare the defence of Dunkirk for the evacuation of the B.E.F. The Gers. threw into their attack on the citadel the whole weight of two Panzer divs., besides sending waves of dive bombers over the tn. The Brit. troops were short of everything—guns, food, and ammunition; and there were next to no fighter planes to attack the Ger. bombers. Their task was further complicated by Fifth Column (q.v.) snipers and streams of refugees, while, throughout, they were fighting in very hot weather in the midst of the foul heat of the burning town. They fought to their last round of ammunition and most of them perished; but the saving of the greater part of the B.E.F. at Dunkirk was due, in no small measure, to the fortitude and sacrifice of the defenders of C. Pop. 67,000. See also WESTERN FRONT IN SECOND WORLD WAR.

Calais, city of Washington Co., Maine, U.S.A., on r. b. of R. St. Croix, 80 m. from Bangor. Sev. bridges across the riv. connect it with St. Stephen, New Brunswick. It is the S.E. terminus of the Washington Co. (St. Croix and Penobscot) railway. C. has shipbuilding, lumber trade, foundries, and machine shops. The C. Academy is there. Pop 5600. Also the name of post-vill. in U.S.A.

Calais, Pas de, see PAS-DE-CALAIS.

Calaisis, name of Calais and the adjoining dist., occupied by the Eng. from 1347 to 1558, and then reconquered by the Fr., who called it the *Pays reconquis*. It now forms part of the arron. of Boulogne and of St. Omer.

Calamander = Wood (probably from Coromandel Coast), very valuable cabinet wood, like rosewood, only more beautiful and durable. Produced from the *Diospyros hirsuta* or *quassia* of the order Ebenaceae, of the same genus as the

ebony and persimmon trees. A native of S.E. India and Ceylon, it is becoming very rare. It yields veneers of exceptional beauty, and takes an exquisite polish. The colouring is largely chocolate and fawn. One cub. ft. weighs about 60 lb.

Calamata, see KALAMATA.

Calamary, *Loligo vulgaris*. A variant name for the squid.

Calamba, municipality, Philippine Is., 37 m. from Manila, a centre of the sugar industry. Pop. 18,000.

CALAMINT

Calame, Alexandre (1810-64), Swiss painter and engraver, was b. at Vevey, where his father was a stone-cutter. He studied painting at Geneva under François Diday (1812-77), of whose school he later became master. He travelled for some time in England, Holland, Germany, and Italy, but all his best work represents his native Swiss scenery. He succeeded in reproducing its glorious variety with truth and energy. His works are to be found in Ger. and Swiss galleries, and there are two at S. Kensington. Among the best are 'Mont Blanc,' 'Lake of Brienz,' 'The Lake of the Four Cantons,' 'Lake Lucerne.' His etchings are numerous and well known, those of the scenery of Lauterbrunnen being the most famous. There has been instituted a Calame prize for landscape, one winner being Ferdinand Hodler (1853-1918).

Calamianes, group of is. belonging to the Philippines, situated midway between Mindoro and Palawan. They have an estimated area of 615 sq. m. The prin. is. is Calamian, which is about 35 m. long and 15 m. wide. The chief production is rice; great quantities of honey and wax are also produced. Pop. 20,000.

Calamine, term applied to two ores of zinc and an alloy: 1. Zinc carbonate, occurring in rhomboid crystals, white, yellow, brown, green, or grey in colour, sometimes translucent. It is found at Matlock, Mendip, Alston Moor, Leadhills,

and at Wanlockhead in Dumfriesshire. 2. The native hydrous silicate of zinc, occurring in white, green, blue, or yellow crystals, and usually found associated with carbonate. It is also called smithsonite and hemimorphite. C. is used as a pigment in the painting of pottery, producing a fine green colour. 3. An alloy of zinc, lead, and tin formerly used as a protective coating for iron utensils.

Calamintha, genus of herbs giving the name to the common Eng. herb called calamint. The family of these plants is Labiate. The calamint is very much like the other herbs, thyme and sage, to which it is related. They are very hardy plants and easily grown in any ordinary soil found in gardens in Great Britain. There are two very small species, namely *C. glabella* and *C. alpina*, which make excellent subjects for a rock garden; the larger kind, *C. grandiflora*, does very well as a border plant. This latter species flowers in the month of June. See also **BASIL**.

Calamis (*A.* 440 B.C.) was an Athenian sculptor who made statues of Apollo, Aphrodite, and Hermes, as well as part of a chariot group, commissioned by Hiero, king of Syracuse. Archaeologists cannot point to any work as incontestably his, but the bronze Delphic charioteer expresses so well his merits, as also his limitations, that there is every justification for the attribution of this masterpiece to C. Pliny speaks of his grace and delicacy, and these qualities at once impress the student as he observes the refined, almost girlish, expression of the charioteer's face and the charming simplicity of the straight folds of his long and flowing chiton. Certain conventionalities in the treatment of head and drapery further convince the student that the statue must be the work of a predecessor of Myron, Polyclitus, and Phidias.

Calamites are the fossil plants of most frequent occurrence, and are believed to belong to the Equisetaceae. Many of them are gigantic in size for their group, reaching a height of 30 ft., and they are reed-like in appearance. They seem to grow in clumps in damp clay soil or under water, and occur abundantly in the Devonian to the Jurassic strata, being especially frequent in the Carboniferous. The leaves receive various names, e.g. *Annularia*, *Asterophyllites*.

Calamus is the generic name of 200 species of tropical palms native to Asia, Africa, and Australia. Most of these plants are leaf-climbers with long thin stems, and many have hooks growing from the under side which attach themselves to passing objects and prove very troublesome. The stem of *C. Scipionum* supplies Malacca cane, of *C. Rotang*, *C. rudentum*, *C. tenuis*, and *C. verus* rattan-cane, while *C. Draco* yields the 'dragon's blood' of commerce, used in the preparation of printers' blocks and for red lacquers. See also **SWEET FLAG**.

Calamy, Benjamin (1642-86), Prebendary of St. Paul's son of Edmund C. the elder (q.v.), the Presbyterian divine. Educated at St. Paul's and at Cambridge.

Chaplain-in-ordinary to the king (c. 1677). His *Discourse about a Doubting (scrupulous) Conscience* appeared in 1683. It was dedicated to Jeffries. The Nonconformists accepted it as a challenge, replying to it by De Laune's *A Plea for the Nonconformists*, which cost its author his life, in spite of C.'s intercession. The execution of Henry Cornish (d. 1685) broke C.'s health. See *Biographia Britannica*, iii., 1784; T. Birch, *The Life of Dr. John Tillotson*, 1753; E. Calamy (ed. J. T. Rutt), *An Historical Account of my own Life*, 1829.

Calamy, Edmund, called the elder (1600-1666), Eng. divine, b. at Walbrook, London; educated at Cambridge, where he joined the Calvinists; became chaplain to the bishop of Ely. From 1626 to 1636 he was a lecturer at Bury St. Edmunds, but later left the Anglican Church for the Presbyterian, becoming in 1639 minister of St. Mary, Aldermanbury, London. Here he officiated for twenty years, being throughout a supporter of the Royalist cause, and becoming chaplain-in-ordinary to Charles II. He was one of the Presbyterian representatives at the Savoy conference in 1661, but was ejected from his living in the next year under the Act of Uniformity. He was one of the five compilers of *Smectynnuus* (q.v.), 1641, a polemical work written in reply to Bishop Hall's *Episcopacy by Divine Right*, 1640.

Calañas, com. of Andalusia, Spain, about 20 m. from Huelva, dist. of Valverde del Camino, producing copper. Pop. 10,000.

Calandra is a genus of insects belonging to the Curculionidae, or weevils. *C. granaria*, the corn-weevil of our granaries, is a little beetle which bores a hole in the grain and there deposits its eggs, which hatch into a destructive grub. *C. orizæ* infests rice, and *C. palmorum* lives during its larva state in the pith of palms of S. America.

Calantas, Philippine cedar, *Cedrella toona*, a lasting wood, red in colour and much used in making cigar boxes, and lining ceilings and walls; also for building canoes.

Calanus, an anct. Hindu philosopher, belong to that sect known to the Gks. as Gymnosophists. According to Plutarch, his real name was Sphines. He came into close contact with Alexander the Great, and spent some time at his camp in India. At Pasargardæ he became sick, and, at his own request, was burned alive on a funeral pyre. Just before his death he is reported to have said to Alexander, 'I shall soon see you again in Babylon,' a speech which is regarded as a prophecy in the light of Alexander's death at Babylon a few months later. See the *Anabasis* of Arrian.

Calappa, typical genus of the Calappidae, is a brachyurous decapod crustacean with a rounded and crab-like cephalothorax. The species have crested claws, and the abdomen is hidden under the thorax. Their geographical distribution is wide, and they are found in the warm seas. *C. granulata* is a crab which occurs in the Mediterranean.

Calarasi, or **Calarache**, prin. tn. of the dist. of C., Rumania. It is situated on a branch of the Danube, and has a good export trade in timber, wheat, hemp, and linseed. Pop. 13,600.

Calas, Jean (1698-1762), Fr. Protestant merchant, accused of having strangled his son, Marc Antoine (who had probably committed suicide), to prevent his turning Rom. Catholic. He was condemned by eight judges of Toulouse to be broken on the wheel. The charge was fostered by Rom. Catholic societies, the White Penitents and the Franciscans. This judicial murder caused an agitation in which Voltaire played a leading part. His generous efforts got the sentence against the family annulled, and resulted in the amelioration of the legal position of Fr. Protestants. In 1765 the stigma was removed from C.'s name. See A. J. Coquerel, *Jean Calas et sa famille*, 1858; Voltaire, *Traité sur la tolérance*, 1865; R. Allier, *Voltaire et Calas*, 1898; M. Chassaigne, *L'Affaire Calas*, 1929.

Calascibetta, tn. of Sicily, 15 m. from Caltanissetta, in prov. of Caltanissetta, on a hill opposite Castrogiovanni. Produces wine, silk, olive oil. Pop. 9000.

Calasião, municipality of Luzon, Philippine Is. Pop. 17,000.

Calasparra, tn. in the prov. of Murcia in Spain, lies about 40 m. distant from the auct. tn. and cap. called Murcia. Agriculture is the prin. occupation of the inhab.

Calatafimi, tn. in prov. of Trapani, N.W. Sicily, 8 m. from Alcamo, 32 m. from Palermo. Ruins of auct. Segesta are near; Garibaldi defeated the Neapolitans, 1860, about 2 m. from C. Pop. 10,300.

Calatayud, tn. of Saragossa (Zaragoza), Aragon, Spain, on R. Jalon, about 45 m. from Saragossa, on main railway to Madrid. In the older parts of the city there remain cave dwellings in the rock. There are mineral springs near, stalactitic caverns, and the ruins of Martial's bp., Bilbilis. C. is of Moorish origin, the name, in Arabic, meaning 'Job's castle.' The exterior is imposing, but the tn. is now backward and purely agric. Pop. 12,000.

Calathea, genus of Marantaceæ consisting of perennial herbaceous plants which are natives of tropical America and W. Africa. The leaves are very beautiful, and most species have a petaloid staminate. In the W. Indies the tubers of *C. Allouia* are used as a substitute for potatoes.

Calathus, genus of coleopterous insects of the family Carabide, or ground-beetles. The species are generally black or brown, and *C. cistellodes*, a black beetle with black antennæ, red at the basal joint, and either red or black legs, is commonly found on Eng. pavements.

Calatrava la Vieja, auct. fortress in Ciudad Real, Spain, on the R. Guadiana, 65 m. S.E. of Toledo. In the Middle Ages it was considered the key to the Sierra Morena. It was taken from the Moors in 1147. The military order of Calatrava was founded here in 1158. The surrounding dist. is known as the Campos de C.

Calaveras, co. of California, U.S.A., called after R. Calaveras, which runs through it to join R. San Joaquin, about 12 m. below Stockton. Bounded N.W. by Mokelumne R., S.E. by Stanislaus R. On the E. is the Sierra Nevada. C. has rich gold and copper mines, and contains one of the most famous groves of *Sequoia gigantea*. Cap., San Andreas. Pop. 7000. Area 1027 sq. m.

Calaveras Skull, a famous fossil cranium, found in 1886 by Prof. J. D. Whitney in C. co., and now at the Peabody Museum, Cambridge, Massachusetts. The discovery raised the question of the existence of tertiary man in the New World. Doubt has been thrown on its genuineness.

Calaverite, telluride of gold; contains about 44 per cent of gold and 2 to 3 per cent of silver. It is a compact mineral and massive, and resembles pale pyrites but is of greater density. It occurs in volcanic rocks in Colorado and in W. Australia. The name comes from Calaveras, Colorado, where it was first found.

Calbayog, municipality in Samar Is., one of the group of Philippine Is. Very pleasant climate. Pop. 25,380.

Calcaire Grossier, name of a number of limestones and marls very rich in fossils. They developed in the Paris basin, and are thought to date back to the middle of the Eocene period. The limestones yield many varieties of fossil shells, and also a great number of mammalian remains.

Calcareous Rocks, Soils, Tufa, etc. (correct spelling calcareous, from Lat. *calx*, limestone): 1. Rocks that contain much lime, especially in the form of carbonate (CaCO_3), whether calcite or aragonite. Usually such rocks are aqueous, and those formed in the sea are composed of the fossilised remains of marine animals (brachiopods, corals, crinoids, echinoderms, molluscs, and the like). Many Palæozoic limestones are composed of shells, corals, etc., others of foraminifera. These rocks are mostly of organic origin, the lime salts of sea-water being extracted by the living tissues of these animals and deposited in the form of carbonate of lime by shell-secreting membranes. Others are formed as precipitates by the evaporation of C. solutions, e.g. stalactite and calc-sinter (C. tufa), and probably oolite (all chemically formed). A crystalline structure, varying from partially crystallised limestones to granular statuary marble, is produced by metamorphic action. These are usually associated with the crystalline schists and the contact rocks developed by the action of heat given out by great masses of cooling granite to surrounding rocks. The existence of the carbonate in rocks can be discovered by applying dilute nitric or hydrochloric acid. Effervescence is thus caused through liberation of carbonic acid. Quicklime is obtained by calcining these rocks. 2. C. soils are produced by disintegration of C. rocks. When these rocks are pure they yield rather barren soils of little agric. value, as is the case in many chalk and limestone

dist. of Britain. They are thin and full of hard flint nodules, more adapted for pasture than agriculture. If the rocks contain lime mixed with clay so as to form marl, with a little vegetable matter added, they form a good, friable, rather light soil. It is rather difficult of drainage, as soft lime retains water so readily, but yields it up by evaporation. After rain it soon dries on the surface, but rarely suffers from severe drought. C. soils, being light in colour, absorb heat slowly. They are often rich in phosphates, but lack potash. Most soils are improved by a certain amount of C. matter. Peaty soils are often dressed with chalk. See *Fream, Soils and their Properties*, 1890; F. H. King, *The Soil*, 1900; R. G. McConnell, *Agricultural Geology*, 1902; A. D. Hall, *The Soil*, 1904. 3. C. tufa, or calc-sinter (calc-tuff), also travertine, stalactite, onyx, marbles, are porous deposits of carbonate of lime, formed by the waters of C. springs. Water charged with carbonic acid can dissolve carbonate of lime out of the rocks, and, when it emerges into the air, deposit part of it again as an incrustation. Such springs are sometimes called petrifying springs, as objects placed in the water are covered with the deposit. There are noted examples of these at Matlock, and along the R. Arno (T. Arno), near Rome. The formation there is hard and compact, and much 'travertine' is used as a building stone at Rome. Other well-known springs are at Carlsbad, Bohemia; at Clermont in Auvergne; and in the Yellowstone region, N. America. C. incrustation, often seen in caverns in limestone rocks, are varieties of C. tufa, and are called stalactites and stalagmites. When free from impurity the deposit is white or translucent, but often it is stained with other substances, and is yellow, brown, or grey in colour, and sometimes variegated. It is a spongy, cellular, or concretionary structure, often banded, and showing rings of growth. It is found in a variety of forms, massive, tubular, botryoidal, or encrusting animal and vegetable remains, such as leaves, twigs, moss, nuts, or insects. It is often quarried for building purposes, being soft at first, but becoming hard and solid through exposure to the atmosphere. The temples of Paestum, Italy, were constructed of massive C. tufa. Calc-spar is carbonate of lime, rhombohedral in crystallisation. C. waters are called hard, contain much carbonate and sulphate of lime, and form a deposit when heated.

Caicedony, see CHALCEDONY.

Calceola, or Slipper Coral, fossil belonging to the middle Devonian period. Abundant in the limestones of the Eifel region of the Rhine in Germany. It derives its name from its peculiar formation in the semblance of the toe of a slipper, being conical, rather flat, and curved and tapering to a blunt point.

Calceolaria (Lat. *calceolus*, a slipper, from the shape of the flower), genus of plants originally from S. America, Mexico, and the W. Indies, but now extensively cultivated by gardeners in this country.

The family is Scrophulariaceae. There are two kinds of C., the herbaceous and the shrubby. The herbaceous varieties are generally grown from seeds, sown in July in a light soil, composed of sand, leaf-mould, and loam. A cool greenhouse suits their growth at all stages, and they flower from May to July. The shrubby kinds are generally produced by means of cuttings that should be taken in Sept. These cuttings should be put in a cool greenhouse after planting them in a soil composed of fine fibrous loam and silver sand. When the roots have struck, the plants should be put in pots and placed in a frame with the sun's direct rays falling on them. At the end of Feb. the points ought to be nipped off and then transplanted into bigger pots. This transplanting should go on until the 7-in.-size pot is attained, or at all events until they can be planted out, in the month of May. If the shrubby C. is kept growing in pots, it does best in a soil similar to that adopted for the herbaceous variety.

Calchedon, see CHALCEDON.

Calciferol, in chem., a crystalline substance with a molecular formula of $C_{27}H_{46}O$. It is obtained by simple irradiations of ergosterol. It is a pure vitamin D and is present in egg yolk, cod-liver oil and other fish-liver oils.

Calciferous, name applied to a system of sandstones and limestones found in N. America.

Calciferous Sandstone, name given to a div. of the carboniferous system found in Scotland. It consists of two subdivisions, the lower being called red sandstone and the upper cement stone. It is from the shale occurring in the latter rocks that the mineral oil produced in Scotland is obtained. Volcanic rocks are also found in this stratum.

Calcination, metallurgical name for burning or roasting an ore. It can either be performed in an air blast to obtain the oxide, or without air to drive off any volatile constituent such as sulphur.

Calcite, or **Calcspar**, natural carbonate of calcium used, on account of its property of strong double refraction in making optical instruments. Usually occurs in veins associated with sulphide lead ores or haematite. See ICELAND SPAR.

Calcium, atomic number 20 (symbol Ca, atomic weight 40.1), metal belonging, together with strontium, barium, and radium, to the class known as alkaline-earth metals, on account of the alkalinity of their oxides. It does not occur free in nature, but in combination it is widespread and abundant. The carbonate occurs as limestone, coral, marble, and calcspar (calcite); with magnesium carbonate as dolomite; the sulphate as gypsum and selenite, while the fluoride is fluorspar. Many other rocks contain it, as also do organic bodies, bones being formed chiefly of the phosphate. C. is a silver-white metal forming hexagonal crystals. It is fairly hard and can be hammered a bit. If left in damp air it tarnishes with formation of hydroxide, but if the air is dry it remains bright for some time. It decomposes water liberating

hydrogen, and ignites if heated in air, burning fiercely with a reddish light (hence its use in C. 'flares'). Davy was the first to isolate C. in 1808 in his electrolytic researches. It may be obtained by electrolyzing the fused chloride, and Moissan obtained its crystals by the action of sodium on C. iodide. The excess of sodium is extracted by absolute alcohol. C. is used as a drying agent, as a deoxidiser in hardening lead, desulphurising petroleum, as an alloy with aluminium, and for many other industrial and technical purposes. Compounds of C. are widely used and very important substances. The oxide CaO , or quicklime, is obtained by burning limestone and coal in kilns, the carbon dioxide being driven off from the carbonate. It is white, amorphous, very infusible, and becomes incandescent when strongly heated, and was formerly used with the oxy-hydrogen flame in the old 'limelight.' Mixed with water it forms C. hydroxide or slaked lime, the combination being accompanied by evolution of heat. Slaked lime when mixed with sand forms mortar. C. chloride occurs naturally and as a by-product from many manufacturing processes. It is extremely hygroscopic when anhydrous, and is used for drying gases (except ammonia, with which it combines). Bleaching powder, conveniently though inaccurately represented as chloride of lime, is $\text{Ca}(\text{OCl})\text{Cl}$, and is obtained by the action of chlorine on slaked lime. Plaster of Paris is C. sulphate deprived of some of its water of hydration by heat. On adding water rehydration occurs, and selenite is formed and sets in a hard mass. C. carbide, used for production of acetylene, is produced by heating chalk with carbon in an electric furnace. C. sulphide is a phosphorescent substance used for luminous paint. It is prepared by passing hydrogen sulphide over heated lime. The property of luminosity is probably due to an impurity, for it is found that pure C. sulphide is not luminous. The hardness of water may be classed as permanent or temporary. The first is due to the presence of C. sulphate and the second to C. bicarbonate. The latter may be removed by boiling the water or adding lime so that the insoluble carbonate is formed and by filtration can be removed. Hardness in water is explained by the fact that the sodium stearate in the soap is converted by the C. salt in the water into C. stearate, which does not lather. C. bisulphate $\text{Ca}(\text{HSO}_4)_2$, is made by passing sulphur dioxide into milk of lime until no further absorption of the gas occurs. It is used in making lower-grade paper from wood. Wood consists mainly of two substances, lignin and cellulose, the second of which is required for paper-making. By steeping wood chips in hot C. bisulphate solution under pressure, the lignin is dissolved, but the cellulose is left unattacked. C. salts when volatilised in the flame of a Bunsen burner produce a brick-red coloration.

Calcreose, drug composed of creosote and lime, and used internally instead of pure creosote. It is a dark brown powder.

Calc-sinter, see TRAVERTINE.

Calculating Machines. From the earliest times the need for mechanical aid in performing long calculations, which require no skill, but merely accuracy, has been felt, and various simple contrivances, such as the abacus, have been invented to meet this want. More complicated machines, providing for various kinds of calculation and degrees of accuracy, have been produced in this country since the seventeenth century, one of the earliest being 'Napier's Bones.' This appliance, which consisted of ten rectangular slips of wood, having the digits and their multiples on each of the four sides, was intended for use in multiplication and division. Its use was described by the inventor, Napier of Merchiston, in his *Rabdologia* (1617), and was received with considerable enthusiasm by the mathematicians of the day. Shortly afterwards Edmund Gunter, prof. of astronomy at Gresham College, produced his surveying chain, scale, logarithmic line, and line of numbers, the principles of which are still in use in the slide rule, much employed by engineers. The calculating machines invented by Pascal in 1642, Sir S. Moreland in 1666, and Leibnitz in 1671 were of little practical use. In the two former the addition of each place of figures had to be made separately, while the last, a model of which still exists at Gottingen, was intended for use in astronomical calculations. In 1775 a machine consisting of twelve ten-sided prisms, each face of which had a rack engaging with a toothed wheel, was put on the market by Viscount Mahon. The prisms were pushed in one direction for addition and in the other for subtraction, and these operations were repeated for multiplication and division. Circular machines were invented in 1779 by Hahn and in 1784 by Muller, but the first invention of the kind of real importance was that made by Charles Babbage about 1822. His machine, which was intended to calculate numerical tables by method of 'differences,' was left uncompleted at his death. The invention of the arithmometer, by M. Thomas de Colmar, about 1850, marked a great stride forward. This machine, which will add, subtract, multiply, divide, and extract square root, is easily operated by turning a handle, and is accurate and rapid in its results. The mechanical principle is that of toothed-wheel gearing, the wheels being engaged by setting stops to the figures. Several improvements on this machine have since appeared. Another advance was made by the production of adding machines capable of dealing with money columns. One of the first of these was the Burroughs (1888); other Amer. and Brit. inventors have produced variants of this type. The cash registers so largely in use at the present day are a development along the same lines. Some of the most recent of these automatically dispense the correct change. The electric tabulating machine and the planimeter, for use in geometrical calculations, are examples of other kinds of calculating machines. Other types are the tide-predicting machine invented in

1910 by Lord Kelvin; the area tabulating machine, used chiefly in measuring leather and hides; and the curvometer or kartometer for measuring the length of curves on, for instance, a map of a road.

Mechanical book-keeping provides a method of speedy and accurate posting to ledgers with the advantages that all accounts are kept in a legible and uniform style. Each account shows a balance which is the total of all the items posted to it and is progressive, being increased or reduced according to the nature of the postings, whether debit or credit. The arithmetical accuracy of the postings to the ledger can be checked daily or at any date by extracting a list of the balances. By the use of carbon paper a copy of each item posted to the ledger accounts is recorded line by line so that a complete summary and proof of the work posted for the day is obtained. Where customers' statements are required these can also be provided, being built up gradually as the posting is done during the month or quarter. The statement is usually the original posting, the ledger account and summary sheets being carbon copies.

Mechanical book-keeping, while used principally for sales and purchases ledgers to which large numbers of invoices on cash items are posted daily, is also used for posting the complete set of books. And machines which have typewriters incorporated are particularly useful in as much that accounts in the impersonal and private ledgers which require details and information recorded upon them can be typed on during posting. Such machines are also used for varied counting house work such as the entering of the receipts cash book, providing at the same time the customer's receipt, credit posting slip, loose cash book sheet, and bank paying-in slip. There are many different types of machines, each offering methods and systems suitable to different business and trades, and machines are designed to customers' varied requirements.

Calculus, in mathematics, any systematic method of arriving at a solution of a series of problems. Specifically, the term is applied to the differential C., with which the integral-C. is closely associated. The method has its germ in certain calculations devised by Archimedes, the Syracusan mathematician, who lived in the third century B.C. The processes referred to depended upon the comparisons of curvilinear figures or curved surfaces with the inscribed rectilinear figures or plane solids. The work of Archimedes was restricted by the poverty of symbolic methods, and it was only after the development of algebra by Vieta in the sixteenth century that the methods of Archimedes received any extension. Cavalieri proposed his method of indivisibles in 1635, and about the same time Roberval made the conception of what he called fluxions. The latter considered curves as formed by the motion of a point and obtained the direction of the tangent of the curve by a composition of the velocities of the point as determined by

the nature of the curve. Newton and Leibnitz both prepared specific notations, each for his own notions of quantity. That of Newton survived until the beginning of the nineteenth century, but has since been generally discarded in favour of Leibnitz's system. The nature of the general problem may be apprehended by considering certain operations in arithmetic to which an approximate answer only can be given. The quantity represented by the symbols $\sqrt{6}$ may be found to any required degree of accuracy, so that the square of the fraction may be found to approach 6 nearer and nearer without actually reaching that number. This may be expressed by saying that 6 is the *limit* of the value $x \times x$, where x represents the square root to any number of decimal places. In the series $1, 1 + \frac{1}{2}, 1 + \frac{1}{2} + \frac{1}{4}, 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8}$, etc., the quantities as they progress approach the value 2 nearer and nearer, although the value will never reach 2 for any extent of the progression. The series of quantities $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}$, etc., gradually decreases *without* limit, but if we take the ratio of each to its predecessor, we get $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}$, etc., a series of quantities which gradually increase, but without reaching the value 1. The increase, therefore, is not without limit, and by taking two successive quantities sufficiently small, we may get a ratio as near unity as we please. Suppose part of the circumference of a circle to be cut off by a chord; the ratio of the chord to the part of the diameter cut off by it increases as the chord approaches the circumference. In the case of the base of an isosceles triangle being moved parallel to itself towards the apex, the ratio, of course, remains the same, but the extra bulging out, as it were, of the circle means that the chord does not decrease in the same proportion as the perpendicular. Now circles are all of the same shape, and one may imagine that part of the circumference being magnified and again magnified to ocular vision while the movement of the chord goes on. The nearer it approaches the circumference the more times will the chord contain the perpendicular. By taking a sufficient number of such small chords we can approach as nearly to the length of the whole circumference as we please. It is true that the greater the number of arcs the greater the number of errors will be; but, as has been shown, the proportion of the error to its whole are diminishes, so that the total error becomes less and less. With reference to the problem of finding an arc of a known curve, it may roughly be said that the differential C. ascertains what is the form and value of the parts which are to be added; the integral C. adds them together and gives the result. The assumption made in what was formerly called the *infinitesimal* C. is that all quantities can be subdivided into an infinite number of infinitely small parts, each part being less than any assigned fraction of the whole, and yet not equal to nothing. Quantities connected with curves may be said to be of two kinds, called *constants* and *variables*. Constants

are quantities which are looked upon as always having the same magnitude, such as the radius of a circle or sphere, while variables are quantities which may have a number of particular values, as the co-ordinates of any point on the curve. Variables are also distinguished as being *independent* or *dependent*. A dependent variable changes according to changes in the value of another quantity, and is usually called a function of that quantity, thus, $2x$, x^2 , $a + bx$ are all functions of x . Independent variables are denominated by the last letters of the alphabet and constants by the first letters. When quantities are supposed to increase by infinitely small increments, the increments are called *differentials*, and the ratio of the increment of a function to that of the independent variable has usually a definite limiting value, and the study of differential C. involves in the first place the determination of these limiting ratios for certain functions of the independent variable. Integration may roughly be taken as the converse of differentiation. The requisites for a study of the C. are a knowledge of algebra to at least the binomial theorem, plane and solid geometry, plane trigonometry, and the simpler principles of the application of geometrical methods to algebra and *vice versa*. See G. A. Gibson, *An Elementary Treatise on the Calculus*, 1901; I. M. Milne-Thomson, *The Calculus of Finite Differences*, 1933.

Calculus, in medicine, a concretion forming in any part of the body by the accumulation of matter round a central core. Calculi are variously classified according to their structure, size, composition, and location. *Alternating* or *laminated* calculi are composed of layers of different material superposed in one another. As regards position, calculi may be *aural*, formed of hardened secretions in the external auditory canal; *nasal*, in the nose passages; *salivary*, formed in the salivary ducts; *bronchial*, formed in the air passages; *arthritic*, or *gouty* calculi, formed at the joints; *bilialy*, or gall-stones, in the gall-bladder; *renal*, in the kidneys; *vesical* in the bladder; *prostatic*, in the prostate; and *uterine*, in the uterus. The method of their formation may vary also. *Organic* calculi are those which have a nucleus of epithelium, blood, etc.; *fatty*, those which have a nucleus of fat; *blood* calculi, consisting of fibrinous matter and blood corpuscles; and *chalky* calculi, consisting of calcium carbonate and calcium phosphate usually with some foreign body as a nucleus. *Urinary* calculi are those formed in the bladder and urinary tract. They consist of concentric layers of substances crystallised out of solution and cemented together by mucus, etc. The substances may be uric acid and urates, or phosphates of calcium and magnesium, or mixed calculi of both urates and phosphates, or calcium carbonate, or organic substances found in the urine, as cystin, xanthin, and fibrin. The calculi are commonly called sand, gravel, or stones, according to their size, and are usually

the result of some derangement of the general health. *Secondary* calculi are those formed as a result of the diseased condition of the urinary tract, and are, therefore, often met with in *cystitis* or inflammation of the bladder. Treatment varies with the composition of the concretions and the conditions which have set them up. The introduction of solvents is of value in some cases, but stubborn growths need to be crushed or removed by surgical operation. 'Cutting for stone,' or lithotomy, is an operation of great antiquity. Calculi often cause little trouble to the person affected, but as there is a risk of their being drawn into narrow passages and thus causing possibly dangerous obstructions, prompt treatment is usually advisable.

Calculus of Variation, see **VARIATION**.

Calcutta, the second city of the dominion of India and, until recently, seat of the presidency of Bengal, but now cap. of the prov. of W. Bengal. It is situated on the E. bank of the R. Hugli, being connected by a bridge with Howrah on the W. bank, about 80 m. from the sea. The city, which is the terminus of numerous railways and canals, has a port extending 10 m. along the riv., with excellent anchorage and a depth of water permitting vessels with a draught of 26 ft. to enter at all times. There are both wet and dry docks, the chief being the Kidderpur, and the Upper and Lower Union Docks. The chief hindrance to navigation is formed by shifting sandbanks. The waterway of the Hugli is connected by the Nadiya R. with the Ganges, by the Sundarbans with the Brahmaputra, while the Midnapur Canal forms a highway for vessels to the W. The city, which is well drained and has an excellent water, gas, and electricity supply, and a tramway service, consists of a European and a native quarter. The native quarters, though still being improved, are squalid, the dwellings being built of mud or bamboo. The European, which lies E. of the maidan, or great park, is entirely W. in appearance. The Chowringhee, or residential portion, contains some splendid mansions. The commercial part of the city is centred on the site of the old Fort William, and contains most of the gov. and other public buildings. These include the Gov. House, the high court, the tn. hall, the mint, the cathedral, and numerous museums, colleges, and churches. The present Fort William (1757-73) stands in the maidan, the large open area round the fort, and which is C.'s glory: it is 2 m. long by 1 m. broad. The native city has some fine streets and sev. magnificent palaces of Indian potentates. C., from its position as the natural outlet of the Ganges and Brahmaputra valleys, has an enormous trade, having only comparatively recently taken second place to Bombay as a commercial centre, and dealing with about a third of the total trade of India. The exports, which considerably exceed the imports, consist of jute, indigo, rice, wheat, oil-seeds, opium, cotton, tea, sugar, coffee, hides, silk, salt-petre, matting, etc. The imports include

cottons, linens, and silks, hardware and metals, coined silver, wines and spirits, and salts. The manufs. include sugar refineries and cotton mills. A thousand industrial concerns employ over 150,000 persons. Jute is the most important industry, and employs some 50,000 males and 10,000 females. There are also ironworks and timber yards. Over 300,000 season ticket holders travel into C. every day. There are only about 470 females to every 1000 males. Probably not more than 250,000 of the inhab. are permanent residents. In certain areas overcrowding is excessive, and 181 in 1000 of the pop. of C. are illiterate.

than one-third Moslems, and some 4½ per cent Christian; in 1941 they numbered 2,108,000 (including suburbs), and in 1947 the pop. of Greater Calcutta was estimated to number about 4,500,000.

Calcutta Cup, trophy competed for annually by England and Scotland at rugby football, presented by the Calcutta Club.

Calcutta Sweepstake was promoted annually by the Royal Calcutta Turf club, the prizes being given on the result of the Derby horse-race run at Epsom usually on the first Wednesday of June every year, but occasionally on the last Wednesday of May. The 'sweep' was nominally

THE HOWRAH BRIDGE, CALCUTTA

Canadian Pacific

The univ. of C. was founded in 1857, and the Senate House on the W. side of College Square in 1872. In the grand hall, 120 by 60 ft., the convocations for conferring degrees take place. There are 20,000 students in C. studying in the affiliated colleges where they are required to live in hostels.

The hist. of C., which takes its name from Kalikata, on the site, begins in 1686, when Job Charnock estab. a factory of the E. India Company there. The old Fort William was erected in 1696. In 1772 C. became the cap. of Bengal, and in 1773 of Brit. India until superseded by Delhi in 1912. A notorious event in the hist. of C. was the atrocity of the Black Hole of C., 1756 (see BLACK HOLE OF CALCUTTA). The Indian Premier of Bengal announced in 1940 that the prov. gov. had decided on the removal of the Holwell Monument commemorating the tragedy. The original obelisk erected by Holwell was removed in 1821, the later monument having been erected in 1902.

The pop. are two-thirds Hindu, less

private, being limited to the members of the club, each drawing a number for which he paid about 10 rupees, but experience showed that tickets were freely transferred through members to the general public in all parts of the world. The drawing took place in Calcutta, generally on the Saturday before the Derby was run, and ingenious precautions were taken to ensure perfect fairness. The stakes were very high, and in 1929 three prizes totalled £135,000; in 1930 it was decided not to publish any figures in relation to the sweepstake.

Caldara, see CARAVAGGIO; ITALIAN ART. Caldas da Rainha, tu. 47 m. N. of Lisbon, and lies in the prov. of Estremadura in Portugal. Noted for its sulphurous and saline springs. 'Caldas' is a Sp. and Portuguese term for 'hot springs.' The bathing estab. was founded in 1485 by the queen of John II.

Caldas da Reyes, tu. in Spain in the prov. of Galicia, and 5½ m. distant from Pontevedra.

Caldecott, Randolph (1846-86), Eng.

artist, worked in a bank, 1861-72, but always showed a taste for art. His first sketches appeared in local papers, *Wall o' the Wisp* (1868), and the *Sphinx* (1869). In 1872 he became a student at the Slade School. He became famous as illustrator of Washington Irving's works. 'Old Christmas' (selections from the *Sketch-book*) appeared 1875; 'Bracebridge Hall,' 1876. In 1882 he became a member of the Institute of Painters in Water Colours, exhibiting there, at Grosvenor Gallery, and at the Royal Academy. In 1876 his oil-painting, 'There were Three Ravens sat on a Tree,' was in the Royal Academy. His greatest work was the series of coloured books for children, starting in 1878 with *John Gilpin* and *The House that Jack Builth*, ending in 1885 with *Elgy on Madam Blaize* and *The Great Panjandrum Himself*. See R. Blackburn, *Randolph Caldecott: Personal Memoir of his Early Art Career*, 1886.

Calder, Sir Robert (1745-1818), Brit. admiral. He entered the navy in 1759, and was present at the battle of St. Vincent (1797), on which occasion he was knighted for bringing home dispatches. In 1804 he was promoted to the rank of rear-admiral; in the following year he was stationed off Cape Finisterre to intercept the Fr. and Sp. fleets, fleeing before Nelson from the W. Indies. C. succeeded in capturing two Sp. ships, but was outnumbered, and retired to Brest. He was tried by court-martial, and censured for an error of judgment. He retired from active service, but rose to the rank of admiral in 1810.

Calder, name of four rivs. in England: 1. In W. Riding, Yorkshire, rising near Burnley and joining the R. Aire at Castleford; length 40 m. 2. In Lancashire, joining the Ribble near Whalley. 3. In Cumberland, flowing into the Irish Sea 10 m. S.E. of Whitehaven. 4. In Lancashire, joining the R. Wyre at Garstang Church.

Calderari, Ottone, Count (1730-1803), It. architect, b. at Vicenza. He formed his style on the model of Palladio, and imitated him with great success. Among his chief works were the palaces of Bonini, Loschi, Cordellina (1776), which is one of his best productions, and Antisola at Vicenza, and the seminary at Verona, which is generally acknowledged to be his masterpiece. He was an associate member of the Institute of France, and pub. a treatise on architecture. His plans were pub. posthumously (1807-17) by Diedo as *Opere di Architetture*. D. at Vicenza. See his *Life and Works* (in Fr.) by J. le Breton, 1804.

Calderón de la Barca, Don Pedro (1600-83), Sp. poet and dramatist, b. in Madrid, of a noble family; educated at the univ. of Salamanca and showed great precocity, producing a play, *El Carro del Cielo* (The Chariot of Heaven) at the age of thirteen. He seems to have served with honour as a private soldier in sev. campaigns in Italy and the Low Countries during 1623-29, and having already become famous as a dramatist, was invited to the court of Philip IV., and made

a knight of the order of St. James about 1636. He produced an enormous number of plays of all kinds till about 1651, when he entered the church, and in 1653 became a canon of Toledo, thereafter confining himself mainly to works on sacred subjects. He gained great preferments in the church, becoming a chaplain to the king in 1663, and later superior of the congregation of San Pedro. As a dramatist, C. ranks second to Lope de Vega, whom he excelled in moral depth and purity and grace of expression. He fell far below Lope in invention and ingenuity, and his work suffers from his disregard of conventional dramatic rules, his brilliant imagination leading him into extravagances. The lofty moral standard of his plays and their refined clearness of language made them a valuable influence in an age when the drama was beginning to suffer from the lasciviousness and floridness of Lope and his school. His great fault is a lack of insight into human nature, but his plots are managed with such skill and spirit that this defect is not immediately apparent. While his plays were very popular at court, they had qualities of simplicity and precision of diction which rendered them intelligible to the lower classes as well as to educated audiences. His best general plays are *El Mágico Prodigioso*, a religious drama somewhat reminiscent of *Faust*, and probably the best known in this country, part of which has been trans. into Eng. by Shelley; *La Vida es Sueño* (Life is a Dream), a philosophical play which runs the former very close in its continental reputation; *El Principe Constante* (The Constant Prince), a historical drama on the subject of Prince Ferdinand of Portugal, which, together with the former, has been trans. into Ger. by Schlegel; *El Alcázar de Zamora*; *El Divino Orfeo*; *El Purgatorio de San Patricio*, another religious play; *La Dama Duende* (The Fairy Lady), a 'cloak and sword' play; *El Médico de su Honra* (The Physician of his own Honour); *El Pintor de su Deshonra*; and *El Mayor Monstruo los Zelos* (No Monster like Jealousy), tragedies of passion. But in the opinion of many critics his sacred plays, *Autos Sacramentales* (6 vols.), contain his best work. His collected plays were first pub. at Madrid in 1682-91, and later eds. have been issued there in 1848-50 and 1882. The best ed. of the *Autos* is that issued at Madrid in 1759-60. There is a good Ger. trans. by Lorinser (1882) and Eng. trans. of different plays by Denis MacCarthy (1853-73), Edward FitzGerald (1853 *et seq.*), Archbishop Trench (1856), and N. Maccoll (1888). See Archbishop Trench, *Essay on Calderón*, 1820; E. J. Hasell, *Calderón*, 1879; J. H. Bridges, *Essays and Addresses*, 1907; S. do Madariaga, *Shelley and Calderón, and other Essays on English and Spanish Poetry*, 1920.

Calderon, Philip Hermogenes (1833-98), Anglo-Fr. artist, b. at Pottiers, of Sp. parentage. He studied in Paris under Picot, and in London. He exhibited at the Royal Academy from 1853, and at the Paris exhibitions of 1867 and 1878. He

was elected an associate of the Royal Academy in 1864. Academician in 1867, and Keeper in 1887. His subjects were chiefly historical, his most important works being 'The Renunciation of St. Elizabeth of Hungary' (1891); 'Her Most High, Noble, and Puissant Grace' (1886) (gold medal 1867); 'The Gaoler's Daughter,' and 'The Proposal.'

Calderón, Rodrigo (d. 1621). Sp. adventurer, b. in Antwerp. Patronised by the duke of Lerma, chief minister of Philip III., who gave him titles and honours and a large salary for sharing the burdens of office. C. eventually became a secretary of state, in which capacity he roused the jealousy and hatred of the court. On the fall of his patron C. was accused of murder, and, after languishing in prison for two years, was tried by order of the duke of Olivarez, who had become chief minister under Philip IV. He was found guilty and executed. He is the hero of Bulwer Lytton's *Calderon the Courtier*.

Calderon, Serafin Estébanez (1801-67), Sp. writer, celebrated for his brilliant sketches of Andalusian scenes and manners, which he contributed to the *Carlas Españolas*, a weekly Madrid magazine. Canovas del Castillo, C.'s nephew, wrote his biography, called *El Solitario y su Tiempo*, wh. in he pub. with his writings in 1883.

Calderón, Ventura García (b. 1886), considered one of the best writers that Sp. S. America has produced, was b. in Peru. He is the son of a former president of Peru, who preferred imprisonment and exile to the shame of signing a treaty that he considered dishonourable for his country. As a result, the son has lived a large part of his life in France and Spain. In his books he writes of Peruvian native subjects in the Sp. language, but with a grace he has partially borrowed from the Fr. His best-known vols. are *The Vengeance of Condor*, *Danger Death*, and *Colour of Blood*, all of which are collections of short stories of which he is considered the S. Amer. master.

Calderwood, David (1575-1650), Presbyterian divine and eccles. historian, b. at Dalkeith, Midlothian. He was educated at the Edinburgh Univ., and became minister of Crailing, Roxburghshire (1604). He opposed the designs of James VI. to introduce Episcopacy into Scotland, and was tried before the Scottish Parliament and banished. He resided in Holland from 1619 to 1625, where he wrote extensively on controversial subjects, and on his return to Scotland he collected material for his *History of the Kirk of Scotland* (1678). He also wrote *Altare Damascenum* (1621), and took part in drawing up the *Directory for Public Worship in Scotland*. Consult the life by T. Thomson prefixed to the *History*, printed by the Woodrow Society in 1842-45.

Calderwood, Henry (1829-97), Scottish minister and philosopher, educated at the Edinburgh Univ. and Theological Hall of the United Presbyterian Church. He was appointed examiner in philosophy, Glasgow, 1861; prof. of moral philosophy,

Edinburgh, 1868, and chairman of the first school board of that city, 1873-77; author of *The Philosophy of the Infinite* (1854); *The Relations of Mind and Brain* (1877); *Evolution and Man's Place in Nature* (1893). See life by his son, W. Calderwood, and D. Woodside, 1900.

Caldey, is. of Pembrokeshire, Wales, 2½ m. S. of Tenby. Has a Cistercian abbey and an agric. college.

Caldwell. This name occurs as a par. in Renfrewshire, Scotland, and in many parts of the U.S.A. There is a city of that name in Kansas; a co. in Kentucky; a par. in Louisiana; a vil. near New York; a tn. near Texas, and a city in Idaho.

Caldwell, Anne, see MARSH, Mrs.

Caldwell, Robert (1814-91), Anglican coadjutor bishop of Madras, b. near Antrim. He was sent out to India by the London Missionary Society, but joined the Church of England, and was consecrated bishop of Tinnevely as coadjutor to the bishop of Madras in 1877. He wrote a *Comparative Grammar of the Dravidian or S. Indian Family of Languages* (1858); and assisted in a Tamil translation of the Prayer Book, 1842-72, and the Bible, 1858-69. See *Reminiscences* (1894).

Caleb, son of Jephunneh, of the tribe of Judah, and one of the spies appointed by Moses to explore the land of Canaan. C. and Joshua, the son of Nun, were the only spies privileged to enter 'the land flowing with milk and honey,' for the other ten spies brought back an unfavourable report and caused the children of Israel to rebel. They acknowledged that the land 'flowed with milk and honey,' but they declared that the cities were well protected and that the people were of giant-like proportions. C. and Joshua were anxious to fight their way to Canaan, with the result that they were spared to see the event accomplished. C. received Hebron and its dist. as his portion.

Caledon: 1. Tn. in Cape Province, S. Africa, 87 m. by rail S.E. of Cape Town. It is on the Zwartberg, and has seven thermal springs, strongly radio-active, whose content of ferrous carbonate held in solution is declared to be four times as great as that of any other springs known. 2. Riv. of S. Africa rising in Mont-aux Sources in the Drakensberg, and flowing into the Orange R., forming for the greater part of its course the boundary between the Orange Free State and Basutoland. Length 220 m. (See illustration, p. 130.)

Caledonia, anct. name of that part of Scotland lying N. of the firths of Clyde and Forth. The term is still used in poetry for the whole of Scotland.

Caledonia, New, see NEW CALEDONIA. **Caledonian Canal**, chain of lochs, united by artificial canals, which stretch N.E. and N.W. across Scotland, connecting the N. with the Irish Sea. It traverses the Great Glen of Albin, through the counties of Inverness and Argyll, from Moray Firth to Loch Eil. The lochs are Beauly, Ness, Oich, Lochy, Eil, and Linnhe. The total length of the canal is nearly 62 m., the canals being 23 m. long. The work of cutting these channels was begun in 1803, under the supervision of Telford. The

canal was opened for navigation in 1823, but the work was not completed till 1847. The average depth of the artificial channels is 17 ft., the breadth at the surface being 120 ft., and at the bottom 50 ft. The total cost of construction was £1,311,270. The canal enables vessels to avoid the dangerous route via Pentland Firth and the Hebrides, and is chiefly used by fishing craft and tourist steamers.

and Gourock, and to Oban and Ballachulish. The railway was amalgamated in 1923, together with numerous other national and local lines, with the L.M.S. Since Jan. 1, 1948, the Scottish railways so amalgamated have been organised as the Scottish region of the Brit. Railways system.

Calembourg, or **Calembourg**, play upon words, based upon the difference in

A. J. Bowland

A VALLEY IN THE MALUTI MOUNTAINS ALONG THE CALEDON RIVER,
SOUTH AFRICA

Caledonian Market, so-called 'thieves' market,' held near the Caledonian Road, London, in the par. of Islington, and once known as the Islington Cattle Market. It ranks in reputation with the famous Rasta of Madrid, but though some stolen goods may find their way to the market, it is by no means ill conducted and unquestionably good articles may be found by the bargain-hunter. Before the development of the trade in frozen and chilled meat from abroad, it performed its original function of a cattle market.

Caledonian Railway. The company was formed in 1845, amalgamated and absorbed the Scottish Central and Scottish N.E. railways, together with a number of small lines which served tns. N. of Perth in 1865-66, and obtained possession of the Forth and Clyde Canal and the Monkland Canal in 1867. The total length of line was 1080½ m. The main lines ran from Carlisle to Aberdeen via Stirling and Perth, Edinburgh to Glasgow, Greenock,

meaning of words pronounced alike, in great favour among the Fr. wits of the eighteenth century. The name is said to be derived from an abbot of Kahlenberg, an amusing personage, or a teller of amusing anecdotes, in old Ger. tales, or possibly from a count of Kahlenberg, who was notorious for the amusing blunders in speaking Fr. at the court of Louis XV.

Calenberg, or **Kalenberg**, former principality of Hanover, which was traversed by the Rs. Weser and Leine and had an area of 1050 sq. m. The name was taken from an anct. castle near Schulerberg. In the Middle Ages the principality belonged to Lüneburg, and after descending from one branch of the House of Brunswick to another, it came in 1705 into the possession of Ernst August, electoral prince of Hanover.

Calendar (from Lat. *Calends*, or *Kalends*), means of distributing time with respect to its natural divs. in periods for the purposes of civil life. The most

obvious and most natural of all divs. was that of the day, a period marked out by the diurnal revolution of the earth on its axis, and the alternation of light and darkness. The solar year, which completes the circle of the seasons, was the largest div. The period from the new moon to new moon marked out the month. The anct. Egyptian year consisted of twelve months of thirty days, together with five supplementary days. Calculating their year in this way, they lost one complete day in every four years, so that in the course of time they caused a complete revolution of the seasons. The Gks. divided their month of thirty days in three equal divs., a method which revolutionary France at a later date tried to follow. The Rom. days of the month were calculated *backwards* from three fixed periods, the Calends, the Nones, and the Ides. The Calends was always the first day of the month, the Nones always the ninth day before the Ides, and the Ides in the middle of the month either in the 13th or 15th. The method of calculation was as follows: The days between the Calends and the Nones were the days before the Nones, the days between the Nones and the Ides, the days before the Ides, and the days between the Ides and the end of the month, the days before the Calends, and in the calculation of the day of the month, the days were counted inclusively. The proverbial phrase *Ad Kalendas Græcas* is equivalent to 'never,' as the Gk. C. had no Calends. The C. of practically every civilised state is borrowed from that of the Romans. Originally, it would seem, the Rom. C., as ascribed to Romulus, consisted of only ten months, which began with March and ended with Dec. This, however, only allowed for 304 days, and no known arrangement seems to have been made for the remaining days. Under Numa two additional months were added to the C., one, Jan., at the beginning of the year, the other, Feb., at the end. Ultimately this was changed so that the two additional months fell at the beginning of the year. All the months consisted of 29 and 30 days alternately, so that the year now consisted of 354 days, which was increased to 355, from the superstitious belief of the luck of odd numbers. Still the year was over ten days short of its correct period, and an additional month was intercalated in Feb. every two years. This month, which consisted alternately of 22 and 23 days, made the year one day too long, and additional means had to be adopted to correct this mistake. The length of the intercalated month does not appear to have been regulated by any fixed principle, with the result that it came to be a weapon of some effect in the hands of the pontiffs with whom the regulation of the C. rested. They curtailed the year in order to spite their enemies, they lengthened it in order to benefit their friends. By the time that Cæsar became the dictator of Rome they had reduced the C. to chaos, and one of his first steps was to attempt, successfully within limits, the reform of the C. By the year 46 B.C. there was a difference of

three months between the civil Rom. year and the astronomical year. With the help of Sosigenes, an astronomer from Alexandria, Cæsar fixed the average length of the year at 365½ days. Every fourth year was to have 366 days, the ordinary years containing only 365. The civil year was to be regulated by the sun, the intercalary month was abolished, and in order that the days of the year should be properly restored 67 days were inserted in the current year, which consisted of 445 days, the last year of the era of confusion.

The first year of the Julian C. was 46 B.C., or 708 A.U.C. The number of days in the months of the Julian C. were 30 and 31 alternately, with the exception of Feb., which was to have, in ordinary years, 29 days, and in leap years 30. This order was only upset in the time of Augustus, who named the eighth month of the year after himself, and in order that it should have the same number of days as the seventh month, named after the great Julius, took one day from Feb., and decreed that in future Feb. should in ordinary years have 28 days, and in leap years 29. In order also that three months of 31 days should not come together, he decreed the alteration of the number of days of the four last months of the year as follows: Sept., 30; Oct., 31; Nov., 30; Dec., 31. They had previously been: Sept., 31; Oct., 30; Nov., 31; Dec., 30. The pontiffs, who still had charge of the C., made the mistake of allowing one leap year every three years, instead of every four. This mistake was discovered and corrected during the reign of Augustus, who ordered the intercalating of the additional day to be dropped until the error had been corrected. The Julian C., although a vast improvement on the older method of calculating the year, yet made the year some 11 min. 14 sec. too long. Gradually this came to be recognised, and by the sixteenth century the C. was some ten days wrong. Already ideas had been put forward for its correction. At the council of Nicea, the vernal equinox, which fell on March 25 in the year 46 B.C., fell on the 21st. Efforts had been made by astronomers to correct the fault, but it was not until Pope Gregory XIII. took up the matter that the fault was corrected. By that time it had been made obvious that the error amounted to three days in 400 years. Gregory issued a bull by which the ten days, which represented the difference between the date of the equinox in 325 and in 1582, were annulled, and Oct. 5 was recognised as the 15th. In order also that the fault should not again occur, it was ordained that the centennial years should not be recognised as leap years, save where they were divisible by 400. Thus 1600 was a leap year, 1700, 1800, and 1900 were common years, and 2000 will be a leap year. This method of calculating the year was called the Gregorian C. new style. It was promulgated by a bull, and found immediate acceptance in Spain, Portugal, and parts of Italy. France adopted the Gregorian C. in the same year. Prussia, the Ger. Rom. Catholic states, Holland,

Flanders, and Switzerland adopted the change on Jan. 1, 1583; Poland in 1586, Hungary in 1587. Naturally enough, the proposal of the Catholic Church did not find immediate acceptance in the Protestant countries. Scotland adopted the change in 1600, making also Jan. 1 the beginning of the year. The greater number of the Ger. states and Denmark adopted the new style about the end of the seventeenth century. Sweden adopted it gradually between 1700 and 1740. England, held back to a large extent by vulgar and ignorant prejudice, did not adopt the new style until 1752. For a long time she had probably found it inconvenient to calculate her chronology by means of a system long given up by W. Europe and also antiquated. The C. (New Style) Act was passed in 1750, and the difference, which amounted to eleven days, was rectified by calling Sept. 2 Sept. 14, 1752. The first day of the year was also changed from March 25 to Jan. 1. The bill was not passed without considerable outcry from the mob, who went about crying for the restoration of their eleven days. The Russian, Gk., Serbian, and Rumanian Churches did not abandon the Julian C. until May 1923, when the Gregorian, slightly modified, was adopted.

Hebrew Calendar.—The Jewish year consists of 12 or 13 months, according to whether the year is ordinary or embolismic. The year is lunisolar, and the date is calculated back to the creation, which is computed as having taken place 3760 years and 3 months before the beginning of our Christian era. The ordinary year has only 354 days, but the embolismic 384; the embolismic year is obtained by the intercalation of a month of 29 days, called Veadar. This intercalated month occurs seven times in a cycle of nineteen years, and readjusts the Jewish year with the solar year. The day is held to begin with the sunset, but in reality the day begins always at 6 p.m. and continues for the successive 24 hours. The hour is divided into 1080 equal parts, called *halaqim*, of which each *helaq* is equal to 3.3 sec. The Jewish month consists of 29 days, 12 hrs. 44 min. 3½ sec. The names of the Jewish months are Tishri, Heevan, Kislev, Tebet, Sebat, Adar (Veadar in embolismic years), Nisan, Iyar, Sivan, Tammuz, Ab, Elul. Each of the months has 30 or 29 days, alternately. The Jewish New Year's Day is the 1st Tishri, which falls between Sept. 5 and Oct. 5. In 1948 the 1st Tishri fell on Oct. 4, the Jewish year being A.M. 5709.

The Muslim Calendar.—The era of the E., or the era of the Hejira, is dated from the first day of the month preceding the flight of Mohammed from Mecca to Medina. The era therefore began on July 16, 622. The year is purely lunar, and composed of twelve lunar months, which contain 30 and 29 days respectively. The years are divided into cycles of thirty years, nineteen of which are ordinary and eleven of which contain one extra day added to the last month of the year. Obviously, with such a system the months

are not kept in any way to the same season according to the solar year, but run through all these seasons in the course of about 32½ years. The Muslim year begins in the month called Muharram, which corresponds with Nov. 3 of the year 1948, and is the beginning of the 1368 year of Hejira. The Muslim months are Muharram, Saphar, Rabia I., Rabia II., Jomada I., Jomada II., Rajab, Shaaban, Ramadan, Shawwal, Dulkaada, Dulhoggia. The month Ramadan is observed by all Moslems as the month of abstinence.

The Revolutionary Calendar.—The Revolutionaries, flushed with success, decreed in the National Convention of 1793 that the year of the Christian era should no longer be observed as the civil year, but that a new era, dating from the commencement of the republic, should be estab. Accordingly, the date Sept. 22, 1792, was fixed as the first day of the new era of freedom. The model they chose to establish themselves on was essentially Grecian. The year was to consist of twelve months of 30 days. There were to be five complementary days which were to be celebrated as holidays, and were dedicated to Virtue, Genius, Labour, Opinion, and Rewards. Every fourth year was to have another complementary day, which was to be called Revolution Day. The period of four years was to be called a Franciade, and the months were to be equally divided into three periods of 10 days each. The months, commencing on Sept. 22, 1792, were to be as follows: Vendémiaire, Brumaire, Trimaire, Nivose, Pluviose, Ventose, Germinal, Floréal, Prairial, Messidor, Thermidor, Fructidor. An elaborate system also was evolved, by means of which the centurial error would be corrected, but the Gregorian C. was adopted in 1806, by a decree of Napoleon. Consult R. Lamont, *The Roman Calendar and its reformation by Julius Caesar*, 1920; A. Philipp, *The Calendar: its History, Structure, and Improvement*, 1921; W. Schultz, *Zeitrechnung und Weltordnung* (Leipzig), 1924; R. Sowell, *The Siddhantas and the Indian Calendar*, 1924.

Calendering, process of producing a glazed or polished surface upon paper, linen, and cotton. The term is a corruption of 'cylindring,' having reference to the usual method of passing the material between revolving cylinders, usually of steel or hydraulically compressed paper, under high pressure. The principles are illustrated by the domestic iron and mangle.

Calends, or Kalends, see CALENDAR.

Calendula, genus of plants of the order Composite, common to the Mediterranean. *C. officinalis* is well known in England as the pot-marigold, Mary-bud, or gold, and is a very hardy garden plant. *C. arvensis*, the field marigold, grows profusely in vineyards of the Rhine.

Calenius, Walter (d. 1151), archdeacon of Oxford, from 1115 to 1138. The name C. was given to him by John Bale, it being an adjective formed from *Calena*, a supposed name for Oxford (really a misreading for Calova, the name of a Rom.

station at Silchester). According to Geoffrey of Monmouth, this Walter brought from Brittany the Breton or Welsh original which Geoffrey professed to translate in his *History of the Kings of Britain*.

Calenture (from Sp. *calentura*), temporary delirium of fever to which sailors are prone in hot climates. The nature of the disease is somewhat obscure, but it is brought on through exposure to the sun's rays.

Calepino, Ambrogio (1435-1511), It. lexicographer, b. at Bergama, and became an Augustine monk. His whole life was spent in the compilation of a polyglot dictionary of which the first ed. appeared at Reggio in 1502. Eleven eds. were pub. by the Aldi between 1542 and 1592.

Calewatta, see DARLING.

Calexico, city in Imperial co., California, U.S.A. Pop. 5500.

Calf, see CATTLE.

Calgary, city in the prov. of Alberta, Canada; the centre of a ranching and agrio. dist., founded in 1883, with a pop. of 100,000. It is an important junction on the main line of the Canadian Pacific Railway, 40 m. from the Rocky Mts., whence it obtains a supply of coal. The railway here rises to 3437 ft. above sea level. It has an institute for technology and art, and a public library of 20,000 vols. There is a Normal school for the training of teachers. There is also a stock exchange of increasing importance; the well-organised telephone system of Alberta is centred here, and there are more than seventy local trade unions, and a dept. of Labour. Workshops of the Canadian Pacific Railway are estab. here, and its industries include corn mills, saw mills, and iron foundries. C. is on the Lethbridge-Edmonton branch of the Trans-Canada Air Lines system.

Calhoun, John Caldwell (1782-1850), Amer. statesman, b. in Abbeville co., S. Carolina, of Scotch-Irish parentage. He graduated at Yale in 1804, and then entered the legal profession. In 1811 he represented his native state in Congress, and strongly supported measures which led to the declaration of war with England (1812-15). He was secretary of war in Monroe's Cabinet (1817), and twice became vice-president of the U.S.A., in 1825-29 and 1829-32. In 1829 he showed that his political views were undergoing a change, and in 1831, in his *Address to the People of South Carolina*, he definitely severed his connection with President Jackson, by setting forth his theory of state rights as opposed to federal rule. He retired from the vice-presidency and sat in the Senate from 1832 till 1843, when he became secretary of state under Tyler. C. strongly opposed war with Mexico (1846-47) and championed the slave-holding states (1848), honestly believing slavery to be a blessing to master and slave alike. He d. at Washington. For his life, consult R. S. Jenkins, 1851, and R. K. Cralle, in the collected ed. of his works (1853-55); for his political and social views, and for the hist. of his time, consult the life by Von Holst,

1882. His *Correspondence* was pub. by J. F. Jameson in 1900.

Call, tn. of Colombia, in the dept. of Cauca. It is situated on the Rio C., near its junction with the Rio Cauca, at an elevation of 3100 ft. It is an important commercial tn., and contains the fine Ionic church of San Francisco. Pop. 105,000.

Calibration, term which was originally applied to the measurement of the bore or calibre of a cannon, an accurate knowledge of which was essential. Passing through the meaning of measurement of the bore of *any* tube it has now reached the meaning of the comparison of the readings of any instrument with what it should indicate. In manufacturing a scientific instrument for which accuracy is required, it is found that the most satisfactory method of procedure is not so much to graduate the scale so as to give very accurate readings, but to make the scale roughly accurate and then attach a list of corrections. As an illustration of the methods used we may take the case of some electrical instruments. An ammeter measuring continuous current can be calibrated by comparison with a tangent of galvanometer of which we know that the tangent of its angle of deflection is proportional to the current flowing. This gives a means of comparing the divs. of the ammeter scale among themselves, but if the values recorded are to be compared with actual current values, the constant of the galvanometer must be found by means of a voltmeter or similar instrument. Similarly, an ammeter measuring alternating currents may be calibrated by means of an electro-dynamometer, the deflections of which are proportional to the square of the current. The principles of C. are best illustrated in the case of the ordinary mercury in glass thermometers. In the process of manuf. the tube is scratched at points reached by the mercury at the freezing and boiling points of water. The distance between these marks is divided into a hundred parts, each part called a degree. But this assumes that the bore of the capillary tube is constant throughout its length, which is never true. The process of C. consists in observing the length of a detached column of mercury at different parts of the tube.

Calibre, see GUN.

Caliche, impure sodium nitrate, or Chile salt-petre. Formula NaNO_3 . It is from C. that the world's supply of sodium nitrate is obtained. The deposits occur only in N. Chile, notably in the prov. of Tarapaca.

Calico-printing, process of impressing on cotton or other textiles certain designs in colours. The art was known to the Egyptians, even as far as the effect of certain substances called mordants in making the colours permanent in the fabric. It was also known in quite ant. times in India, whence, through the agency of the Dutch E. India Company, the trade was brought into Holland. It was introduced into London in 1676, Glasgow in 1738, and into Liverpool in 1764. The essential principles of the

methods have remained the same, but the development of the use of machinery and the extension of chemical knowledge have made the operations less tedious and more varied in their colour-effects. There are two processes of printing, block-printing and machine-printing. In the former, a wooden block is engraved with the design by hand, exceptionally fine work sometimes being done on copper plates let into the wood. The design for machine-printing is first of all engraved upon a soft steel roller, which is hardened and made to impress the design in relief on a second steel cylinder. This cylinder is hardened in its turn and finally transfers the original design to a copper roller. Each colour to be printed demands a separate roller, so that machines carrying as many as twenty copper cylinders may be employed. Each printing cylinder is mounted so as to press against a large central roller, around which the cloth to be printed passes. The colour is supplied to each copper cylinder by a colour-box in which a small roller revolves up to its axis at the same time pressing against the copper cylinder. The 'colour doctor,' a thin steel blade fitting against the surface of the copper cylinder before contact with the cloth, removes excess of colouring matter; while another steel blade, called the 'lint doctor,' is similarly fitted after the printing cylinder leaves the cloth to remove all impurities communicated by the cloth. There are many 'styles,' or methods, of colour printing, some involving the printing of mordants first and dyeing the whole material after, some which involve the oxidation of the colour material used, and some which require the application of steam at considerable pressure to fix the colours. Mordants may be defined as substances which have an affinity for the fabric on the one hand and an affinity for the colouring material on the other; they thus serve to hold the colouring matter in place. They vary in composition according to the purpose they have to serve, and it may be noted that the same colour material may give different colours with different mordants. In the 'madder style,' for example, a cloth may be printed with four or more different mordants in the printing machine. After being dried in a drying chamber, the pieces are put through a process called ageing. This consists of subjecting them to the influence of heat and moisture, by which certain necessary physical and chemical changes in the printed mordants are brought about. The next process, called dunging, consists of passing the cloth through a hot solution which removes any uncombined mordant or thickening agent. A solution of cows' dung was formerly used for this process, but many effective substitutes have been discovered. The material after being thoroughly washed is ready for dyeing, a process usually occupying one or two hours. The material then has to be 'cleared,' that is, the colour has to be taken out of those portions not mordanted. This is done by means of a hot soap solution and a chlorine solution, all colours not 'fixed' being thus removed. In

colouring with indigo or aniline black, it is customary to print a 'resist,' that is, a substance which prevents the incorporation of the colour material with the fabric; the coloured portion will then ultimately be that portion not treated with the resist. Steam is used with some colouring substances either to fix them in the fabric by mere mechanical blowing through, or to effect a desired chemical change, or, when, albumen is used as a fixing agent, to bring about the required coagulation. See C. O'Brien, *Calico Printing*, 1892; W. Watson, *Textile Design and Colour*, 1937.

Calicut, seaport of Malabar dist., Madras, India, on the coast, 84 m. N.W. of Coimbatore. It was the first place in India visited by Europeans, Pedro do Covilhão calling here in 1486 and Vasco da Gama in 1498. It had been a great centre of native trade, but declined under Portuguese rule, and only revived after its occupation by the Eng. in 1792. It has given its name to calico. Its industries are cotton spinning and weaving, and it exports tea, coffee, coco-nuts, and spices. Pop. 127,000, mostly Muslim Moplahs, the rest being Hindus.

Calidāsa, or Kālidāsa, Hindu poet of the post-Vedic period of Sanskrit literature. The dates of his life are extremely uncertain. He seems to have lived during the reign of Vikramāditya of Ujjain, but as there were sev. monarchs of that name from 57 B.C. to A.D. 1050, this does not assign any very definite limits. He has been traditionally assigned to the first century B.C., but modern scholarship tends to place him considerably later. His most famous works are his dramas, especially *Sākuntalā*, which, when first introduced to Europe through the trans. of Sir Wm. Jones in 1789, was received with great admiration. A later trans. by Monier Williams appeared in 1856. His other dramas are *Vikramorvasi* (The Hero and the Nymph), containing some fine lyrical passages, and *Mālavikāgnimitra*, a comedy. There are also assigned to him two epic poems, *Raghuvansa*, trans. into Eng. by P. de Lacy Johnstone, 1902, and *Kumāra Sambhava*, only remarkable for isolated passages, and differing so greatly that it seems doubtful if they can be credited to the same author; and sev. lyrics, the best, *Meghaduta* (The Cloud Messenger), being very beautiful. *Nalodaya*, a poetical romance, trans. by Rev. W. Yates, 1844, is also ascribed to C.

Calif, see CALIF.

California, Pacific state of the U.S.A. bounded N. by Oregon, E. by Nevada and Arizona, S. by Lower C. (Mexico), and W. by the Pacific Ocean. It lies between parallels 32° 28' and 42° N. lat. It is popularly known as the Golden State, and in the W. it is often spoken of as the Coast. The vast mt. system of C., with the variation it gives of peak and cañon, valley and hill, is one of its most conspicuous features. Two great mt. ranges exist. The Sierra Nevada runs almost parallel with the coast along the E. boundary of the state. Its average

breadth is about 80 m., and it includes about a dozen peaks over 10,000 ft. high. Chief of these is Mt. Whitney (14,898 ft.), the highest in the U.S.A. (excluding Alaska). Among the Sierra Nevada ranges are the rifts of the Yosemite, King's, and Tuolumne, cañons famous throughout the world for their magnificent scenery. Along the coast lies the series of disconnected ranges grouped as the coast range, longer but lower than the Sierra Nevada. Between these two ranges lies the great valley of the Sacramento and the San Joaquin, which two

efforts are being made to preserve them. Timber production is valued at some \$30,000,000 (2,000,000,000 board feet—chiefly pine). There are twenty National forests, which cover over 23,000,000 ac. Of animals, the most characteristic are the grizzly and black bears, the puma, the bighorn sheep, and various varieties of deer. The N. rvs. supply good stores of salmon, and coast fishing is generally important. The geology of the state is fairly simple. The general basis is fairly recent, the Sierra Nevada being chiefly composed of Triassic and Jurassic beds

THE YOSEMITE FALLS, CALIFORNIA

Canadian Pacific

rivs. unite and run into San Francisco Bay. The former, with its trib. the Feather, drains the N. part of the state, the latter drains most of the S. part. Other rvs. are the Eel, Trinity, and Klamath, all in the N. Since C. extends over 770 m. from N. to S., the climatic conditions are varied. The N. dist. is very rainy, particularly in the winter, and the N.W. is damp and foggy. The S., however, is warm and semi-tropical, and has thus become a favourite winter resort. The rainfall is generally low, and the nights are generally cool throughout. On the whole, the climate is one of the best in the world. The flora of C. is very distinct from that of the more easterly states. Among its characteristic products may be named the mammoth *Sequoia gigantea* and the *Sequoia sempervirens*, a species of redwood which flourishes particularly in the N.W. These two species are the only survivors of the genus *Sequoia*, once widely spread over the N. hemisphere, and

the coast ranges are chiefly Cretaceous and Tertiary. The axis of the Sierra Nevada is probably Archean, and the elevation of the coast range occurred towards the end of the Miocene period. The mineral resources are great, and since the discovery of gold in 1848 the output has been enormous. Lode and placer operations (1941) produce gold valued at nearly \$11,000,000. In 1942 the output of gold was 1,400,000 oz. Other minerals are silver (output about 1,000,000 oz. annually), iron, coal, borax, rock-salt, quicksilver, and copper. The mining of precious stones is increasing in importance. The total of mineral production for 1943 was nearly \$370,000,000. The gradual increase in the number of small owners had given an impetus to C.'s agric. progress. Thirty-five million ac. are under cultivation, and of this about 700,000 ac. consist of vineyards, while on 200,000 ac. cotton is grown. The peach and pear orchards produce important

crops, and all cereals, including wheat, vegetables, fruits, and nuts common to temperate and sub-tropical zones are found in C. The cash income from crops in 1945 was over \$1,250,000,000, while that from live-stock was about \$534,000,000. Abundant irrigation is provided by the numerous streams and unnavigable rivers, and 4,746,600 ac. of land are under irrigation. The output of petroleum is anything up to 250,000,000 barrels annually, but production varies. The Long Beach wells have increased their output by drilling to a depth of 8000 ft. The main industry of C. is petroleum refining. Gasoline or petrol output is about 80,000,000 barrels. Other industries are food canning and meat packing. Los Angeles and San Francisco are very active ports, the exports from the two ports totalling each \$137,000,000 to \$150,000,000 (1941), and the imports between \$80,000,000 and \$90,000,000 each. One of the chief interests in C. is the film industry at Hollywood, Los Angeles. The clear atmosphere allows motion pictures to be taken on all but about ten days in the year. Millions have been invested in the industry, and Hollywood probably makes more films than all the rest of the world. Communication by road and railway is well developed, \$60,000,000 having lately been spent on road construction. Air lines have been estab. The present constitution of C. was adopted in 1880. It was drawn up by the Workingman's party, following the anti-Chinese labour agitations. The state administration is in the hands of a governor elected every four years. Taxes are administered by a board of equalisation. Under the constitution gov. depts. have no measure of autonomy, and any new departure means a revision of the constitution in the form of an amendment. This is known as the C. Idea. There have been sev. amendments. The senate consists of forty members elected for four years, and the assembly of eighty members elected for two years. C. is represented in Congress by two senators and twenty representatives. C. was first discovered by Juan Cabrillo in 1542 and remained under Sp. rule until 1822, when it declared its independence and allegiance to Mexico. It was taken over by the U.S.A. in 1847, and became a state of the Union in 1850. Chief tns.: Los Angeles, 1,504,000; San Francisco, 634,300; Oakland, 302,000; San Diego, 203,000; Long Beach, 164,000; Sacramento, the state capital, 105,000. The gross area of C. is 158,693 sq. m., and the total pop. is estimated at 6,907,000. There are over 90,000 Jap. (of whom 60,000 were born in the U.S.A.), and 40,000 Chinese (over half born in the U.S.A.). See A. Drury, *California: an Intimate Guide*, 1939; J. W. Caughey, *California*, 1940; J. A. B. Scherer, *Thirty-First Star*, 1942; R. E. Cowan, *A Bibliography of the History of California, 1580-1930*, 3 vols., 1943; R. G. Cleland, *From Wilderness to Empire*, 1944.

California, Gulf of, arm of the Pacific which separates the Lower Californian peninsula from the rest of Mexico.

Length is about 700 m., and breadth varies from 50 to 130 m. It was originally known as the Sea of Cortés, after its first explorer. Both shores are bordered by high mts. and the coast-line is very varied. At its N. extremity it receives the Colorado, and various other streams also run into it. On its coasts are the ports of San José, La Paz, Mazatlán, and Guaymas.

California, Lower, 700-m.-long and narrow and drought-cursed peninsula in the Pacific Ocean forming two ters. of Mexico, with an area of 55,629 sq. m. and a pop. of 130,300, is nearly destitute of streams, and for weary months not a drop of rain falls on the parched deserts. But the Boleo copper mines in the N. are one of the chief sources of the world's copper supply, rich deposits of gold have been discovered and a solid mt. of iron and various other minerals. The chief tn., La Paz (pop. 6000), is one of the three greatest pearl-producing centres of the world.

Californian Poppy, genus (*Eschscholzia*) of perennial herbs of the poppy family, native of the valleys of the Sierra Nevada Mts. and grown as an ornamental ann. The name is sometimes given to the *Platystemon*, another genus of *Papaveraceae*, native to California.

California, University of, one of the most important univs. in the U.S.A., opened at Oakland in 1869, but removed to Berkeley, California, in 1873. In this year the College of Medicine was organised in San Francisco, and this, with other San Francisco colleges for law and medical research, were affiliated to the U. of C. Other affiliated institutions are those for agriculture at Davis, for subtropical horticulture at Riverside, and for oceanography at La Jolla. The famous Lick Observatory, Mt. Hamilton, belongs to the univ. There is also a S. branch of the univ. at Los Angeles. Large-scale improvements have been carried out at Berkeley, following a permanent plan for construction, designed in 1896 by Bernard, a Fr. architect. The Gk. theatre, seating 8000 people, was built in 1903. The univ. is co-educational, and has 50,000 students (1947). In addition there are numerous students enrolled under an extension scheme. Tuition is free to all permanent residents of California. Agriculture is the specialised subject most studied, and the research stations at Mt. View, Cortena, and in the Imperial Valley belong to the univ.

Caligula, Gaius Cæsar Augustus Germanicus (A.D. 37-41), was b. at Artium in the year A.D. 12, the son of Germanicus and Agrippina. He was brought up among the soldiers at the camp, and thus became their great favourite, receiving from them the nickname of C., from the soldier's boots (*caligulae*) he used to wear. He was adopted as his grandson by Tiberius, and on the death of that monarch in A.D. 37 it was found that the empire was left to C. and the true grandson of Tiberius. C.'s appointment was hailed with enthusiasm, and the senate and people soon gave him sole power. For a time he gave no sign of carrying out

Tiberius's prophecy that he was educated 'for the destruction of the Rom. people.' He removed taxes, and scattered rewards and indemnities liberally. Then came an illness induced by his evil life, and on recovery from this he seemed possessed by a fury. He slaughtered his own relatives, and filled Rome with blood. His extortions, prodigality, and cruelty were unspeakable. Finally the citizens decided to rid themselves of the tyrant, and he was assassinated.

Calipers, instrument resembling a compass with bent legs, and used for measuring the diameters of various objects. It is used for finding the correct measurement of bores and shafts.

CALIPERS

Caliph, Calit (from the Arabian *kalifa* or *khalifah*, meaning successor), the title given to the civil and religious head of the Muslim states. The name caliphate denotes the rank, dominion, or office of a C. Each C. is supposed to be a direct lineal descendant of Mohammed. There is a tradition which has been wrongfully attributed to him, that there can only be one C. at a time, and should another one be set up, he must be put to death, 'for he is a rebel.' After Mohammed died this title was first borne by a man named Abu-Bekr, who was elected Mohammed's 'representative.' The hist. of these rulers can be divided into three divs.: (a) The first four Cs., who immediately succeeded Mohammed; (b) the Ommayyad Cs.; and (c) the Abbasid Cs. With regard to Abu-Bekr, the first of the Cs. to be elected at Mohammed's death, there was much dissension between the people of Medina, who wished to set up a member of their house, and the emigrants, who set up an opposition claim, and who were successful, as they had brought into Medina many Muslims to terrorise the inhab. Abu-Bekr was the friend and father-in-law of Mohammed, and he proved himself quite capable of dealing with the trouble of the times. He organised an attack on the Gks., but he himself remained behind to defend Medina. When his army came back, he attacked the rebel party; eleven small flying columns were enough to put down the rebellion. The war that had been started by Mohammed against the border countries was an excellent way of

making the religion popular with Arabs, as time was given for looting, and much wealth was gained thereby. In the war that was carried on against the Persians, the Moslems were unsuccessful at first, but at last, at the battle of Kadesia, the Persians were defeated and had to give up part of their land and limit themselves to Iraq proper. The Muslims under Abu-Bekr had soon annexed all the lands bordering on Arabia, and to these they added Egypt. Abu-Bekr d. on Aug. 22, 634, having been in power for only a short time. He was succeeded by Omar, during whose reign there were further tremendous conquests. Omar was a great plunderer, but he paid for his fault by being murdered by a Kufan workman in a mosque in Medina in Nov. 644. Othman succeeded Omar in the caliphate; he was a very weak ruler, and all the gov. of Islam fell into the hands of the Koreish nobility. He was besieged in his own house, where he defended himself for a time, but at last the mob gained an entrance, and put him to death. He was then eighty years of age. After much controversy Ali was elected as successor to Othman. Ali had no right to be elected, having gained his position by ambition and sheer desire for power. His reign was not at all a peaceful one, nor an enjoyable one for him, and he was murdered also, in Jan. 661. After these four Cs. had passed away the Ommayyad dynasty arose. Moawiya (661-680) was the first ruler under the new dynasty, which derived its name from one of Moawiya's ancestors. Their seat was Damascus. Many fights and battles took place during his rule. He was essentially a statesman, and he was a religious man as well, as he followed closely the precepts of Islam. None of his successors, however, had either of these virtues. Moawiya's son, Yazid I. (679-683), succeeded. During his reign he committed three actions for which Muslims never pardoned his memory: the murder of Hosain (grandson of the prophet), who had refused to take the oath of allegiance to Yazid, and who had led a revolt of the people of Iraq and sustained defeat and capture at the battle in the plain of Kerbela opposite Kufa (A.D. 680); the pillage of Medina, whose people had espoused the cause of Abdullah ibn Zohair, a rival for the caliphate, who had himself proclaimed C. at Mecca (A.D. 682-83); and the taking of the Ka'aba (Kaaba) (q.v.). Yazid was followed by his eldest son, Moawiya II. (683), a young man of weak character, who d. of the plague or through being poisoned. The choice of a successor then fell on Merwan bin al-Hakam, at Damascus, a descendant of Ommayya, who ruled as Merwan I. After a brief reign spent in unceasing warfare with the Shi'ites, he was suffocated by his wife because he had nominated his own son, Abd al-Melik as his successor instead of her son, Khalid. Abd al-Melik's reign lasted till 705, and a very turbulent reign it proved to be. He gave the caliphate a coinage of its own, and also gave his patronage to scholars, and urged them to translate Persian works

into Arabic. In the year 692 he levied a capitation tax on all Christian men. This was a means of getting money with which to support his wars. The next C. was Walid I. (705-15), who, though not an active man himself, saw the caliphate greatly extended, going as far as to include Spain on the one side and to the mouth of the Indus on the other. Suleiman I., who d. in 717, was followed by a good ruler, Omar II., but he was poisoned in 720. Yezid II. next succeeded, and d. in 724. Hisham d. in 743. Walid II. was slain in a rebellion in 744. Yezid III. d. also in 744. Ibrahim was dethroned by Merwan II., who was governor of Armenia (745). This was the end of the rule of the Ommayyads. They were not popular, and at last three brothers, descendants of Abbas, an uncle of the prophet, rose in rebellion. The whole land was thrown into a civil war between the white Ommayyads and the black Abbasids. Merwan was pursued into Egypt, and killed in battle in 750. Abdullah, an uncle of the claimants, sent an invitation for a feast to eighty Ommayyads in Damascus, and when they were assembled he slew them all. Thus came the Abbasids into power. Abul Abbas (750-54) was the first C. under the Abbasids' regime. He was called also Saffah, meaning shedder of his enemies' blood. He was followed by Abu Jaafar Almansur, his brother (754-75), who made Bagdad the seat of empire. He left behind him vast riches, but his son, Almahdi (775-85), and his grandson, Alhadi (785-86), spent all vainly. Alhadi's brother, Harun al-Rashid (the Just) came next (786-809). He is best known from the fact of having given his patronage to all orthodox and literary men. He persecuted the Christians, and made eight separate attacks on the Gk. empire in Asia Minor. His three sons fought for supremacy instead of accepting their father's div. of the empire. Amir was defeated and slain in 813, and his brother Almansur succeeded him (813-33). Mutaseen followed his brother (833-42), but with him departed the glory of the caliphate under the Abbasids. He was afraid of his own subjects, so he left Bagdad and went to Samarrh, and got together under his leadership about 50,000 Turks, who soon had all the power in their hands. Ever after the Cs. held power and life by the sanction of the Turks.

To support a revolt against the Turks during the First World War, the Brit. Gov. guaranteed to Hussein, Grand Sherief of Mecca, the independence of the Arab countries contingently on a successful revolt against the Turks. Hussein accordingly in 1916 threw in his lot with the Brit. arms, and, after the capture of Mecca and Jiddah, assumed the title of king. This new kingdom, the Hedjaz, was recognised by the post-war treaty with Turkey; and later, in 1924, Hussein, whose ambition had led him to regard himself as monarch of pan-Arabia, assumed the caliphate rendered vacant by the deposition of Sultan Abdul Mejid by

the Turks under Mustapha Kemal. Two years previously the Grand National Assembly of Angora, in abolishing the office of sultan, had decreed that that of C. hitherto vested in the person of the sultan, should be filled by election from among the princes of the house of Osman. But in March 1924, the Assembly decided to abolish also the Turkish Caliphate, and the members of the house of Osman were then expelled from Turkey, while Kemal (see ATATURK) was re-elected president of the Turkish Republic. Consult E. Freeman, *History and Conquests of the Saracens*, 1856; Sir W. Muir, *Annals of the Early Caliphate*, 1883.

Calippus, Gk. astronomer, fl. at the beginning of the fourth century B.C. He rectified the lunar cycle, giving it a duration of sixty-three years, the period being known as the Calippic cycle.

Calixtus, or Callistus, name of three popes:

Calixtus I. (218-22), successor of Zephyrinus. His life is known chiefly from the accounts of Hippolytus, a schismatical adversary of his. This writer says that C. was a slave, denounced as a Christian by the Jews, and later associate of Pope Zephyrinus. Hippolytus accused him of favouring the Patristic views and of lax discipline. The cemetery on the Via Appia bears his name.

Calixtus II. (1119-21), prior to becoming pope was archbishop of Vienna in France. He ruled during the struggles over the investiture question and the schism of the anti-pope. He commenced negotiations on the former question with the Emperor Henry V., and after some trouble matters were settled at the Concordat of Worms, 1122. He defeated the anti-pope, Gregory VIII.

Calixtus III. (1455-58), Alfonso de Borgia, a Spaniard. He preached a crusade against the Turks, who had just taken Constantinople (1453). His chief work was the vindication of the memory of Joan of Arc. The same title, C. III., was also borne by one of the anti-popes, whom Frederick Barbarossa, the emperor, set up in 1168 in opposition to Alexander III.

Calixtus, Georg, properly Callisen (1886-1856), Ger. Protestant theologian, was b. at Medelbye in Schleswig. In 1613 he became prof. of theology at Helmstedt, and was engaged in keen controversy with the Rom. Catholics. His study of the first centuries inclined him to toleration, and his advocacy of this brought him into some suspicion. His chief work is an *Eyntome theologiae moralis*, (1634).

Calla, genus of Araceae with the single species, *C. palustris*, bog arum, found in marshes of N. Europe. The leaves are cordate, not sagittate, and the hermaphrodite flowers, borne every two years, are enveloped in a beautiful white spathe. *Richardia* or *Zantedeschia aethiopica*, the Egyptian lily, or lily of the Nile, commonly known as the C. or C. lily, was formerly included in this genus.

Callaghan, Sir George Astley (1852-1920), Brit. admiral. Entered the navy,

1865, and by 1894 had reached the position of naval adviser to the inspector-general of fortifications. In 1900 he commanded the *Endymion* in Chinese waters, taking part in the suppression of the Boxer rebellion. Also fought at Taku and later commanded the naval brigade which co-operated in the relief of the Peking legations. Promoted rear-admiral in the Channel Fleet when the 'Dreadnought' type was introduced, and in 1911 became commander-in-chief, which post he held till the outbreak of the First World War, when he was succeeded

is mentioned as the 'gate of the Highlands.' The shapely peak of Ben Ledi (2875 ft.) rises to the N.W. of the tn. Being thus romantically situated, it has become a centre for tourists, and large hotels and hydropathic establs. have been built. There are sev. churches, including an Episcopal. Pop. 2400.

Callanish, see CALLEARNISH.

Callao, tn. and chief seaport of Peru, 6 m. S.W. of Lima, the cap. It is situated on C. Bay, where it is sheltered from storms by the is. of San Lorenzo. It has a floating dock, fine harbour walls, and

THE STANDING STONES OF CALLEARNISH

Viold Banks

by Adm. Jellicoe. It was due largely to his recognised skill in training organisation that the Home fleet was in so high a state of efficiency when he retired.

Callahan, James Morton (b. 1864), prof. of hist. and political science at W. Virginia Univ. Head of the dept. of hist. and political science, W. Virginia Univ., 1902; dean, College of Arts and Sciences, same univ., 1916. Among his works are *Neutrality of the American Lakes* (1898); *Diplomatic History of the Southern Confederacy* (1900); *American Relations in the Pacific and the Far East* (1901); *The American Expansion Policy* (1903); *Semi-centennial History of West Virginia* (1914); *History of West Virginia, Old and New* (1933).

Callais, see TURQUOISE.

Callan, tn. of Kilkenny, Eire, 8 m. S.W. of Kilkenny; pop. about 2000.

Callander, mkt. tn. and bor. of Perthshire, Scotland, situated on the R. Teith, about 16 m. N.W. of Stirling. It is in close proximity to the Trossachs, and

narrow streets of shabby appearance. It has gasworks, sugar refineries, iron-works, etc., and its chief exports are minerals, sugar, hides, wool, etc. Almost all the world's supply of vanadium, used in making motor axles and aeroplanes, is exported from C. The present tn. dates only from 1746, when the old city was destroyed by a great earthquake. It has suffered considerably from bombardments by Sp. and Chilean navies. Pop. (dept.) 82,000, (city) (1936) 75,000.

Callcott, Sir Augustus Wall (1779-1844), Eng. landscape painter, was b. at Kensington. He early studied music and was for sev. years a chorister at Westminster Abbey. In 1799 he determined to devote himself entirely to painting, and exhibited for the first time at the Royal Academy. In 1806 he became A.R.A., and in 1810 received his R.A. In 1837 he received knighthood. His best works are landscapes, and these are remarkable for their clearness and delicacy. But his largest work is 'Raphael and the Fornarina.'

Callendar, Hugh Longbourne (b. 1865), Eng. physicist. Educated at Marlborough and Cambridge Univ. Was prof. of physics at McGill Univ., Canada, 1893-98, at Univ. College, London, 1898-1902; and later at the Imperial College of Science. He has carried out much research work in thermodynamics, notably in calorimetry. His *Callendar Steam Tables* (1915) and *Properties of Steam and Thermodynamic Theory* (1921) give the results of his researches on steam.

Callernish, or Callanish, dist. and vil. on Lewis Is., Ross-shire, Scotland, on the E. coast of Loch Roag, 16 m. W. of Stornoway. The standing stones of C. in the form of a cross with a circle in the centre are among the finest in Britain. Pop. about 500. (See illustration, p. 139.)

Calles, Plutarco Elias (b. 1887), Mexican military leader and statesman, b. at Guaymas, Sonora, Mexico. Joined in the rebellion against the rule of the tyrant-president, Porfirio Díaz. His life for a large number of years after that was that of a military man. He was on the side of Carranza (q.v.) in the latter's fight with Huerta (q.v.), reaching the rank of a general. In 1915 he campaigned with Gen. Obregón (q.v.) against Pancho Villa. In 1917 he was made governor of his native state of Sonora. After holding Cabinet posts under Carranza and Obregón he was elected president of the Mexican republic for a four-year term, beginning in 1924. His administration was marked by very stormy times. The oil-land laws brought a conflict with the big Amer. petroleum companies, and the laws for separation of Church and State resulted in a conflict with the Rom. Catholic Church.

Callianassa, genus of decapod crustaceans, and is the type of the family Callinassidae. They are noted for the inequality in size and form of the chelae, or claws. *C. subterranea*, the commonest species, is found at Naples and on Fr. and Eng. shores.

Callias, name borne alternately with Hipponicus, by the heads of a powerful Athenian family which produced many distinguished citizens. The best known of these, surnamed Cacoplitus (beginning of fifth century B.C.), was reckoned as the richest Athenian of his time. He is said to have slain a Persian at Marathon who revealed to him the hiding-place of a vast treasure. Legend also tells that in 469 B.C. he was one of the ambas. sent by the Athenians to Artaxerxes, and that he arranged the peace of C. The name 'peace of C.' was also given to the peace between Athens and Sparta negotiated by a later C. in 371.

Callicera, generic name of certain dipterous insects of the family Syrphidae. They are stoutish flies with large heads and eyes, the body is silky, and the antennae form elongated and slightly curved clubs.

Calliobroma, genus of Coleoptera of the family Cerambycidae, or longicorns. It differs from allied beetles in having the whorl of palpi smaller than the labial, and shorter than the terminal lobe of the antennae. It emits a very agreeable odour.

Calliothryx, genus of malacoptyrigous

fishes belonging to the Siluridae, or catfish family. The body and head are protected by large, hard, scaly plates, only the snout and under surface being naked, and barbels depend from the mouth. The species frequent rivers and streams in hot climates, and when the water dries up they perform journeys overland in quest of new ponds.

Calliocrates, Gk. architect who, with Ictinus, planned the celebrated Parthenon, which is the magnificent temple erected in honour of the virgin goddess Athena in the year 438 B.C. It is the finest example of Gk. architecture still extant.

Callieratidas, Spartan general, was sent in the year 406 B.C. to take Lysander's place as commandant of the fleet, towards the end of the Peloponnesian war. He pursued Conon, and defeated him in the harbour of Mitylene. Conon took refuge here, and held out till the Athenians sent a large force to his relief. C. was then defeated and slain in the naval battle of Arginusae. C. was greatly hampered in his efforts for efficiency by the incapacity of his predecessors.

Callidium, genus of coleopterous insects of the Cerambycidae, or longicorns. *C. bagulus* is a Brit. species, about three-quarters of an inch long, of dull black colour, and is very destructive to fir-trees.

Calligonum, genus of Polygonaceae which consists of about twenty species from Africa and Asia. *C. Palasia* yields a nutritious gum, which is obtained from the root, and a beverage is made from the fruit.

Calligraphy, art of fine handwriting. See WRITING.

Callimachus, Athenian sculptor, who fl. in the fifth century B.C. He was possibly a disciple of Calamis, and the great characteristic of his work was over-minuteness. He is supposed to have invented the Corinthian capital, and also to have been the first to employ the running borer for drilling marble. Among other decorations furnished by him for the Erechtheum was a famous golden lamp.

Callimachus (c. 310-c. 240 B.C.), Gk. grammarian, critic, and poet, b. at Cyrene of the distinguished family of the Batladiæ. He founded a school at Alexandria, where he had Aristophanes of Byzantium and Apollonius of Rhodes among his distinguished pupils. He was a favourite of both Ptolemy Philadelphus and of his successor, Ptolemy Euergetes. He became chief librarian of the Alexandrian library under the former, and held this office till his death. In his *Pinakes* (tablets) he gives a catalogue of the books in the library, with a short criticism and account of the writers. This laid the foundation of the critical study of Gk. He is said to have written some 800 works, but of these only six hymns and sixty-four epigrams remain entire. His elegy, *Berenice's Lock*, is known to us in the trans. of Catullus. Some fragments of his epic *Hekale* have been found, but his *Aitia* is quite lost. It dealt with the foundation of cities, religious customs, etc. The best eds. of hymns and epigrams are those of Meineke (1861) and Wiamowitz

(1883). See also Eng. version with Gk. text in the Loeb series (U.S.A.).

Callimorpha, genus of Lepidoptera of the family Arctiidae; it includes sev. beautiful night-flying moths. The body is small and the wings large, somewhat triangular, and the hinder margins are rounded. *C. Jacobææ*, the pink underwing, is a common example.

Callington, mkt. tn., Cornwall, England, 10 m. from Launceston. It has extensive quarries, granite from which was used for the construction of the Thames Embankment, and Blackfriars and Battersea bridges, London. Pop. 1600.

Callionymus, technical name of the acanthopterygious fishes known popularly as dragonets, genus of Gobiidae, or goby family. The gill openings are reduced to a single small hole near the nape of the neck, the ventral fins are under the throat, the fin-rays of mature males are produced into filaments, and the body is smooth and without scales. *C. draco*, the sculpin, is about 10 in. long, and is brown and white in colour; *C. lyra*, the gemmeous dragonet, is another Brit. species, and is yellow, sapphire, and violet in hue.

Calliope, first of the nine muses and the mother of Orpheus. She is the muse of epic poetry, and is generally depicted with a tablet and a pencil.

Callirrhoe, na.-to c. a famous fountain in Athens, and formed one of the chief water supplies to that tn. According to Gk. legend C. was the daughter of Achelous, the riv. god.

Callisen, Georg, see CALIXTUS.

Callisthenes (c. 360-328 B.C.), of Olynthus, Gk. philosopher and historian, kinsman and pupil of Aristotle, accompanied Alexander the Great into Asia. He was put to death on account of his remonstrances against Alexander's oriental luxury and assumption of divine origin. He is credited with an account of Alexander's expedition and a hist. of the Phocian war, but the life of Alexander, once ascribed to him, is certainly spurious. The romance of Alexander in its different versions is derived directly or indirectly from the Gk. original which went under the false name of C. and this original was the foundation of the legends of Alexander circulated in the Middle Ages. This romantic life seems to date from the era of the Ptolemies and its author, called the pseudo-Callisthenes, otherwise Alsopos, has been variously identified—but without much evidence—with Aristotle, Antisthenes, and others.

Callisthenes, light gymnastic exercises for health and the development of the body. See GYMNASTICS.

Callistratus: 1. Rom. jurist, who lived in the reigns of Septimius Severus and Caracalla. He is said to have been a pupil of Papinian. None of his writings is extant, but some of his works are the source of the *Digest* of Justinian, in which some extracts from him are given. 2. Athenian orator of the fourth century B.C. whose eloquence is reputed to have inspired Demosthenes with a love of oratory. He was both a general and a statesman, but was ultimately exiled to Thrace,

where he founded the city of Datum. Later he returned to Athens and was executed. 3. Gk. grammarian of the second century B.C., author of commentaries on the chief Gk. poets. He is said to have been the first to introduce the twenty-four-letter alphabet to the Samians. 4. Gk. rhetorician of the third century B.C., author of descriptions of fourteen statues by famous artists.

Callitricheaceæ, very small order of dicotyledonous plants, consisting of about twenty-five species, all contained in the single genus *Callitriche*. They are nearly all floating plants, and are cosmopolitan but for S. Africa; in Britain they are known as water starwort. The flowers are unisexual and devoid of all floral covering, the male flower being simply a single stamen and the female a bilocular, spuriously quadrilocular, ovary with two styles. In *C. vernalis* (*C. palustris* (Linnaeus)) pollination takes place in the air, in *C. autumnalis* under water.

Callosities, bare patches of skin where the epidermis has thickened into a horny substance. This thickening is due to pressure, friction, or chemical irritation continued for a lengthy period. They are more frequently found in mammals, and they are especially conspicuous in camels and on the inner side of the legs of horses. In the human being C., or corns, are generally situated on any prominence such as a joint, but they also appear on any part of the integument and are often formed on the soles of the feet. In appearance the skin takes on a yellowish colour, is smooth and horn-like, and is thickest in the centre.

Callot, Jacques (1593-1635), Fr. painter and engraver, was b. at Nancy in Lorraine. At the age of twelve he ran away from home, intending to seek Rome and devote himself to art. He joined a band of gipsies, and later the suite of a nobleman. He was then found, however, and taken home. Once again he escaped and was brought back, and then his parents gave way, and sent him to Rome with the duke of Lorraine's ambas. For some time he painted in Florence, but quitted this tn. to return to his prince. He visited the Low Countries to gather the material for his 'Siege of Breda,' and later Louis XIII. of France engaged him to engrave other war pictures, among which is the 'Siege of La Rochelle.' C., the great painter of manners, has left a vast number of engravings. He was rapid and impatient in his work, and all his engravings are marked by vigour and animation. His 'Gipsy Hail' and 'Miseries of War' are particularly remarkable in this respect.

Calluna vulgaris constitutes in itself a genus of Ericaceæ, and is known as ling or heather; it flourishes on every heath of Britain, and is common in N. America and Europe. The plant is a low-tufted shrub, with small, sessile, closely imbricated leaves, flowers varying in colour from deep red to white, and fruit a septeloid capsule.

Callus, substance given off round the fractured ends of a bone forming a new bone which unites the breakage. A

similar process takes place in plants when a cutting is taken or a branch pruned. When a plant is damaged a succulent tissue exudes and covers up the cut surface. In cuttings this C. produces the roots of the young plants.

Calmar, see KALMAR.

Calmet, Augustin (1672-1757), learned Fr. Benedictine monk, was b. at Mesnil-la-Horgne, near Commercy (Meuse). He entered the Benedictine order in 1689. In 1719 he was appointed abbot of St. Léopold at Nancy, and ten years later was transferred to the abbey of Sonones. His chief work is the *Histoire ecclésiastique et civile de la Lorraine* (1728), characterised by great learning and research. His *Dictionnaire historique, géographique, chronologique et littéraire de la Bible*, 4 vols. (1722-28), is one of the first works of its kind. Another important production is the *Commentaire sur tous les livres de l'Ancien et du Nouveau Testament*, 23 vols. (1707-16). Life by Dom Fangé, 1763.

Calmette, Gaston (1858-1914), Fr. journalist; b. July 30, at Montpellier. Educated at lycées of Brest, Bordeaux, Clermont-Ferrand, and Mâcon. He joined the staff of the *Figaro* in 1880, was secretary of editorial board 1894-1903, thenceforward editor-in-chief. A chevalier of the Legion of Honour, he acquired riches and strong enmity through the *Figaro*, for Chauchard, who had been prin. shareholder, left him a large part on his wealth; and he was unhesitating in his attacks on personal character. When editor of the *Figaro*, he threatened to publish letters which would have compromised Mme Caillaux (see CAILLAUX). His assassination by Mme Caillaux at his office on March 16 was the social sensation of the year 1914. Mme Caillaux was arrested but, after a trial characterised by many remarkable incidents, was acquitted.

Calmette, Léon Charles Albert (1863-1933), Fr. bacteriologist, b. at Nice, brother of Gaston C. (q.v.). Became a director of the Pasteur Institute and one of the leaders of medical research in France. Spent most of his life in the study of tuberculosis, his researches eventuating in the introduction of the bacillus C. Guérin, which proved successful in the treatment of tubercular children.

Calms, The, regions of calm weather at sea, just N. of the equator, on the confines of the trade winds. They last for many weeks at a time. Also known as the doldrums.

Calmucks, see KALMUCKS.

Calne, mkt. tn. of Wiltshire, England, 5 m. E.S.E. of Chippenham. It has a large bacon-curing industry, and manufs. of flour and paper. In 978, at a synod held here, the floor gave way, precipitating all but St. Dunstan to the ground. Pop. 4000.

Calceohortus, Mariposa Lily, or Star Tulip. A genus of Amer. Liliaceæ, nearly allied to the fritillary and tulip; the fruit is a septicidal capsule. The plants are abundant in California, but do not grow well in England unless their roots

are carefully protected from frost and excessive water, and can be exposed freely to light and air when growing. *C. albus* is a white and *C. lilacinus* a lilac-coloured species.

Calomel, popular and medical name for mercurous chloride, Hg₂Cl₂. This substance is found in nature as horn mercury or horn quicksilver, a sectile tetragonal mineral of hardness 1 to 2 and sp. gr. 6.48. C. is prepared in the laboratory by adding mercury to sulphate of mercury and triturating the whole in a mortar, afterwards adding common salt and subliming the mixture. Any corrosive sublimate which passes over is renewed by washing with hot water. A more convenient method is adding mercury to corrosive sublimate (mercuric chloride) and subliming. C. is a dense, white, odourless powder, insoluble in water; it turns black when treated with lime-water, potash, soda, or ammonia. When heated it vaporises without charring and sublimes again unaltered. It is the most widely used preparation of mercury in medicine, producing its effects without much local inflammation. In small doses it is used to relieve congestion of any part of the alimentary system, as it gently stimulates secretion, and thus helps to 'clear the system' in cases where increased functional activity is required to counteract the effects of overfeeding, unaccustomed lack of exercise, etc. In larger doses it is used by adults as a purgative, and generally as an alterative, as it is often efficacious in restoring the normal activity of any organ after it has been deranged through any cause. C. is not so poisonous as the more soluble mercuric salts, but the absorption of the mercury in great quantity, as in the syphilis cure, may give rise to poisoning characterised by a coppery taste in the mouth, loosening of the teeth, and in the severer cases, by emaciation, necrosis of the jaws, and neuritis.

Calonne, Charles Alexandre de (1734-1802), Fr. statesman, was b. at Douay. He entered the legal profession, and after having filled various offices, became in 1783 comptroller-general of the Treasury. He found the deficit already large, and in a short time he had managed to increase it much more by borrowing in all directions. Finding at last that it was impossible to continue, he persuaded Louis XVI. to call an assembly of the 'notables,' to whom he proposed that their privileges should be abolished. This was not well received, and he was compelled to resign. He spent some years in England, but returned to die in France.

Calophyllum, genus of trees belonging to the Guttifereæ, is noted for the beautiful colour of its young leaves. The species grow in tropical countries, chiefly of the Old World. *C. inophyllum*, a native of the E. Indies, attains a height of 100 ft., and has large leaves like those of a water-lily, snow-white fragrant flowers, and a nut which yields an oil useful for burning in lamps. *C. lacamahaca* yields the resin which is known as tacamahac. *C. Calaba*, the calaba-tree, grows in the Caribbee Is.

and is noted for its white, sweet-scented flowers, green fruit with an oily seed, and timber which is used in making staves and oak-headings.

Calorescence, name given by Prof. Tyndall to the production of light from the invisible rays beyond the red end of the spectrum (*q.v.*). These rays are the hottest, and magnesium can be burned and platinum brought to white heat by them. The action of the platinum renders the rays visible, whence the description 'calorescent.'

Caloric Theory, now discarded theory of heat, which postulated a fluid 'caloric' of no weight, the presence of which rendered a body hot. It was believed that 'caloric' flowed from a hot to a cold body in contact with each other. The theory was replaced by the kinetic or dynamic theory, following the researches of Benjamin Thomson in 1798.

Calorie, unit quantity of heat. The 'small C.' is the amount of heat required to raise the temp. of 1 gm. of water 1° C. As the specific heat of water varies slightly with its temp., the temp. is usually specified, as from 0° to 1°, or from 15° to 16°. The latter temp. has the advantage that the C. so measured is almost equal to the 'mean C.' obtained by dividing the amount of heat required to raise 1 gm. of water from 0° to 100° by 100. The 'great C.' is the amount of heat required to raise 1 kg. of water 1° C. It is therefore equal to 1000 small Cs., and is approximately equivalent to 3.968 Brit. thermal units. For the use of the term in reference to human energy see DIET and FOODS AND FEEDING.

Calorimeter (Fr. *calorimètre*, from Lat. *calor*, heat, and *metrum*, derived from Gr. *μέτρον*, measure), apparatus used to measure quantities of heat developed or absorbed in different chemical and physical changes, e.g. heat developed by friction, combustion, etc.; or absorbed as by melting ice. Cs. vary in form according to the purposes they serve. The simplest variety, a plain metal vessel, is that used to determine the specific heat of metals. In the ice-C. the heat is measured by the amount of ice which it melts. More complex forms are used to determine the specific heat of gases. In these experiments many contrivances, such as vacuum jackets, non-conducting air jackets, are used to prevent loss of heat, which is the greatest difficulty to overcome. See SPECIFIC HEAT and THERMOCHEMISTRY.

Calosoma, genus of coleopterous insects, is included in the family Carabidae. They greatly resemble the genus *Carabus*, and *C. synophanta* is one of the largest and most beautiful species of its family.

Calotropis, genus of Asclepiadaceae common to the tropics of Asia and Africa. *C. gigantea*, the madar, mular, wara, or bow-string hemp, grows in sandy places in many parts of India, and is noted for its milky juice, which is used medicinally in the E.; for the fibre made from the bark and the floss obtained from the seeds, *C. procera* is known as Fr. cotton or Fr. jasmine.

Calottistes, satirical society founded by Aymon and Torsac, two of Louis XIV.'s bodyguard, in 1702. It derived its name from *calotte*, the small cap that the priests wore to hide their tonsure. In the middle of the eighteenth century it was converted into a military institution, but it was finally crushed out of existence at the time of the revolution.

Calotype, process of photography invented in 1811 by Fox Talbot, whereby paper sensitised with silver oxide, exposed in a camera, and developed with gallic acid, resulted in the image being a negative, i.e. reversed as regards light and shade.

Calovius, Abraham (1612-86). Ger. Lutheran divine, who was b. on April 16, at Mohrungen in Prussia. He studied at Königsberg, and in 1650 he gained the position of prof. of theology at Wittenberg, where he later on became general superintendent and primarius. He was the most ardent upholder of Lutheran doctrines during the seventeenth century. He strenuously fought against Catholics, Calvinists, and Socinians, and he was particularly opposed to the reconciliation policy, or 'syncretism,' of Georg Calixtus. As a polemical writer he had few rivals. His prin. work was *Systema locorum theologicorum*, written between the years 1655 and 1677, and which runs into 12 vols. His book, *Historia Syncretistica*, written in 1682, was suppressed.

Caloyers, Gk. monks; very strict religious order divided into three ranks, and following the rule of St. Basil. Bishops, patriarchs, and theologians are chosen from this order because the monks are of high social rank for the most part. Many monasteries exist, the most celebrated being that of Mt. Sinai.

Calpe, anc. name of Gibraltar. C. was the name of a mt. in the S. of Spain between the Mediterranean and Atlantic; opposite to it on the African coast was Mt. Abyla, the two being called the *Columns* (or *Pillars*) of *Hercules*.

Calpee, see KALPI.

Calprenède, Gautier de Costes de La, see LA CALPRENÈDE.

Calpurnia, last wife of Julius Caesar. He married her in 59 B.C. She has been immortalised by Shakespeare through his representation of her anxiety and superstitious dread at the time of the conspiracy against her husband by Brutus and his colleagues at the Ides of March.

Calpurnius, Titus Julius (Titus Calpurnius Siculus), Lat. poet; wrote early in the reign of Nero. Chiefly remembered for his *Eclogues*, in which he assumes the name of Corydon. He ultimately found a patron in Meliboeus, whose identity is not fixed—possibly Seneca. Corydon, in one of his idylls, gives thanks to Meliboeus for his bounty and asks him to bring the poem in question to the notice of the emperor. But Meliboeus is also thought to represent C. Calpurnius Piso, the noble who was afterwards involved in a conspiracy against Nero. If this be so, the poet himself may have his name, Calpurnius, to the fact that he was a son of one of Piso's freedmen. His other name, Siculus, is probably owed to the character of his

idylls. C. is in no way original, but 'a skilful literary craftsman.' Some four of the eleven *Ecloques* ascribed to him are now generally attributed to Nemeseianus (q.v.). Like Virgil C. enlivens his pastorals by allusions to contemporary events and persons, and all his seven idylls are closely imitated from Virgil; but C. has not Virgil's great love of country, and his hexameters, if impeccable in following the metrical usage of bucolic verse, are monotonous. The most striking of his idylls is, perhaps, the last, in which, as in the first of Virgil's eclogues, a shepherd describes a visit to the cap. The long Lat. hexameter poem, *Ætna*, once ascribed to Virgil, has also been attributed to C., as being a poet who was familiar with the *Ænied*.

plateau almost in the centre of the is., and is 43 m. N.E. of Girgenti. It has a cathedral, technical and mining schools, sulphur mines, mineral springs, and potteries. Near by is a Norman monastery built by King Roger in 1153. In the Second World War the W. portion of the roof of the nave and the vault of the cathedral with frescoes by Borremans were destroyed. The church of San Giovanni was completely destroyed. Pop. 50,500.

Caltha, genus of Ranunculaceæ, which flourishes in temperate countries and is represented in Britain by *C. palustris*, the marsh marigold. The flowers are radially symmetrical, have no petals, but usually five petaloid stamens, and the fruit is an eterio of follicles.

MOUNT CALVARY

Calshot, headland of Hampshire, England, at the W. extremity of Southampton Water. Is now an important seaplane base.

Calstock, par. and mining tn., E. Cornwall, England, on the Tamar. Pop. 4400.

Caltabellotta, tn. in the prov. of Girgenti in Sicily, near the site of the anc. Tricala, and situated 9 m. N.E. of Selacca. Originally a Saracen fortress. Pop. 7100.

Caltagirone, tn. and episcopal see in Catania in Sicily. It is a well-built tn., and situated on the tops of two hills (1930 ft.), and these are connected by a bridge. It is a residential place for the nobility of the is., and is famous for its schools and also for its pottery. The church of S. Giacomo was damaged in the Second World War. Pop. 40,000.

Caltanissetta: 1. Prov. of Italy in the middle of Sicily. It rises to a height of 3000 ft. in the N., and is drained by the Salso and other small riva. Its chief products are sulphur, wheat, wine, salt, olives, and other fruits. Area 1263 sq. m. Pop. 255,000. 2. Cap. of the above prov. It is a bishop's see, and stands on a lofty

Calton Hill, hill overlooking Edinburgh city from the E. It is 355 ft. high and on its summit is the National Monument.

Caltrop (A.-S. *calca-træppe*), small iron ball covered with projecting spikes. They were much used in the warfare of the Middle Ages. When an enemy was expected, the ground over which it was to travel was thickly strewn with these balls. The result was disastrous to the horses as well as to the barefooted infantry. Cs. were also used by the colonists in New England. They placed them among the grass as a defence against the assaults of the Indians. The word is also applied to plants that catch the feet, the 'water Cs.' being the name of the *Potamogeton* because it entangles swimmers.

Calumba Root, or *Radix Calumba*, is obtained from the climbing herbaceous plant, *Jalorhiza palmata*, a species of Menispermaceæ occurring in tropical Africa. The odour is faintly aromatic, the taste bitter and slightly acid, and the bitter active principle is known as calumbine. It is used medicinally as a tonic and stomachic.

Calumet, tobacco pipe known among Amer. Indians as the peace pipe. This was always handed round at an assembly of warriors at the conclusion of peace negotiations. In these days it is offered to strangers as a mark of hospitality. Dire offence would be taken should they decline to smoke it. The pipe has a stem of wood 2½ ft. in length, with a stone bowl, and is ornamented with women's hair or eagles' feathers.

Calvados, in Normandy, a maritime dept. in the N. of France, and called by that name after one of the vessels of the Sp. Armada, which was shipwrecked off a dangerous ledge of rocks in 1588. The coast is dangerous on account of the rocks, and lighthouses are placed at the mouths of the Rs. Touques, Dives, Orne, and Vire. The region is mountainous with extensive fertile valleys. The pasturage is good, and there is an abundant supply of wheat and agric. produce. Cider is produced in great quantities from the orchards in the Auge dist.; a spirituous distillation of cider is made also and bears the name of the dept. There are six arrons., named respectively after the chief tns., Caen, Vire, Bayeux, Lisieux, Falaise, and Pont l'Évêque. The prin. ports are Caen, Trouville, and Honfleur, and there is an excellent fishing industry. For the battles of C. in 1944 see under WESTERN FRONT in SECOND WORLD WAR—*Battle of Normandy*. Pop. 405,000.

Calvary. The word C. or Calvaria is a translation of the Heb. word Golgotha, a skull, and it is conjectured by some authorities that this name was given to the spot on which our Lord was crucified because of the skull-like appearance of the mt. ridge; others attribute its name to the fact that this place was the scene of public executions. Mt. C. is situated outside the city of Jerusalem and lies to the N.W. The site of C., like that of the Holy Sepulchre, had not disappeared by the beginning of the fourth century, and for some ten years from A.D. 325 Constantine lavished the skill of builders and treasure on giving to these sites an ambitious architectural covering. Rom. Catholics have commemorated this event in some foreign cities by giving a representation in sculpture of the scene on C.

Calvé, Emma (Rose Emma Calvert) (1864-1942), Fr. opera singer, b. at Decazeville, Aveyron. Her father took the family to Spain and Sp. became her first language, but she was educated at a Fr. convent. Studied music under Jules Puget in Paris and, after she had made her first important appearance, which was at Brussels, 1882, as Marguerite in *Faust*, she became a pupil of Mme Marchesi. She had a great range and could sing both Hérodiade and Salomé, contralto and soprano, in Massenet's *Hérodiade*. Appeared at Covent Garden in 1892 as Santuzza in *Caratteria Rusticana*, her success, both in that part and as Carmen in Bizet's opera, being immediate. It is generally agreed that she was the greatest of all Carmens. Other roles were Anita in Massenet's *Navarraise*, Sapho in the same composer's opera of that name, and

Messaline in Isidore de Lara's opera. She made a great impression as Salomé in a revival of Massenet's *Hérodiade*, given at Covent Garden in 1904 as *Salomé*. Strictly her voice was a mezzo-soprano and through all the registers there was a timbre of remarkable beauty and individuality. Purchased the château of Cabrières, which became the home of her retirement, and there she founded and maintained a sanatorium for young girls.

Calveley, Sir Hugh (d. 1393), Eng. soldier. He fought in Brittany in the war of 1341-61, during which he was imprisoned at Josselin. He took part in the battle of Auray (1364), which ended the war. C. was a freelance and fought for which ever leader pleased him. In 1367 he left Henry of Trastamare and served the Black Prince, and fought under Sir John Chandos at the battle of Navarrete (1367). He became deputy-governor of Calais (1377-79) and of Brest (1380). He is said to have been one of the founders of a college in Rome (1380), and in 1385 founded one at Bunbury in Cheshire.

Calverley, Charles Stuart (1831-84), Eng. poet. A son of Rev. H. Blayds, he adopted the name of C. Educated at Harrow, and at Oxford and Cambridge. At the latter he proved himself a fine scholar, a fact evidenced by his *Translations into English and Latin* (1866), and *Theocritus translated into English Verse* (1869). Full of exquisite humour and wit are his *Verses and Translations* (1862), and *Fly Leaves* (1872). A brilliant man, but unhappily suffering from ill health, he wrote only short pieces, some of which have secured him his high reputation. As a parodist he was delightful, and there are some who assert that he is the best writer of parodies in verse in the language.

Calvert, Mrs. Charles (1836-1921), distinguished Eng. actress, daughter of James Riddles, an actor. Played as a child actress at the age of seven with Charles Kean and wife. Became leading lady at the Theatre Royal, Southampton, in her teens; also acted at the Boston Theatre, U.S.A. During her husband's tenure of the Prince's Theatre, Manchester, she built up a considerable reputation in such Shakespearian parts as Cleopatra, Hermione, Miranda, Catherine of Aragon—with Phelps as the cardinal—and many others. Also successful in modern comedy, notably as Catherine Petkoff in Mr. Shaw's *Arms and the Man*, and as Mrs. Hardecastle.

Calvert, Denis (1555-1619), Flemish painter, who studied first in Antwerp; thence he went to Bologna and Rome; after studying Raphael's works, and assisting Lorenzo Sabatini with paintings for the ducal palace, he returned to Bologna, where he founded a school which Domenichino and Guido both attended.

Calvert, Edward (c. 1803-83), Eng. painter and draughtsman, b. in Cornwall, son of a naval officer. Was a midshipman, but left the service to study the arts. Attended the Royal Academy schools and studied painting under John, a W. country artist. Began work in London as an illustrated draughtsman upon wood,

but impressions from his blocks are rare, because in his diffidence he destroyed most of them. Paintings exhibited at the Royal Academy were 'Nymphs,' 'A Shepherdess' (1827); 'Morning' (1829); a picture illustrating Milton's 'Eve' (1936). He produced a number of woodcuts and plates of considerable beauty, the most notable being the 'Christian Ploughing the last Furrow of Life' and the 'Cider Press,' both of which show the influence of Wm. Blake, whom he worshipped and whose acquaintance he made early in his career.

Calvert, Frederick Crace (1819-73), Eng. chemist, who was b. in London, but all his scientific education he received in France. His celebrity was gained from his researches into the industrial side of chem., tanning, calico-printing, and iron-puddling. He was the first person to manuf. pure carbolic acid, and he was the founder of extensive works in Manchester for its production. It may also be said that he made the first use of it as a disinfectant. He also pub. a book called *Dyeing and Calico-printing* (2nd ed. 1876).

Calvert, George (c. 1580-1632), first Baron Baltimore, Eng. statesman and founder of the state of Maryland, in U.S.A. For some time he was secretary of state to James I., but being a Rom. Catholic was forced to resign. He retained the king's favour, however, and was granted land in N. America. He d. before the charter was completed, but it passed to his son Cecil.

Calvert, Louis (1859-1923), Eng. actor, son of an actor. Well known in Shakespearean parts, particularly as Falstaff in *Henry IV.* He was equally successful in many Shavian parts, his technique and flair for character being remarkable. Pub. *Problem of the Actor* (1919).

Calvert, Thomas (1775-1840), theologian, b. at Preston. He became tutor of St. John's Cambridge, 1814; Norrisian prof. of divinity, 1815-24; Lady Margaret's preacher, 1819-24. He was appointed king's preacher at Whitehall, and in 1822 was given the wardenship of the collegiate church at Manchester. See *Raines, Lives of the Wardens of Manchester*, 1885.

Calvi, fort. tn. and harbour on the N.W. coast of Corsica, and 45 m. N. of Ajaccio. The citadel was captured by the Eng. in 1794 at the time Nelson lost his eye. Some trade in wine, oil, and fruits is carried on, and it is a fishing centre. Pop. 2600.

Calvin, John (1509-64), was b. at Noyon in Picardy. His name is the Latinised form of Chauvin or Cauvin. His father, Gérard Chauvin, was notary apostolic and procurator fiscal of the co. of Noyon, and intended his son for the Church. In 1521 C. received a chaplaincy in the cathedral of Noyon, and a few days later he was made curé of Marteville. During this time he was engaged in study at Paris in the colleges of Marche and Montaigu. It was then that he resolved not to take orders, and went to Orleans to study law. Here he found Pierre Olivétan, a kinsman of his, who was then busy translating some of the Scriptures, and who induced

the young student to study them with him. Thence C. went to Bourges, where he came under the influence of the famous Gk. scholar, Melchior Wolmar (or Volmar) who further influenced him in the direction of the reformed faith, though his conversion does not yet seem to have been definite. His residence at Bourges was cut short by the sudden death of his father. He paid a hurried visit to Paris and then returned to Noyon, where he lived for two years. From 1529 to 1532 he apparently resided in Paris, lodging with a tradesman, Étienne de la Forge, who early fell a victim to his zeal for the Reformation and whom C. accounted as a 'holy martyr blessed among believers.' In Paris he began to speak freely against the Rom. Church and its faith. Forewarned of an attempt to arrest him, C. retired first to a castle near Mantes, then to Saintonge and afterwards to Nérac, the residence of the queen of Navarre. Persecution was now raging so hotly that C., having given up all his preferences, left the country and settled in Basle, whence, in 1536, he issued his epoch-making work, the *Christian Religionis Institutio*, with its famous preface addressed to Francis I. of France, in which the exile exhorts him to support the Reformation. This work was pub. in Basle in 1535-36. It was written in Lat., and, four years later, trans. by C. himself into Fr. It is the first attempt at a logical and complete definition and vindication of Protestantism. C. then made a short visit to Italy, where the new faith had made some headway, and here he was well received by Renée, duchess of Ferrara. He now paid a last visit to France, where he sold the paternal estates, and set out to settle in Switzerland. In 1536 he was passing through Geneva, at which city Farel was striving hard to establish the reformed faith. This friend entreated him to remain and help in the work, but this he was unwilling to do till Farel threatened him with the curse of God if he should neglect this clear duty. Then C. threw himself into the work with tremendous energy. A Confession of Faith was drawn up and approved by the people, and strict morality was enforced. But a reaction soon came against the strict rule of Farel and C., and the party known as the Libertines gained the upper hand. C. left the city and settled at Strasburg in 1539, where he married Idelette de Bure, a widow, by whom he had one son, who d. in childhood. Meanwhile, Geneva was finding that even C.'s strict rule was better than no rule, and in 1540 he was summoned to return. He was at first unwilling to do this, for his life in Strasburg was an easy one. However, he considered that in Geneva duty lay, and in Sept. 1541 he re-entered the city. Here he devoted himself for the rest of his life to the task of ordering Geneva and the Protestant theology. He estab. the College of Pastors, and did his best to enforce a rigid morality. He also added the reformed churches in all countries, being in correspondence with England, France, the

Netherlands, Poland, etc. In 1559 he founded the academy of Geneva. His activity was prodigious till his death in 1564. During the first fourteen years of his pastorate he was engaged in conflict with the Libertines, who were again his enemies. To the same period belong his three great controversies, with Sébastien Castellio, with Jérôme Bolsec, and with Michael Servetus (*q.v.*). The last is the most memorable. Servetus was a heretic whose views are fully explained in his *Restitutio Christianismi*. He was arrested by the Rom. Church in France, and here C. did his best to secure his condemnation. Servetus escaped and came to Geneva whence C. had promised that he should not escape alive. After a scurrilous verbal conflict, the unfortunate man was tried and sentenced to be burnt. Though the great reformer did his utmost to get the manner of death altered, the sentence was carried out. That C. loathed the doctrines which he found in his book is certain, but that he was actuated by personal spite and animosity against Servetus himself there is no evidence, though undoubtedly he took the initiative in bringing on the trial. The heresy of Servetus was not extirpated with his death, and the trials of sev. of his followers, with the conference and controversies connected with them, occupied much of C.'s time for sev. years. In connection with such controversies on points of faith, as, for example, his protracted dispute with the Lutherans respecting the Lord's Supper, C. was for many years much troubled, and sometimes even endangered, by the opposition of the libertine party in Geneva to the eccles. discipline which C. had estab. there. But amidst these many cares and consultations on matters great and small, C. found time to commit to writing a number of works besides those provoked by the various controversies in which he was engaged; the most numerous of them were exegetical, though of course it is chiefly as a theologian and the head of a theological school that C. is now known. The incessant and exhausting labours to which C. unsparingly devoted himself could not but tell on so fragile a constitution; but it was not until his frail body, torn by fever, asthma, gout, and stone, had almost collapsed, that his indomitable spirit surrendered. In 1564 his sufferings became so aggravated, that it was evident his life was rapidly drawing to a close. On Feb. 6 of that year he preached his last sermon, having with great difficulty found breath enough to enable him to complete it. He quietly expired in the arms of his faithful friend Beza on the evening of May 27, in the fifty-fifth year of his age. See T. MacCrie, *The Early Years of Calvin*, 1880; H. F. Henderson, *Calvin in his Letters*, 1909; A. Menzies, *A Study of Calvin*, 1918; E. Donmergue, *Jean Calvin*, 1926-27; R. N. C. Hunt, *Calvin*, 1933; J. MacKinnon, *Calvin and the Reformation*, 1936.

Calvinism is distinguished particularly by its dogma of Predestination. This says that God has chosen certain souls for salvation, others for damnation, and that

these decrees are unalterable. To the elect sufficient grace is sure to be given, and also the gift of perseverance. The Westminster Confession is the most complete exposition of the Calvinistic faith. C. is estab. in the Reformed churches, in opposition to the Lutheran, of France, Scotland, Holland, etc. It entered England, and gave birth to the Puritans and the numerous dissenting bodies. Thence also it reached America. Dr. Jowett thought that Calvin was 'the greatest commentator of the Scriptures that Europe had ever known.' Its adherents claim for C. that it is a system of courageous consistency in all its parts, in premise, process, and conclusion, and that 'the men who held it felt that they had their feet upon the last and highest reality.' It was certainly the inspiring force of the men who fought the battles of the Huguenots in France, of the soldiers and citizens, who, in the swamps of Holland, resisted the tyranny of Catholic Spain, and of the Eng. Puritans. For a modern statement of C. see H. Tydemann Chilvers, *Is there a Future for Calvinism?* See also bibliography for preceding article.

Calvinistic Methodists, see METHODISM. **Calvinistic Methodist Church of Wales** is the only Church of purely Welsh origin. Its adherents comprise a very large part of the Welsh-speaking pop., the number of communicants being 175,000. The form of gov. is Presbyterian, the church being in federation with the Presbyterian Church of England, the United Free Church of Scotland, and the Presbyterian Church of Ireland. It is also a constituent of the Pan-Presbyterian Alliance. There are foreign missions in India, Assam, and elsewhere. It has about 1500 churches and about 1720 chapels and buildings for Sunday schools and other purposes. In 1933 the Calvinistic Methodist or Presbyterian Church of Wales Act received the royal assent, thereby securing the autonomy of the Church in matters spiritual and the estab. of a properties board. The Church celebrated its bicentenary in 1935.

Calw, tn. in Württemberg, Germany, health resort; had a large timber trade with Holland before the Second World War. Pop. 6000.

Calyceanthaceæ, small family of dicotyledonous plants, containing two genera in China and N. America. The species are shrubs, which are usually aromatic and have square stems; the flowers have numerous sepaloid and petaloid perianth leaves, five to numerous stamens, numerous carpels, and an etherio of achenes as fruit. The genus *Calyceanthus*, or Carolina allspice, is represented by three species; *C. floridus*, common Carolina allspice, is a fragrant plant with chocolate-coloured flowers, and its bark is used as a substitute for cinnamon. The genus *Chimonanthus*, or Japan all-pice, has two species; *C. fragrans* has lemon-coloured flowers which appear at a different season from the leaves.

Calyceaceæ small family of dicotyledons formerly considered to be allied to the Compositæ, on account of the form of the inflorescence and the partially fused

stamen anthers. They differ from Compositæ in having the stamen filaments fused, and in the seeds, which are albuminous and pendulous. They are now classified close to the Dipsacaceæ (Teasel and Scabious family). The species of *C.* occur in S. America.

Calycifloræ, name given by De Candolle (*q.v.*) to the series of plants in which the sepals and petals are separate, the petals are perigynous or epigynous, and the stamens are perigynous. The chief families include the Leguminosæ, Rosaceæ, Saxifragaceæ, Myrtaceæ, Cucurbitaceæ, and Umbellifere.

Calycophyllum, small genus of Rubiaceæ which contains only three species, natives of the W. Indies and S. America. They are small, smooth trees with corymbs of flowers; in some cases the sepals are pink, and give the tree the colour of a rose.

Calydon, anct. tn. in Ætolia which, according to the writings of Pliny, was situated 7½ m. from the sea on the R. Evenus. It was supposed to have been founded by C., the son of Ætolus. The famous Calydonian boar, sent by Artemis to lay waste the fields, is said to have been hunted here by Meleager and other heroes. The walls of C. are sometimes said to be those of the Kastro of Kurtaga. They have a circuit of over 2 m., with one large gate and six little ones. Ruins of terrace walls outside the tn. are thought to indicate the site where the temple of Artemis Laphria stood.

Calymene, genus of fossil trilobites, common in the Silurian rocks of Europe and N. America. It is frequently found in Wenlock limestone in Great Britain.

Calymma, genus of coelenterate ctenophores of the order Tentaculata and family Calymmatidae. The species, some of which are found near the equator in the S. Seas, have strongly compressed and little elevated bodies, and are furnished with tentacles. The term C. is also applied to the outer, vacuolated protoplasm of Radiolarians.

Calypso, daughter of Atlas, inhabited the is. of Ogygia. According to Homer, when Odysseus was wrecked on her isle, she treated him hospitably and promised him immortality if he would marry her. She detained him for seven years and bore him two sons, but finally the longing for home prevailed, and he left her to die of grief at his departure.

Calyptra (Gk. *καλυπτειν*, to conceal), name given in botany to a hoodlike body connected with the organs of fructification. In the *Musci*, or mosses, it is formed from the upper half of the enlarged and ruptured archegonium, and is a membranous cap. In *Pileaanthus* it is formed of united bracts, in *Eucalyptus* and *Eudesmia* it is a lid or operculum to the stamens, produced in the one case by the consolidated sepals, in the other by the consolidated petals.

Calyptraea, cup-and-saucer limpet, is a genus of gastropod mollusc described by Lamarck. The species are numerous and widely diffused, and fossil species occur in the tertiary strata.

Calyptegia, genus of temperate and sub-

tropical Convolvulaceæ, consisting of lactescent, glabrous, twining, or prostrate herbs, with solitary one-flowered peduncles. *C. sepium*, the larger bindweed, which grows in Brit. hedges, has two large bracteoles which invest the calyx, and is fertilised by a hawk-moth called *Sphinx convolvuli*. *C. Soldanella*, the sea bindweed, is a native of European sea-coasts and some parts of Asia. The young stalks are sometimes pickled and the juice of the plant is a cathartic.

Calyx, term applied in botany to the external set of floral leaves, each of which is called a *sepal* and is usually green, but may be coloured, or *petaloid*, *e.g.* monkshood. The sepals serve as a protective structure to the more important parts of the flower, and when coloured they attract insects. When they are separate from one another, the C. is *polysepalous*, *e.g.* in buttercup; when united, it is *gamosepalous*, *e.g.* in primrose. When the C. is below the gynoecium, it is said to be *inferior*; when above, it is *superior*. If the sepals fall off before the flower opens, the C. is *caducous*, *e.g.* poppy; if they fall off after the flower has opened, it is *deciduous*; if they remain until the fruit is ripe, it is *persistent*, *e.g.* violet. The C. is frequently quite inconspicuous and rudimentary, and in other cases it is represented by a *pappus* of hairs, *e.g.* dandelion; in the apple and pear it helps to form the fruit. In describing it fully, attention must be paid to the number of whorls, number of free sepals, or lobes of sepals, and to their shape, of which the terminology is the same as that of leaves. The terms used for the general form of the C. are the same as those for the corolla, *e.g.* spurred, in 'nasturtium' (*Tropæolum*), *galeate* in monkshood, *saccate* in wallflower. In some flowers, for instance, strawberry and gum. extra segments are present between the true sepals and constitute an epicalyx.

Cam, riv. which rises in Ashwell, Hertfordshire, England, and flows 40 m. N.W. and N.E. through Cambridgeshire, and then into the Ouse, 3½ m. S. of Ely. It is joined at Grantchester by the Granta, which rises in Essex. It is navigable to the tn. of Cambridge.

Cam (Cão), Diogo, Portuguese navigator of the fifteenth century, who continued the explorations of the African coast, begun by Prince Henry of Portugal. In 1482 he discovered the Congo, and afterwards explored the W. African coast to 22° S. lat.

Camaguëy, see PUERTO PRINCIPE.

Camaien, see CAMEO.

Camaldolenses, Camaldolites, also called Camaldulians, strict religious order whose founder was Romuald, a Benedictine monk (c. 950-1027). The monks were divided into two classes, *Gemobites* and *Eremites*, and wore white garments. Their huts were built in the plain of Camaldoli, near Arezzo in the Apennines. As the order grew, so in time the collection of separate huts became grouped into a hamlet of cells with an abbot presiding; one common place of worship was instituted. Both Guido Grandi and Pope Gregory XIII. belonged to this order.

Camalodunum, or **Camulodunum**, see COLCHESTER.

Camargue, La, is in France, situated in the delta of the Rhône. It covers an area of 150 sq. m. One-third of its extent is marshland, but on the other two-thirds wine and cereals are grown, and there is pasture land for cattle and sheep. If it were not for dikes that have been built it would be inundated. The mistral, a cold north wind, blows over this is., thereby making it healthier than it might otherwise be. Numbers of seabirds are to be found here.

Camarilla, Sp. word originally denoting the small or audience chamber of the king, but it has now come to mean a court clique or group of favourites, who influence a pope or monarch in opposition to his official advisers and ministers.

Camarina, tn. situated on the S. coast of Sicily. It was founded as a colony from Syracuse in 599 B.C., and twice the people of Gela recolonised it, namely, in 492 or 495 B.C. and in 461 B.C. It was destroyed four times: by the Syracusans in 552 B.C. (because it had thrown off its allegiance to the mother city), by the Carthaginians in 405 B.C., by the Romans in 238 B.C., and finally by the Saracens in A.D. 853.

Cambacérés, Jean Jacques Régis de (1753-1824), Fr. legis. who lived in the time of the Fr. Revolution. He was appointed member of National Convention in 1792, but was strongly opposed to bringing the king to trial. After the fall of Robespierre, he was made president of the Convention and president of the Committee of Public Safety (1794). C. was suspect on more than one occasion on account of his moderate views, and lost office for a time; appointed second consul under Napoleon, and subsequently created high chancellor of the empire, and duke of Parma. He was partly instrumental in the compilation of the *Code Napoléon*. Upon the restoration of Louis XVIII., he went into exile, but was recalled in 1818.

Cambay, native Muslim state with an area of 390 sq. m. and a pop. of 71,715 on the gulf of C. in the N. of the port of Bombay, India. There are many ruins which testify to a time of great prosperity, but the tn. has declined owing to the state of navigation. The cap. C. reached its highest glory at the beginning of the seventeenth century, and according to the first canto of part ii of *Hudibras* (1664) the daily food of its princes was 'asp and basilisk and toad.' (According to *Purchas His Pilgrimes*, it was only Macamut, sultan of Cambaya, who lived on poison so that his saturated breath or touch carried death.) In 1583 Queen Elizabeth addressed letters to Akbar as king of C. It began to decline as Surat flourished, and is now an unimportant place, but with manufs. of agate, cornelian, and onyx ornaments. Pop. 97,000.

The gulf, shallow and abounding in shoals and sandbanks, penetrates the coast of India for about 80 m. The tides, which are high, run into it with great velocity, but at low water the bottom is left almost dry for some distance below the lat. of C.

Camber, in engineering, an upward curve or convexity applied for a specific purpose. In roads, it denotes the rise from the channel to the crown. Generally speaking, the rougher the surface, the steeper the C., the purpose being to allow wet to run off into the channel. The rise is anything from 1 in 30 to 1 in 50—the latter for asphalt surfaces. In aeronautics C. is the degree of curvature of a wing or controlling surface. C. is also given to the decks of ships.

Camberley, dist. of Surrey, England, on the S. Railway, 7 m. from Ascot. The Army Staff College was built here in 1858.

Cambert, Robert (c. 1629-77), Fr. musical composer, b. in Paris. He was musical director at the court of Anne of Austria, mother of Louis XIV. Associated with the Abbé Perrin, who had obtained a grant of monopoly for the performance of musical stage works in the Fr. language, C. composed the music for Perrin's *Pastorale*—claimed, though probably erroneously, to be the earliest Fr. comedy in music or opera—performed at the Châteaufort in 1659. Through the privilege of this monopoly was performed in 1671 C.'s own opera *Pomone*, also claimed to be the first Fr. opera—a fact which largely constitutes his historical importance (Scholes). (See, however, on this Loewenberg's *Annals of Opera*, 1943.) With Perrin as librettist C.'s *Ariadne*, rehearsed in Paris in 1669, was (probably) produced in London in 1674. Lully bought Perrin's monopoly and C. went to England, where, according to some, he was murdered by his valet. See also A. Pougin, *Les Vrais Créateurs de l'Opéra français*, 1881.

Camberwell, parl. and metropolitan bor. in co. of London. It returns four members to Parliament. Pop. 252,000.

Camberwell Beauty (*Vanessa antiopa*), large and beautiful butterfly, rare in Britain but common in central and S. Europe and N. America. The wings are a deep purplish-brown, with outer band of black and greyish-white or yellow border. The black band contains a row of large blue spots. In addition the two small wings have two small white spots. Formerly found occasionally at Camberwell, when that was a rural place.

Cambiassi, Luca (1527-85), Genoese painter, b. at Moneglia in the Genoese state. At fifteen he helped his father to paint subjects from Ovid's *Metamorphoses* on the front of a house in Genoa. He became a great friend of the artist Giambattista Castello, whose work closely resembled his own in character. In 1583 Philip II. commissioned him to finish a series of frescoes begun by Castello in the Escorial. C. was very dexterous with his brush, and sometimes painted with one in each hand. His best works are at Genoa.

Cambium, single layer of cells found between the primary wood and the bast of the vascular bundles in most dicotyledonous plants which are then said to be open. Each cell has thin walls made of cellulose, and is rich in protoplasmic contents: in transverse section it appears

four-sided and flattened, and in longitudinal section it is elongated. By successive div. of the single layer, the C. gives rise to other layers which form secondary wood, secondary bast, and also secondary modullary rays, so that a C.-ring is formed internal to the bark. Cork-C., or phellogen, is a layer of meristematic cells which arises in the epidermal region and forms cork.

Cambodia, one of the provs. in Fr. Indo-China. The name C. is European, and is derived from the Hindu Kambuja. Kambu was the name of the mythical founder of the Khmers. anct. inhab. of C.

the lower Mekong, which, entering this ter. on the N., flows S. for some distance, then inclines S.W., as far as Pnom-Penh, where it spreads into a delta, and resumes a southerly course. Fishing forms the staple trade of C., for Tonlé-Sap supports a fishing pop. of over 30,000. The fish are caught by means of large nets at the end of the floods, and are either dried or fermented for nuoc-mam sauce. Next to fishing come the agric. products, and here rice is largely grown in the low-lying dists. Agric. products grown include the tobacco plant, coffee, cotton, pepper, indigo, maize, tea, silk, and rubber. The

MEKONG RIVER CRAFT AT PNOM-PENH

E.N.A.

Geography.—This large tract of country in S.E. Asia (area, 67,550 sq. m.) is bounded on the E. by Annam, on the S.E. by Cochín-China, and on the S.W. by the gulf of Siam. There are two marked features in C. which add to its geographical importance. These features are the R. Mekong and the large lake Tonlé-Sap. The lake serves as a reservoir for receiving the overflow waters of the Mekong, which becomes greatly swollen by the rains and melted snow from the Tibetan range in the month of June. At this period the lake, which is fed by an arm of the R. Mekong called the Bras du Lac, attains to a depth of from 45 to 48 ft., overflows its banks, and inundates the country round for over an area of 770 sq. m. Conversely, during the dry season, when there is a shrinkage of the waters of the Mekong, the Tonlé-Sap Lake also becomes greatly reduced in area, and its depth falls to an average of 5ft. The whole of C. lies in the basin of

chief native activity is the salting and smoking of fish from the lakes. Cattle-breeding is also a flourishing native occupation. Other native industries are weaving of silk and cotton, pottery, and the making of rush mats. The exports are rice, salted fish, pepper, maize, cotton, tobacco, fish-oil, palm-sugar, kapok, resin, hides, and cattle. The chief tns. are Pnom-Penh, the cap. (pop. 104,000) situated at the crossing of Tonlé-Sap and Mekong Rs.; Battambang, 180 m. further N.W.; Kampot (92 m. from the cap.); and Kompong-Cham. There are two small sea harbours, Kep and Ream, both on the gulf of Siam and connected to Bangkok by steamers. There are nearly 900 m. of waterways and 2000 m. of asphalt and macadamised roads, the chief roads being from Saigon to the Siamese frontier, via Pnom-Penh and Battambang, from Pnom-Penh to the gulf of Siam, from Saigon to Kratie and from Pnom-

Penh to Angkor. A railway from the cap. to Mongkol Borey will link up with the Siamese railway system.

Climate.—Much the same as that of Cochín-China, and varies with the monsoons. During the N.E. monsoon, which lasts from mid Oct. to mid April, the weather is dry and warm, with a temp. ranging from 77° to 80° F. From mid April onwards until Oct. there is constant rain, and the temp. is considerably higher, sometimes reaching 95° F. Wild animals of all sorts abound, such as the elephant, rhinoceros, buffalo, tiger, panther, and leopard. Monkeys and rats are the plague of the dist., as they destroy the crops and agric. products.

The People.—C. consists of three or four races. The majority are the Cambodians themselves, whilst the rest are Annamese, Chinese, and Malays. Uncivilised tribes are met with in the thinly populated dists. on the outskirts of the forests, and among the mts. The Cambodian men are tall contrasted with the Annamese, whilst the women are short and thick-set. They have dark brown skins, flat faces, short noses, and black hair. Class distinction is represented by caste founded on blood-relationship. The different castes and the mandarins are exempt from all taxation and all military service. Although Buddhism is the prevailing religion, there are many converts to Catholicism amongst the Annamese, and Brahmanism is still retained at the court. The Cambodians are a superstitious race, and the worship of spirits or local genii largely prevails.

History.—There are ruins of cities, palaces, and bridges near Lake Tonlé-Sap, which point to the prosperity of the Khmers or Cambodians in the Middle Ages. The royal city Angkor Thom still displays its mighty ruins (see ANGKOR). War against Thais or the inhab. of Siam, together with internal revolts and feuds, have brought about the decadence of C. The invasion of the country under Europeans completed its final overthrow, and in 1863, after renewed hostilities with Siam and Annam, C. became a protectorate under Fr. supervision in 1867. C. is divided into fourteen provs. controlled by Fr. residents.

By a treaty of 1941 France ceded all C. W. of the Mekong and N. of Angkor Thom to Siam, but reserved the latter archaeological centre to Indo-China. The ceded Cambodian ter. was demilitarised. Japan was given the right to station a garrison at Phnom-Penh as well as at a number of other places. But Japan's chief gain was Cam Ranh Bay, where Jap. forces were promptly concentrated to the exclusion of all others. In a few weeks the Jap. occupation was complete and their forces were stationed on the Siamese border facing Siamese troops who had estab. themselves in the supposedly demilitarised areas acquired the previous winter from Indo-China. There was some support for Gen. de Gaulle (*q.v.*) in C. as in Indo-China generally. After the Jap. collapse in 1945 C. reverted to France. Until the constitution of the Federation of

Indo-China has been settled, relations between France and C. are governed by the convention signed in Jan. 1946 between the Fr. commissioner and the Cambodian Prime Minister. The king, Norodom Sihanouk, who succeeded in April 1941, promulgated a constitution in May of that year. Under this instrument he governs through a council of ministers who are assisted by Fr. advisers. Legislative power is exercised by an elected assembly. There are only 2000 Europeans in C. and 3,048,000 other races, divided as follows: Cambodians, 2,594,000; Annamites, 191,000; Chinese, 106,000; Malaysians, 74,000; Laotians, 20,000; other races, 54,000. See C. Roubéquin, *The Economic Development of French Indo-China* (trans. by T. A. Ward), 1944.

Cambodia River, see MEKONG.

Camboge, see GAMBOGE.

Cambon, Jules (1845-1935), Fr. diplomat, b. in Paris. Governor-general of Algeria, 1891; ambas. in Washington, 1897; in Madrid, 1901. He was ambas. in Berlin when the First World War broke out. In the Fr. Yellow Book he gives a searching analysis of Germany's relations with France during the two or three years preceding the war. He shows how, despite the aversion from war of the S. states, there was in political matters in Germany an all-powerful undercurrent, which in its steady flow swept pacific influences away into the abyss of war, and that in Germany's eyes a regenerate France was incompatible with a free Germany. His account of his interview with Herr von Jagow, Germany's foreign minister, on July 24 certainly engenders the suspicion that Germany and Austria were playing for a bold stroke in the belief that Russia would remain passive. He was secretary-general to the Foreign Ministry, 1915.

Cambon, Pierre Paul (1843-1924), Fr. diplomatist, b. in Paris. Educated at Lycée Louis-le-Grand and at Ecole de Droit; called to Bar. Secretary to Jules Ferry. Resident in Tunis, 1882. Ambas. in Madrid, 1886; Constantinople, 1891; London, 1898. He took an active part in establishing the Anglo-Fr. Entente. Retired 1920.

Camborne, mkt. tn. in Cornwall, England. 12 m. W.S.W. of Truro and 3 m. S.W. of Redruth, the centre of a mining dist. Here is the School of Metalliferous Mining. Pop. of ward, 14,000; of urban dist., 36,000.

Cambrai, tn. in France, in the dept. du Nord, situated some 32 m. from Lille. Chief manufs.: cambric, lace, linen, thread, soap, and leather. It is a picturesque tn. with broad, irregular streets, possessing a fine cathedral, theatre, and archiepiscopal palace, and a place of historical interest, for it was a long time under the rule of bishops, from whom the people succeeded in obtaining a charter in 1227. Its anc. name was Camaracum. The famous League of C. was formed here (1508). The city fell into the hands of the revolutionists in 1793, when the cathedral was destroyed. The bones of Fénelon were ignominiously

disturbed, but tribute was paid to his memory in 1825, when a monument was erected to him in a new cathedral. Pop. 28,000.

Cambrai, Battle of (N. France).—Two battles took place round C. in the First World War: (1) In 1917 the Gers. were heavily pressing the Ita., and with a view to relieving this pressure, by preventing further Ger. divs. being taken from the W. front, a Brit. offensive against C. was planned, to be undertaken by the Third Army under Gen. Byng. Gen. von Marwitz was opposed to him. In place of the usual bombardment, which had hitherto announced the attacker's intentions, an enormous number of tanks was employed to destroy minor obstructions such as barbed-wire entanglements and machine-gun posts. The surprise nature of the attack proved to be the main feature contributing to success. The attack was launched on Nov. 20, 1917, with successful initial results, but the Gers. heavily and persistently counter-attacked at Hourlon Wood (q.v.), which was ultimately abandoned before C. was taken. (2) The great Brit. final offensive against the Gers. began in Aug. 1918, and to the Brit. First Army (to which a Canadian corps was added) under Gen. Horne was allotted the capture of C. The Canadians opened the attack on Aug. 26, and gained their first objectives, but as progress was made resistance became increasingly formidable as the Gers. strengthened their rear lines. Resistance was first met in the Scarpe valley. Protecting C. to the N.W. was the Ger. Drocourt-Quéant line. This was attacked on Sept. 2, and after only four hours' fighting the whole of the line, with its supporting lines, was in Brit. hands. The Gers. hastily withdrew their remaining troops in this area and prepared to make another stand behind the Canal du Nord, which held up the Brit. advance. So far ten Brit. divs. had defeated thirteen Ger. divs. with considerable loss to the enemy. On Sept. 27 the Canal du Nord was crossed on a narrow strip where it happened to be dry, and hostile positions to the N. of C. were captured. The advance was continued the next day, and Fontaine Notre-Dame, to the S.W. of C., was captured. C. was now gradually becoming enveloped, but violent Ger. counter-attacks compelled ground to be given up in one or two places. Both sides were becoming exhausted with the struggle, but neither weakened, and on Sept. 30 another Brit. and Canadian advance carried the line beyond C. on the N. as far E. as the canal at Ramillies. By Oct. 1 all the suburbs of C. had fallen. Steady progress to the S. of C. was being made by the Third Army, which had also commenced its advance on Sept. 27. One of its important objectives was the spur which dominated the country about Marcoing; Ribecourt just S. of this position, was taken early in the advance, and by the evening Brit. troops were in the neighbourhood of Marcoing. At this time the First and Third Armies were in contact at Fontaine Notre-Dame. The next day

the advance was continued against great opposition, but by nightfall the Gers. had been driven over the Scheidt Canal, and the Allies' troops were firmly estab. at Noyelles and Marcoing. On Sept. 29 some of the Third Army crossed the canal about Masnières, while further N. others crossed at Noyelles and Marcoing, thus pressing on C. from the S. Resistance now became stronger than ever, and the Gers. were fighting with great stubbornness. Nevertheless, the Brit. troops were gradually closing round the city. Further S. the Australian troops were attacking about Masnières, and on Oct. 3 had captured ground to the E. of it and on the 5th took Montbréhain. C. fell on the same day. This battle proved to be one of the sternest fought during the war. Throughout this great battle the Canadians under Gen. Currie fought with conspicuous bravery, and the success of the operations was due mainly to their extraordinary exertions.

Cambresis, anct. div. of the prov. of Flanders, which now forms the chief part of the dept. of Cambrai (France).

Cambria, Lat. name of Wales, derived from Celtic Cymry or Kymry, and originally applied to both Wales and the Cymric kingdom of Strathclyde. The name also appears in the Cambrian Mts., Cumbria, and Cumberland.

Cambrian Rocks, name given by Prof. Sedgwick to a stratified system of rocks occurring between the Silurian and Archaean systems which is found in a high state of development in Wales (Cambria). A famous controversy took place between Sedgwick and Murchison, a geologist who had been working contemporaneously with Sedgwick in another part of Wales, and who maintained that C. R. belonged in reality to the Silurian system. C. R. are the oldest rocks to contain well characterised fauna. The fossils found in rocks of this system include crustaceans, brachiopods, pteropods, worms, sponges, and coral, traces of marine life, worm holes and worm-castings being abundant. It is evident that the rocks were formed by sedimentary deposition from water, although they probably never formed the bed of a deep ocean, since there is much evidence, such as the occurrence of ripple marks, to show that the water was not of great depth. A noteworthy fact is that in the case of the crustaceans some of the trilobites are apparently deficient in the organs of vision. C. R. are recognised chiefly in Wales, Scotland, Ireland, Europe, N. Asia, and N. America the strata varying in depth from 3000 to over 30,000 ft. The strata consist mostly of schists, slates, and limestones, and are usually unconformable on the older rocks of the pre-Cambrian period.

Cambrie, name given to fine white linen fabrics, originally manufactured at Cambrai in the Fr. dept. of Nord. Some of the best Cs. are now manufactured in Switzerland, while Scottish C. is an imitation of real C., in which the linen is replaced by finely twisted cotton.

Cambridge, municipal and parl. bor.,

co. tn. of Cambridgeshire, 56 m. N.E. of London, and 76 m. N.E. of Oxford. The tn. lies in a level plain, on the S. edge of the Fen country, and to its position here it probably owes its development, for the position of the hills around makes it the natural starting-point in crossing the Fens from the midlands. That its importance was early recognised is shown by its antiquity. There are probably ant. Brit. remains in Castle Hill, two Rom. roads cross here, the tower of St. Benet's Church is one of the finest pieces of Saxon work in the country, and its importance in Norman times is well known, whilst the Church of the Holy Sepulchre is the oldest of the four round churches in England. The univ. (see CAMBRIDGE, UNIVERSITY OR) is one of the oldest in Europe. The Leys School (q.v.), founded in 1874, is a public school for boys. There are four large grammar schools: Perse School (q.v.), founded in 1615; Perse School for Girls (1881); and the C. and co. high schools for girls and boys. The tn. is built chiefly on the rvs. Granta and Cam (one riv.). It has manufs. of scientific instruments, and light and electrical engineering, and it is the centre of a prosperous agric. dist. The name is generally derived from *Grantebrigg* or *Grantabridge*, though the intermediate stages are not extant. The pop., which was increased to 59,000 in 1922 by the operation of the Cambridge Corporation Act of that year, is 90,500. See C. W. Stubbs, *The Story of Cambridge*, 1912, 1932; B. W. Downus, *Cambridge, Past and Present*, 1926.

Cambridge: 1. City and one of the co. seats of Middlesex co., Massachusetts, U.S.A., on the Charles R. It almost forms a suburb of Boston. It is divided into various sections: Old C., the seat of Harvard Univ., N. C., port, and E. C. The two last are the manufacturing dists. Besides printing and publishing, carpentering, furniture-making, meat-packing are flourishing industries. Pop. 110,800. 2. Co. seat of Dorchester co., Maryland, U.S.A., on the Choptank R., 60 m. S.E. of Baltimore; centre of a farming region, and exports fish. Manufs. canned vegetables, flour, underwear. Pop. 28,000. 3. Co. seat of Guernsey co., Ohio, U.S.A., on Wills Creek, 75 m. N.E. of Columbus. Coal, oil, clay, and iron are found in the vicinity. Pop. 15,000.

Cambridge, Adolphus Charles, first Marquess of (1868-1927), eldest son of the prince of Teck, whom he succeeded in 1900, and Princess Mary of C., and elder brother of Queen Mary (widow of George V.). Saw service in the S. African war, 1899-1902, lieutenant-colonel of Life Guards, 1914. Renounced continental titles in 1917, assuming the name of C.

Cambridge, Adolphus Frederick, first Duke of (1774-1850), seventh son of George III., b. at Buckingham (then Queen's) Palace. He served in the campaign of 1794-95, and was created duke of C. in 1801, appointed field marshal in 1813, and was viceroy of Hanover from 1816 to 1837.

Cambridge, George William Frederick Charles, second Duke of (1819-1904), first

cousin of Queen Victoria, b. in Hanover, the only son of George III.'s seventh son, Adolphus Frederick. He was present at most of the engagements in the Crimean war. Made field marshal in 1862, and held position of commander-in-chief from 1856 to 1895. His administration was marked by a conservative spirit towards innovation, together with a warm interest in the welfare of the private soldier. He married an actress, Miss Farebrother, their children bearing the name of Fitz-George.

Cambridge, Richard Owen (1717-1802), Eng. poet. First studied law. At his family seat of Whitminster, Gloucestershire, he wrote his poem *Scribleriad*, pub. in 1751. Other poems: *Dialogue between a Member of Parliament and his Servant* (1754); *The Faker* (1756). All were successful but are now forgotten.

Cambridge Platonists, mid-seventeenth-century Cambridge philosophers, opposed to Puritan extremism and the materialism of Hobbes and Descartes. They taught the harmony of religion and reason, the unity of truth and moral goodness, and the rational basis of morality.

Cambridgeshire, E. inland co. of England, bounded N. by Lincolnshire, E. by Norfolk and Suffolk, S. by Essex and Hertfordshire, W. by Bedfordshire, Huntingdonshire, and Northamptonshire. The surface is generally very flat, and large parts, particularly in the N., consist of fens (q.v.). Undulations occur in the S., where the Gog-Magog Hills, S.E. of Cambridge, are the most important elevations. The S. is also better wooded than the rest of the co. In the N. occurs the Bedford Level (q.v.). The prin. riv. is the Ouse, which crosses the co. from W. to E., with its tribs. the Cam, Lark, and Little Ouse. The Nene, in the N., is also important. These rvs. flow chiefly in artificial channels of recent construction, and are extremely sluggish. The co. is intersected by numerous drainage works. C. is a rich agric. dist., and the climate is on the whole healthy. The fen-land, when drained and burnt, provides good soil for various crops, and the hills are mainly chalk. The co. is one of the chief grain-producing dists. of England. Dairy farming and sheep-rearing are also extensively carried on. There are some manufs., including light and electrical engineering, fruit-canning, jam-making, sugar-beet refining, brewing, and brick-making.

In Celtic times C. was in the ter. of the Iceni, and possesses some pre-Rom. remains, while relics of the Rom. occupation, in roads, urns, coins, etc., are common. At the Norman Conquest the dist. stubbornly resisted the Norman invader, and at Ely Hereward the Wake held out against him for some years. Ely possesses a very fine cathedral, notable for its lantern tower and Perpendicular detail. The co. was prominent in the internecine struggles under Stephen, John, Henry III., and Charles I. The prin. tns. are Cambridge (the co. tn.) Chatteris, Ely, March, Soham, Whitby, and Wisbech. For administrative purposes C. is divided into two cos., C. and the Isle of Ely. C., Cambridge bor., and the Isle of Ely

constituencies each return one member to Parliament. Area (including Isle of Ely) 553,241 ac. Pop., exclusive of administrative co. of Isle of Ely, 163,000 (including Isle of Ely, 254,000). See C. Fox, *The Archaeology of the Cambridge Region*, 1923; A. Mee, *Cambridgeshire*, 1939.

Cambridge, University of, is one of the oldest univs. in Europe. The earliest evidence that there were bodies of students in Cambridge dates from the beginning of the thirteenth century. In 1231 Henry III. issued a number of writs for the organisation and discipline of the students, and in 1284 Peterhouse, the first of the colleges, came into being as a

tury the prin. subjects of further study were theology, canon law, civil law, and medicine, and candidature for a doctor's degree required a further period of residence of at least eight years. The sixteenth century saw the introduction of Gk., when Erasmus held the Lady Margaret's professorship of divinity in 1511, and the stimulus received from the Reformation was responsible for a great development in the univ. which at this time came to be considered a rival to the univ. of Oxford.

During the Civil war the sympathies of the colleges were royalist, and many of the heads of colleges were deprived of their

WREN BRIDGE AND CLARE COLLEGE, CAMBRIDGE

The Times

house of residence for members of the univ. Formal recognition of the univ. came in 1318 when Pope John XXII., at the request of Edward II., confirmed its privileges with the issue of a bull decreeing that it should be a *studium generale* and should enjoy the privileges of a *Universitas*. From then onwards a Cambridge doctor could lecture in any part of the Christian world, and the univ. itself was independent of the jurisdiction of the bishop of its diocese. New statutes were given to the univ. in the year 1570, and in 1573 it received its grant of arms. The prin. effect of the new statutes, which remained in force for nearly three hundred years, was to increase the power of the vice-chancellor and the heads of the colleges.

In the medieval univ. the student followed a three-year course of Lat. grammar, logic, and rhetoric, known as the *trivium*, and became an 'incepting' bachelor. He then proceeded to the *quadrivium*—a course of geometry, arithmetic, and astronomy, lasting for four years, and was then entitled to proceed to the degree of Master of Arts. Until the fifteenth cen-

tuaries, which were, however, restored after the Restoration. The latter half of the seventeenth century was noteworthy for two developments within the univ.—the rise of the Cambridge Platonists (*q.v.*) and the increasing prominence of mathematical studies. The first professorship of mathematics was estab. in 1663, and its second holder (1669) was Isaac Newton.

The univ. curriculum was further broadened throughout the eighteenth century, and examinations assumed a greater importance, in contrast with the disputations, known as 'acts' and 'opponencies,' of earlier times. Written examinations were first introduced in 1772.

The nineteenth century was a period of reform and expansion. Honours examinations or triposes (*see below*) were introduced in classics in 1824, and within fifty years in moral sciences, natural sciences, law, and hist. In 1871 religious tests were abolished. In 1850 and 1872 royal commissions recommended many changes, which resulted in the statutes of 1856 and the Oxford and Cambridge Act of 1882. The prin. results of the legislation of this period were (1) to redress the

balance between the univ. and the colleges, and to give to the general body of Masters of Arts much of the influence hitherto exercised by the college heads; (2) to abolish the tenure of college fellowships for life without conditions of work or residence, and to associate them with the holding of a univ. or college office, and (3) to raise the general intellectual level by competition among entrants to the univ., and among its senior members.

The development of univ. studies during the last years of the nineteenth century and the beginning of the twentieth outstripped the capacity of the univ. and the colleges, and in 1914 the univ. made formal application for a subsidy from public funds. This led to the first gov. grant of £5873 for medical education. In 1919 the vice-chancellor informed the president of the board of education that the univ. would welcome an inquiry into its resources, and stressed its urgent financial needs. The result was a special grant from the Treasury of £30,000, the forerunner of increasing ann. grants subsequently provided on the recommendation of the Univ. Grants Committee. In 1919 a royal commission on the univs. of Oxford and Cambridge was set up. It reported in 1922, and was followed by a statutory commission whose statutes were approved by the king in council in 1926. The main effects of these statutes were (1) the transference of the control of univ. legislation from the Senate (Masters of Arts and holders of higher degrees) to the Regent House (approximately, the resident members of the Senate); (2) the institution of the faculty system of instructions with a consequential transference of formal teaching from college to univ. teaching officers; (3) the fixing of age limits for the tenure of univ. and college offices; and (4) the setting up of an obligatory pension scheme. By these statutes the univ. is still governed.

While certain functions are reserved to the Senate, such as the election of the chancellor and other officers of the univ., and the approval of proposals for the conferment of degrees, the gov. of the univ. now rests in effect with the Regent House. Legislative proposals are called *graces* (Lat. *gratia*), which are submitted at periodic meetings of the Senate and of the Regent House, called congregations, presided over by the vice-chancellor.

The colleges of the univ. are corporate bodies having their own statutes and managing their own affairs. Further information is given in articles under their respective names. In order of foundation they are Peterhouse, Clare, Pembroke, Gonville and Caius, Trinity Hall, Corpus Christi, King's, Queens', St. Catharine's, Jesus, Christ's, St. John's, Magdalene, Trinity, Emmanuel, Sidney Sussex, Downing, Girton (for women), Newnham (for women), Selwyn, and Fitzwilliam House (for non-collegiate students). Women first became full members of the univ. in 1947. Before coming into residence a candidate for admission to the univ. must be accepted by a college, must pass or gain exemption from the Previous Exam-

ination (including papers in Lat.), and may also have to pass a college entrance examination. At the end of three years an undergraduate may proceed to the degree of Bachelor of Arts. Honours degrees are conferred on the results of examinations called triposes, which are held annually in May and June in mathematics, classics, moral sciences, natural sciences, theology, law, hist., oriental languages, modern and medieval languages, mechanical sciences, economics, archaeology and anthropology, Eng. geography, music, and chemical engineering. Special Examinations are held for degrees in medicine and surgery. An Ordinary B.A. Degree, as distinct from an honours degree, may be conferred on a student who has passed examinations in Christian theology, architectural studies, engineering studies, agriculture, or estate management.

Facilities for the education of adults who are not members of the univ. are provided in the form of lectures and classes at centres outside Cambridge, and of vacation courses in Cambridge, by the Univ. Board of Extra-mural Studies.

The number of students in residence during the academic year 1949-50 was 7986 (men 7277, women 709), of whom 707 were undertaking research for a degree or for a higher diploma.

See *Statutes and Ordinances of the University of Cambridge*, 1919 (reprinted every three years, supplement pub. annually); *The Student's Handbook to Cambridge* (pub. annually); *The Cambridge University Calendar* (pub. annually); R. Willis and J. W. Clark, *Architectural History of the University of Cambridge*, 1886; T. Atkinson, *Cambridge Described and Illustrated*, 1897; S. C. Roberts, *Introduction to Cambridge*, 1948; *Report of the Oxford and Cambridge University Commission*, 1922.

Cambridgeshire Regiment. Raised in 1860 as a volunteer battalion. A contingent served in the S. African war 1899-1902. In 1907 it became a unit of the Territorial Force (now Army). During the First World War it went to France in Feb. 1915 and within a month distinguished itself at St. Eloi. Four battalions were raised for the campaign and took part in the battles of Ypres, the Somme, Kemmel Hill, and the allied victorious final advance. During the Second World War the C. R. produced two battalions; both went out to Singapore and both were lost, being captured by the Jap. The regiment was not reconstituted until Jan. 1947. For some years they had been linked, for administrative purposes, with the Suffolk Regiment, but in recent times they have become a unit of the Royal Artillery.

Cambuskenneth, ruined abbey in Stirlingshire, Scotland, on R. Forth, 1 m. E. of Stirling, founded by David I. in 1147. The first Scots Parliament, attended by representatives of burghs, assembled here in 1326. James III. and his queen, Margaret of Denmark, were buried in the abbey, and their remains were discovered during excavations in 1864, and reinterred with an altar memorial erected over them by command of Queen Victoria in 1865.

Cambuslang, tn. in N.W. Lanarkshire, Scotland, situated on the l. b. of the R. Clyde, about 5 m. S.E. of Glasgow. It has large steel works and coal mines. Pop. 25,000.

Cambyzes, or **Kambujiya** (529-521 B.C.), second king of the Medes and Persians, was the son of Cyrus the Great. After assassinating his brother Smerdis, he wished to form an alliance with Egypt, but, receiving an affront from the Pharaoh, he invaded that country, and conquered it in six months.

Camden: 1. City and port of New Jersey in U.S.A., and the cap. of C. co. It stands on the l. b. of the Delaware, opposite Philadelphia, and has foundries, cotton and woollen mills, chemical and glass works, etc. Pop. 117,000. 2. Co. seat of Kershaw co., S. Carolina, U.S.A., 33 m. N.E. of Columbus. Occupied by the Brit. in 1780 when an Amer. force was defeated here by Lord Cornwallis. Cotton, grain, and rice are produced in the vicinity. Pop. 5,750.

Camden, Charles Pratt, first Earl (1714-94), Eng. lawyer and politician, was b. at Kensington, and educated at Eton and King's College, Cambridge. He was called to the Bar in 1738, but had practically no briefs till 1752, when he made his name as junior to R. Henley, who fell ill and left the case to him. He was made king's counsel and attorney-general to the Prince of Wales in 1755, in 1757 attorney-general, and in 1759 recorder of Bath. In 1761 he was knighted and made chief justice of the court of common pleas, and in 1765 was raised to the peerage as Baron C. of Camden Place, Kent. In the following year he succeeded Worthington on the woolstack, receiving an addition of £1500 to his salary as recompense for the loss of his justiceship. He held the office till 1770, although he disapproved of the policy of the gov. He lived in retirement till 1782, when he became president of the council till 1783, and again in the following year till his death. Created Earl C. 1786.

Camden, William (1551-1623), Eng. scholar, historian, and antiquary, was b. in London, his father being a painter. His early education was at St. Paul's School and Christ's College. In 1566 he went to Oxford, which he left in 1571 without having taken a degree. In 1575 he was made second master of Westminster School, of which he became principal in 1593. The first ed. of *Britannia*, the work which has made his name famous, was pub. in 1586, the result of some fifteen years' research (in 1605 he pub. his *Remains Concerning Britain*, a book of collections from his *Britannia*). He was perpetually improving this, and in 1607 the sixth ed. was reached. It is written in elegant Lat., and was first trans. into Eng. in 1610. The best trans. was pub. in 1789 (2nd ed., 1806) by Gough and Nichols. In 1597 C. resigned his headmastership on being appointed Clarenceux king-of-arms. Other important works of his are a list of the epitaphs in Westminster Abbey, entitled *Reges, Principes, Nobiles et alii in ecclesia collegiata*

Beati Petri Westmonasterii sepulti (1600); *Anglica, Hibernica, Normannica, Cambria, a veteris scripta*, an ed. of the works of Asser, Giraldus Cambrensis etc. (1603); *Actio in Henricum Garnetum, Societatis Jesuiticæ in Anglia superiorem et ceteros*, a report of the trial of the conspirators of the Gunpowder Plot (1607); *Annales rerum Anglicarum et Hibernicarum regnante Elizabetha* (1615). He enjoyed the Camden professorship of anc. hist. at Oxford, and in 1883 the Camden Society was founded in his honour.

Camden Town, dist. of London in the metropolitan bor. of St. Pancras.

Camel (Arabic *djemal*), name given to the one-humped Arabian *Camelus dromedarius* (see *DROMEDARY*), and to the two-humped Asian *C. bactrianus*. The Arabian C. is used in N. Africa and India, as well as in Arabia; it was also introduced into Australia in 1860, and into N. America, but is no longer used in either country. It is not so well able to withstand the cold as the Bactrian C., which has a much thicker coat, and shorter legs, but it is swifter. The C. has a long thigh, which is vertical in position, and this accounts for its peculiar swaying walk. The humps vary in size, according to the condition of the animal; they are reserves of fat and become small and flaccid after many days of hardship and indifferently food. It exists chiefly on the leaves of trees and dry vegetables. The female carries her young for eleven months, and a week after birth the baby C. has attained a height of 3 ft., but it is not full-grown until its sixteenth or seventeenth year. It lives from forty to fifty years. The power of carrying water in its stomach and living on limited quantities of food earned for it the title 'ship of the desert.' While on a journey through the desert a C. will go three days, doing twenty-five m. every day, without water, but on the fourth day it must receive a supply; the swifter breeds, for there are many varieties of the Arabian C., will go much longer, and travel over sixty m. a day without refreshment. If too heavily laden it will sometimes refuse to rise; but while on its journey it bears its burden patiently, and will often only succumb under it to die. If a sandstorm should arise, it falls on its knees, stretches its neck along the sand, and, closing its nostrils, remains in that position until the storm has passed. In character the C. is a wild and savage animal, and it is to the fact of its extreme stupidity and passiveness, and not to any instinct of attachment to its master, that man has been enabled to make it of any service. At times the males become very fierce and dangerous, and make savage assaults on their fellows. It is not until its fourth year that its training as a beast of burden commences; it is then taught to rise and kneel at a given signal, and is accustomed by degrees to carry increasing loads, which may weigh anything from 50 to 1000 pounds, according to the breed of the C. which is used. We have evidence that the Arabian C. were some of the earliest animals used for domestic purposes, for

according to Scripture 6000 of these beasts formed part of the great possessions of Job. They were also included as part of the gift that Abraham received from Pharaoh. The flesh of the C. is a very favourite food among the Arabs; their milk also forms a good and nutritious beverage. The Arabs weave the hair of the C. into various materials for clothing; it is also imported into Europe, and used in the manuf. of artists' brushes. The mounting of infantry on Cs. has proved of great advantage, as it enables the men to reconnoitre in hot, arid countries, where water is not easily found, and where horses are not of much service. European troops have often made use of Cs. in this

BACTRIAN CAMEL

way, when operating in India, Egypt, and the Sudan. In many of the central Asian deserts the Bactrian species is to be found in its wild condition. The C. is classified as an artiodactylate (even-toed) ungulate; like deer and oxen, it has the ruminant type of stomach, and here it stores up water in special cells of the stomach lining. Closely related to the C. are the llama, the alpaca, and other S. Amer. species.

Camel, apparatus used for raising a ship, so as to render it navigable in shallow water, consisting of large hollow vessels attached to the ship's side. Invented by a Russian engineer, De Witte, and much used between Kronstadt and Leningrad.

Camelford is a vil. of Cornwall, England, situated on the Camel, 28 m. to the N.W. of Plymouth. The ruins of the castle associated with the name of King Arthur are situated at Tintagel, 4 m. to the N.W. The pursuits of the inhab. are mainly agric. Pop. 1500.

Camelina, genus of cruciferous plants which belong to Europe and the Mediterranean. *C. dentata* is sometimes found in Britain, where *C. sativa*, gold of pleasure, or Siberian oil-seed, also occurs.

The latter is of humble appearance, has small yellow flowers, and yields a good fibre.

Camellia, Asiatic genus of evergreen trees and shrubs belonging to the family Theaceae, with thick, dark, shiny leaves, and white or rose-pink flowers. Linnaeus so named it after Camellus, or Kamel, a Moravian Jesuit, who wrote an account of the flora of Luzon. There are sev. species, the best known being *C. japonica* and *C. reticulata*. The former originally came from Japan, being introduced into England in 1739. Its flowers are red, and it grows to a height of 30 ft. The latter was brought from China, and is a much smaller plant, with large pink flowers, known as semi-double. *C. oleifera* has sweet-scented white flowers; *C. Sasanqua*, an inhab. of China and Japan, and *C. drupifera*, from Cochinchina and the mts. of India, are both oil-yielding species. The oil of *C. Sasanqua* is in use for many domestic purposes, and has a pleasant odour; it is made by the crushing of the seeds into a coarse powder. The leaves of the plant are also made into a decoction and utilised by the Jap. women for their hair. The oil of *C. drupifera* is used for medicinal purposes. The C. is generally grown in Great Britain under glass, but in the S. parts it does well in the open. They grow to advantage in rich sandy peat and loam, requiring shelter from the cold easterly winds. They are propagated by layers or cuttings, also by seeds. Sev. varieties of *C. sinensis* are cultivated in India, Java, China, and Japan; the leaves are dried and used for brewing a kind of tea.

Camelopard, see GIRAFFE.

Camelopardalis (the Giraffe), constellation near the N. Pole, between Ursa Major and Cassiopeia. It was originally discovered by Jacobus Bartschius, assistant to Kepler, 1624, and added to the astronomical maps by Hevelius (*q.v.*). It contains numerous but no conspicuous stars.

Camelot, name given in medieval romance to the seat of King Arthur. It has been identified with Caerleon-upon-Usk, and also with Winchester, Queen Camel in Somerset, and Camelford in Cornwall. It is mentioned by Tennyson in *The Lady of Shalott* and *The Idylls of the King*, and by Shakespeare in *King Lear*.

Cameo, or **Camaieu** (fr. *caméo*, from Med. Lat. *cammaeus*). Origin unknown. The word was in use in the thirteenth century. C. is an engraved gem in which the figures, or subject, is carved in relief, in direct contrast to the intaglio, a gem in which the engraved subject is hollowed out, as in the manner of a seal. It was not until after the time of Praxiteles, the Gk. sculptor, that C. cutting became an art. The stones used for the purpose were brought from the E., and most of them were of magnificent size and colour. Classical and artistic results were in requisition, for the ornamentation of caskets, vases, cups, etc., as well as for personal ornaments. Many of these have been preserved in excellent condition, and

are to be found in various private and public collections. One of the most famous Cs. is the Gonzaga, or Odescalchi, originally in the possession of the Empress Josephine, and later preserved in the imperial cabinet in Leningrad. On it are represented the portraits of Nero and Agrippina. Another smaller but not less valuable C. is that of Jupiter fighting the Titans, by Athenion, A.D. 50, now in the Vatican. The art of C. cutting was revived during the fifteenth century in Italy, and was carried on with great success until comparatively recent times, Piistrucel ending the long line of renowned engravers. The modern C. cutters of Italy, and other places, finding there was great difficulty in treating the hard gems, also being unable to obtain a sufficient supply of the fine ones necessary for the work, began to think of some other method: hence the introduction of shell Cs. The shells of various molluscs are now often used for making Cs., and they are also imitated on glass.

Camera, see PHOTOGRAPHY.

Camera Lucida, optical instrument constructed for various purposes. Dr. Robert Hooke was the inventor of one about 1674, and Dr. William Hyde Wollaston brought out another in 1807. This latter one was intended to facilitate the perspective outline of objects, and consists of a four-sided prism of glass, having one angle of 90° , and the opposite angle of 153° , while the other two angles are each of $67\frac{1}{2}^\circ$. The C. L. was of some

CAMERA LUCIDA

importance to draughtsmen, before photography was used in that capacity, on account of its small size, which rendered it easily portable. Its chief use was in copying, reducing, or enlarging drawings. But it is not an instrument that many have been able to use satisfactorily. An instrument devised by Amici was made with a right-angled triangular prism, involving two refractions and one reflection.

Camera Obscura, an optical apparatus

by means of which the images of objects are made to appear on a light or white surface, or a darkened room in which an image of surrounding objects is projected on to a large screen by a long-focus convergent lens. At the top of the dark chamber is a box containing a convex lens and sloping mirror. If a plane mirror is placed behind the lens at an angle of

CAMERA OBSCURA

O, object; M, mirror; L, lens; I, image.

45° to the horizon so that the rays of light would be reflected vertically downwards, a true image of the object is produced; that is to say, the image appears exactly as the object, and is not perverted, as is the case when an object is viewed in a mirror. This is the principle of the C. O. Its invention has been ascribed to Giovanni Battista della Porta, 1569, but it is a well-known fact that this principle had been recognised, and made use of, many years before his time. The C. O. was first employed in the interests of photography about 1791, by Thomas Wedgwood.

Camerarius, Joachim (1500-74), Ger. scholar, b. at Bamberg. His proper name was Liebhard, but because the office of chamberlain at the court of the bishops of Bamberg was always held by his family, he changed it to C. (Ger. *Kämmerer*, late Lat. *Camerarius*). He was one of the most distinguished philological scholars of his time, and improved the organisation of the univ. of Leipzig and Tübingen. He had a considerable part in the preparation of the Confession of Augsburg, 1530, and in 1555 he was deputy of Leipzig Univ. to the Diet of Augsburg. He was a friend of Melancthon, of whom he wrote a biography in 1560. His works were numerous, and include translations of the classics, and monographs on Gk. and Lat. philology and antiquities.

Camerino, tn. of central Italy, S.W. of Macerata. It is situated on an E. spur of

the Apennines, and has a cathedral, a univ. founded in 1727, and silk manufs. Pop. 12,300.

Camerlengo, sometimes **Camerlingo** (It., chamberlain), the cardinal who had charge of the papal treasury during the existence of the papal states.

Cameron, Barons Fairfax of, see **FARFAX**.

Cameron, Sir David Young (b. 1865), Scottish painter, b. in Glasgow. Skilled as an etcher. Then took up landscape painting, especially of Scottish scenes. A.R.A., 1911; R.A., 1920. Knighted, 1924. In 1933 he was appointed painter-limner to the king's household in Scotland.

Cameron, Sir Donald Charles (1872-1948), Brit. colonial administrator, son of Donald Charles C. of Brit. Guiana, educated at Rathmines school, Dublin, and entered the civil service of Brit. Guiana in 1890. He acted as colonial secretary of Mauritius between 1904 and 1907; in 1908 he became assistant secretary to the gov. of S. Nigeria and, in 1911, prin. assistant secretary. In that capacity he rendered good service in connection with the development of road and other communications and in making Lagos an open port. In 1914, when Lagos and S. Nigeria were united with N. Nigeria as the colony and protectorate of Nigeria (see **NIGERIA**) with Sir Frederick Lugard as governor-general (see **LUGARD, LORD**), C. was promoted to be secretary to the central gov. When, after the treaty of Versailles, a mandated ter. in the Cameroons was placed under the control of the governor of Nigeria, C., as chief secretary to the governor, rendered distinguished service in shaping the native administration of the Cameroons and in bringing the general administration of the country into line with that of Nigeria. In 1924 C. was promoted to be governor of Tanganyika Ter. where his Nigerian experience made him exceptionally well qualified to administer a country equal in size to Nigeria. Here his name is especially associated with the organisation of a system of native administration known as 'indirect rule' modelled on the principles already in operation in Brit. W. Africa. In the same year he inaugurated the creation of an African civil service, improved the public health service of Tanganyika, and promoted the estab. of gov. schools in that ter. From 1931 to 1935 he was governor of Nigeria. His capacity for work was extraordinary and he combined with it a gift of lucid expression in writing and speech. His own account of his administration was pub. in 1939 in *My Tanganyika Service and Some Nigeria*. K.B.E., 1923; K.C.M.G., 1926; G.C.M.G., 1932.

Cameron, John (d. 1446), bishop of Glasgow and chancellor of Scotland. He became secretary to the earl of Wigtown in 1423, who bestowed on him the rectory of Cambslang, Lanarkshire. In the following year he was appointed secretary to King James I.; keeper of the privy seal, 1425; keeper of the great seal, 1427; bishop of Glasgow and chancellor of Scotland, 1428.

Cameron, John (c. 1579 - 1625), Scottish scholar and theologian. He was b. in Glasgow, and studied at the univ. there. In 1600 he visited the continent and taught classics and philosophy in many continental colleges, becoming prof. of divinity in the univ. of Saumur in 1618. In 1620 he returned to Britain, and in 1622 became prin. of Glasgow Univ. His advocacy of the divine right of kings made many enemies, and in 1623 he returned to Saumur and thence went to Montauban as prof. of divinity.

Cameron, Richard (c. 1648-80), Scottish covenantor, b. at Falkland in Fife where he became schoolmaster. Converted by the field preachers from Episcopacy, he became an extreme Presbyterian, and preached in Annandale and Clydesdale. In 1678 he went to Holland, and returned in 1680 to take part in the Sanguhar Declaration, for which a price of 5100 marks was set upon his head. He took refuge with some comrades in the hills in Ayrshire, preaching whenever he found an opportunity, until surprised by a party of dragoons at Aird's Moss, and both he and his brother were slain. See **CAMERONIANS**.

Cameron, Verney Lovett (1844-94), African explorer, b. at Radipole in Dorsetshire. He entered the navy in 1857, served in the Mediterranean, the W. Indies, and the Red Sea, and took part in the Abyssinian expedition and in the suppression of the slave trade. In 1872 he was made head of the expedition to relieve Livingstone, and left Zanzibar in March 1873, but at Unyanyembe met Livingstone's followers bearing his remains to the coast. He proceeded to Ujiji, where he found Livingstone's records, and subsequently explored the S. portion of Lake Tanganyika. Afterwards he explored the upper reaches of the Congo, but was prevented from tracing its course to the W. coast owing to the hostility of the natives. He then turned his attention to the Zambesi, of which he discovered the sources, and in 1875 crossed Africa from E. to W., being the first traveller to achieve this feat. In 1878 he explored the route for a Constantinople to Bagdad railway from Beirut to Bushire, and in 1882, with Sir R. Burton, visited the Gold Coast. He wrote among other works, *Across Africa* (1877); *Our Future Highway to India* (1880); and some books for boys.

Cameron Highlanders, Queen's Own. Formerly 79th Foot. Raised 1793 by Lt.-Gen. Alan Cameron who, in that year, raised some 800 young men in his native co. Inverness, and led them in most of the battles of the Peninsular campaign and at Waterloo. Its other campaigns are Crimea, Indian Mutiny, Egypt 1882, Nile 1884-5, S. African 1900-2. During the First World War it raised thirteen battalions, which served in France, Flanders, and Macedonia. In the Second World War the C. H. saw service on all the three major fronts—N.W. Europe, N. Africa, and Italy—and in Burma. As part of the 51st Highland Div. under Maj.-Gen. Douglas Wimberley, the C. H. were in very hard fighting in 1943 at the

battle of Akaret, particularly on April 6 on the Roumana Ridge. Other units were part of the Chindit force, in Burma. Its badge is the thistle ensigned with the imperial crown. The depot is at Inverness.

Cameronians, followers of Richard Cameron (*q.v.*) a Scottish Covenanter, who separated from the Church of Scotland towards the end of the seventeenth century on a question of eccles. polity. The C. refused to recognise the State control over the Church, and adhered strictly to the Solemn League and Covenant, ratified by the assembly of Westminster divines in 1643. They separated from the Presbyterian Church, and were officially known as the reformed Presbyterians. The C. were bigoted fanatics, but undoubtedly acted from high motives. They refused to take the oath of allegiance, and thus cut themselves off from some of the privileges of citizenship. In 1876 the Reformed Presbyterians formally united with the Free Church, who also maintained the spiritual independence of the Church of Christ. There are, however, in the Highlands, a few who still call themselves C. See Walker, *Sir Scots of the Covenant* (repub. in 1901).

Cameronians, The (Scottish Rifles), formerly 26th (1st Battalion) and 90th (2nd Battalion) Foot. Raised in 1689 from the amnestied survivors of the Cameronian covenants to help William III. against James II. As the earl of Angus's regiment, it served with distinction under William III., and later under Marlborough. For long the 26th regiment of the line, and now the Scottish Rifles. Under Abercromby it gained further laurels in the Egyptian campaign of 1801, and also under Moore at Corunna in 1808-9. In 1881 the 26th and 90th were linked to form one regiment, and as such served in the S. African (1899-1902) war. During the First World War it raised twenty-seven battalions, which served in France, Flanders, Macedonia, Gallipoli, and Palestine. The C. took part in battles in all the major theatres of war in the Second World War. In Burma they were part of the Chindit force of Maj.-Gen. Wingate. They played the chief role in the epic capture of Walcheren and S. Beveland early in 1945, suffering heavy losses in the final stages of the assault when the Gers. rallied to counter-attack. They also took part in the Rhine operations of the Second Brit. Army, notably in March 1945. The depot is at Hamilton.

Cameroon, formerly a Ger. colony on the W. coast of Africa, extending from the mouth of the Rio del Bey to a point slightly below 3° N. lat. Formerly known as the Oil Coast, the ter. was demarcated by treaties between England and Germany in 1893, and between Germany and France in 1885 and 1894; and was increased in Nov. 1911 by acquisition of part of Fr. Equatorial Africa in compensation for recognition of Fr. suzerainty over Morocco. It is a mountainous country, with a strip of low-lying land near the coast. The prin. rvs. are the Lom, Nyory, Lokinya, and Kribi. The

part that was ceded to Germany in 1911 is watered by the Logone, which flows into Lake Chad, and the Sanga, which is a trib. of the Congo. There is considerable rainfall, with no prolonged dry season. At the outbreak of the First World War the Allies decided to deprive Germany of her powerful wireless stations abroad by which she kept in touch with her fleets. With this object in view, a force of Fr., Brit., and Belgian natives, about 4500 strong, was organised under the command of Maj.-Gen. Sir Charles Dobell to destroy the wireless station in the C. The Ger. military resources in the country were estimated at about 6000 native troops. The campaign opened in Sept. 1914, and an attack on Duala was planned. The Gers. protected the tn. by sinking eleven sea-going ships in the R. C. so as to form a barrier which prevented the allied ships from approaching it closer than a distance of 8 in. This obstacle, however, was overcome and Duala surrendered on Sept. 27. The wireless station was destroyed and the object of the campaign achieved. But as the Ger. forces were still at large, the conquest of the whole colony was decided upon. The force therefore moved against Edoua on the Sanaga R. By the middle of Nov. 1200 Gers. had been taken prisoners. The next move was against the railroad, and Bare, which covers it, was accordingly occupied. During the early months of 1915 reinforcements began to arrive. Jaunde was next attacked, because, on the surrender of Duala, the Gers. had moved the seat of gov. to the former place. In April Gen. Cunliffe from Nigeria joined Sir Charles Dobell's force, bringing reinforcements with him. In Sept. the Brit. force was directed against Jaunde, and were opposed vigorously all along the route, and it was not until Jan. 1, 1916, that the force entered the tn. The Fr. troops arrived on Jan. 5. The enemy troops, pursued by the Allies, escaped into Sp. ter., where they laid down their arms. A small band of Gers. was still gallantly holding out at Mora, but surrendered on Feb. 18. The protectorate was now entirely free of Gers., and in April 1916 practically the whole of the country was handed over to Fr. administration.

By the Milner-Simon agreement of 1919 the whole area was divided into a Brit. sphere of about 31,000 sq. m. and a Fr. sphere of about 143,400 sq. m. and in 1922 the ters. were placed by the League of Nations under Brit. and Fr. mandates. The C. under Brit. mandate marches the entire distance of the Nigerian E. boundary, except for one short break. The C. under the Fr. mandate borders on the Atlantic and has a pop. of 2,514,000 Bantus, Sudanese, Hausas and half-caste Arabs, and some 2000 Europeans. By decrees of 1921 and 1925 the Fr. C. was constituted an autonomous ter., both administratively and financially. The pop. of the Brit. C. is about 831,000. The two narrow strips of ter. extend from the Atlantic to Lake Chad, a distance of 700 m., and lie diagonally between 4°-12°

30° N. lat. and 8° 30'–14° 45' E. long. The nature of the country varies to a remarkable extent, from the coastal mangrove swamps and dense forest region to the grasslands at heights of 400 to 7000 ft., and again to sandy, swampy tracts in the Dikwa country and around Lake Chad. The highest peak is C. Mt., a volcanic mt. 13,350 ft. high. The Brit. C. is administered as part of Nigeria. The N. areas are administered by the residents of the neighbouring provs. of Adamawa, Bornu, and Benue; the S. part forms a separate prov., known as the Cs. Prov., with headquarters at Buea on C. Mt. Cattle raising and the growing of guinea corn are the chief industries of the Dikwa people, who are mainly Arabs and Kanuri. Cs. Prov. is rich with timber, and the volcanic soil of the C. Mt. is especially fertile. The ports Victoria and Tiko are linked to Buea (pop. 3000) by motor road. The exports are cocoa, palm kernels, rubber, bananas, and mahogany. The Victoria dist. contained large Ger. cocoa, rubber, and banana plantations, with some 48,000 ac. under cultivation. They were sold by auction in 1924. Victoria lies amidst fine scenery and has a botanic garden planted by the Gers. Buea was the Ger. administrative cap. The wealth of the forests and minerals is as yet little exploited. There are 315 m. of railways and 13,000 of roads. The Brit. Gov. has announced its intention to place this and other mandated ters. under the trusteeship system estab. in the United Nations Charter (see COLONIAL TRUSTEESHIP). See F. W. Migeod, *Through British Cameroons*, 1925, and Annual Reports of the Colonial Office to the Permanent Mandates Commission of the League of Nations (H.M.S.O.).

Camillus, Marcus Furius (c. 445–365 B.C.), celebrated Rom. patrician and general. He was censor, or, according to Livy, consular tribune, in 403 B.C. In 396 he took Veii, which had withstood a ten-year siege, and in 394 he captured Falerii. Being condemned on the ground of misappropriating the booty of Veii, a decision which was caused more by his unpopular haughtiness than guilt, he retired to Ardea in 391. It is reported that he returned in the nick of time to stop Brennus from taking the Capitol. He opposed the desire of the plebs to move to Veii, and was largely instrumental in rebuilding the city. During subsequent campaigns he vanquished the Æqui, the Volsci, and the Etrusci, and finally, in 367 B.C., the Gauls, near Alba. During his life he was elected military tribune with consular powers six times, and five times dictator. He d. of the plague.

Camisards, insurgent Huguenots or Protestants of the Cévennes, so called from the *camise* or white shirt which formed their uniform. They rose in revolt against the revocation of the Edict of Nantes by Louis XIV. in 1685, and their zeal was fanned by the ruthless dragonnades, or quartering of dragoons upon Protestant households and the accompanying acts of cruelty in order to enforce conversion to the Catholic faith. At first

consisting only of isolated outbreaks, the movement became of greater importance owing to the murder in 1702 of the abbé du Chaila, who for fifteen years had proved the most heartless persecutor of the oppressed people. A general insurrection followed upon this event, and the rebels, now numbering some 3000, were able to maintain themselves in the mts. against the royal forces. The defeat of some small detachments of soldiers led to Marshal Montrevel being sent to the dist. with an army of 60,000 men. The C. were, however, led by a youth of great military capacity named Jean Cavalier, and though the royal army burnt over 400 villages, Cavalier managed to increase the scope of the revolt. In 1704 Montrevel was superseded by Marshal Villars, who wisely adopted more conciliatory measures, pardoning those who surrendered and releasing all prisoners who swore allegiance, while his troops scoured the country in all directions and forced band after band of the insurgents to submit. In May 1704 Cavalier himself accepted the conditions offered, and left the country, with many of the more moderate C. A few zealots still held out, and the rising was renewed in 1705, owing to the severity of Villars's successor, the duke of Berwick, but was put down with an iron hand, and the prov. entirely devastated. Cavalier and many others took service with the Eng. and fought at Almanza in 1707, where most of them perished. Cavalier, however, came to Britain, and became governor first of Jersey and then of the Isle of Wight. See Anna Eliza Bray, *Recall of the Protestants of the Cévennes*, 1870.

Camlet, cloth made in the Middle Ages from camel's hair, but now usually from the hair of the Angora goat, mixed with silk, wool, cotton, or linen.

Cammaerts, Emile (b. 1878), Belgian poet and author, b. at Brussels, resident in England since 1908. He came into prominence at the beginning of the First World War, with two vols. of Belgian poems, 1915 and 1916—the Fr. being printed side by side with free Eng. trans. by his wife, a daughter of Marie Bremus, the singer. One poem in the second vol., about the Angels of Mons that some people professed to have seen fighting on Belgium's side against the Gers., spread and preserved that legend. A somewhat similar idea was contained in his mystery-play *The Adoration of the Soldiers* (1916), also printed with trans. His pubs. also include four vols. of trans. from John Ruskin and one from G. K. Chesterton, into Fr.; *Les Deux Bossus* and *La Veillée de Noël*, plays (1917); *Through the Iron Bars*, description of two years of Ger. occupation of Belgium (1917); *Messines and other Poems* (1918); *Belgium from the Roman Invasion to the Present Day* (1920); *Poèmes intimes* (1922); *The Childhood of Christ as seen by the Primitive Masters* (1922); *The Treasure House of Belgium*, a guide-book with a vein of historical learning, but mainly concerned with modern affairs—for the author is no worshipper of dead cities (1924); *Les*

Bellini, an essay in art criticism (1927); *Discoveries in England* (1930); *Rubens, Painter and Diplomat* (1931); *The Keystone of Europe* (1939); *The Prisoner at Løken*, (1941); *Upon this Rock*, 1942; *The Devil Takes the Chair* (1948).

Camoens (Camoës), Luis Vaz de (1524-80), most celebrated of Portuguese poets, was descended from an ancient noble and wealthy house. The exact place of his birth is disputed, but it is almost certain that he was b. at Lisbon. By this time the full flood of the Renaissance was making itself felt in Europe, and among other countries Portugal was benefiting from the desire for further and fuller knowledge which seemed at this time to fill all men. C. was educated at the college of All Saints at Coimbra, and steeped himself in the literature and mythology of the classics. He had an excellent memory, and little that he learnt was ever forgotten. His education, however, proceeded on very general lines, and there was practically no subject upon which he was not able to speak with some authority. He knew well the contemporary literatures of Spain and Italy, he had read much hist., and altogether we can say that his great poem *Os Lusíadas* (*The Lusíads*) gives evidence of his universal knowledge. He came then to Lisbon, which city made a firm and lasting impression on him, an impression which in his great poem he immortalised. He found easy entrance into the highest society, and he quickly came to be recognised as a poet of no mean talent. In 1544 he fell violently in love with Caterina de Ataíde, the daughter of a high official at court, who disapproved of his suit. This lady was the inspiration of many of his most impassioned sonnets, and has been aptly described as his Beatrice. He was introduced at court, and here whilst he made many friends he also made enemies, and his too-open passion quickly became a matter of gossip. He left the court, but his voluntary exile was restless; the verses which he wrote at this time show him to be now exuberant now in the uttermost depths of despair. Many of his sonnets and roundels were written at this time, and from this period also date the greater number of his eclogues. He was now also employed in the composition of his patriotic poem, the *Lusíadas*, but his love affairs were still unsettled, and he was finally forced into exile. His exile was hastened by the production of *El Rei Seleuco*. In his place of exile he composed *The Elegy of Exile*, and a number of beautiful sonnets. He now became a soldier, and in 1547 he fought against the Moors, and in an attack on Ceuta lost his right eye. Here he remained for the next two years still pouring forth verses, some despairing and sad, other philosophical; he himself seems to have been buoyed up by the memories of the past. In 1549 he prepared to go to India, and for that purpose returned to Lisbon; once there he found it impossible to drag himself away, and he remained to be near his love. But he indulged at this time in wild extrava-

gances which finally landed him in prison, was pardoned, and proceeded to India. He sailed in 1553. In some poems he describes the voyage, which probably was not without its influence on the *Lusíadas*, since after this date the discovery of India becomes the main theme. The Portuguese were at this time dominant in the E., and although C. was well received, he quickly became disgusted with his life at Goa. Between 1553 and 1555 he saw a fair amount of active service, his experiences being described in the *Lusíadas*. He did not, however, stay at Goa, but travelled to many places in the E., usually to perform some military duty. He wrote whilst there *Desparates na Índia*, *Filodemo*, and *Satyras do Torneio*. He had acquired some little wealth, but now fortune turned against him. After waiting at Macao for a ship to take him back to India, he was imprisoned for intrigue, and he was shipwrecked whilst being brought back a prisoner to India. He managed to save his *Lusíadas*, but remained a prisoner at Cambodia, where he composed his *By the Waters of Babylon*. Still a prisoner he was taken back to Goa, where he heard for the first time of the death of Caterina. It was on this occasion that he produced his famous sonnet *Alma Minha Gentil*. He remained a prisoner for some time, being finally released when a friend of his became governor, and again for a short time he was imprisoned for debt. He was now very poor, but seems to have remained in India living a fairly happy life and working at his chief poem. For three years he was thus employed, and finally the poem was finished, and his ambition became to go back to Portugal and print it. In 1567 he got as far as Mozambique, but here again he was imprisoned for debt for two years, and finally by the charity of friends he was released from prison and sailed for home. He reached Portugal in 1570. He found his mother ready to welcome him; his father was dead, and now, having regained his home, he set about obtaining permission to print his poem. Permission was given in 1571, and the book appeared. It was received with acclamation by everybody. He was granted a substantial pension for three years, a period which was later extended, and he lived for a time in peace and enjoyment. In 1575 he fell, for a short time, into helpless poverty once more, but the renewal of his pension soon set him right again. In 1578 came the disaster of the battle of Alcaçer, and C. mourned the loss of his patron and king, Sebastian, in a magnificent sonnet. Early in 1580 the cardinal king d., and C., who saw the vanishing of Portuguese independence, had no further desire to live. In June of the same year the last of a great and illustrious line fell a victim to the plague which was ravaging Portugal. His greatest work was the *Lusíadas* (the *Lusitanians*) for which he has been not inaptly called the Virgil of Portugal. It has for its main theme the discovery of India and the greatness of Lusitania. It is written in ottavaprima, and may be

regarded as Portugal's national epic. C. also wrote comedies, sonnets, eclogues, and elegies. In 1918 a Camoens Chair of Portuguese Language and Literature was estab. in King's College, London. See J. Adamson, *Life and Writings of Camoens*, 1820; Sir R. F. Burton, *Translation of Camoens' 'Lusiad,' with Life and Commentary*, 1880; J. J. Aubertin, *The Lusiads* (trans.), 1884; T. Braga, *Camões e o sentimento nacional*, 1891; E. Prestage, *Minor Works of Camoens*, 1924.

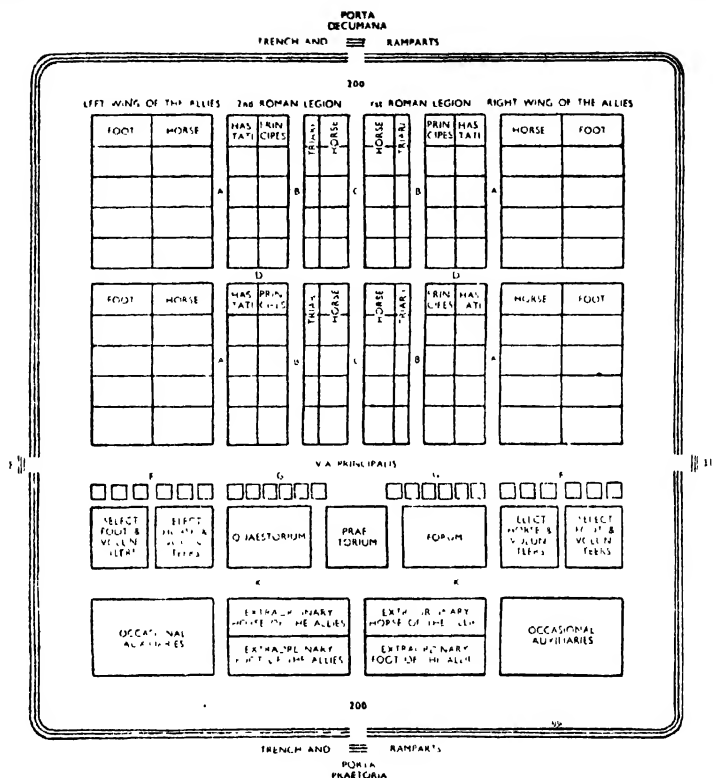

Camomile, or **Chamomile**, genus of Compositæ. It is a herb native to England and W. Europe, and cultivated for medicinal use. It is grown largely at Mitcham in Surrey, where far more valuable plants are produced than any brought from foreign countries; it is also indigenous to Saxony, France, and Belgium. Its flowers in the cultivated state are said to be double, and the most satisfactory results are obtained from the largest, whitest, and most perfected double flowers. The flowers have a very fragrant odour, with an intensely bitter taste. In addition to the bitter extraction that is yielded, the C. also produces about 2 per cent of a volatile fluid, which at first is pale blue in colour, but on exposure to the light it turns yellowish-brown. The odour is fragrant, like that of the flowers, and it is composed of butyl amyl angelates, and valerenes. The most important species of the genus is *Anthemis nobilis*, from which an infusion of its flowers is obtained and used as a bitter stomachic and tonic. In olden times it was used in fevers, but now other more effective remedies are in use. In large doses the infusion acts as a simple emetic. Other Brit species are of no account; one of these (*A. Cotula*), known as the stinking C. or mayweed, is so pungent as to blister the fingers. A foreign species (*A. tinctoria*) yields by its flowers a beautiful dye. The wild C. (*Matricaria Chamomilla*) is sometimes employed as a substitute for the cultivated species, but it is easily distinguishable, its flowers being single, not bitter, and with less odour.

Camorra (It. *camorra*), secret society estab. about 1820 by prisoners in the Neapolitan dungeons to protect themselves against the brutalities of their jailers. The associates on their release transferred their practices to Naples itself, and in a few years the C. became a powerful organisation, practically controlling the life of the city. Smuggling, robbery, blackmail, all went on under its rules, traders having to pay heavy sums for permission to carry on their business, and the society derived a large revenue from disorderly houses and the promotion of illegal lotteries; but while it remained non-political, it was unmolested by the authorities. Indeed, both ministers and police sometimes invoked its assistance, and men of high station languished themselves with it. In 1848, however, it adopted revolutionary ideas, becoming a political as well as criminal organisation, and controlling all elections. During the sixties it carried on practically a reign of terror, but after years of struggle its

power was broken by the gov. in 1877. Even then, however, it by no means became extinct. In 1900 so many Camorristi were proved to have attained high offices that the Neapolitan municipality was superseded for some months by a royal commission. In 1901 the Camorrist candidates were utterly defeated by the Honest Government League. Five years later a double murder by some Camorristi led to the arrest of forty conspirators, their chief being Enrico Albano. Witnesses' lives being unsafe at Naples, the court was removed to Viterbo, and the trial took place in 1911, long sentences of imprisonment being awarded to sev. of the accused.

Camouflage (from Fr. *camoufler*, to blind or veil). Although the word C. came into prominence only during the First World War, the principle of deceiving the enemy by artificial aids is very old. The deception most practised is that of so altering the appearance of troops or works as to render them either invisible or to assimilate them to the surrounding countryside. Hence during the S. African war of 1899-1902 Brit. troops were clothed in khaki, and practically all troops throughout the world wear uniform and equipment of a neutral shade. Taking cover by dressing troops in grass, reeds, or branches of trees is a very ancient practice. A good example is referred to by Shakespeare in *Macbeth*, where Macduff's army advances hidden by boughs (see Act v. sc. vi.). C. was fairly easy before the development of aircraft, but during the First World War lines of trenches stood out in the landscape like huge scars and were most difficult to hide. Air power confers great powers of observation upon an enemy, the antidote to which is a better use of C. So important was C. during First and Second World Wars that guns, tanks and vehicles, buildings, tents and marquees, were painted in such a manner as to deceive the observer from the air. C. on the sea was equally important, and the majority of low-powered ships were also painted in such a manner as to make observation from submarines difficult. The particular form adopted was known in the First World War as 'dazzle painting,' which gave a distorted appearance to vessels. Ships with high speed relied upon their speed for security against a submarine attack. During the Second World War C. was extended to all manner of buildings and works in Great Britain as a measure of defence against Ger. air raids. For C. in nature, see COLOURS OF ANIMALS; MIMICRY.

Camp is a collection of tents or huts which is used to lodge soldiers on a campaign or during field manoeuvres. The 'C. of exercise' is slightly different in nature, and will be described later. The size of European armies renders it impossible for tents to be carried for the troops, and cantonments and bivouacs (q.v.) take their place. But when the force is comparatively small, and stationed in a hot country, the troops are still placed under canvas. The space required

ROMAN CAMP ON CASTRA

A, B, C, streets 50 ft wide; D, street called Quintana, 50 ft wide; E, porta principalis dextra; F, tents of the praefecti sociorum; G, tents of the tribunes; H, porta principalis sinistra; K, street 100 ft wide, 200, street (or intervallum) 200 ft wide.

by a battalion of Brit. infantry at war strength is 190 yds. front and 280 yds. depth. The quarter-guard tents come in the middle of the front; the parade ground, 80 yds. deep, comes next; then the men's tents, followed by the field kitchens, the officers' tents, and the baggage wagons and horses; to the rear of all are the tents of the rearguard. The space required by a cavalry regiment is 188 yds. front and 255 yds. depth. The formation of the tents is similar to that used in an infantry regiment; the horses are fastened by means of picket ropes laid down between the tents. If the camp is pitched for one night only, less space is required. The space required by a battery of field artillery is 100 yds. front and 180 yds. depth; a similar space is required for each unit of field hospital, engineer,

ordnance store, commissariat, and transport Co's. The different Co's. are distinguished by various ensigns in the daytime and by different-coloured lamps at night. Thus a field hospital has a white flag with a red Geneva cross, or a red lamp; a commissariat and transport Co. has a blue flag with a white centre, or a green lamp; an ordnance store Co. has a blue flag with a red centre, or a yellow lamp. When near the enemy, on active service, the tactical considerations are of paramount importance; the Co. must be so arranged that the troops can be in fighting order on the shortest notice. When this is observed, the Co. should also have, if possible, a supply of good water, fuel, etc.; the ground should be firm with good natural drainage; and access should be open to good roads. When a large per-

manent garrison in barracks is visited by regulars and territorial troops during the drill season, for the purpose of combined manoeuvres under war conditions, this is termed a C. of exercise. All the ordinary requirements of a good C. site, as mentioned above, should be complied with, and in addition a wide expanse of fairly wild and changing country is a necessity. The Brit. Gov. has acquired such an expanse on Salisbury Plain, and six Cs. of exercise have been instituted: Aldershot, Colchester, Shorncliffe, Strensall, Salisbury Plain, and Stobs. Artillery of the various grades, field, mountain, siege, and garrison, have Cs. at Okehampton, Hay, Lydd, and Devonport respectively.

Camp, Roman. The Romans were the first nation to carry the act of encampment to any degree of perfection; their camp was the same in outline from the time of Polybius to the fall of the empire, and was in form as follows. The camp was an exact square of 207 Rom. ft. in size. The *via principalis*, or prin. street, was 100 ft. wide, and was situated about two-thirds of the distance down one side. In the smaller portion of the square, facing the middle of the *via principalis*, was the *prætorium*, or consul's tent. There were four gates in the camp, and one at each end of the main street, named *porta principalis dextra* (right prin. gate), and *porta principalis sinistra* (left prin. gate). The gate facing the *prætorium* was the *porta prætorialis* (prætorian gate), that at the back the *porta decumana* (decuman gate). The space between the *porta prætorialis* and the *via principalis* was occupied by two legions and their allies—18,000 in all. On a level with the *prætorium* were the quarters of the consular guard (horse and foot), the legates, and the quaestor. Behind the *prætorium* were the extraordinaries and strangers. The whole camp was surrounded by a *vallum* (rampart) and a *fossa* (ditch); the former was composed of earth from the latter and was surmounted by a palisade.

Campagna, tn. in the dist. of Salerno, Italy, seat of a suffragan bishopric; 16 m. E.N.E. of Salerno and 13 m. S.W. from Conza. Pop. 9400.

Campagna di Roma is an lt. region, stretching along the Tyrrhenian Sea from Civitavecchia to Terracina, and having the Alban and Sabine hills as an E. boundary. This tract, which comprises most of anct. Latium, is from 30 to 40 m. wide and about 100 m. long. The lakes of the C. are craters of extinct volcanoes, judging from their conical form and the hard black lava which in some cases forms their shores. The *emissarium* of Lake Albano still answers its original purpose as an aqueduct. The lake of Solfatara is composed of the waters of hot sulphur springs, and has its floor of calcareous deposit. This plain formed in olden times no inconsiderable part of 'the splendour that was Rome,' as is attested by the numerous ruined tus. to be found there. In those times the C. was well populated and very fertile; but it was only by the skill and care of the anct. inhab. that it was made so,

and even then many of the tns. in the dist. were unhealthy at certain seasons, according to Livy, Strabo, Cicero, and others. The main cause, however, of the marked changes, was the increased malignity of malaria. This was doubtless due to the repeated devastations of the land by the Goths, the Vandals, and the Longobards, and more recently by the Normans and Saracens. Since the land belongs mostly to the Church, sev. of the popes have attempted to improve its condition, and the lt. Gov. has taken up the problem. Drainage has been attempted, and embankment of the riva., and large numbers of eucalyptus-trees have been planted. Attempts have also been made to extirpate the anopheles or malarial mosquito. The few inhab. at present on it rear horses, buffaloes, cattle, sheep, and goats; a few cereals and some fruits are grown.

Campagnola, Domenico (b. c. 1482), lt. painter, noted for his frescoes in the Scuola del Santo, Florence, and his oil paintings in the Scuola del Carmine. Learned under Titian. His most notable work is the 'Adam and Eve' in the Pitti Palace, Florence.

Campan, Jeanne Louise Henriette (née Genêt) (1752–1822), Fr. authoress, was b. in Paris. She was appointed reader to the daughters of Louis XV. in 1767, and Marie Antoinette later made her first lady of the bedchamber. She kept a school for young ladies at St. Germain until 1807, when Napoleon Bonaparte founded a school at Écouen, and appointed her principal thereof, a post which she held until the abolition of the school by Louis XVIII. She d. at Nantes. Her best-known work is her *Memoires sur la vie privée de Marie Antoinette* (1823).

Campanella, Tommaso (1568–1639), lt. philosopher, was b. at Stilo, in Calabria. Whilst still quite young he showed great talent, and was admitted into the Dominican order at the age of fifteen. Like Bacon, of whom he was a contemporary, he 'took all knowledge for his province,' but specialised in philosophy. He was opposed to the doctrines of Aristotle, and in his *Philosophia Sensibus Demonstrata*, pub. at Naples in 1591, he endeavoured to show that philosophy should be grounded, not so much on *a priori* conceptions, as on the observation of the natural world. After travelling to Rome, he proceeded to Florence, where he was well received by the Grand Duke Ferdinand. Returning to Naples in 1598, he was in the following year arrested in Calabria, whither he had gone on a visit, on a charge of conspiracy against the Sp. Gov., which then held sway over Naples. He was accused of having schemed to obtain Turkish assistance in making himself the ruler of Calabria. Though there does not appear to have been any evidence against him, he was imprisoned, tortured, and condemned to perpetual confinement. Whilst in prison he wrote many philosophical treatises. Pope Urban VIII. procured his removal to Rome in 1626, and in 1629 he was set free and given a pension. He betook himself to France in

1634, being afraid of further persecution; he was received with honour by Louis XIII. and Richelieu, and was an honoured figure among the savants of that country. He devoted himself to philosophic studies until his death, which occurred at the monastery of his order in Paris. He attempted to form a philosophy of hist. and politics, the principle of which was the general progress of man leading to a millennium. Among his numerous works may be mentioned *De Sensu Rerum et Magia* (1620); *Civitas Solis* (1643); *Philosophia Rationalis* (1638).

Campanha, city in the state of Minas Gerais, Brazil, 190 m. N.E. of Santos, and about 120 N.W. of Rio Janeiro. It is the centre of a mining dist., and has hot springs in its vicinity. Pop. 15,000.

Campani, Matteo, It. physician of the seventeenth century, was priest of a Rom. par. He was also interested in astrology and astronomy and had great skill in manufacturing the glass for the lens of telescopes. His brother, Giuseppe C., was occupied with similar pursuits, and left works treating of them.

Campania was the anct. name of a prov. of Italy: as a territorial div. it now includes the provs. of Avellino, Benevento Caserta, Salerno, and Naples. The Neapolitan Apennines traverse the region, running parallel to the coast. Though the dist. drained by the R. Sele is rather malarious, the region as a whole is very fertile. The prin. riv. is the Volturno, which flows into the Tyrrhenian Sea at a point midway between the gulf of Gaeta and the bay of Naples. C. has always been densely populated, and the prov. of Caserta is the most beautiful, as it is the most fruitful, part of Italy. The chief products are wheat, maize, wine—the famous 'Falernian' of the Romans.—hemp, silk, sulphur, and fruits. The fields of C., with their luxuriant crops, poplar-trees, and canopies of vines, caused Goethe to remark that 'there it is worth while to till the ground.' The area of the prov. is 5214 sq. m. In Rom. times the dist. was the scene of many legends; Lake Avernus and the Sibyl's Cave were situated there. The aristocracy of Rome built magnificent country houses in the interior, to which the Applan and Lat. ways led. The oldest part of all is situated round Cumæ (Κυμæ), a Gk. settlement, and is associated with such names as Cicero, Augustus, Nero, etc. All the names of cities are rich in classical associations—Puteoli, Cumæ, Naples, Salernum, Capua, Beneventum, Nola, etc. Then there are the three unfortunate cities buried in the eruption of Vesuvius in A.D. 79, Herculaneum, Pompeii, and Stabie. Before the time of the Romans, the Oscans, followed by the Etruscans, were masters of the dist.; in modern times it has been part of the kingdom of Naples. Pop. 3,699,000.

Campanile (It. bell-tower, from Lat. *campana*, a bell) is a term applied to the towers which are erected in close proximity, though not attached to, very many churches in Italy. They are of considerable height, usually rectangular, and graceful in design. The leaning

tower of Pisa is perhaps the best known, owing to its remarkable deviation from the perpendicular. It was begun in 1174, the architects being Bonano of Pisa and Wilhelm of Innsbruck. Eight storeys, each surrounded by columns, form the tower, which inclines almost 13 ft. from the perpendicular. Giotto, Taddeo Gaddi, and others designed a C. at Florence in 1334, which rises to a height of nearly 300 ft., and is adorned with many bas-reliefs and statues of an allegorical

E.N.A.

THE BASILICA AND CAMPANILE OF SAN
APOLLINARE NUOVA, RAVENNA

nature. The C. of St. Mark's at Venice was the best in design; eight storeys in height, and tapering in design, an open loggia of marble, containing five huge bronze bells, surmounted by a statue of an angel in copper, formed the belfry itself. From base to crown it reached a height of 325 ft.; it was completed in 1349. The belfry storey was added in 1510, after having been commenced in 888, and on July 14, 1902, it collapsed without any warning. Among other examples of Cs. may be mentioned the Torre degli Asinelli, the C. of San Apollinare Nuovo at Ravenna, and the Torre Garisenda at Bologna.

Campanology, see under BELL.

Campanula (dimin. of Lat. *campana*, bell), typical genus of the Campanulaceae, contains between two and three hundred species of plants, many of which

are well known in Britain. The bell-flowers, or bell-worts, as they are often called, are found in colder climates, but in the Mediterranean and other warm regions they occur as Alpine plants. Older names for the genus were *Trachelium* and *Cerricaria*, from the supposed power of many species of curing diseases of the trachea and neck. Campanulate plants are all herbaceous, have usually a milky latex in the stem, and may be annual or biennial, though most of them are perennial. Of them all perhaps the commonest in Britain is *C. rotundifolia*, called in Scotland the bluebell and in England the harebell; the graceful stem and the delicate hue of the flower make it one of the daintiest members of our flora. The flower-juice yields a very good blue ink, and when mixed with alum a green one. *C. pyramidalis*, the chimney plant, is indigenous on rocks and walls in Carinthia, Carniola, and Dalmatia, but is often cultivated for its tall raceme of beautiful flowers, when the plant attains a height of about 3 ft. *C. medium*, the Canterbury or Coventry bell, is a native of central Europe, and is a biennial from which have been obtained many varieties differing greatly in size and colour, and often cultivated in gardens. *C. Trachelium*, the nettle-leaved bellflower, is a European species with large blue bell-shaped flowers; *C. glomerata*, the clustered bell-flower, occurs in England in both a wild and cultivated state; *C. Rapunculus*, the garden rampion or ramps, has an edible root, and the leaves are sometimes used in salads; *C. latifolia*, the giant bell-flower or hush-wort, is found on dry mt. pastures; *C. rapunculoides*, creeping bell-flower, occurs in the N; *C. patula*, the spreading bell-flower, frequents hedges and thickets. *C. muralis*, a tall species; *C. Erinus*, a forked plant; and *C. macrostyla*, a long-styled annual sometimes known as the candelabrum bell-flower, are all further examples of the genus which flourish in Brit. gardens.

Campanulaceæ, family of dicotyledonous plants to which the family Lobeliaceæ is often united. The species are occasionally trees or shrubs, but more often they are herbs with a milky latex; about 1000 known species flourish in warm climates. The calyx consists of five sepals, the corolla of five united petals, the androecium of five epigynous stamens, the inferior gynoecium of two to five united carpels, with usually a trilocular ovary, containing numerous ovules. The fruit may be a capsule or, less frequently, a berry. Two of the chief genera are *Campanula* (q.v. above) and *Lobelia*.

Campanularia, genus and family of Hydrozoa, common in European seas. They have stems bearing sporosacs, small bell-like cups containing the zooids or polyps. In some Hydrozoa, these go free as 'swimming bells,' but in the *C.* they are stationary.

Campbell Family. In 1280 Colin Mor C. of Lochawe was knighted by Alexander III., and in 1445 Sir Duncan received a peerage. The earldom dates from 1480, the marquessate from 1641, and the duke-

dom from 1701. The ninth duke of Argyll married Princess Louise, daughter of Queen Victoria. The Cs. of Breadalbane, Cawdor, and London are cadet branches of the great clan.

Campbell, Alexander (1788-1866), Amer. preacher, was b. in Ireland. In 1809 he went to America to join his father, a Presbyterian minister, who had formed a 'Christian Association' at Washington to promote Christian unity on evangelical principles. In 1811 Alexander became minister at Bethany, W Virginia, and in 1812 succeeded his father as leader of the new church, self-named 'Disciples of Christ,' but generally known as Campbellites (see CHRIST, DISCIPLES OF). Teaching baptism by immersion, he yet fell out with the Baptist churches of Virginia and Pennsylvania, and subsequently with the whole Baptist connection. From 1841 to his death he was president of Bethany College.

Campbell, Archibald, see under ARGYLL. DUKES OF.

Campbell, Sir Colin, Baron Clyde (1792-1863), was the son of a Glasgow carpenter, but his maternal uncle Col. C. provided his education, and in 1808 procured him a commission. He fought at Walcheren and through the Peninsular war, earning a captaincy. After thirty years of active service and garrison duty, he became lieutenant-colonel in 1837, and for brilliant services in the second Sikh war, particularly at Chillianwalla (Chillianwala) and Gujrat (Punjab), was made K.C.B. and appointed in command at Peshawar. Here, in 1849, he spoke of himself as 'old, and only fit for retirement,' but a few years later he commanded the Highland brigade in the Crimea, and won fresh laurels. In the mutiny year, when appointed by Palmerston commander-in-chief in India, he started from London next day, and within a few months stamped out the rebellion. Made Baron Clyde and field marshal in 1858, he returned home in 1860, and was awarded a pension of £2000. Three years later he was buried in Westminster Abbey.

Campbell, George (1719-96), Scottish divine, was b. at Aberdeen, and educated at Marischal College. He was apprenticed at Edinburgh to a writer to the signet, but left the law in 1741 in order to study divinity. He became principal of Marischal College in 1759, and prof. of divinity there in 1771, in which year he also became minister of Greyfriars. The work by which he is principally known is his *Dissertation on Miracles*, a reply to Hume, pub. in 1763. His *Philosophy of Rhetoric*, pub. in 1766, shows sound learning and good critical judgment. His other works include a new translation of the Gospels (1778), and *Lectures on Ecclesiastical History*, pub. four years after his death, in 1800.

Campbell, George Douglas and John, see under ARGYLL, DUKES OF.

Campbell, Gordon (b. 1886), Brit. rear-admiral. In the First World War he was in command of one of the 'Q' or so-called mystery ships, on which he pub. in 1929 a book entitled *My Mystery Ships*. Awarded the V.C. in 1917. After the war commanded, in turn, the *Impregnable* and

Tiger. Rear-admiral, 1928. M.P. for Burnley, 1931, defeating Arthur Henderson.

Campbell, John, Baron (1779-1861), lord chancellor of England, son of the Rev. George C., of Cnpar, became a law student at Lincoln's Inn, and was called to the bar in 1806. For nine years he occupied himself in reporting *in prius* cases, which he afterwards pub. with notes. His private practice as a barrister was not very successful, but becoming K.C. in 1827, he entered Parliament as member for Stafford in 1830 and was re-elected in 1831. He made his mark as a practical man of business, and was concerned in many useful measures, mostly connected with the rectification of abuses. He strongly supported Lord John Russell's first Reform Bill, and in 1832 was knighted and appointed solicitor-general. Sitting for Dudley, 1832-34, he was then elected at Edinburgh, and represented that city until 1841, taking part during this period, as a Whig, in many fierce contests, especially concerning the abolition of church rates and the reform of eccles. courts. In 1840, as attorney-general, he conducted the prosecution of Frost and other Chartists, who were found guilty of high treason, and in the following year he became chancellor of Ireland, with the title of Baron C. of St. Andrews. He resigned the chancellorship a few weeks later, and devoted his leisure to writing *The Lives of the Lord Chancellors and Keepers of the Great Seal* (1845-69), a work which brought him both fame and obloquy. While valuable as a storehouse of facts, it is frequently inaccurate, prejudiced, and unfair, especially when its author is referring to his own contemporaries. Wetherell said that C. had 'added a new sting to death.' As a judge he was learned, careful, and honest, but as a statesman wanting in broad and generous views.

Campbell, John Francis (1822-85), of Islay, Argyllshire, Scottish author. He spent a great part of his leisure in collecting and arranging Highland songs and folk-lore and in collecting a large number of legends, which he pub. under the title *Popular Tales of the Western Highlands* (4 vols. 1860-62), also other Gaelic stories and ballads. *Leubhair na Fèine* (*Book of the Fiants*), in 1872.

Campbell, John McLeod (1800-72), Scottish divine, son of the Rev. John C. of Kilniver, Argyllshire, was educated at Glasgow and Edinburgh. Soon after 1825 his teaching on the doctrine of the Atonement aroused so much hostility that in 1830 he was charged with heresy. The General Assembly considered the offence proved, and removed him from office. He then went on an evangelical mission to the highlands, and afterwards ministered at Glasgow in a large chapel erected by his supporters. In 1856 he pub. *The Nature of the Atonement*, which was very widely read.

Campbell, Sir Malcolm (1884-1940), Brit. motor engineer who frequently held the world's motor speed record. Sir Henry Segrave (q.v.) was the first to reach

a speed of over 200 m.p.h., his time on Daytona Beach, on March 23, 1927, being 203.79 m.p.h. or 29 m.p.h. better than the previous record held by C. On Feb. 19, 1928, C. reached 206.96 m.p.h., which record was beaten by Ray Keesh, the Amer. motorist, on April 22, 1928, at 207.55 m.p.h., both performances being on Daytona Beach. Then on March 11, 1929, Segrave reached 232 m.p.h., but was in his turn beaten on Feb. 5, 1931, by C. with 246.15 m.p.h. The 'Blue Bird' Napier-C. motor with which this record was accomplished had been often rebuilt since it was begun in 1924. At Daytona in 1931 he attained a mean average speed of 246 m.p.h., and, in 1933, 272 m.p.h. In 1935 he set up a new world's record, over a measured mile, of 301 m.p.h. Knighted in 1931. In 1937 on Lake Maggiore he estab. a motor-boat record of 129.5 m.p.h. In 1938 in his *Blue Bird* he broke his own speed-boat record by averaging 131.41 m.p.h. for two runs over Lake Hallwil, Switzerland. Held the world's record for the fastest trip on water: this was on Aug. 19, 1939, on Coniston Water, his record being 141.74 (142.85 and 140.62) m.p.h.

Campbell, Mrs. Patrick (Beatrice Stella Cornwallis-West) (1865-1940), Brit. actress, b. in Kensington, Feb. 9, daughter of John Tanner and Louisa R. Romani; married Patrick C., who was killed in the S. African war in 1900, and then Maj. George Cornwallis-West. Educated in England and in Paris. Gained a scholarship at the Guildhall School of Music. At twenty-three took up acting as a profession, making her first appearance at Liverpool. Between 1891 and 1893 she was in melodrama at the Adelphi Theatre, where George Alexander singled her out for the part of Paula in Pinero's *The Second Mrs. Tanqueray*. This was the part of her life and her performance put her at once in the front rank of Eng. actresses. Success after success now followed under Alexander, Tree, and Hare. In 1895, at the Garrick Theatre, she acted the title part in Pinero's *The Notorious Mrs. Ebbsmith*. In a season of joint management with Forbes-Robertson at the Lyceum, she played Juliet, Miltiza in *For the Crown* (John Davidson's rendering of *Pour la couronne*), Magda (Sudermann), Lady Trazle, Ophelia, Lady Macbeth, and Paula. Among other good performances were the Rat Wife in Ibsen's *Little Eyolf* in 1897; Mélisande in Maeterlinck's play to the Pelléus, first of Sir John Martin-Harvey and then of Sarah Bernhardt; Hilda Tesman in *Heida Gabler*, and Deirdre in W. B. Yeats's play. In 1914 she gave her memorable performance of Eliza Doolittle in G. B. Shaw's *Pygmalion*. In 1917 came *The Thirteenth Chair*; in 1920 George Sand in *Madame Sand*; and in 1929 *The Matriarch*. In later years she was chiefly occupied in film work. In her youth she had a strange disturbing personality and a languorous It. beauty inherited from her mother; but besides these advantages, she had a keen and cutting wit and a strong sense of humour, a beautiful voice and perfect enunciation.

The simpler emotions were not her true sphere, but she could express the passions with rare intensity. Pub. *My Life and Some Letters* (1922).

Campbell, Reginald John, Christian minister, b. in London in 1867; son of a Methodist minister. Educated privately; also at Univ. College, Nottingham. He went to Oxford in 1891—intending to enter the Estab. Church; but he became minister of the Union Street congregational church, Brighton, and, on the death of Joseph Parker, succeeded him at the City Temple, London, 1903-15. He was in the van of the modernisers of Christianity, issued a book called *The New Theology* in 1907, and filled the Temple continually, but the controversy he aroused over these works has long abated. In 1916 he was received into the Church of England. C. was vicar of Christ Church, Westminster, 1917-21. Vicar of Holy Trinity, Brighton, 1921-29. Other publications: *A Spiritual Pilgrimage* (1916), *Life of Christ* (1921).

Campbell, Thomas (1777-1811), Scottish poet, b. in Glasgow. He was educated at the grammar school and univ. of his native town, and in 1795 went to the is. of Mull as a tutor. Two years later he settled in Edinburgh to study law, but he found the occupation little to his taste, and instead wrote *The Pleasures of Hope*, which appeared in April 1799, and went through four eds. within a year of publication. In 1800 he travelled on the Continent for some months and visited Munich, Leipzig, and Copenhagen. While he was staying at Hamburg he witnessed the battle of Hohenlinden; there, too, he met the hero of his *Epile of Erin*. He contributed articles to the *Edinburgh Encyclopædia*, and ed. the *New Monthly Magazine*. C.'s longer poems, *The Pleasures of Hope*; *Gertrude of Wyoming* (1809); *Theodore* (1824), are not much read now. Their interest lies chiefly in the fame they once achieved. His war songs, *The Mariners of England*, *Hohenlinden*, *The Battle of the Baltic*, are written with a fine energy, and are, for stirring patriotism, unequalled in our language. C. d. at Boulogne, and his body was buried in Westminster Abbey. Works ed. by: Washington Irving, 1810; W. A. Hill, 1851, 1875, 1890; W. M. Rossetti, 1880; J. L. Robertson, 1911. Lives: W. Beattie, *Life and Letters of Thomas Campbell*, 1849, 1850; C. Redding, *Literary Reminiscences and Memoirs of Thomas Campbell*, 1860; J. C. Hadden, *Thomas Campbell*, 1899; W. M. Dixon, *Thomas Campbell: an Oration*, 1928.

Campbell, William Wilfrid (1861-1918), Canadian poet, b. at Berlin, W. Ontario; educated at Toronto and Cambridge, Massachusetts, and entered the Episcopal Church, but soon resigned. Among his works are: *Lake Lyrics* (1889); *Dread Voyage* (1893); *Mordred and Hildebrande* (1895); *Beyond the Hills of Dreams* (1899); *The Practical Side of Imperium* (1904); *Sagas of Vaster Britain* (1906); *Canada* (1907); *War Poems* (1915).

Campbell-Bannerhann, Sir Henry (1836-1908), Liberal Prime Minister. He was b.

on Sept. 7, the son of Sir James Campbell of Stracathro, who was at one time lord provost of Glasgow. C. was the second son, and was educated at Glasgow High School and Glasgow Univ., where he had a brilliant career. After leaving Glasgow he went to Trinity College, Cambridge, where he remained from 1853 to 1858. Both his father and his elder brother were staunch Conservative politicians. In 1868 C. successfully contested Stirling Burghs in the general election which followed the Reform Act of 1868. In 1871 he became financial secretary to the War Office. He was again financial secretary for war, 1880-82, secretary to the Admiralty, 1882-84, and was given Cabinet rank in 1884, becoming chief secretary for Ireland. In 1886 he announced his adherence to his leader, Mr. Gladstone, when the latter declared himself in favour of Home Rule, and was secretary for war in 1886, fulfilling the same office in the gov. of 1892-95. It was the 'corrupt vote' in 1895 that led to the downfall of the Rosebery ministry in 1895. The years which followed were years of great difficulty for the Liberal party. For a time it was impotent, and when Harcourt resigned the leadership in 1898, C. was selected for the vacant post. The outbreak of the Boer war, the opposition of C. to the imperial policy of a section of the Liberal party, led to still graver differences, but in 1901 a meeting of the party unanimously confirmed him in his leadership. The controversial measures of the gov. were unpopular, and the tariff reform policy advocated by Mr. Chamberlain gave the Radicals a fine rallying point. The end came in Dec. 1905, when the Unionists resigned and the king sent for Sir H. C. At the election which followed the political pendulum swung, the Liberals winning 379 seats. The prin. measures of his gov. were an Education Bill, an Irish Council Bill, and a plural Voting Abolition Bill, all of which were either rejected or previously altered by the House of Lords. Amongst the important measures which were passed may be mentioned the Small Holdings Act, a Trades Dispute Act, the Patents Act, and the Merchant Shipping Act. But almost immediately after his acceptance of the premiership C. began to fail in health, and to be unable to fulfil the duties of the office, and the leadership of the House passed practically into the hands of Mr. Asquith, and ultimately C. resigned on April 5, 1908.

Campbellites, see CHRIST, DISCIPLES OF. **Campbelltown**, seaport in Argyllshire, Scotland, on the peninsula of Kintyre, 36 m. S. of Tarbert. The harbour, sheltered by Davaar Is., is an excellent one; shipbuilding is carried on, and herring fishing. Whisky is distilled and exported, and there are manufs. of woollens. The town, which was anciently called Dalruadhain, has a pop. of 7000.

Campbelltown, N. Carolina, see FAYETTEVILLE.

Campeachy (Sp. Campeche) is the name of a state, a town, and a bay in the state of Mexico. The state is level in character,

and rice, sugar-cane, and tobacco are grown. Dye-woods, cordage of sisal hemp, cotton, and indigo are the prin. exports. Area of state, 18,087 sq. m. Pop. 90,000. The tn. of C. is situated on C. Bay, 90 m. to the S.W. of Merida. The harbour is safe but shallow; cigars and palm-leaf hats are the prin. manufs. The tn. was founded in 1540 on the side of a vast series of catacombs of the Mayas, and was repeatedly sacked by buccaners. Pop. 18,000.

Camperdown, tn. in Victoria, Australia, 123 m. from Melbourne. Pop. 3500.

'**Camperdown**,' 10,600-ton Brit. battleship, launched in 1885, which rammed and sank the *Victoria* in collision in 1893 (see 'VICTORIA').

Camperdown, Battle of. Eng. naval victory over the Dutch, fought on Oct. 11, 1797, which served to wipe out the disgrace of the mutiny of the *Nore*, the Dutch fleet under De Winter being destroyed. The victor was Adm. Duncan, whose fleet comprised seven ships of seventy-four guns, seven of sixty-four, besides a few frigates and cutters; the Dutch fleet, of four of seventy-four guns, seven of sixty-four, and other smaller ships, being only slightly inferior in strength. Duncan captured no fewer than eleven of the Dutch ships, but the casualties were heavy on both sides. The battle was fought a few miles off the Dutch coast, near the vil. of C., and Duncan in recognition of the victory was created Lord Duncan of C.

Camphor ($C_{10}H_{16}O$), waxy translucent substance closely related to the etheral oils, obtained from the C.-tree (*Camphora officinarum*). It is produced in Japan, along the coast of China, but mostly in the is. of Formosa. The substance is obtained by storing chips of C. wood in earthenware vessels closed at the top, into which a current of steam enters. The C. is volatilised, and passes with the steam to the top of the pots, where it condenses in the form of small white crystals. C. has a sp. gr. nearly equal to that of water, melts at $178^{\circ}C$, and boils at $204^{\circ}C$. It is used as an ingredient in many liniments

for sprains, muscular rheumatism, etc. It is also largely used to keep away moths and noxious insects from clothing, furs, stuffed animal specimens, etc. C. was synthesised by Komppa in 1909, and it is now manufactured artificially from turpentine.

Camphoric Acid ($C_{10}H_{16}O_6$), substance formed by digesting camphor with nitric acid. It forms colourless flakes which do not readily dissolve in water.

Camphor Oil, reddish liquid which is produced in the distillation of chips of the C.-tree. The crude product usually contains a quantity of C. in solution.

Camphorsulphuric Acid, $C_{10}H_{16}O \cdot SO_2H$, made by the action of fuming sulphuric acid on camphor, is a white crystalline solid used by Sir William Pope (1870-1939) in his classical researches upon stereochemistry.

Campi, or **Campo**, family of It. artists, of the school of Cremona, their bp.

Galeazzo Campi (1475-1536), the founder of the family. He was a pupil of Boccacino, but his style is in imitation of Perugino. His 'Resurrection of Lazarus' is at Castelmaggiore.

Giulio Campi (1502-72), son and pupil of Galeazzo. He studied under Giulio Romano at Mantua, but modelled his style on that of the great masters.

Antonio Cavaliere Campi (c. 1522-c. 1600), studied with his brother Giulio under Giulio Romano. He painted historical pieces in oil and fresco, modeling his art upon Correggio. His prin. pictures are 'St. Paul raising Eutychus,' an altar-piece of the Nativity, and 'St. Jerome in Meditation' (in the Prado). He was commissioned to paint for Philip II. of Spain at Madrid, and won some reputation as an architect and writer.

Bernardino Campi (1522-1592), was probably related to this family. He studied under Giulio C. and Ippolito Corta at Mantua, and imitated the work of Titian, Raphael, and Correggio. He was chiefly employed in the churches of Italy. In 1584 he pub. a treatise on painting, *Parer sulla pittura*.

Campine, see KEMPEN.

Campion, Edmund (1540-81), Eng. theologian and Jesuit. b. in London, his father being a bookseller. Educated at Christ's Hospital and Oxford. Recanted Protestantism at Douay in 1571 and, seven years later, was ordained deacon and priest by the archbishop of Prague. Came to England on a Jesuit mission and pub. his *Decem Rationes*, against Protestantism. Arrested in Berkshire in 1581, where he had taken refuge on account of the gov.'s proclamation against Jesuits. Committed to the Tower, put to torture, and subsequently convicted on the most shadowy evidence of seditious conspiracy, and hanged, drawn, and quartered. See life by Richard Simpson, 1867.

Campion (Campion), Thomas (c. 1576-1620), Eng. poet and musician. b. at Witham, Essex, and educated at Cambridge and on the Continent; studied law at Gray's Inn, but, discarding it, practised medicine in London. A delicate

writer of vocal music, for lute accompaniment usual at the period; a writer of masques, among the best of their kind; author of many fine lyrics notable for their metrical finish. He also displayed his nimble wit and scholarship in Lat. verse and discussed in prose form the values of music and poetry. His songs are light as thistledown seeming to float away in the air. The best known are *There is a Garden in her Face* (*Cherry Ripe*) and *My Sweetest Lesbia! Let us Live and Love*, a fine trans. of Catullus's *Vivamus, mea Lesbia*. C. was concerned in five books of airs or three collections: (i) *A Book of Airs*, by Thomas C. and his friend Phillip Rosseter. The words of the second part of this collection, set by Rosseter, do not appear to be by C. The book is dated 1601. (ii) *Two Books of Airs* (*Divine and Moral Songs and Light Concepts of Lovers*), date probably 1613. (iii) *The Third and Fourth Books of Airs*, which is said to have appeared soon after 1617. He also wrote *Poemata* (*Thomas Campian's Poemata*), in Lat., which includes occasional poems, elegies, and epigrams (1595). The *Observations in the Art of English Poesy* (1602) is an attack on the use of rhyme and a plea for the adoption of unrhymed metres formed on classical models. (C.'s own *Rose-cheeked Laura*, come in an example. Daniel's *Defence of Rhyme* was an answer to this plea. He also composed the music for most of his songs. His *Collected Works* were ed. by A. H. Bullen (1889). See S. Daniel, *Thomas Campian: Observations in the Art of English Poesy*, 1602; E. Arber, *English Garner: Shorter Elizabethan Poems* (containing the books of airs), new ed., with an introduction by A. H. Bullen, 1903; also *Cambridge History of English Literature*, iv., 141-48.

Campion, popular name of sev. species of *Silene* and *Lychnis*. *Silene latifolia* is the bladder C.; *S. maritima*, the sea C.; *S. acaulis*, the moss C.; *Lychnis alba*, white C.; *L. coronaria*, rose C.; and *L. dioica*, red C.

Campoamor y Campoosorio, Ramón de (1817-1901), Sp. poet and politician, b. in the Asturias. In youth it was his aim to enter the Society of Jesus, but he took up medicine as his true calling, and then deserted it for poetry and politics. A zealous Conservative, he served as governor of Alicante and Valencia, and both in speeches and in polemical writings fiercely assailed democracy. But he was not taken seriously as a politician, nor are his essays regarded as of any real importance, his professed 'convictions' being looked upon as only 'occasions for humorous ingenuity.' His ventures into the sphere of drama are by no means remarkable. His two chief plays are *El Pulcero de la Verdad* (1871) and *Dies Irae* (1873), others being *El Honor* (1874), and *Glorias Humanas* (1885); and in the same sphere he wrote *El Drama Universal*, a pretentious poem in eight cantos. His claim to a place in Sp. literature is his invention, as he supposed, of a new poetic genre under the names *doloras* and *humoradas*; but critics have long failed to detect

any genuine novelty in the forms under those names. *Doloras* has been variously defined or described, but the clearest description seems to be that it is a 'transcendental' fable in which the persons typify the 'verities'—palpably unoriginal; while *humoradas* is merely an amplified *doloras*. None the less these witty poems are self-revelatory, and do succeed in attaining brevity, pathos, and refinement in an ironic setting. Withal C., who in his time was the accepted doyen of Sp. literature, was an accomplished craftsman, even if his verse lacks essential poetic feeling, and a colner of brilliant aphorisms and epigrams, even if his philosophy lacks substance.

Campobasso, formerly Molise, is the name of a prov. and tn. in Italy. The prov. extends from the S. Apennines to the Adriatic, and has an area of 1778 sq. m. Sheep and goats are reared, and wheat, maize, and olives grown. The cap. of the prov., C., is situated 50 m. to the N.E. of Naples. It is a fort. tn.; the manufs. of cutlery are considered the best in Italy, and silk, paper, and hats are made. The fourteenth-century church of San Giorgio was severely damaged in the Second World War. Pop. 29,000.

Campo Formio, vil. of N. Italy, 6 m. S.W. of Udine. Celebrated for the treaty of peace concluded here between Austria and France in 1797, when Napoleon, fresh from the subjugation of Italy, threatened Vienna. Pop. 3500.

Campomanes, Don Pedro Rodríguez, Conde de (1723-1802), Sp. statesman, b. in Asturias. He was president of the Cortes, and director of the Royal Academy of History; during his term of office as minister of state he introduced many reforms, such as the opening of Sp. ports to foreign trade, the free import of raw materials, and the institution of a national bank.

Campo y Zabaleta, Conrado del (b. 1879). Sp. musical composer, b. in Madrid. One of the chief figures in modern Sp. music. Possesses a complex musical mind, and though accused of opposition to Sp. traditions, he has been also described as the Sp. Strauss; has a mastery of modern technique and excels in chamber and symphonic music. All his works, and they are very numerous, have been performed in Spain, many having won prizes. Was for many years the viola soloist at Madrid Royal Opera House and the Orquesta Sinfónica, of which he was a founder. Operas and other works: *El Final La Dama Desconocida*; *Leonor Teller*; *Los Amantes de Verona*; *Don Alvaro*; *Tragedia del Beso*; *Dies Irae*; *Avapiés*; *La Flor del Agua*; *La Divina Comedia* (orchestral trilogy with chorus); *Granada y Galicia* (a symphonic poem); *Danza del Nícar* (orchestral); *Kasida*; *Don Juan de España* (orchestral suite); *Aires*, *Atríños*, *Aires* (for orchestra, solo voice, and chorus).

Campus Martius (the plain of Mars) was the name given to a large plain skirting the walls of Rome on the N.E. side; it was called also *Campus* as being the plain of the city. It was sacred to Mars, and was therefore used for military manoeuvres,

contests, etc. During the later period of the republic it was laid out in walks, baths, etc., and was used as a public recreation ground.

Campus Stellæ, see SANTIAGO DE COMPOSTELLA.

Camulodunum, see COLCHESTER.

Camrose, of Long Cross, first Baron, William Ewart Berry (b. 1879), Eng. journalist and newspaper proprietor; one of a family of three sons of Alderman J. M. Berry of Merthyr Tydfil, Wales. With his two brothers, Henry Seymour, Lord Buckland (killed in an accident while hunting, 1928) and James Gomer Berry (now Lord Kemsley, built up the great Berry brothers' interests of newspaper ownership and big business; C.'s part being mainly on the newspaper side. Editor-in-chief of the *Sunday Times* from 1915. In 1907 he founded the *Advertising World*; later became proprietor of the *Daily Telegraph*, chairman of Allied Newspapers, and other groups of papers. Baronet, 1921; peer, 1929. Did valuable work in the Ministry of Information, 1939.

Camwood, name of a wood obtained from a tree that grows in Africa and Brazil. From it an exceedingly brilliant red dye is obtained, of which the only defect is its lack of permanency.

Cana of Galilee, vil. of Palestine, the traditional scene of Christ's first miracle (John ii.). Now called Kefr Kenna.

Canaan (low lands) was the name which was originally applied only to the low coastland of Palestine, on the Mediterranean, as opposed to the mt. lands (Numbers xlii. 29).

Canada. Before the year 1867 C. was a region which extended from the watershed W. of Lake Superior eastward to Labrador, and had a length of about 1400 m. and a breadth varying from 200 to 400 m. The independent Brit. provs. of Nova Scotia, New Brunswick, Prince Edward Is., and Newfoundland, together with the immense area owned by the Hudson's Bay Company, constituted with C. the Brit. possessions in N. America. Various considerations caused the union of these provs. (excluding Newfoundland) into the dominion of C. in 1867; these reasons will be dealt with in the historical section. The dominion of C. was constituted by the British North America Act of 1867, which united the various colonies of Brit. N. America. The first colonies to unite were upper and lower C., Nova Scotia, and New Brunswick; what had formerly been the Hudson Bay ter. was bought from that company, and formed into the provs. of Manitoba and the N.W. Ter. These were admitted into the confederation in 1870. In the following year Brit. Columbia joined the union, and in 1873 Prince Edward Is. Out of the N.W. Ter. in 1905 were carved the two new provs. of Saskatchewan and Alberta, leaving under dominion administration the dists. of Mackenzie, Keewatin, and Ungava. C., as now formed, is bounded on the N. by the Arctic Ocean, on the W. by the Pacific Ocean and Alaska,

on the E. by the Atlantic, and on the S. by the U.S.A.

The dividing line between C. and the United States is the middle line of Lakes Superior, Huron, Erie, and Ontario, and to the W. of the Lake of the Woods the parallel of 49° N. lat. The middle line of the St. Lawrence as far as the parallel of 45° N. forms the boundary E. of the Great Lakes; then the boundary line runs by that parallel to Hall's Stream, the most westerly of the headwaters of the Connecticut R., and by that stream to its head. The water-parting of the St. Lawrence basin is the continuation of the boundary to about 46° N., when it is continued by arbitrary straight lines between the St. John R., the Grand Lake, and the Croix R. as far as Passamaquoddy Bay on the Atlantic. The whole of the N. part of the continent, including the Arctic Is. W. of Greenland, is Canadian ter., with the exception of Alaska, which belongs to the U.S.A.

Physical Features.—The is. of the Arctic Archipelago are connected with the hist. of commerce and exploration, for a N.W. passage to the E. of Asia was vainly sought for many years among the channels separating the is. Maclure between 1850 and 1853 effected a passage, but the discovery was of no commercial value, as the route is too much hampered by ice. The Atlantic and the Pacific shores are well supplied with deep bays which form magnificent harbours. On the Atlantic coast the chief indentations are the Bay of Fundy, which is remarkable for its high tides and 'bores', the gulf of St. Lawrence, and Hudson Bay, which has an area of over 350,000 sq. in. The Pacific coast has no such vast bays, and is smaller in extent than the Atlantic coast, but it is broken up in a noteworthy manner by fjords. There are a good number of is. off the coasts. Vancouver Is. and Queen Charlotte Is. are the most noteworthy off the Pacific coast; Prince Edward Is., Cape Breton Is., and Anticosti on the Atlantic side. Plains and undulating lowlands make up the surface to the E. of the Rocky Mts. Large tracts in the N. are composed of tundras similar to those of N. Russia and Siberia; these descend as far as the 58th parallel on the W. shore of Hudson Bay, and extend still further E. along the whole coast of Labrador. The whole of the dominion E. of Lake Winnipeg, except the area mentioned above and the portions cleared for agriculture, is covered with forests of pines and firs. The prairie lands succeed this region in the W. of the dominion; these are of greatest extent on the tablelands immediately to the E. of the Rocky Mts. The prairie region rises in what are known as the three prairie steps from E. to W. The Red R. valley is the lowest level, with an altitude of about 750 ft.; the surface rises to 1500 ft. W. of that valley, and then extends westwards, forming a terrace of about 250 m. in extent; after that the ground rises rapidly to 2000 ft., then rises in a more gradual slope to the foothills of the Rockies. All the land forming these prairies is of the

highest importance from an agric. point of view, as the soil is fertile and the climate is favourable for agriculture. To the E. of the Great Lakes no outstanding features are to be found. The Laurentian Mts. skirt the St. Lawrence on the N., the S. range terminates in the cliffs of Gaspé.

Lakes, Rivers, and Mountains.—The prin. lakes are: Lake Superior (area 31,800 sq. m.), Lake Michigan (22,400 sq. m.), Lake Huron (23,200 sq. m.), Lake Erie (10,000 sq. m.), Lake Ontario (7260 sq. m.). The prin. rvs. are: St. Lawrence (length 1900 m.), Saguenay (405 m.), Ottawa (685 m.), Hamilton or Grand in Labrador which flows into the Atlantic

there are a number of lakes of varying sizes, some joined together, others isolated. The whole area from the lower St. Lawrence to the shores of Lake Winnipeg is composed almost entirely of Archæan rocks. The surface features of this region are similar to those of the unorganised ter. of the N.W., where granite is known to prevail over very large areas. Silurian rocks succeed the Archæan in the E. of the dominion, with one or two patches of Cambrian; these formations extend along a narrow piece of land bordering the St. Lawrence from a little below Quebec and occupying the whole area between the St. Lawrence and lower Ottawa. The area

Canadian Government

BOW RIVER VALLEY, BANFF

Ocean; Dubawnt (580 m.), Severn (420 m.), Attawapiskat (465 m.), Albany (610 m.), Big (520 m.), Nottaway (400 m.), Koksoak (335 m.), Kanapiskau (415 m.), flowing into Hudson Bay; Columbia (465 m. in Canada), Fraser (695 m.), Yukon (1765 m.), flowing into Pacific Ocean; Mackenzie (2525 m.), Liard (550 m.), Athabasca (765 m.), Peace (1065 m.), Coppermine (525 m.), Back's (605 m.). The prin. mts. are: (1) In the Yukon dist.: Logan Mts. (19,539 ft.), Hubbard (16,100 ft.), Vancouver (15,617 ft.), Augusta (14,900 ft.), Newton (13,860 ft.), Cook (13,700 ft.). (2) In Brit. Columbia: Fairweather (15,292 ft.), Columbia (14,000 ft.), Bullock (13,000 ft.). (3) In Alberta: Columbia (14,000 ft.), and Forbes (13,400 ft.).

Geological Formation.—The geological structure of C. is of very great physical features. Archæan and other crystalline rocks extend over very large continuous areas, and where such rocks prevail the earth covering is as a rule only a thin layer spread over a hard foundation. Over this thin earth many rvs. flow with innumerable turns and windings, and

between Lake Ontario and Georgian Bay, together with the N. part of Lake Huron, extending nearly as far N. as the Mada-waska R., is composed of the same class of rocks; the S.W. part of the lake peninsula between Lake Erie and Lake Huron is composed of rocks of the Devonian period. Lakes Manitoba and Winnipegosis are also almost surrounded by Devonian rocks. The Archæan rocks near Lake Winnipeg are succeeded by Silurian and Devonian strata, which stretch westwards in strips running parallel with Lake Winnipeg and Lake Manitoba. To the W. of these formations a vast area of Cretaceous deposits is found, of which the precise limits have not yet been determined. Tertiary rocks are found here and there to the westward of the above area, and the geology of the mountainous tract in the W. is much too complicated to be dealt with in detail. Over almost the whole of the dominion glacial deposits are found, and in some places there are aqueous deposits; the rich soil of the Red R. valley in Manitoba is formed by aqueous deposits.

Climate.—The climate of C. is characterised by greater extremes of heat and cold than that of Great Britain, but is healthy on the whole. E. of the Rocky Mts. the climate of the dominion has those extremes of temp. which are prevalent all over the N. hemisphere in the same lats., save in those regions which are exposed to S.-westerly winds from the sea. The difference in the climate of W. C. and Europe is mainly due to the fact that the area between the Rocky Mts. and the Pacific is mountainous in character, and the mts. extend at right angles to the prevailing winds and parallel with the coast. For this reason great contrasts both of rainfall and temp. are found close to the Pacific. The total precipitation is very scanty to the E. of the Rocky Mts. as far as E. Assinibola, when it begins to increase again. Since the future of the Canadian W. still depends largely on its cultivation of wheat, the peculiarities of the climate as affecting this industry must be borne in mind. Most of the total precipitation takes place during the summer months; a considerable proportion of the precipitation is in the form of snow. This is the case throughout the dominion of C., but in a much greater degree in the E. than in the W. From this snowfall springs in each part of the country a different advantage for the cultivation of wheat. The great advantage of the snow in the E. region, where the precipitation is distributed more equally throughout the year, is that it protects the ground against the severe frosts. Therefore in those regions 'fall' or winter wheat can be grown. In Manitoba, Saskatchewan, and Alberta the frost precedes snow, and spring wheat only can be grown. But the melting of the frozen water in the spring furnishes moisture at the time when it is wanted, save in the very dry parts of this region, where irrigation is receiving the attention of the gov. as well as of private individuals. The rainfall does not determine the amount of the produce so much as whether or not frost occurs before harvest. The risk of crops being ruined in this manner is being lessened by the careful choice and cultivation of hardy varieties of wheat, which ripen quickly. Spring in C. commences in April, two or three weeks later than in England, but by the middle of July the crops of the latter country can claim no advantage in their condition. June, July, Aug., and Sept. may be said to constitute the summer, and from Oct. to the middle of Nov. is the autumn. The remaining portion of the year, from the middle of Nov. to the end of March, is the winter. Although cold temps. are frequently found, the Canadian air is generally dry and exhilarating, and the climate in consequence salubrious. The temp. in the winter in dists. near to the mts. is mitigated by warm winds, which blow from the S.E., S., or S.W. on the westward side of the Rocky Mts., and from the S.W., W., or N.W. on the E. side. These winds are known as chinook winds, and they account for stock-raising being an important industry in Alberta,

as these winds cause the cold of winter to alternate with periods of warm weather when the ground is cleared of snow, and the grasses flourish.

Canals and Waterways.—Canals were the earliest large transportation works in C. One of the first locks was a small one constructed by the Hudson's Bay Company at Sault Ste. Marie which was destroyed by U.S.A. troops in 1814. Another was built at the Lachine rapids in the St. Lawrence above Montreal in 1825, followed by the Welland Canal in 1829 to overcome the obstacle of Niagara Falls. The Rideau Canal (military in primary purpose), the St. Lawrence system, and the Chambly Canal followed. To-day there are six canal systems under the dominion department of Transport, namely (1) between Fort William and Montreal, (2) from Montreal to the international boundary near Lake Champlain, (3) from Montreal to Ottawa, (4) from Ottawa to Kingston, (5) from Trenton to Lake Huron, and (6) from the Atlantic Ocean to Bras d'Or lakes to Cape Breton. These canals have opened to navigation from the Atlantic about 1890 m. of waterways. Under the dept. of Public Works or other authority are minor canals and locks to facilitate local navigation on disconnected waterways. Among projected canals the most important are those connected with the deepening of the St. Lawrence waterway. The Great Lakes and St. Lawrence R. form one of the busiest waterways in the world. More traffic passes up and down the Detroit R. than any other waterway, and the traffic through the canals at Sault Ste. Marie in 1929 reached a peak of 92,617,000 tons, more than through the Panama and Suez Canals combined. The greater part of this traffic is iron ore from Lake Superior to the U.S.A. ports on Lake Erie and return cargoes of coal, and grain down-bound destined to St. Lawrence ports, Buffalo, Port Colborne, and other lower-lake ports. The maximum draught of vessels plying between the lakes is governed by channels in the Detroit and St. Mary's Rs., and is limited to about 21 ft. Since 1931 when the New Welland Ship Canal, with 25 ft. in the stretches between locks (the locks have 30 ft. of water above the sills) was opened large upper-lake vessels have passed down as far as Prescott. The St. Lawrence canals have a depth of 11 ft. (reduced in periods of low water) so that ocean vessels, except of very small tonnage, cannot sail up into the lakes; a few such vessels have been engaged in the Lakes traffic for sev. years, bringing over cargoes from European ports. Traffic using the St. Lawrence canals reached a new high record in 1937, with 9,195,400 tons despite a relatively light movement of wheat. About a third of the St. Lawrence and Welland Canals traffic is grain and other agric. products. Canal traffic in 1943 and 1944 averaged 21,000,000 tons (Welland Ship, 10,000,000 tons; St. Lawrence R., 6,148,000 tons; Sault Ste. Marie, 4,569,000 tons; Richelieu R., 288,000 tons).

Railways.—Transportation has always, in spite of the great achievements of engineering skill in C., presented difficult problems in that country. In the pioneer days, when communication was principally by the rivers, difficulties of navigation on the St. Lawrence, which reaches into the centre of C., were multiplied by the frequent falls and rapids. The earliest heavy expenditure for public works in C. was in respect of canals; then came the era of railways, and with it the problem of overcoming sections of rough and difficult terrain, which even to-day, of course, offer problems for solution by the transportation engineer. The periods of rapid railway development were always attended with striking results in the general economic conditions in C. Railways are of supreme importance to the country, and it is significant that the two great systems, the Canadian Pacific Railway and the Canadian National Railways, are the largest single employers of labour in the dominion. The first Canadian railway was constructed in 1836 between St. John's and La Prairie. It was at first operated by horses, locomotives being substituted in 1837. By 1850 there were only some 60 m. of railroad in C. With the inauguration of the Grand Trunk system, and subsidiary lines, development was accelerated, and by 1864 the total mileage had reached 2200, the Intercolonial, which joined the Maritime provs. and Quebec, being an integral part of the Confederation compact. With the completion of the Canadian N. Railway and the Grand Trunk Pacific in the twentieth century, C. possessed the most extensive railway system of any country of its pop. The total single track mileage of steam railways in operation to-day (1948) is 42,335. The total mileage, including second track, and sidings, is slightly over 57,000. The money invested in the thirty-five Canadian railways amounts to \$3,000,000,000, the gross earnings being \$288,000,000. The tonnage of freight, which in 1875 was 5,600,000, is now upwards of 120,000,000. The Intercolonial and the Prince Edward Is. were always owned by the dominion gov. In 1915, on the failure of the Grand Trunk Pacific to take over the National Transcontinental Railway from Moncton to Winnipeg, the gov. undertook its operation, as well as that of the Lake Superior branch of the Grand Trunk Pacific. In 1917 the gov. acquired the capital stock of the Canadian N. Railway Company, and in 1919 the Grand Trunk was included in the gov. railway system, which in 1922 was consolidated and reorganised under a single national board, the Canadian National Railways (C.N.R.). This system controls 23,687 m. of railway, the largest single system in N. America, and it includes Quebec Bridge (central span, 1800 ft.), next to Sydney Bridge, the longest in the Brit. Empire. The Canadian Pacific Railway has 17,038 m. of railroad, and has subsidiary steamship lines on the Atlantic and Pacific, thereby ranking as one of the great trade routes of the world. The Canadian Pacific Railway has an

advantage over its older rivals, the N. Pacific and the Union and Central, in the lower height of its passes and the shorter length of route at high levels; though the Canadian National Railway (4518 m.) has as good a route on the whole as the Canadian Pacific Railway. These two railways jointly own the N. Alberta, with 923 m. of road, and the Toronto Terminals with 3.19 m. The Canadian National operates the Hudson Bay Railway, with 510 m. of road, for the dominion gov. and owns the Central Vermont with 25 m. of road in Canada, and the Thousand Is. Railway with 4.5 m. U.S.A. railways operating in C. account for 863 m. and, of the remaining 1891 m., the provincially owned roads, the Temiskaming and N. Ontario and Nipissing Central, in Ontario with 574.43 m., the Pacific Great E. with 347.8 m. in Brit. Columbia, and the Greater Winnipeg Water Dist. with 92 m., owned by the city of Winnipeg, account for over half. Thus 23,810 m., or 56 per cent of the total miles of railway in C., are publicly owned. Under the agreement between C. and the newly created prov. of Newfoundland, C. takes over the Newfoundland railway (including some marine services). There are over 700 m. of gov. railway line in Newfoundland. The lines constituting the Canadian National and the Pacific Great E. were taken over by the dominion and prov. govts. because of the inability of the companies to continue operations. The Railway Commission, organised in 1904 to supersede the railway committee of the Privy Council, and now the Transport Commission, has jurisdiction over all freight, passenger, and other railway rates, except certain rates on grain in the Prairie provs. which are all fixed by statute. The commission also has jurisdiction over safety features of railway operations, the train service, and the abandonment of services and track and other relevant railway activities and jurisdiction over rates for certain waterborne traffic.

Electric Railways and Roads.—There are now some thirty-seven electric railway companies in operation, owning 1771 m. of track. The total investment in electric railways is about \$205,000,000. The highways in C. are becoming increasingly important every year in the economic life of the dominion; and over them passes a very heavy passenger and freight traffic. Since the advent of the motor vehicle, and more especially since 1919 when the dominion gov. made a grant to the provs. of \$20,000,000 for the construction of roads and to relieve unemployment, the mileage of paved highways has increased rapidly each year. For the seven years, 1929-35, the average expenditure on rural roads was over \$73,000,000, exclusive of some expenditure on local roads by rural municipalities. These expenditures ranged from \$93,000,000 in 1930 to \$40,500,000 in 1933. The mileage of surfaced roads during these years increased by 19,000, amounting to 125,000 in 1944. The number of motor vehicles registered in

C. in 1906 was 1447; by 1916 it had increased to 128,328; by 1926 to 832,268, by 1946 to 1,622,400. This extensive use of motor vehicles is revolutionising conditions in C. as in other countries. The passenger travel by steam railways has declined rapidly, but the total travel has probably increased many times during the past two decades.

Air Navigation.—The aeroplane has provided a vastly improved means of transportation in the undeveloped N. areas of C., where the only alternatives were canoe in summer and dog team in winter. Air travel soon proved not only much quicker, but much cheaper, and a

tato progress along this line. This airway began experimental flights between Vancouver and Winnipeg on Jan. 1, 1938, and two months later a start was made in transporting mail over this portion of the airway, while by Oct. modern aids to air navigation, including night-flying facilities, were completed and a regular air-mail service was instituted. On Oct. 17 an express service was extended to Toronto and Montreal, and before the close of the year a daily air-mail service was estab. between Vancouver and Montreal. Services were also estab. between Lethbridge and Edmonton, and from Regina to Moose Jaw, Saskatoon

Compagnie Aérienne Franco-Canadienne

QUEBEC: DOCKS AND GRAIN ELEVATORS AT THE MOUTH OF THE
ST. CHARLES RIVER

rapid expansion took place without the aid of gov. subsidy. The mileage flown by aircraft was 185,000 in 1922. In 1946 Trans-Canada Air Lines, the national air service, flew 14,162,300 m., carrying 305,400 passengers. Other air carriers, including the Canadian Pacific Air Lines, transported 18,344,600 lb. of freight and 4,811,800 lb. of mail. Furthermore, the aeroplane has proved a great boon in the administrative sphere in C. in developing and conserving the vast natural resources of the country. Aerial forest fire patrols are now conducted over large parts of almost every prov.; fishery patrols by aeroplane protect territorial waters and enforce fishing regulations, and aeroplanes, equipped with special cameras, make rapid preliminary surveys over large tracts of difficult country. This is a special development in C., for in other countries air traffic between the chief centres of populations has generally received most attention. The Trans-C. Airway is designed to facil-

Prince Albert, and N. Battleford. By 1939 there were in operation thirty radio range stations at approximately 100-m. intervals except in the mt. section where the spacing is closer. Adjacent to most of these are airports fully lighted for night-flying. Meteorological services provided weather maps four times a day, and dist. forecasts for the ensuing six hours. The service on the section E. of Montreal was subsequently extended to Moncton.

When the Second World War began, civil aviation was playing an ever greater part in the daily life of the nation. The plane was taking a leading part in mail deliveries in all areas; in transporting passengers and goods to the outposts; in photographing and mapping uncharted areas; in exploring and prospecting; in the transport of hunters and trappers to inaccessible areas; and in taking tourists into the remoter parts for hunting and fishing. In addition to these activities, there was a development of inter-city air traffic on a large scale from ocean to

ocean. The Second World War necessitated the suspension of all these activities in the interest of national defence; but during the war period the position of Canada in the air was enormously strengthened by improved technology and a great increase in the numbers of trained personnel, and also by the efficient organisation built up. The successful progress of the war in Europe in 1944 made it possible to curtail the Brit. Commonwealth air-training plan (See AIR FORCE, ROYAL), and this meant that a number of air ports became available for civil flying. In the development of the N.W. airways system, the operating of the N.W. staging route is important, this being the main artery for air traffic between the U.S.A. and Alaska, and beyond to N.E. Asia. This route is Canadian property and was initially built, developed, and operated by C., and subsequently improved with the co-operation of U.S.A. army engineers and workmen. The possibilities of an airway connecting with the trans-C. system at Edmonton to give access to all parts of N.W. C. and Alaska had long been appreciated. The survey parties were still in the field at the outbreak of the Second World War, but it was decided not to abandon the project despite the existence of possibly more urgent needs, but to expedite the completion of the route, and this decision was justified by subsequent events. The total cost of the war-time development of this route was nearly \$60,000,000. During the war, with the completion of Goose Bay air base by C. and the Greenland and Iceland airfields by the U.S.A., a staging route was available for short-range aircraft in the N.E., but later air routes were organised over N.W. C. to ferry long-, medium-, and short-range aircraft to Europe.

Telegraphs, Telephones.—To-day there are over 55,750 m. of telegraph lines in C. Six trans-oceanic cables terminate in C.—four on the Atlantic and two on the Pacific. There are also eighteen other cables from Atlantic ports to Newfoundland, St. Pierre and Miquelon, Bermuda, and U.S.A., and Canadian ports. Radio telephony has also been estab. Though the telephone was invented in C., telephone development in C. dates only from 1880. To-day there are over 1,848,000 telephones in the dominion (plus about 12,000 operated by the Avalon telephone system of Newfoundland), and there are well-organised gov. systems in the Prairie provs. and in Newfoundland. C. has more telephones *per capita* than any other country except the U.S.A. The first exclusively Canadian postal service dates from 1788, when a monthly courier route from Halifax to Quebec was estab. In 1851 the post office was transferred from the control of the Imperial Dept. to the provs., and at Confederation, the provincial systems were transferred to the dominion, when the domestic rate on letters was reduced from 5 cents to 3 cents per 4 oz.; in 1897 it was further reduced to 2 cents per oz. To-day the post office is under a special dept., the dominion

being divided into fifteen dists., which embrace a ter. more extensive than that served by any other systems in the world except those of the U.S.A. and Russia.

National Radio.—The Canadian Broadcasting Corporation, estab. on a basis similar to that of the Brit. Broadcasting Corporation, replaced the Canadian Radio Broadcasting Commission on Nov. 2, 1936. It has a board of nine unpaid governors (appointed for three years in rotation), which acts as 'trustee of the national interest in broadcasting,' and is responsible for the policies of the corporation. It is thus the guarantee to the public that broadcasting is administered in a non-partisan and business-like manner. The corporation is responsible to Parliament through the minister of transport. In 1938 two 50,000-watt transmitting stations were installed, the first high-power transmitters in C.—C.B.I. at Hornby, Ontario, serving the prov. of Ontario, and C.B.F. at Verchères, Quebec, for the prov. of Quebec. Similar transmitters were later constructed at Aulac, Cole's Is., New Brunswick (C.B.A.) to give coverage in the Maritime provs. and C.B.K. for the Prairie provs. In addition to the stations owned by the Canadian Broadcasting Corporation, the national network includes a large number of privately owned transmitters. Close relations have been estab. with U.S.A. broadcasters, and exchange of programmes by U.S.A. networks has met with increased success.

Shipping.—The tonnage of sea-going vessels entered and cleared at Canadian ports showed a continuous increase up to 1914 and again after the First World War. The increase in sea-going and inland international tonnages was from 13,000,000 in 1868 to 83,000,000 in 1928. The tonnage of coasting vessels increased from 10,000,000 in 1876 to 89,000,000 in 1928. The number of vessels on the Canadian shipping registry was 8573 in 1919; by 1935 the number had increased to 10,127 representing 1,274,100 tons. At present the registry has 9369 sea-going and inland vessels, representing a total net tonnage of over 1,645,200. Additionally to this there are 2383 vessels representing over 106,300 tons in Newfoundland. In the seventies, shipbuilding was an important industry in C., especially in the Maritime provs., the vessels built being mostly wooden sailing vessels. The invention of the iron steamboat caused a decline in the trade, and the number of vessels built and registered declined each year from 1885 to 1914. But the First World War stimulated shipbuilding. During 1927, fourteen steel vessels of 23,800 tonnage and seventy-four wooden, of 4977 tonnage, were built in C. The value of production in the shipbuilding industry in 1936 was \$6,250,000. The Canadian shipbuilding programme during the Second World War was a major phase of the war effort of the United Nations and its cost approximated by 1943 to \$1,300,000,000, and in 1944 the industry employed more than 100,000 persons, and there were more than fifty

berths capable of handling large ships. Up to 1944 (autumn), 1000 vessels had been launched, including 352 freighters, tankers, victualling ships, etc.; 500 combat vessels and naval craft, ranging from torpedo-boats to tribal destroyers; and 148 special vessels, such as transport ferries, base ships, salvage vessels, railway barges, and sett steel tugs.

Fisheries.—C.'s fishing-grounds are perhaps the most extensive in the world. They comprise the bay of Fundy, 8000 sq. m. in extent; the gulf of St. Lawrence, over ten times that size; and other ocean waters, of a total area of 200,000 sq. m., or four-fifths of the fishing area of the Atlantic. In addition, there are 15,000 sq. m. of Atlantic inshore waters controlled entirely by the dominion, Hudson Bay, and the Pacific coast. The quality of the product is yet more important than the extent of the grounds, owing to the purity and coldness of the waters. Canadian cod, halibut, herring, mackerel, whitefish, and salmon are the equal of any in the world. Fishing was the first industry to be systematically followed by European settlers in what is to-day Canadian domain. Cape Breton, one of the oldest place-names in America, is a memorial of the early French fishermen. The present fishing industry of C. is the growth of the past sixty years. In 1836 fish production in what now constitute the Maritime provs. had an estimated value of \$1,000,000, while that of Lower C. was about \$1,000,000. In the nineties it passed \$20,000,000, and in 1911 \$34,000,000; but the highest record was reached in 1918 with \$60,000,000. Since then there have been sharp decreases, due to lower prices rather than to any decrease in the quantity of the catch. In 1939 the figure was \$40,000,000. Prices rose, and the figures for 1940-43 were, respectively, \$45,000,000, \$62,000,000, \$75,000,000, and \$85,000,000. Of the figure \$85,000,000 the shares of the provs. were as follows: Brit. Columbia, \$32,479,000; Nova Scotia, \$21,684,000; New Brunswick, \$11,129,000; Quebec and Ontario each over \$5,000,000. The above figures (exclusive of Newfoundland) represent the total value of fish marketed, whether in a fresh, dried, canned, or otherwise prepared state. The figures for the prov. of Newfoundland were: 1939-40, \$8,100,000; 1940-41, \$9,735,000; 1941-42, \$12,656,000; 1942-1943, \$12,057,000 (nine months only); 1943-44, \$18,486,000; and 1944-45, \$21,869,000. The hist. of the Newfoundland fishery during the past fourteen years shows how sensitive the industry continues to be to political and economic changes in its overseas markets (see NEWFOUNDLAND).

Formerly the cod and haddock of the Atlantic were the most important fish; to-day Brit. Columbia, with its great salmon and halibut fisheries, leads among the provs. and accounts for nearly half the entire dominion catch. The lobster fishing industry in the E. has also become of increasing importance, and is now the largest in the world. Great improve-

ments have been effected in the methods of catching and preparing the fish, especially by the development of the canning industry. There are over 200 fish-curing estabs. besides 130 (1943) lobster canneries, 32 salmon canneries, 51 sardine and other fish canneries, and 60 fresh-fish and freezing plants; the salmon pack amounted, in 1920, to 2,000,000 cases of 48 lb. each. In 1949 the Dominion's resources were increased by the processing and canning plants, together with eight fish refrigerating plants, in Newfoundland (besides a number of small bait fish refrigerating plants owned by the Newfoundland Gov.). In the primary operations of catching the fish the capital represented by boats, equipment, etc., is now \$31,000,000, of which \$25,000,000 are invested in the sea fisheries and over \$6,000,000 in the inland fisheries. Employees in these operations in 1943 numbered 15,500; and in the secondary operations of canning and curing the capital invested is some \$31,000,000 and the number of persons employed over 16,000. The above figures do not include Newfoundland, the protection and encouragement of whose fisheries was taken over by C. under the agreement of 1948. In 1945 there were 19,650 men employed in the inshore fishery of Newfoundland and 1039 in the deep sea fishery, besides 4117 in that part of Labrador which was then Newfoundland ter. The trade depends chiefly on foreign markets, and in 1943 the total exports amounted to over \$57,000,000. In 1945 the value of fish exports was \$80,225,600 (excluding Newfoundland, the figure for which, in 1945-46 was \$29,697,000. From 60 to 70 per cent of the ann. catch is an average export, of which the U.S.A. takes approximately one-half and the United Kingdom one-fourth. The most important single export is canned salmon (to the United Kingdom and European markets), followed by fresh lobster, canned lobster, fresh salmon, fresh whitefish, and dried cod (to the W. Indies, S. America, etc.). For fresh fish the U.S.A. is the chief market, although (in normal times) the United Kingdom takes considerable quantities of salmon and halibut, classified as fresh and frozen. Exports from Newfoundland consist almost entirely of fish and fish products (apart from newsprint) but in the early 1930's they suffered a serious decline. From 1934-39 dried, salt bulk, pickled and soft cured codfish accounted in each year for some two-thirds of the total value of the fishery. Newfoundland's chief markets were in the Iberian peninsula, Italy, Greece, etc., but political events and the competition with Norway seriously affected these markets (see further under NEWFOUNDLAND).

The dominion dept. of fisheries, estab. on a separate basis in 1928, controls the tidal waters of the maritime provs. and Brit. Columbia, the fisheries of the three prairie provs. and the fisheries of the Magdalen Is. in Quebec prov. The non-tidal fisheries of the maritime provs. and Ontario and both the tidal and non-

tidal fisheries of Quebec (except the Magdalen Is.) are controlled by the respective provs., but the right of fisheries legislation for all provs. rests with the dominion gov. The main object of legislation has been the prevention of depletion, the enforcement of close seasons, the forbidding of pollutions and obstructions, and the regulation of nets, gear, and of fishing operations generally. The gov. has also taken steps from time to time in the field of direct assistance to the industry, including the broadcasting by radio of reports of weather probabilities, bait and ice supplies, and prevailing local market prices; the payment of bounties (under the Washington treaty); and instruction in improved methods of curing fish.

Minerals and Mining.—The mineral resources of C. are very large, though not by any means fully developed. The mining industry is fourth in importance among the dominion's activities, being exceeded in value only by manufacturing, agriculture, and forestry. Thirty-five per cent of the freight tonnages moved in C. are to and from the mines. There are coalfields of very large extent, though they are as yet worked only in the neighbourhood of seaports, such as Vancouver Is. and in the N. of Nova Scotia, or at various points on the route of the Canadian Pacific Railway. It is this deficiency that accentuates the economic importance of C.'s turbine horse-power installation, which on a *per capita* basis is nearly five times the installation of the U.S.A.; and the importance of what is eloquently called C.'s 'white coal' is emphasised when it is pointed out that the chief bituminous deposits of the dominion are in the extreme E. and W., and that Quebec and Ontario at present are mining no coal, though they have 60 per cent of the manufs. of C.; and the pulp and paper industry, which requires enormous quantities of power, is located for the most part in these two provs., and in the newly acquired prov. of Newfoundland (*q.v.*). The leading mineral products are coal, copper, gold, nickel, cement, lead, asbestos, clay products, silver, zinc, stone, natural gas, sand and gravel, lime, petroleum, gypsum, cobalt, salt, and platinum. The metals of chief importance in C. are copper, gold, iron, lead, magnesium, nickel, those of the platinum group, pitchblende products, silver, and zinc. Various gov. agencies, estab. for the purpose, have stimulated production of the chief non-ferrous metals—copper, nickel, lead, and zinc, as well as tungsten, molybdenum, chrome, mercury, mica, arsenic, fluorspar, graphite, and cobalt. Six of these—mercury, tungsten, chrome, molybdenum, muscovite mica, and fluorspar—were not produced in quantity in C. before the Second World War. In order of value gold is the chief mineral (in 1943, 26.5 per cent of the total value of mineral production), nickel (13.5 per cent), copper (12.7 per cent), coal (11.9 per cent), zinc (4.6 per cent), asbestos (4.4 per cent). These ratios were more or less maintained in the mining returns for 1945 and 1946.

The coal seams of Cape Breton were the first to be worked in N. America. Metallurgy began on the St. Maurice R. when in 1740 a furnace for smelting the local bog iron ore was estab. Among famous finds of minerals which have made mining hist. were those of a deposit of argentiferous galena in Lake Temiskaming and the famous gold rushes to the Fraser R. and Cariboo in the fifties, which led to the founding of the colony of Brit. Columbia; and the accidental discovery, during the blasting of a cutting for the Canadian Pacific Railway in 1883, of a body of nickel-copper ore near Sudbury, which has since made that dist. world-famous; the Klondyke gold rush of 1898; the finding of silver in the Cobalt dist. in 1903 during the construction of the N. Ontario Railway; the gold finds at Porcupine and Kirkland Lake early in the twentieth century, the subsequent copper-gold discoveries in W. Quebec, and the recent discovery of uranium ore near Flin Flon, Manitoba. Whilst traces of many minerals are known to exist in Newfoundland their inaccessibility and, in most cases, the considerable capital expenditure required to exploit them have prevented the development of any large-scale operations except in the case of the iron ore deposits on Bell Is. and the composite lead-zinc-copper deposits at Buchans in the centre of the Is. Large high-grade iron ore deposits exist in Labrador and intensive work is being carried out in the areas concerned. There are also a number of smaller operations concerned with the working of fluorspar, limestone, and pyrophyllite, whilst some prospecting and exploration are in progress where deposits of gold and asbestos are known to exist. There are also known to be coal seams on the W. coast; but it is not yet possible to indicate what effect all these mining developments in Newfoundland may ultimately have on the economy of the prov. The number of men employed in the Newfoundland mining industry in 1945, was 2571 (Bell Is. mines, 1427); the total value of the mineral exports of Newfoundland in 1944-45 was \$7,021,075. The mining industry of C. employs over 90,000 persons in the operations of mines, mills and smelters, quarries, gas and oil wells, and investment in mine plant and equipment and in working capital amounts to nearly \$1,055,000,000 (\$800,000,000 in metalliferous and \$255,000,000 in fuels). The total estimated value of C.'s mineral production (1943) was over \$530,000,000. In 1945 the total figure was \$179,588,000.

Agriculture.—Farming is still the leading primary industry in C. though the rapid advance of secondary industries has placed C. among the important manufacturing nations of the world. The parent of Canadian agriculture may be said to be Louis Hébert, the first real Canadian farmer, a Frenchman who landed in 1617 and began to clear land at a spot now in the centre of Upper Town, Quebec. In half a century from that time the *habitués* had 11,000 ac. under crop and 3000 cattle. Wheat, as in

U.S.A., is the premier crop, and it is in respect of the prin. grain crops, but especially of wheat, that agric. progress in C. has been so remarkable. For ten years after confederation the wheat crop rarely exceeded 25,000,000 bushels, but in 1898 the yield was over 50,000,000 bushels and exports reached 24,500,000. The completion, in 1886, of the Canadian Pacific Railway linked E. and W., made the dominion for the first time an economic unit, and opened up the great prairie lands of the middle W., with their soils of virginal fertility. The prairie provs. have since gradually come to produce nearly all

in 1943, 195,000,000 in 1944. Grain production yields (in bushels) in the post-war years (including 1945) were: wheat 1945, 318,512,000; 1946, 413,725,000; 1947, 340,758,000; and 1948, 391,000,000; oats, 1945, 381,596,000, 1946, 371,069,000, 1947, 278,670,000 and 1948, 361,700,000; barley, 1945, 157,757,000, 1946, 148,887,000; 1947, 141,372,000, and 1948, 157,100,000 (figures for 1948 are estimates). Prices of agric. products reached their peak during and just after the First World War. They slumped steeply thereafter, falling to a very low level in 1923, recovering, however, considerably

National Film Board, Canada

HARVEST IN ALBERTA: A COMBINE IN A TYPICAL STRIP-FARMING FIELD

the wheat of the dominion. The first year in which production exceeded 100,000,000 bushels was 1905. In 1915 it was 393,000,000 bushels, and in six of the seven years, 1922-28, was this total exceeded. In 1928 the yield was actually 566,000,000, but in 1929, owing to a severe drought, it fell sharply to 304,000,000. Production in the years following was, 1930, 420,500,000; 1931, 321,330,000; 1932, 443,000,000, 1933, 282,000,000; 1934, 276,000,000; 1935, 282,000,000; 1936, 219,200,400; 1937, 182,400,000; and 1938, 348,000,000. In the Second World War the totals were 1941, 315,000,000; 1942, 556,000,000; 1943, 284,000,000; 1944, 436,000,000. The other grain crops are of scarcely less importance for the maintenance of the livestock industry: oats yielded 664,000,000 bushels in 1923, 500,000,000 in 1944. Barley yielded 259,000,000 bushels in 1942, 216,000,000

in later years. As the effects of the First World War came to be felt, the maximum was reached in 1919 with a total of \$1,537,179,100. This value receded in 1923; but the recovery during recent years, combined with excellent harvests, brought the value up to about \$1,173,133,600 in 1927 and \$1,125,000,000 in 1928. From then it declined to \$948,981,000 in 1929, and \$432,199,000 in 1931. From then (excepting in 1935) there was a rise in value until in 1936 it stood at the highest level since 1930. In 1937 it was \$553,893,000. In the Second World War years values rose sharply: 1939, 686,000,000; 1940, 677,000,000; 1941, 684,000,000; 1942, 1,179,000,000; 1943, 1,184,000,000; and 1944, 1,288,000,000. In 1945 the total prices of agricultural products were \$1,284,682,000; in 1946, \$1,245,254,000 (estimated).

Apart, too, from expansion of area and increase of vol., the production of better varieties of grain and improvement in the methods of cultivation under the scientific and educational activities of the dominion and prov. depts. of agriculture have also been of great importance. In 1948 the Federal Dept. of Agriculture operated 28 experimental farms and stations, 7 large substations, 52 smaller substations, and 159 illustration stations. To ensure full co-operation between the dominion dept. of Agriculture, the prov. depts., the agric. colleges, and the farmer, an advisory council on agric. service, consisting of dominion and prov. representatives meets annually. Wheat of the prairie provs. is famous for its hard, dry, glutinous quality. Apart from the effects of climate and soil, its success has been largely due to the excellence of the Red Fife variety, which was discovered accidentally in 1842 by an Ontario farmer named David Fife. The success of the celebrated Marquis variety of wheat has been such that by 1930 it had almost entirely superseded the Red Fife. The use of this new variety has increased by millions of dollars annually the revenue derived from wheat-growing by the farmers of W. C. Still later products are varieties called Garnet and Heward.

Important developments have occurred in W. C. during recent years by the organisation of what are popularly known as wheat pools, which represent a form of co-operative marketing by producers. The grain producers of the prairie provs. had previously co-operated in the ownership and working of grain elevators. The formation of the wheat pools is a further development of the same principle. The inspiration of the enterprise was supplied by the success of the gov. control of grain marketing during the war, which control ceased in 1920. In 1921 representatives of each of the three voluntary W. wheat pools of Alberta, Saskatchewan, and Manitoba organised a central selling agency under a dominion charter, with the title of the Canadian Co-operative Wheat Producers, Ltd. The claim made for the pools is that better prices are obtained for the members than by the ordinary system of marketing, and, by 1930, the pools were operating over 1600 country elevators and and eleven terminals at Vancouver, Fort William, Port Arthur, and Buffalo. In the early months of the Second World War, the total licensed capacity of grain elevators in C. was approximately 423,000,000 bushels; in 1915, the total had risen to 596,000,000 bushels or 40 per cent over the storage capacity before the war. The total daily capacity of flour mills is nearly 100,000 barrels. There were (1942) 1171 flour and feed mills operating in C. and the output of the flour-milling industry (in 1942) was valued at \$31,417,000 (net) or \$159,464,000 (gross). In addition to the ordinary crops grown on a field scale, there are a number of special crops suited to particular localities which represent an important proportion of C.'s agric. wealth. These comprise tobacco, maple syrup and sugar.

sugar beets for beet sugar, flax for fibre, and others. The raising of livestock has made substantial progress in the dominion. The removal of the embargo against the introduction of store cattle into Great Britain was secured in 1923 and as a result shipments of store cattle to Great Britain reached the total of nearly 120,000 in 1926 against the previous year's 30,000. In the war years 1910-43 the numbers exported were 234,000, 254,000, 216,000, and 63,000 respectively, and practically all went to the U.S.A. About 3,500,000 sheep are produced annually. There are about 3,000,000 horses in C. Cattle in the two decades 1921-41 totalled between 8,000,000 and 8,500,000; swine numbered 1,774,000 in 1931 and 6,174,000 in 1941. Totals in 1946 were: Sheep, 3,378,000; horses, 2,387,000; cattle, 7,792,000; swine, 89,850,000. Large numbers of poultry and rabbits are also produced. The establishment of the dairying industry on a co-operative basis has been one of the most striking of Canadian agric. developments. Co-operative farming is indeed regarded as the sheet anchor of present-day farming in E. C. In 1944 the income from dairying amounted to \$264,000,000 as compared with \$148,000,000 at the commencement of the Second World War. The total value of all products of dairy factories in 1945 was \$260,000,000. Slaughtering and meat packing are important side industries. The fruit-growing industry of C., owing to the congenial climate and soil of the Annapolis valley, the Niagara peninsula, and the Okanagan dist., Brit. Columbia, has become world known. In Brit. Columbia commercial fruit growing is of comparatively recent origin, but progress has been very rapid in recent years and in fruit farming the prov. now leads all the other provs., the value of its production being (1946) more than that of the next prov. (Ontario) and over fivefold that of Nova Scotia. The total value of Canadian commercial fruit in the five years between 1936 and 1940 varied between \$15,619,000 in 1936 to \$19,993,000 in 1938; in the three years 1941-43 the values were \$20,537,000, \$27,656,000, and \$30,835,000 respectively. In the five-year period 1935-39 apples were valued at nearly \$11,000,000; strawberries at \$2,104,000; peaches at \$1,473,000; raspberries, \$953,000; and grapes at \$793,000. Other fruits included pears, \$701,000; plums and prunes, \$318,000; apricots, \$104,000; cherries, \$556,000; loganberries \$100,000. During the Second World War years there were large increases in production: apples (1942), 13,000,000 bushels, value over \$14,000,000; peaches (1942), 2,000,000 bushels, value \$3,550,000; strawberries (1940), 28,000,000 bushels, value over \$2,000,000; plums and prunes (1941), 536,000 bushels, valued at \$822,000; pears (1942), 753,000 bushels, valued at \$1,429,000; raspberries (1940), 12,000,000 bushels, valued at \$1,214,000; grapes (1942), 74,913,000 bushels, valued at \$1,862,000; cherries (1942), 364,000 bushels, valued at \$1,587,000; and loganberries (1940), 1,886,000 bushels, valued

at \$100,000. Of the 2,242,000 barrels of apples exported in an average year before the war, all but 100,000 barrels went to the United Kingdom.

Forestry and Lumbering.—The timber industry of C. has always been of the greatest importance, and since the invention of so many uses for wood pulp it has gained rather than lost. The Canadian saw-mills are very well managed and appointed, and large numbers of men are employed in the various stages of the timber industry. The varieties of woods dealt with include the maple, elm, hickory, ironwood, spruce, cedar, pine,

252,000,000,000 board ft., of logs in trees large enough to produce sawlogs and 1,685,000,000 cords of smaller material suitable for pulpwood, fuel, posts, mining timber, etc. To the above forestry resources must now be added those of Newfoundland, and the area under timber in that prov. has been estimated at 25,000 sq. m. Of these 4000 sq. m. remain under the control of the Crown, mostly in the form of a strip around the coastline known as the 'three-mile limit,' much of which has now been denuded by excessive cutting, both for local and other needs. Of the balance,

VANCOUVER ISLAND: A LOGGING TRAIN

Paul Popper

hemlock, walnut, oak, basswood, chestnut, rowan, birch, willow, etc. The forest area of C. has recently been estimated at 1,220,400 sq. m., or 35 per cent. of the total land area. About 450,000 sq. m. of the existing forests are classed as 'unproductive,' but these unproductive trees help to protect the watersheds and conserve water supplies, besides providing fuel and building materials to natives and travellers in remote areas. The productive forests covering more than 770,000 sq. m. are considered capable of producing continuous crops of timber suitable for domestic and industrial purposes. A considerable proportion of these forests is not yet accessible to commercial operations, but constitutes a valuable reserve for the future. The total stand of timber of merchantable size is estimated to be 389,000,000,000 cub. ft., of which 239,000,000,000 cub. ft. is accessible. Expressed in commercial terms, the accessible timber is made up of

small timber companies control a little over 2000 sq. m.; whilst the two major pulp and paper concerns, the Anglo-Newfoundland Development Company, of Grand Falls, and Bowater's of Corner Brook, hold between them 19,000 sq. m. or four-fifths of the total forest area of the is. Of the 25,000 sq. m. hitherto regarded as forest, only 15,000 sq. m. are suitable for commercial exploitation and of these the two large companies hold 11,000 sq. m. between them. In terms of production and employment, the pulp and paper industry ranks immediately after the fisheries in importance in Newfoundland.

Commerce.—From an isolated and dependant community, C. has become a nation trading with most countries of the world, and now exceeds many of the oldest and largest countries in commercial status. Her total trade in the decade 1929-39 ranged from \$2,478,000,000 (1929) to under \$1,000,000,000 during the

economic crisis of 1932-33. By 1937 it had reached a figure twenty-fold what it was at confederation. In only four of the twenty-six years, 1919-44, have imports exceeded exports, and in two of these years, viz. 1920 and 1931, the amounts of the excess were quite moderate. On the other hand, what is generally referred to as the 'favourable balance of trade' has been, on the average, quite substantial, indeed embarrassingly so for the three war years, 1912-44, owing to the export of the vast quantities of munitions of war that the Canadian economy was geared to produce. In the early years of the dominion, when the United Kingdom was lending C. capital on a considerable scale, that country supplied more than half of the Canadian imports, even though, as a purchaser of Canadian goods, she took second place to the U.S.A. To-day, though there have been vast changes and shifting trends, Canadian trade is still carried on predominantly with these two countries. In 1941 C.'s export trade amounted to \$3,483,098,000; this was twice as large as during any year of the First World War, and three and a half times greater than in 1939. Exports alone during 1944 were much higher than total external trade in 1939. Marked changes characterised the trade of C. during the war year and indeed after the war. Prior to the First World War a large proportion of Canadian exports were raw or only semi-manuf. goods, whereas to-day the larger bulk of exports are fully manuf. In 1941 36 per cent of all exports went to the United Kingdom and 11 per cent to other countries of the Brit. Commonwealth; 38 per cent to the U.S.A., and 15 per cent to other countries. C. is in normal periods the leading nation in the exportation of wheat, printing paper, nickel, and asbestos; occupies a place near the top for wheat flour and wood pulp, and a high place for lumber and timber, automobiles, copper, barley, fish,

cheese, furs, whisky, farm implements, cattle, gold, silver, leather, and hides, meats, oats, rye, and rubber footwear. The trade of C. for many years has been carried on with the United Kingdom and the U.S.A., with whose standards of living and tastes Canadians have much in common; but from Confederation to the outbreak of the Second World War there were marked fluctuations in the position of the two countries in regard to their trade with C. Coming, however, to recent years, from 1929 to 1938, C. sold the Brit. people about \$2,800,000,000 worth of goods, and bought less than half that amount from the United Kingdom. In each of the seven years prior to 1939 the United Kingdom was the greatest single buyer of Canadian exports. Previous to the Second World War C. had in the United Kingdom a customer who was able to buy from her without regard to the amount of trade in the opposite direction, and who was able to pay in cash of a kind that could be readily converted and used anywhere. But during and after the war Brit. exports fell to a very low level, and there was a heavy decline in the return from Brit. investments abroad, factors which must affect the future trade policy of the United Kingdom in relation to the purchase of Canadian products. In 1910 the United Kingdom regained the position as the chief market for Canadian exports which she had held since 1932 (with the exception of 1939); this position was kept in 1941, but in 1942 and 1943 the U.S.A. became C.'s best customer. C.'s total trade with the United Kingdom in 1937-1938 was \$554,400,000, having increased threefold since 1900, with the U.S.A. it was \$910,438,000, a seven-fold increase in forty years. Canadian trade (excluding gold) with the Brit. Empire and foreign countries for the years 1939-43 was as shown in Table 1 (the figures are in thousands of dollars):

CANADIAN TRADE WITH:

Item and Year	United Kingdom	United States	Other British Empire	Other Foreign Countries	Total British Empire	Total Foreign Countries
Imports						
1939	114,007	496,898	74,893	65,257	188,900	562,155
1940	161,216	714,231	106,167	70,336	267,383	814,568
1941	214,419	1,004,198	140,523	84,351	359,942	1,088,850
1942	161,113	1,301,680	112,664	65,786	273,777	1,370,465
1943	134,965	1,423,672	103,666	72,773	238,631	1,496,446
Exports						
1939	328,099	380,392	102,707	113,728	430,807	494,120
1940	508,096	442,984	147,861	80,013	655,957	522,997
1941	658,228	599,793	220,413	142,619	878,641	742,362
1942	741,717	885,523	412,100	324,433	1,153,817	1,209,957
1943	1,032,647	1,149,232	369,015	420,581	1,401,662	1,569,814

C.'s industrial development is striking, and well illustrated by the character of its exports and imports. In the 1890s C.'s imports consisted chiefly of manufactured products and the exports of raw and semi-

manufactured products; but during the twentieth century the position has been reversed, imports comprising raw and semi-manufactured goods for use in her manufs., and exports comprising primary

products which have undergone some process of manuf. Imports for use in industry include alumina and cryolite; bituminous coal; raw cocoa; raw cotton; crude cotton-seed oil; raw furs; raw hides; iron ore; unmanufactured leather; oxide of manganese; manilla and sisal grass; oils for soap; crude petroleum; raw rubber; raw silk; skelp iron for pipe;

sugar for refining; sulphur; tin in blocks, tin plate; raw tobacco; wire rods for wire; raw wool. Wheat is the most valuable export—though occasionally automobiles have headed the list. The value in order of importance of the leading exports (in thousands of dollars) in the years 1920, 1930, 1910, 1941, 1942, and 1943, was as shown in Table 2:

Commodity	1920	1930	1940	1941	1942	1943
Automobiles	14,884	18,799	54,306	128,760	194,312	210,800
Wheat	185,046	185,787	119,530	161,856	121,818	234,458
Automobile parts	3,097	1,588	10,290	20,239	62,961	213,943
Newsprint	53,640	133,371	151,360	154,357	141,066	144,707
Meats	96,161	7,569	63,289	84,178	110,429	130,790
Aluminium in bars, etc.	5,681	7,729	32,971	75,798	112,154	124,461
Wood-pulp	41,383	39,060	60,931	85,898	95,267	100,012
Planks and boards	75,216	36,743	67,737	74,205	80,115	74,182
Nickel	9,039	20,505	61,163	67,680	68,407	68,346
Wheat flour	91,263	37,540	26,352	44,807	45,814	66,274
Fish	40,687	30,098	29,843	39,512	47,929	56,902
Oats	9,349	1,061	6,177	3,295	6,833	42,294
Electrical apparatus	424	2,291	3,283	4,476	24,996*	41,100
Barley	20,207	987	1,117	1,959	5,140	32,435
Cheese	36,337	13,207	15,723	13,555	26,904	26,811
Furs, raw	20,628	15,202	15,617	15,448	17,382	25,584

* Chiefly radio and wireless apparatus.

The figures for 1944 were comparable with those of the other war years, but those for 1945 and 1946 seem to indicate considerable changes in the relative positions of some of the leading exports (see Table 3):

	1945 thousands of dollars	1946 thousands of dollars
Wheat	475,787	250,000
Automobiles	206,795	78,000*
Newsprint	179,451	266,000
Meats	166,974†	120,000†
Aluminium in bars, etc.	121,779	56,000
Wood-pulp	97,855	114,000
Planks and Boards	98,936	125,000
Wheat flour	97,855	127,000
Automobile parts	93,852‡	—
Fish	80,226	87,000
Electrical apparatus (chiefly radio and wireless)	60,957	21,000
Nickel	54,778	55,000
Oats	47,680	—
Eggs (dried and in the shell for war years)	44,120	27,000
Copper in forms	34,055	37,000
Rubber and products	31,328	—
Fertilizers	30,428	32,000
Furs	29,572	31,000
Cheese	27,909	22,000
Barley	24,101	—
Pulpwood	23,881	29,000
Whisky	22,977	30,000
Asbestos, raw	21,842	25,000
Locomotives and parts	21,473	53,000§
Zinc	20,373	28,000
Farm implements, etc.	20,196	29,000

* Includes trucks and parts.

† Includes bacon and ham, fresh beet, and veal and canned meats.

‡ Figures included in those for automobiles.

§ Including railway cars.

Since Confederation, exports have exceeded imports in thirty-seven years, while imports have exceeded exports in thirty-six years. The 'unfavourable' trade balances occurred chiefly in 1903-13, years of heavy capital imports. Since Confederation there has been an excess of exports to the United Kingdom in sixty years, and an excess of imports in twelve years. During the past seven decades the trade balance with the U.S.A. has been unfavourable in over sixty years, favourable only in nine years, favourable balances being recorded in 1934-35, 1935-36, and 1936-37. The exchange of commodities does not, however, complete the tale of Canadian commercial prosperity, for many 'invisible' exchanges must be taken into account, interest and freight payments, insurance premiums, and financial services, while the money spent by tourists constitutes an appreciable income for which C. has to thank her picturesque scenery, fish and game preserves, and winter sports.

Since 1879 the foreign commerce of the dominion has been affected to a large extent by the increase of the customs tariff. The percentage of duty on the total value of goods imported, both dutiable and free from duty, was in 1868 12 per cent, and in 1878 13½ per cent. In the following year a general increase in the tariff was sanctioned by the gov., and what is known as the 'national policy' was begun. The percentage of duty was in 1881 20½ per cent, and in 1901 16 per cent. There are no restrictions placed on trade between the different provs., and within the boundaries of the dominion free trade prevails. The Colonial Conference of 1894, held at Ottawa, carried a resolution in favour of an arrangement between Great Britain and her colonies

by means of which the former should be given preferential treatment over foreigners. Accordingly an Act was passed in 1897 under which Brit. goods were to be admitted on the payment of customs dues 25 per cent less than those levied on foreign goods; the new arrangement came into force from Aug. 1, 1898. The preferential reduction was raised to 33½ per cent from July 1, 1900.

Two trade agreements, one between C. and the U.S.A., and the other between the United Kingdom and the U.S.A., were signed at Washington, on Nov. 17, 1938. They mark a step forward in the estab. of better trade relations between the Brit. Commonwealth and the U.S.A.; their significance lies in the fact that they are the most notable advance yet achieved in the new trade-agreements programme, which is the U.S.A.'s Gov.'s contribution to the lowering of the barriers to international commerce. The agreements were the result of protracted negotiations in which all the self-governing dominions were called upon to concur in the temporary modification of certain preferential privileges they had long enjoyed in the Brit. market in order to contribute to the freer flow of trade between the Eng.-speaking peoples—the world's greatest empire and its greatest republic. The extension to all com. 'alts with which the parties to these treaties are on a most-favoured-nation basis is implied in the agreements. For the rest, tariffs as between C. and the United Kingdom depend on the Ottawa Agreements (*q.v.*) of 1932.

Manufactures.—The present century witnessed the chief upward movement in Canadian manufs., the result of two major influences, first, the 'boom' accompanying the opening up of the 'last best West,' which greatly increased the demand for manufactured goods of all kinds, but especially construction materials, and secondly, the First World War, which created huge new demands and left a permanent imprint on the variety and efficiency of Canadian plants. Just before the Second World War C. had (*e.g.* in a typical year like 1936) 21,202 manufacturing estabs., whose capital investment in lands, buildings, and equipment amounted to over \$3,271,000,000, and which employed 591,369 persons. Before the war the leading industries were: pulp and paper; flour and grist-mill products; slaughtering and meat-packing; central electric stations; sawmills; automobiles; butter and cheese; rubber goods, including footwear; electrical apparatus and supplies; non-ferrous metal smelting; cotton yarn and cloth; railway rolling-stock; castings and forgings; bread and other bakery products; petroleum; printing and publishing; sugar refineries; clothing; cigars and cigarettes, hosiery; biscuits; confectionery and chewing gum; breweries; planing mills; boots and shoes; and rolled products, pig-iron, steel products, etc. In 1942 the incidence of the Second World War resulted in a rearrangement in the rank of many industries. Industries producing supplies and equipment for the armed forces

naturally advanced while those industries producing for the domestic consumer market declined in importance. To supply the raw materials needed by the industries engaged principally in war production, it became necessary to restrict or prohibit the manuf. of many products such as pleasure cars, radios, washing machines, electrical equipment, household appliances, agric. implements, etc. Though these industries were forced to change over to wartime production, the changes did not affect the value of their output, and consequently their importance as producers of manufactured goods did not alter drastically. In 1942 the number of estabs. was 27,862, the number of employees 1,152,091, and the capital employed \$5,488,000,000. But to analyse the effects on the war on any industry, it is necessary to compare the nature of the products made before the war with that of the wartime years. Measured by gross value of products the most important manufacturing industries in 1942 appeared to be as follows: producers' materials (*i.e.* farm, manufacturing, building, and general materials), \$2,177,577,100; industrial equipment (*i.e.* farming, manufacturing, trading, service, light, heat, power, and general equipment), \$1,315,623,021; food, \$1,287,339,635; clothing, \$497,675,551; drink and tobacco, \$236,292,352; books and stationery, \$190,289,162; house furnishings, \$171,793,189; personal utilities, \$98,406,172; and other commodities, \$275,235,214. (See also under *History* for wartime industrial developments.) In 1946 the total number of estabs. was 29,050 and, in terms of gross value of output, the chief manufs. were: iron and iron products, \$1,975,310,000; vegetable products, \$1,353,000; wood and paper products, \$1,184,651,000; textiles and textile products, \$807,722,000; non-ferrous metal products, \$779,385,000; chemicals and allied products, \$478,533,000; non-metallic mineral products, \$405,736,000, and other commodities, \$154,116,000. Exports of manufactured products increased from less than \$3,000,000 per annum on the average of 1871-75 to \$614,000,000 in the post-war fiscal year ended March 1920. Exports of 'fully manufactured' products in the fiscal year ended March 1937, amounted in value to \$384,234,219 and exports of 'partly manufactured' products to \$296,321,415. In 1943 the 'fully or chiefly manufactured' export figure was \$1,954,865,077; 'partly manufactured,' \$497,712,310 (raw materials being \$518,897,881). In the post-war years (including 1945) exports of partially manufactured products were: 1945, \$535,931,000; 1946, \$511,751,026; and 1947, \$721,767,318. Exports of fully or chiefly manufactured products were: 1945, \$1,821,083,000; 1946, \$1,196,995,216; and 1947, \$1,408,583,830. The leading centres of manuf. are Toronto and Montreal, the next, Hamilton, Winnipeg, Vancouver, Oshawa, and Ottawa, more or less in that order of value.

Population and Area.—The four original provs. of C. contained 350,188 sq. m. of land and inland waters, of which the

original land area was 338,224 sq. m. After purchase of the Hudson Bay Ter. in 1870 and the admission of Brit. Columbia in 1871 and of Prince Edward Is. in 1873, the area of the dominion was 3,470,392 sq. m. Further exploration in the N. regions resulted in increasing this area to 3,797,123 sq. m. as estimated in 1926, but the decision of the Judicial committee of the Privy Council in 1927 in the Labrador boundary dispute reduced this to 3,684,723 sq. m.—which, however, was still more than ten times that of the original confederation. The present area (including Newfoundland which entered the confederation in 1949) is shown in the tables opposite.

The pop. is distributed in the main only along the S. border. The prin. nationalities represented are Eng., Fr., Irish, Scotch, Gers., Jews, and Russians, and though there are also some few Dutch, Chinese, Welsh, Its., Icelanders, S. Europeans, Swedes, Swiss, Indians, Poles, Norwegians, half-breeds, etc. Eng. is the general language of C., though in some parts of Quebec Fr. is the only language understood, and the Fr. language is by statute an official language in the dominion Parliament and in Quebec, but not now in any other prov. Members of the Quebec and Manitoba Parliaments may also address the House in either Eng. or Fr. The number of Indians in C. in the year 1881 was estimated to be 108,547. In 1941 the number was 118,316 (Ontario, 30,336; Brit. Columbia, 24,375; Manitoba, 15,473; Saskatchewan, 13,384; Alberta, 12,565; Quebec, 11,863). It is thus seen that the race is practically stationary, and when it is recalled that very few Indians of pure blood remain, it may be said to be gradually declining. Such as are in inhabited dists. are usually located on reserves, and are engaged in agric. and industrial pursuits. Many of them hunt and fish for their livelihood, and many are employed as guides by sportsmen.

From 1869 to 1873 there was general prosperity in C., reflecting the construction of the Suez Canal, the industrial development of Germany, and the world-wide railway boom. C. in that period found many new markets. There followed a period of depression, again through external influences, mitigated, however, by the completion of the Canadian Pacific Railway. In 1870 manufs. were stimulated by the adoption of a protective tariff, though, generally speaking, conditions continued depressed until the early nineties, and it was not until almost the end of the nineteenth century that conditions were marked by buoyancy. The censuses of 1881, 1891, and 1901 reflect these conditions. That of 1881 showed a gain of 635,000, but the gains in the two next decades were each under 550,000. It is within the present century that the spectacular expansion of the Canadian pop. and general economic body has taken place. The dominant initial feature was the opening of the 'last best West.' W. pop. had doubled in each of the decades following the completion of the Canadian Pacific Railway; but after 1904

the movement became greatly accelerated. Capital in huge amounts came from Great Britain to undeveloped countries throughout the world, and especially to Canada. Further, immigration, which had seldom previously exceeded 450,000 a year, rose to over fivefold, totalling in the years 1903-13 over 2,500,000, as many as in all the previous years back to Confederation. After the setting-in of the world economic depression in 1930 immigration practically ceased. The following are the totals of immigrants in the years 1891-1944: 1891, 82,000; 1892, 31,000; 1893, 30,000; 1894, 21,000; 1895, 19,000; 1896, 17,000; 1897, 22,000; 1898, 32,000; 1899, 45,000; 1900, 42,000; 1901, 56,000; 1902, 89,000; 1903, 139,000; 1904, 131,000; 1905, 141,000; 1906, 212,000; 1907, 272,000; 1908, 143,000; 1909, 174,000; 1910, 287,000; 1911, 331,000; 1912, 376,000; 1913, 401,000; 1914, 150,000; 1915, 37,000; 1916, 56,000; 1917, 73,000; 1918, 42,000; 1919, 108,000; 1920, 139,000; 1921, 92,000; 1922, 64,000; 1923, 134,000; 1924, 124,900; 1925, 85,000; 1926, 136,000; 1927, 159,000; 1928, 167,000; 1929, 165,000; 1930, 105,000; 1931, 28,000; 1932, 21,000; 1933, 14,000; 1934, 12,000; 1935, 11,000; 1936, 12,000; 1937, 15,000; 1938, 17,000; 1939, 17,000; 1940, 11,000; 1941, 9,000; 1942, 8,000; 1943, 9,000; 1944, 13,000. Immigration figures for the post-war (fiscal) years (including 1915) were: 1945, 31,081; 1946, 66,990; and 1947, 64,127. On the effects of the world economic depression of the 1930's on C., see under *History* below.

Religion and Education.—There is no state religion in C., and absolute toleration is an accomplished fact. Over the period from 1871 to 1941 something like 40 per cent of the pop. of C. has been of the Rom. Catholic faith, and this proportion has been remarkably constant over the seventy years. The 1941 percentage (inclusive of Gk. Catholics) was 43.34 per cent. Methodists were 15.67 per cent in 1871 but fell to 13.19 per cent in 1921. Presbyterians increased from 15.57 per cent in 1871 to 16.04 per cent in 1921; they were reinforced by the considerable immigration from Scotland after the beginning of the century. The organisation of the United Church of C. in 1925 left the Presbyterians and the Congregationalists much weaker in membership. Almost all Methodists, the main body of Congregationalists, and a large number of Presbyterians united to form that Church. In 1941 the leading religious denominations were as follows: Rom. Catholic, 4,980,552 (including 185,657 Gk. Catholics); United Church (see immediately below), 2,204,975; Anglican, 1,751,148; Presbyterian, 829,147 (the figures entered opposite Presbyterian and Congregationalist in the census returns represent the number not included in the United Church); Baptist, 483,592; Lutheran, 401,153; Jewish, 168,367; Gk. Orthodox, 139,629; Mennonite, 111,380. Of the total pop. of the new prov. of Newfoundland and Labrador (1945), 100,872 belonged to the Church of England, 105,895 were Rom. Catholics, 79,758

The estimated pop. of Newfoundland (exclusive of Labrador) at Dec. 31, 1915 was 312,899; (including Labrador), 318,177.

* Revised in accordance with the Labrador award of the Privy Council, March 1, 1927.

† The decreases shown in the pop. of the N.W. Ters. since 1891 are due to the separation therefrom of vast areas to form Alberta, Saskatchewan, and Yukon, and to extend the boundaries of Quebec, Ontario, and Manitoba.

United Church, and 1,579 Presbyterians. Taxation to support free and unsectarian schools has been levied in C. since 1846. The control of the system is vested in trustees elected locally, and the expenses are met by local rates and provincial gov. grants. In Ontario and Quebec, where the number of Rom. Catholics is very large, there are separate schools for members of that denomination; there used to be such schools in Manitoba, but there they were abolished in 1890. The teachers are trained in provincial normal schools at the public expense. The standard of education in the dominion is a very high one, and poverty need be no bar to the

of which has a dept. of education. That education is a great feature in the country is to be gathered from the fact that there are no fewer than 2,330,000 pupils and students in educational institutions, though the fact that C.'s pop. has so high a proportion of persons in the younger periods of life compared with other countries, must be borne in mind. The dominion gov. occasionally makes grants in aid of specific forms of education, as under the Agricultural Education Act of 1913, and the Technical Education Act of 1917. Agric. education is not conducted through the medium of boarding schools to the extent that it is in

Canadian Air Board

intellectual student. The chief univs. of C., with the dates of their foundation, are as follows: King's College, Nova Scotia, 1789; Dalhousie, Nova Scotia, 1818; McGill, Montreal, 1821; Acadia, Nova Scotia, 1838; Queen's, 1841; Bishops College, Quebec, 1845; Toronto, 1849 (King's College, 1828); Ottawa, 1849; Laval, Quebec, and Montreal, 1852; New Brunswick, 1859 (King's College, 1828); Mount Allison, New Brunswick, 1861; Manitoba, 1877; W. Univ. and College, London, Ontario, 1878; McMaster, Hamilton, 1887; Alberta, 1906; Saskatchewan, 1908; Brit. Columbia, 1908; Calgary, 1911. Others are, St. Dunstons, Prince Edward Is.; St. Francis Xavier, New Brunswick; St. Joseph's College, New Brunswick; Univ. Victoria, St. Michael's, Trinity, Wycliffe, and Knox Colleges (federated with the univ. of Toronto).

Public education in C. is under the jurisdiction of the provincial govts., each

many other countries. Agric. instruction, of course, receives attention in the ordinary day schools, and for no other occupation, with the possible exception of homemaking, do govts. in C. conduct so many educational services outside the schools as for agriculture. Educational systems in C. have progressed rapidly in the present century, notably in technical and high-school education. Particular mention may be made of compulsory attendance laws and the creation of municipal school dists., rural graded schools, and rural high schools, which are designed to secure larger taxation areas and so support better classes of schools, and the provision of facilities for teaching manual training, domestic science, and vocational work. An indication of progress is to be seen in the decline in the percentage of 'illiterate' which in 1871 was 20 per cent of people over twenty years of age, and in 1921, only 5 per cent. Scientific research

has now made strides. It began in C. in the eighties with the institution in the univs. of courses in experimental and practical science. Research has been promoted by scientific societies such as the Royal Canadian Institute and the Royal Society of C., and by the laboratories maintained by various depts. of the dominion and provincial govts. In recent years, with the growing realisation of the importance of scientific and industrial research, and aided by the growth of Canadian wealth, the scientific equipment of the leading univs. has been greatly increased and the prosecution of research aided by numerous scholarships. An especially notable achievement was the discovery of insulin by Drs. Banting (q.v.) and Collip, and Charles Herbert Best, working under Prof. Macleod in the univ. of Toronto. 'The National Research Council,' now operating under the Research Council Act of 1924, has charge of all questions of scientific and technological methods affecting the expansion of Canadian industries or the utilisation of C.'s natural resources.

Currency and Banking.—In 1853 a measure was passed providing for the adoption of decimal currency with a dollar equivalent to the Amer. dollar, and from Jan. 1, 1858, the accounts of the prov. of C. were kept in terms of dollars. The use of the dollar as a monetary unit was extended throughout the dominion by the Uniform Currency Act of 1871. The Canadian dollar is a gold dollar weighing 25.8 grains, nine-tenths fine gold, and thus containing 23.22 grains of gold. Five-dollar and ten-dollar Canadian gold pieces have been coined to a limited extent, but, in the main, the currency of C. is in the form of silver, nickel, and bronze token currency for fractional parts of a dollar and dominion notes and bank notes for multiples of a dollar. Since 1931, the gov. has permitted the export of gold only under licences issued by the dept. of finance, thus conserving C.'s gold resources for meeting external obligations, and Canadian mines now dispose of their gold through the Royal Canadian Mint according to definite conditions of purchase. The Canadian gold reserves, which exist for the redemption of dominion notes, contain, besides Canadian gold coin, Brit. and U.S.A. gold coin, which is also legal tender in C., as well as bullion. The issue of dominion notes in one-dollar, two-dollar, four-dollar, five-dollar, and fractional units, also in larger notes of from fifty to five thousand dollars (and in late years fifty thousand dollars) increased steadily prior to 1914, and very rapidly during the First World War period, after which there was a considerable decline corresponding to the reduction in prices. These notes are legal tender everywhere in C. except at the offices which the gov. maintains for their redemption.

The Canadian banking system is a product of evolution, and its most distinctive feature, the branch bank system, is well adapted to the needs of a country of wide area and scattered pop. Banking in C. began to develop some of the

features of a central bank system soon after Confederation. These in order of date are: Central Note Issue, permanently estab. with the issue of dominion notes under legislation of 1868; the Canadian Bankers' Association, estab. in 1900 to effect greater co-operation in the issue of notes, in credit control, and in various other ways; Central Gold Reserves, estab. in 1913; re-discount facilities, made a permanent feature of the system in 1923, provided the banks with a means of increasing their legal tender cash reserves at will; the Bank of C., estab. in 1935. Legislation was enacted in 1934 to establish the Bank of C. as a 'central' or 'bankers' bank. In 1936 Parliament approved a change in capitalisation which gave a majority of outstanding shares to the minister of finance on behalf of the gov. of C. In 1938 legislation was passed for the purchase of all shares then in the hands of the public by the gov. so that the Bank of C. is now completely owned by the people of C. as a whole. The bank assumed the liability of the dominion notes in circulation in 1935, when the bank commenced business, in return for gold and silver held by the gov. as security for dominion notes and 3 per cent five-year Dominion of Canada bonds. The chartered banks also surrendered to the Bank of C. the gold held by them in C. at the currency value. The bank is empowered to buy and sell securities in the open market; to discount securities and commercial bills; to fix minimum rates at which it will discount; to buy and sell bullion and foreign exchange. It may issue notes to any amount so long as it maintains a reserve of gold coin and bullion equal to not less than 25 per cent of its note and deposit liability in C. The chartered banks are required to maintain a reserve by way of deposit with the bank, and Bank of C. notes of not less than 5 per cent of their deposit liabilities in C. The Bank of C. acts as the fiscal agent of the dominion of C. and may, by agreement, act as banker or fiscal agent for any prov. The bank does not accept deposits from individuals and thus does not compete with the chartered banks in the commercial banking field. The following statement gives the main items of assets and liabilities of the Bank of C. before the Second World War (in 1938). Notes in circulation: \$178,000,000; dominion gov. deposits, \$25,363,000; chartered banks' deposits, \$228,460,000; gold coin and bullion, \$181,146,000; investments, \$214,664,000; total assets and liabilities, \$143,113,000. In 1944 the ann. statement showed the following notes in circulation, \$1,035,972,607; dominion gov. deposits, \$30,996,574; chartered banks' deposits, \$401,723,907; investments, \$1,490,825,869. No figure is given for gold coin and bullion, for the Exchange Fund Order, 1940, authorised the transfer of the bank's gold holdings to the Foreign Exchange Control Board and temporarily suspended the requirement for a minimum gold reserve. In recent years the Canadian banks have extended their business outside the dominion, and now have over

200 branches in other countries, mainly in Newfoundland, the W. Indies, Central and S. America, and in London, Paris, and New York. The grand total of bank debts for C. was \$43,477,000,000 in 1928; \$35,166,000,000 in 1937; \$45,526,000,000 in 1942; \$60,677,000,000 in 1944.

Social Conditions.—The social conditions prevailing in the dominion do not favour the existence of such rigid distinctions of caste as still exist in England. There are few tenants, and consequently few landlords; practically every farmer owns his farm and is his own master. With this pervading sense of freedom, C. has passed many such laws as older nations are still vainly trying to bring forward. There is gov. control of the drink question, with theoretical local options, religious liberty is estab.; free and unsectarian education is practically universal. Divorce was not common in C. before the First World War, but has become more common through the unsettling psychological effect of the war period and the provision of new facilities. In Quebec, as a result of a decision of the Brit. Privy Council, the applicant for divorce must secure a special private Act of Dominion Parliament. In most provs. the public lands are under the control of the local gov. In the prairie provs., the 'Peace River block' and the dominion railway belt of Brit. Columbia, however, the dominion gov. owns land, with the object of obtaining some money to lessen the debt incurred by the acquisition of these ters. and the construction of the Canadian Pacific Railway. In these ters. the gov., before the war, offered facilities for agric. training in part solution of the unemployed youth problem. There were also forestry training projects for young men, and a beginning was made with a plan for training courses in mining. Courses in occupational training, in commerce and industry, are carried on in cities and tns. of sev. provs. for both sexes.

Defence.—The Canadian people have always proved themselves loyal to the empire; they took the field in the war of 1812-14, in Papineau's rebellion of 1837, the Fenian raid, the Red R. expedition of 1870, the N.W. rebellion of 1885, and the second Boer war. The imperial gov. garrisoned the fortresses of Halifax, Esquimaux, and Vancouver until the year 1905, when the dominion gov.'s offer to take over the defences of these places was accepted. Prior to 1922, three depts. of the gov. were concerned with defence: the dept. of Militia and Defence; the dept. of Marine and Naval Service; and the Air Board. The National Defence Act, 1922, consolidated them into the dept. of National Defence. The minister of National Defence is advised by a defence council comprising representatives of all the services. C. in 1940 was organised into eleven military dists. The militia was classified as active and reserve, and the active is subdivided into permanent and non-permanent forces. Before the Second World War broke out in Sept. 1939, the permanent force consisted of fourteen regiments and corps of all arms,

with an authorised estab. limited to 10,090, but at that date the strength was about 4000. The non-permanent active militia is made up of cavalry (horse and armoured car), artillery, engineers, signals, infantry, and the usual ancillary corps. The total estab. of the Canadian non-permanent active militia prior to the Second World War was 7050 officers and 79,440 other ranks. All male inhab. of the age of eighteen or more, and under sixty, not exempt by law, and being Brit. subjects, were liable to service in the militia. The Royal Canadian Navy was estab. in 1910. The authorised complements (before 1939) were: 137 officers and 1582 men of the permanent force, and 70 officers and 430 men of the Royal Canadian Naval Reserve. The vessels in commission (in 1939) comprised six destroyers, a training schooner, five minesweepers, and a motor patrol vessel. Naval dockyards are maintained at the naval bases at Halifax and Esquimaux. The Royal Canadian Air Force was also classified like the army. It controls and administers all Air Force training and operations. Its strength at the end of 1938 was: permanent officers, 222; non-permanent, 84; reserve, 154; permanent airmen, 1765; non-permanent, 753; number of aircraft, 212. At the outbreak of the Second World War (Sept. 1939) the Canadian Army numbered only about 54,500 men; by October 1944 it had grown to 761,000 men, of whom more than 260,000 were on overseas service. All members of the Canadian Overseas Army were volunteers as also were a large proportion of those on service in Canada and adjacent ters. Under the National Resources Mobilisation Act, men in certain age groups were called up for compulsory military service, but men so called up might at any time volunteer for general service. At the end of 1944, over 390,000 had volunteered for overseas service. At the peak of enrolment of personnel for the navy (Jan. 1, 1945) the numbers were: 8920 officers and 78,821 ratings, while the Women's Royal Canadian Naval Service included 371 officers and 5363 ratings. By that date the Canadian Navy had grown to a force of 939 ships, of which 373 were warships and the remainder auxiliary craft carrying out the various duties of supply and maintenance. (Shortly after VE Day there began the process of decommissioning ships not required for the war against Japan, and by Aug. 1945 almost all the corvettes which had played such an outstanding part in the battle of the Atlantic were out of service.) The total number of R.C.A.F. squadrons overseas as at March 31, 1945, was forty-seven, of which about one-third were heavy bomber units equipped with Lancaster or Halifax aircraft and operating in the R.C.A.F. Group of Bomber Command. R.C.A.F. units operating in Coastal Command from bases in the Brit. Is., Ceylon, and Iceland, included general reconnaissance and fighter reconnaissance squadrons. Day and night fighters and others operated in R.C.A.F. and R.A.F.

wings of the 2nd Tactical Air Force, Allied Expeditionary Air Force, and there was also a fighter squadron in Italy, besides two Canadian transport squadrons in Burma and one in England. The R.C.A.F. administered the famous Brit. Commonwealth air-training plan, under which more than 100,000 air-crew personnel were trained in C. (See AIR FORCE, ROYAL.) The gov.'s plans for Canada's post-war forces show that the navy will have a force of 28,000 officers and men including its reserves; the army will have an active force of 25,000 officers and men with a reserve force numbering 180,000; the air force will number 16,100 of all ranks, with an auxiliary force of 4,500 and a reserve of 10,000 officers and men chosen from those who served in the war. The navy will have an active fleet of cruisers, aircraft carriers, and destroyers with a training and reserve fleet of frigates and Algerine mine-sweepers. All three forces will maintain training centres across the country. In order that C. may be always ready to keep her covenant with the United Nations Organisation, a new estab. has been created, known as Canadian Arsenal Limited. It will be the task of this service to keep the weapons and equipment for all the forces in efficient condition and also to keep gov. and private factories and key civilian personnel in a state of readiness.

Constitution and Government.—The constitution of C. is not an imitation of the constitution of the U.S.A., but is the Brit. constitution federalised. The many unwritten conventions of the Brit. constitution are also recognised in the Canadian constitution; the British North America Act, 1867, which defines the internal constitution of C., contains really a written delimitation of the respective powers of the dominion and provincial gov's. Down to the time of the Confederation, C.'s constitutional development is based mainly upon four Acts of the Brit. Parliament, the Quebec Act of 1774, the Constitutional Act of 1791, the Act of Union of 1840, and the British North America Act, 1867. The first of these establishes the Fr. civil law throughout what then constituted the prov. of Quebec; the second divided the country into the Fr.-speaking prov. of Lower C. and the Eng.-speaking prov. of Upper C., and conceded representative gov. through an elective legislative assembly, but without executive control except in so far as it could refuse to vote taxes; the third reunited the two Cs. under a single legislature and conceded the principle of responsible gov.; the executive administration being from that time dependent on the legislature; the fourth separated the two Cs. from their existing legislative union to make them prov's., each controlling its own local affairs, in a wider confederation, which within a short period so extended its boundaries as to embrace the whole of Brit. N. America except Newfoundland and Labrador (Newfoundland has since agreed to enter the Canadian Confederation). The constitution of C. cannot be altered save by

the Imperial Parliament, but to all intents and purposes C. has complete autonomy (see further under *History*).

(1) *The Dominion Government.*—The Brit. N. America Act declares that the executive gov. of C. shall continue to be vested in the sovereign of the United Kingdom, represented for dominion purposes by the governor-general, and, for provincial purposes, by the lieutenant-governor. The governor-general is advised by the king's Privy Council for C., a committee of which constitutes the ministry of the day. The dominion Parliament consists of the king, the Senate, and the House of Commons. It must meet at least once a year, so that twelve months do not elapse between the last meeting in one session and the first meeting in the next. Senators, 102 in number, are appointed for life by the governor-general under the great seal of C. The senatorial representation is as follows: Ontario, 24; Quebec, 24; Nova Scotia, 10; New Brunswick, 10; Prince Edward Is., 4; Manitoba, 6; Brit. Columbia, 6; Alberta, 6; Saskatchewan, 6; and Newfoundland, 6. They must be thirty years of age, Brit. subjects, residents of the prov. for which they are appointed, and possess \$4000 over and above their liabilities. Members of the Lower House or House of Commons (who number 252) are elected by the people for the duration of the Parliament, which may not be longer than five years. The prov. of Quebec has the fixed number of 65 members, and the other provs. are represented in the proportion, as ascertained at each decennial census, that the number 65 bears to the pop. of Quebec.

The first dominion Parliament of 1867 consisted at its commencement of 181 members, 82 for Ontario, 65 for Quebec, 19 for Nova Scotia, and 15 for New Brunswick. To this number were added, under the Manitoba Act of 1870, 4 members to represent the then newly created prov. of Manitoba; also, according to the agreement under which Brit. Columbia entered the Confederation, 6 were added to represent that prov., making 191 at the end of the first Parliament of C. In 1874, when Prince Edward Is. entered the Confederation, 6 members were added for that prov. In 1880 4 members were added to represent the N.W. Ters. (2 for Assiniboia and 1 each for the provisional dists. of Alberta and Saskatchewan), the total then being 215. There have since that time been many readjustments, the census of 1911, with its very large but unevenly distributed increase of pop., leading to considerable changes in representation, as enacted by the Representation Act of 1914. The total membership in the thirteenth and fourteenth Parliaments (elected in 1917 and 1921 respectively) was 235. As a result of the smaller increase in pop. shown by the census of 1921, the changes in representation were less far reaching. Nova Scotia lost 2 members and the W. gained 12, 2 of these being added to Manitoba, 5 to Saskatchewan, 4 to Alberta, and 1 to Brit. Columbia.

The representation of the remaining provs. was unchanged. The representation for the newly created prov. of Newfoundland is 7. The nineteenth Parliament, elected on March 26, 1940, comprised 245 members, in accordance with the Representation Act of 1933 which, as the result of the census of 1931, fixed the representation as follows: 32 for Ontario, 65 for Quebec, 12 for Nova Scotia, 10 for New Brunswick, 17 for Manitoba, 16 for Brit. Columbia, 4 for Prince Edward Is., 21 for Saskatchewan, 17 for Alberta, and 1 for Yukon Ter. The only qualification necessary for the Lower House is that the members must be Brit. subjects.

reserved for Indians; naturalisation and aliens; and a number of other lesser topics. In short, it has exclusive legislative power in all matters except those specifically delegated by the constitution to the provincial legislatures.

Since confederation there has been a gradual development of the powers of the Canadian Gov. It was in 1878 that the Hon. Edward Blake secured the formulation of new instructions to the governor-general providing that he should act upon the advice of his ministers. Gradually too, the status of the dominion has become enhanced with each meeting of the Colonial (now Imperial) Conference, and

Canadian in Board

OTTAWA: THE PARLIAMENT BUILDINGS

The dominion franchise is, by the Act of 1922, conferred upon all Brit. subjects, male and female, who have resided in C. for a year, and for two months in the electoral dist. in which they desire to vote, but this latter restriction was removed in 1923 so far as it applied to general elections. The only adult Brit. subjects who are now denied the vote are convicts, paupers in institutions, judges, persons paid for work on behalf of a candidate, and certain persons who by reason of their race are not permitted, under the law of their prov., to vote at a provincial election. The effect of this racial exclusion is, however, to exclude only such Chinese, Jap., and E. Indians as reside in Brit. Columbia and did not serve in the First World War, and such Chinese as reside in Saskatchewan and did not so serve.

The dominion Parliament has exclusive legislative authority in all matters relating to the following: public debt and property; regulating of trade and commerce; taxation; loans on public credit; postal service; census; defence; navigation and shipping; lighthouses; quarantine; fisheries; ferries on frontiers; banking and issue of paper money; Indians, and lands

from 1911 it was recognised that the Brit. Gov. was simply *primus inter pares* among the great nations of the empire. During the First World War, the Canadian premier, together with other dominion premiers, was a member of the Brit. War Cabinet; and, at the close of the war, Sir Robert Borden, then Prime Minister of C., secured for the dominions recognition as signatory powers of the treaty of Versailles and acceptance as members of the League of Nations. (In 1926 a Canadian minister, the Hon. Raoul Dandurand, acted as president of the League assembly.) In 1927 C. was elected as a non-permanent member of the council of the League. Arising out of the recommendations of the Inter-Imperial Relations Committee of the Imperial Conference of 1926, the governor-general of a dominion is now regarded as the personal representative of the Crown and not as an official of the Brit. Gov. Arising out of the position that each dominion is now regarded as a freely associated member of the Brit. Commonwealth of Nations, C. appointed a minister to the U.S.A., which country, in 1927, reciprocated the appointment by sending

a minister to C. Ministers were, later, exchanged with other states. The Brit. Gov. in Ottawa is now represented by a high commissioner. C. now has twelve ambas. and eight ministers in diplomatic posts abroad, in addition to various consuls, consuls-general, etc. There are Canadian ambas. in the U.S.A., France, Brazil, Argentine, China, Russia, Chile, Mexico, Peru, Belgium, Greece, the Netherlands, Italy, and Turkey. C.'s embassy in Moscow has been for some time administered by a Canadian chargé d'affaires. C. has ministers appointed to Luxembourg, Cuba, Norway, Denmark, Poland, Czechoslovakia, Sweden, and Switzerland. The legations in both Poland and Czechoslovakia, however, have been for some time in charge of chargés d'affaires. See also WESTMINSTER, STATUTE OF.

(b) *The Provincial Governments.*—In each prov. the king is represented by a lieutenant-governor, who is appointed by the governor-general in council, and who governs with the advice and assistance of his Ministry or Executive Council. The council is responsible to the Legislature and resigns when it no longer has the confidence of that body. The Legislatures have only one Chamber, consisting of a Legislative Assembly elected by the people—except in Quebec, where there is also a Legislative Council. The Legislature in each prov. may exclusively make laws in relation to the following matters: amendment of the constitution of the prov., except as regards the lieutenant-governor; direct taxation within the prov.; borrowing money on the credit of the prov.; public lands belonging to the prov.; prisons, hospitals, charities, etc.; municipal institutions; shop, saloon, etc., licences issued for revenue purposes, local works and undertakings other than inter-provincial or international communications; companies having provincial objects; property and civil rights within the prov.; administration of justice within the prov.; generally all matters of a merely local or private nature in the prov.

The Canadian constitution was remarkably successful for a period of fifty years, while it was adapted to the conditions in C.; but since then conditions have changed so markedly that the constitution is no longer suited to the age. For when the constitution was framed it was a compromise between those who wanted a strong federal authority and those who thought that it was essential to the success of confederation that Quebec should have control of all those matters in which that prov. differed and indeed still differs from the others, and that consideration should be given to the fears of the remaining provs. lest they should lose their powers. Hence certain specified powers were assigned to the federal gov., certain other specified powers to the provs., and all residuary powers were left to the federal gov. In this century the tendency has been to interpret the constitution in such a way as to strengthen the authority of the federal or central gov.: this being in accord with the movement of public

opinion which, since the first decade, has been shifting the emphasis from liberty to power. Again, in 1864, when the constitution came into being, trade in C. was mainly local; to-day it is dominion-wide. The power of the dominion gov. is no longer adequate for the effective control of trade and industrial activities, nor for the carrying out of international agreements. Conversely, the development of the social services, which appertain to the provincial authorities, has been so great that the financial provisions made for the provs. at the time of confederation have become quite inadequate. By the close of the inter-world war period the need for a change in the relations between the central and provincial govts., especially in relation to the division of taxing powers, was generally recognised. In 1937, the federal gov. appointed a commission, known as the Rowell-Sirois commission, to report on conditions and make recommendations. Its terms of reference were to make 'a re-examination of the economic and financial basis of confederation and of the distribution of legislative powers in the light of the economic and social developments of the last seventy years,' and 'to express what, in their opinion, subject to the retention of the distribution of legislative powers essential to a proper carrying out of the federal system in harmony with national needs and the promotion of national unity, will best effect a balanced relationship between the financial powers and the obligations and functions of each governing body, and conduce to a more efficient, independent, and economical discharge of governmental responsibilities in C.' The commission's report was pub. in May 1940 and the ensuing federal-provincial conference to discuss the recommendations dispersed in violent disagreement. During the war C.'s problems grew in intensity and importance, but the federal gov. overcame difficulties with the provs. partly by agreement and partly by orders-in-council. A second, and post-war conference was more successful, the federal gov. offering a plan whereby the provs. by a voluntary surrender of a portion of their powers, might meet the difficulties of the altered situation. Committees were appointed to consider the offer and a third conference met in 1946. The dominion-prov. conference on taxation and reconstruction adjourned in 1946 without coming to an agreement. Ontario and Quebec led prov. objections to dominion proposals that in return for specified unconditional payments to the provs., the provs. would undertake, for the next three years, not to levy income, corporation, and succession duty taxation, with the proviso that any prov. which wishes to continue to levy succession duties might do so on condition of the dominion payment being appropriately reduced. Counter proposals that in return for cession of these tax fields the federal gov. give up taxation on such items as gasoline, amusements, electricity, etc., were not acceptable to the dominion gov.

Public Finance.—At confederation other revenues which had previously accrued to the treasuries of the prov. were transferred to the dominion, notably the customs duties; and the public works and other property of the provs., except lands, mines, minerals and royalties, also became dominion property. The dominion became responsible for the debts of the provs., and therefore had thenceforth to pay ann. subsidies to the provs. for the support of their govts. and legislatures. In addition to these assured subsidies, which have been increased from time to time, the provincial govts., through retaining the ownership of their lands, minerals, and other natural resources, raise considerable revenues through land sales, sales of timber, mining royalties, leases of water power, etc., while the prairie provs. receive from the dominion special grants in lieu of land revenues. Negotiations for the transfer of the lands and other natural resources of the prairie provs. to the gov. of the respective provs. were completed in 1930. Further, under the British North America Act, provincial Legislatures are authorised to impose direct taxation within the prov. for provincial purposes and to borrow on the sole credit of the prov. C.'s net debt (1944 was estimated at \$8,842,000,000.

History.—John Cabot had reached the shores of C. in 1497, but in 1534 Jacques Cartier, a Frenchman, undertook a voyage of discovery along the coasts of Newfoundland and Labrador, and on his second voyage (1536-37) discovered the St. Lawrence R. and travelled as far as the Indian cap. Hochelaga. Some small settlements were made by the Fr., but abandoned after two years, and it was not till 1608 that Samuel de Champlain, who had visited the country in 1603 and subsequent years, founded the city of Quebec. The St. Lawrence region formed a Fr. colony under the name of C. for the next century and a half, but the Eng. Hudson's Bay Company was formed in 1670, and began to carry on trade with the Indians in the N.W. Ter. Halifax in Nova Scotia was founded in 1749, and a Brit. governor was set over a number of Brit. who had emigrated thither. The struggle between the Fr. and the Eng. for the possession of the N. Amer. continent was lengthy and determined, but the momentous struggle with the Fr. came to a victorious end with the battle of the Heights of Abraham, and the decision virtually made by that battle was confirmed by the treaty which ended the Seven Years war. The life of Wolfe had not been spent in vain, and the passing of that hero synchronised practically with the estab. of the dominion of C. By the treaty of Paris of 1763, C. and the disputed lands between the Mississippi passed for ever into the hands of the Eng. The Fr. colonists were allowed to sell their property and return to France if they wished, but above all they were granted complete freedom of worship, and on the whole C. remained satisfied. During the Amer. war they remained loyal, a loyalty which was

chiefly due to the fact that the Quebec Act of 1774 confirmed their right of worship in their old Catholic faith, and they were also allowed to hold land according to the system of anct. France. Thus pacified, they gave no help to the rebels, and rather regarded the possible inclusion of C. with the revolting colonies as a misfortune which was to be avoided at all costs. The settlement of what is now the prov. of New Brunswick took place about this time as a result of the driving of the loyalists from America (U.S.A.). The colonists, loyal though they were, however, insisted upon a recognition of their constitutional rights, and they demanded self-gov. in local affairs. This they were granted by the Constitutional Act of 1791, which divided C. into an upper and a lower prov., both of which had a representative assembly.

During the war with the U.S.A. both provs. remained loyal and helped to repel the invasions of the Amers. The boundary between C. and the U.S.A. was first defined by another treaty of Paris in 1783 at the end of the Amer. War of Independence. But following on the war we find a state of affairs which boded ill for the mother country. The colonists were discontented and aggressive; their discontent showed itself in the rebellions of Papineau and Mackenzie, both of which were futile. But the opening of the reign of Queen Victoria did not give prospect of an immediate relief of the situation. Bloodshed and discontent were rife; something must be done which would help in the settlement of C. Lord Durham, who was sent out to investigate matters, suggested that the colony should be granted responsible gov., and a legislative union of Upper and Lower C. took place. The Fr. party for some considerable time held the balance of power, and the rioting at Montreal in 1849 led to the removal of the Legislature first to Toronto and Quebec alternately, and finally to Ottawa. For some time there was a considerable movement in favour of union with the U.S.A., but a reciprocity treaty with U.S.A. in 1851 put an end to this movement. After many difficulties and many deadlocks between the great political parties, the British North America Act was passed by the Brit. Parliament in 1867, and the dominion of C., consisting of Upper and Lower C., New Brunswick, and Nova Scotia, came into being. Prince Edward Is. and Newfoundland dropped out of the scheme at the last moment. There were many reasons for this federation, the chief perhaps being that the fear of Amer. aggression made the colonists feel that united action would safeguard the interests of them all. The new additions were of great value to the colonists of Upper and Lower C., and the federation went far to establish a really strong Brit. possession in N. America. Since the Confederation, the Canadian Gov. obtained in 1879 the right to give a preference in tariffs to another colony (or dominion), in 1881 the right of representation when treaties concerning her

interests are being discussed, and in 1897 the right to demand that a treaty which she considers inimical to her interests should be abrogated. In the meanwhile occurred two rebellions of the half-breeds led by Riel, one in 1869 and the other in 1885; the second was the more dangerous, but was put down, and Riel was executed. Again, since the Confederation, in face of many difficulties, the dominion has gone on incorporating new provs. and stretching her boundaries to the N. and to the W. The Hudson Bay ter. was incorporated. Brit. Columbia joined the dominion, and step by step the whole of the present ter. of the dominion was incorporated.

Progress in the last sixty years has been fairly rapid, particularly in the twentieth century, though the primary resources of the country are still practically untouched. Between the years 1881 and 1885, in spite of opposition in the face of the greatest difficulties, the Canadian Pacific Railway was built, and amongst the names which stand out above all others at this time are to be remembered the names of Lord Strathcona, Lord Mount Stephen, and Sir John Macdonald. The latter, after leading the Conservative party in C. successfully for many years, d. in 1891. He had faced many critical movements, but he had been true to his policy of faith in C. and the Brit. Empire. His death broke up the Conservative party, and in 1896 Sir Wilfrid Laurier and the Liberals were returned to power. They remained in office until 1911, when their policy of reciprocity was defeated and the Conservatives under Mr. (later Sir Robert) Borden were returned. During the crisis of the S. African war the Canadians showed their loyalty and sympathy, and the deeds of valour of the Canadian contingents raised C. to the position of one of the leading forces in the Brit. Empire. This loyalty was further demonstrated, in striking manner, on the outbreak of the First World War, the first Canadian contingent landing at Plymouth on Oct. 18, 1914. This contingent landed in France in Feb. 1915, and fought at the second battle of Ypres, April 22, at St. Julien, April 24, Festubert, May 20-26, Givenchy, June 15. In Jan. 1916, an increase in the number of Canadian troops to 500,000 was authorised. Actually, 595,000 men were raised, of whom 418,000 went overseas, while over \$1,000,000,000 worth of munitions were supplied to the allies by Canadian factories. Other notable battles in which the Canadians played a prominent part were the capture of Vimy Ridge, Loos, the capture of Hill 70, Passchendaele, the Somme (March 1918), Amiens, Monchy le Preux, Drocourt-Quéant 'switch' (q.v.) line, Bourlon Wood, and Cambrai (q.v.). During the period of the war the Houses of Parliament at Ottawa were destroyed by fire (Feb. 1916), and there was a disastrous explosion of munitions at Halifax, N. Nova Scotia (Dec. 1917). In the year following the war, the Prince of Wales made an official tour of C., opening Quebec Bridge on Aug. 22 and laying the foundation stone of the tower of the new Parliament

buildings at Ottawa. In the same year the Canadian National Railways were organised. Sir Robert Borden was succeeded by Mr. Arthur Meighen as Premier in 1920, but his Conservative Ministry soon fell, and Mr. W. L. Mackenzie King, Liberal, became Premier (Dec. 1921), and held office till 1926, during which period there were two Imperial Conferences (1923, 1926) at which he represented C.; a trade agreement was signed between C. and the Brit. W. Indies (1925), and Lord Byng of Vimy (q.v.), 1921, was made governor-general. In 1926 Mr. Meighen once again became Premier, but was defeated in the House immediately and resigned. The taxation issue and that of protective tariffs remained the dominant note in Canadian politics, neither party having any very clear advantage in majority, but in 1930 Mr. King was severely defeated at the general elections, Mr. (later Lord) Bennett (q.v.) becoming Prime Minister at a time of somewhat serious unemployment and pledged to an upward revision of tariffs, to exclude, especially, imports of manufs. from the U.S.A. In Oct. 1930 Mr. Bennett came to London at the head of the Canadian delegation to the Imperial Conference, the prin. issues being economic and constitutional (inter-Imperial relations).

C. suffered with other countries in the world economic crisis which began in 1929. Factories closed, the wheat market collapsed, and the demand for manufactured and agric. products fell to disastrous levels. The prairie farmers were especially hard hit and the wheat pools faced great losses. The provincial govts. came to their aid and by 1932 they were operating again as co-operative elevator companies. After the depression a drought set in, bringing eight years of successive crop failures, while soil erosion aggravated the loss, high winds blowing the scorched and crumbled earth for great distances. By 1933 thousands of farmers were on relief, their savings wiped out, and innumerable farms were abandoned. The year 1930 marked the end of the era of the rise of the wheat empire, which had begun with the construction of the railways and though grain must continue to be important, the W. had other resources awaiting development. It was in this year, too, that the natural resources, which hitherto had been kept under the control of the dominion gov., were transferred to the prairie provs. In 1930 Mr. Mackenzie King and the Liberals, who had been in office for five years, were defeated and the Conservatives, under Mr. R. B. Bennett (now Lord Bennett) a lawyer from Calgary, assumed office. The depression also encouraged new political movements. In Alberta the Social Credit party (q.v. and see also ALBERTA) advocated drastic changes in the control of banking and money and gained control of the provincial legislature. The Co-operative Commonwealth Federation, organised in 1933, advocated a wide extension of public ownership and a great extension of the social services. Despite the depressing features of the economic crisis these years

were not devoid of substantial achievements: the Prairie Farm Rehabilitation Act of 1935, passed by the Conservative gov., provided for a programme of research through the co-operation of dominion and provincial govts. Through the efforts of farmers and scientists, the line of agriculture was extended gradually further N. towards the Arctic circle. Radio and flying, too, helped in the expansion northward, freight being carried through the N.W. Ters. and even to the Arctic Is. McMurray, at the end of the railway, 300 m. N. of Edmonton, became the gateway to the Mackenzie, and from there the airline reached N. 1600 m. to Aklavik on the Arctic shore; but the full effects of this expansion northward has not yet been realised. In 1932 a national broadcasting system was established, and four years later it was reorganised under the Canadian Broadcasting Corporation—a combination of private ownership and state control. The overwhelming Liberal victory in the provincial elections of 1934 was followed by Mr. Bennett's heavy defeat in the general election of 1935 when Mr. MacKenzie King once more became Premier. Lord Willingdon succeeded Lord Byng as governor-general in 1926 and was himself succeeded by Lord Bessborough in 1931. In 1935 Lord Tweedsmuir (John Buchan) became governor-general, and was in office until his death during the Second World War. In 1937 Mr. King and his Cabinet appointed a Royal Commission to study the problem of dominion-provincial relations. The outcome was the most thorough investigation since confederation. The commission's report, generally known as the 'Rowell-Sirois report' recommended a change in the financial relations of dominion and provs. by which the dominion gov. would collect more of the country's taxes, but would assume more responsibility for social services and prov. debts; but these proposals were not universally approved, and when the country became involved in war in 1939, the whole question was shelved. This was also the period of constitutional development in C. as in the other dominions affected by the Statute of Westminster passed in 1931 (*q.v.*). In the case of C. and at the express wish of the Canadian Gov., two limitations with regard to the British North America Act, that is, with regard to the Canadian constitution, remained despite the Statute: (a) amendments were still to be made by the Brit. Parliament, which, however, would act only at the request of the Canadian Gov.; (b) legal cases involving the interpretation of the British North America Act could still be taken on appeal to the judicial committee of the Privy Council as the highest court of the empire. These limitations were to be removed whenever C. wished, and were retained because no method of amending the constitution had been found which was approved by all the provs. As the Statute of Westminster, by repeating the principle of the Crown as the symbol of the free association of members of the Brit.

Commonwealth, demonstrated that the Crown was the only legal link binding the members together, it was as king of C. that George VI. made his royal tour in 1939 and addressed the Canadian Parliament in Ottawa. In this transformation from Empire to Commonwealth C. has always played a leading part. 'Since the time of Durham she had been the chief laboratory for the great experiment of colonial self-government which, after a century of trial and error, had finally been brought to its logical conclusion' (George W. Brown). The years 1931 and 1935 were internationally disastrous by reason of the Jap. invasion of China and Mussolini's invasion of Abyssinia—events which sorely tried the efficacy of the League machinery. In 1938 Germany, profiting by the divs. among her adversaries, invaded Austria. With Germany's invasion of Poland the Second World War began.

But C.'s share in these events was a minor one, though more important than, perhaps, was suspected by Canadians. Thus public opinion strongly condemned the Jap. aggression, and the Canadian Gov. supported the protest made by the League. But it was not thought that any further step was necessary—C. was not a great power and the country was not yet entirely free from the effects of the depression. Yet none the less C., like other countries, was being hastened towards war during these critical years by force of circumstances and also by policies in the formulation of which she had no part. Canadians had yet to learn that peace is indivisible and that war, like a bodily disease, infects the whole body. The royal tour of King George and Queen Elizabeth in N. America in 1939 was a striking sign of the new spirit of understanding among the nations of the Brit. Commonwealth and between Britain and the U.S.A. This better understanding, however, did not manifest itself so much in common policies as in the tacit recognition of common interests which in the long run went deeper. The royal tour made this abundantly clear, and to millions the royal pair became a symbol of the meaning not only of the Brit. Commonwealth but of Brit. democracy. Thus, as the clouds of war darkened the horizon of Europe, there emerged signs not only of a better understanding between Britain and the U.S.A., but of a common determination that the U.S.A. and C. would stand together in defence of N. America against the menace of aggression. On Sept. 10, 1939, the Canadian Parliament resolved that the king should declare a state of war between C. and Germany. C. thus ranged herself with Britain and other members of the Commonwealth in the defence of freedom.

Alone among the nations of America, she entered the war at its inception, believing that not only her destiny but that of the world was at stake. Events were to show that her belief was well founded. C. had small but well-organised forces which could soon be

expanded; but otherwise she was virtually unprepared. Yet by the spring of 1942 she had in her active service force more than 265,000 volunteers who had enlisted for service anywhere in the world. (See under *Defence*, above.) Canadian detachments served in Newfoundland, Iceland, the W. Indies, and Hong Kong, but most of the forces overseas were stationed in the Brit. Is., whose defence was essential to victory and whose shores were the only base from which an invasion could be launched in N.W. or W. Europe. From the time, a week after the declaration of war, that C. co-operated in protecting the first convoy, the expansion

THE FIRST CANADIAN SOLDIERS IN ENGLAND, DECEMBER 1939

of the Canadian navy became one of the most striking achievements of her war effort. In the first three years of the war, Canadian naval operations extended not only to home waters, but to the Caribbean, Mediterranean, and the waters around Great Britain. Canadian ships shared in the Dunkirk evacuation, and Canadians attached to the Royal Navy participated in the heroic if desperate operations off Gk. and Cretan coasts. But C.'s most remarkable contribution was that which was associated with the Royal Canadian Air Force. In the autumn of 1939, at the suggestion of the Brit. Gov., the Brit. Commonwealth Air Training Plan was estab. for the training of airmen from all over the self-governing empire. The plan was placed under the administration of C.'s National Defence for Air, and Canadian airfields were chosen as the scene of operations because her geographical position gave immunity from the threat of enemy bombers. This plan became a major factor in determining the course of the conflict. Meanwhile

Canadian airmen were fighting on widely scattered fronts. Large numbers attached to Brit. squadrons fought over Britain, Europe, the Mediterranean areas, and Russia; and, in addition, nearly a score of Canadian squadrons were in action overseas by early 1942. Within two years of the beginning of the war hundreds of Amer.-built bombers were being flown as a matter of course from Newfoundland to Britain. But not until after Dunkirk was the full significance of Canadian industry realised. Tanks, aeroplanes, and innumerable articles of mechanised equipment were required immediately. From this point began a transformation which in less than two years completely geared Canadian industry to the war effort.

New factories were built and old ones converted to war purposes. Tanks, aeroplanes, guns, munitions, and masses of other articles were produced in a volume unprecedented in C.'s hist. On E. and W. coasts and in the ports of the Great Lakes, a ship-building programme was undertaken to produce hundreds of ships, vessels of all sizes from motor torpedo boats to large freighters. The corvette, fast and well armed, was the special contribution in this regard to the campaign against the Ger. U-boat menace. Canadian finance, too, was mobilised completely to meet an enormously increased burden. By mid 1941 Canadians, through taxes and war loans, were contributing 40 per cent of their income to war purposes. A landmark in Canadian hist. was the creation on Aug. 18, 1940, by C. and the U.S.A. of the Permanent Joint Board of Defence, through an agreement signed at Ogdensburg by Mr. Mackenzie King and President Roosevelt. By this agreement the signatories in effect declared their determination to co-operate fully 'in the defence of the N. half of the Hemisphere.' The Ogdensburg agreement marked a new stage not only in the relations of C. and the U.S.A., but in the relations of the U.S.A. with the Brit. Commonwealth. For the first time in her hist. the U.S.A. had signed a permanent military agreement with a member of the Commonwealth, and had recognised C. as her closest friend and associate. For the first time, too, C. had shown that she was bound to join with her neighbour in defence of the common continent while she was free also to stand by other Brit. nations overseas.

Early in 1946 public confidence in Russian integrity was shaken by the 'Soviet spy case.' Mr. Mackenzie King in the Commons (Feb. 15, 1946) said that information had reached the gov. which estab. that there had been disclosures of secret and confidential information by unauthorised persons, including some members of the staff of 'a foreign mission' in Ottawa, and the gov. had appointed Justices Taschereau and Kellock of the Supreme Court as royal commissioners to report on the case. The Soviet Gov., which had not been named, hastily averred that the information they had

received from Canadian citizens concerned technological data which the Soviet authorities did not need, as the U.S.S.R. 'possessed higher technological achievements and which could be found in available pubs. on radiolocation, etc., and that the Soviet ambas. and the other members of the Soviet embassy were in no way concerned—the persons concerned being some employees on the staff of the military attaché who had been recalled.' On Feb. 23 the Royal Canadian Mounted Police detained thirteen persons, including two women, in connection with the inquiry being undertaken by the commissioners. The commissioners in their first interim report (March 4) stated that the evidence proved the existence of a network of under-cover agents for the purpose of obtaining secret and confidential information from Canadian Gov. employees, and that these operations were carried on by members of the staff of the Soviet embassy in Ottawa under direct instructions from Moscow; and that the person in charge of those activities was the military attaché, Col. Nicolai Zabotin, and staff. The commissioners had evidence from one, Igor Gouzenko, cipher clerk to the military attaché, who had described the organisation and produced original documents which showed that specific tasks entrusted in Aug. 1945 by Moscow to Zabotin included those of obtaining information on technological processes in connection with the production of explosives and chemicals; data in connection with the materials of which the atomic bomb was composed; and particulars of the plant at Chalk R., Ontario, and the processing of uranium, etc. The evidence estab. that four persons had communicated information to Soviet representatives in violation of the Official Secrets Act, 1939. One was a woman of Russian origin, employed as a cipher clerk in the Dept. of External Affairs. The second interim report stated that evidence had been heard from four more persons under detention, including Dr. Raymond Boyer, an assistant prof. of chem. at McMill Univ., who had admitted that in 1943 and 1944 he had given full information on his scientific work for transmission to the Soviet Union. This work was in connection with the new explosive RDX, research into which was conducted by the National Research Council. All these four additional persons detained held positions of trust. On March 14-15 F. Rose, Labour-Progressive (Communist) member for Montreal-Cartier in the Canadian Commons was also arrested and charged with conspiring with Dr. Boyer and others. In a full statement in the Commons on March 19 Mr. MacKenzie King said that the documents in the case disclosed *inter alia* that C. was being made 'a base to secure information on matters of very grave concern to the U.S.A. and to Great Britain and that information was being sought through agents in Canada with respect to matters of the utmost concern to Canada, the

U.S.A., and the United Kingdom.' On March 29 the commissioners issued their third interim report naming five more persons. A few days later the Soviet embassy issued a statement describing Gouzenko as a 'criminal' and asserting that his statements were slanderous and fictitious. Dr. Boyer and most of the others charged were committed for trial and eventually convicted and sentenced to varying terms of imprisonment (*see Report of the Royal Commission*, pub. June 27, 1946, by the King's Printer and Controller of Stationery, Ottawa).

The question of the possibility of Newfoundland's entry into the Canadian Confederation began to be mooted in Canadian political circles as early as 1943, and in July of that year Mr. J. W. Noseworthy (a member of the Co-operative Commonwealth Federation party), himself of Newfoundland birth, urged in the Canadian Commons that the time was ripe for union between Newfoundland and Canada and he asked that immediate steps should be taken to bring about that union. Mr. MacKenzie King, in reply, declared that any discussions on the subject ought to be initiated by Newfoundlanders rather than by Canadians, but that 'if the people of Newfoundland ever decide that they wish to enter a Canadian Federation and should make that decision clear beyond all possibility of misunderstanding, Canada would give the most sympathetic consideration to the proposal.' After the war Newfoundland elected (autumn, 1946) a national convention to make recommendations to the Brit. Gov. as to the possible forms of future gov. to be submitted to the people of Newfoundland at a national referendum—the three alternatives being the continuance of commission gov., reversion to dominion status, or federal union with C. The convention did not in fact recommend confederation as one of the alternatives to be put to the people; but the secretary of state for commonwealth relations in London decided that in view of the existence of a strong body of opinion in the is. in favour of it, and also because the convention had sent a delegation to C. which had resulted in terms of confederation being offered by the Canadian Gov., confederation should be put to the people. The first referendum showed that there was no substantial body of opinion in favour of a gov. by commission, while the other two alternatives polled more or less equal votes; but as a result of the second referendum the confederation proposal secured the necessary majority. The Canadian Gov. intimated that they would receive representatives of Newfoundland to discuss terms and the Newfoundland Gov. appointed a delegation for that purpose. The terms of agreement for bringing Newfoundland into the confederation were signed in Ottawa on Dec. 11, 1948, by representatives of the Canadian Gov. and the Newfoundland delegation, the operative date for union being March 31, 1949, subject to the terms of the agreement being approved by the Canadian Parliament and by the New-

foundland Gov. The Canadian Commons having passed the necessary resolution, and the Newfoundland Gov. also assenting to the terms, the Brit. Gov. in accordance with the joint request of C. and Newfoundland, gave its assent to union by an Act of Parliament confirming the agreement. Under the agreement the services taken over by the dominion gov., thereby relieving the new prov. (now the tenth prov. of C.) of the public costs incurred in respect of them after they had been taken over, were: the Newfoundland Railway, including some shipping and other marine services; the Newfoundland Hotel; telegraphic services; civil aviation; customs and excise; defence; protection of fisheries; geological, topographical, geodetic and hydrographic surveys; light-houses, buoys, and beacons; radio broadcasting system; and some other public services.

This proved to be the last political achievement of Mr. MacKenzie King. In 1943 there were rumours that, for health reasons, he proposed shortly to retire from active participation in politics. He had already held the reins of gov. in C., in combined periods, for a greater number of years than any other prime minister in the world. He visited London in Oct. 1948 to take part in the Dominion Premier's Conference, but was unable to attend, and soon afterwards he announced his retirement. He was succeeded as Prime Minister and president of the privy council by the Rt. Hon. Louis Stephen St. Laurent, K.C.

Literature.—Canadian literature, both Eng. and Fr., emerged late. A national literature presupposes a mature society. C., while it has achieved political autonomy, still awaits adulthood. Its ter. is so vast, segmented by geography, and varied in its ethnic communities, that the arts and letters of C. are bound to be regional. The entry of Newfoundland into the confederation, and the increasing importance of the Arctic, still further underline that fact. Racial and religious differences suggest no early or easy fusion of Canadians into a homogenous people. Yet there is slowly appearing a distinguishable type. No other part of C. has produced anything like the self-conscious culture of Quebec, *la petite patrie*, compounded of race and religion, the determination to survive unchanged, the age-old preoccupations with the altar, hearth, and the traditions of the folk.

1. **English Canadian Literature.**—Following the Conquest, Brit. settlement largely consisted of isolated communities of immigrants. Some communities were deliberately segregated units of Highland Scots Catholics, others were Congregationalists or United Empire Loyalists. Each was jealous of its rights and tenacious of its folk-ways. The Puritan tradition of Congregationalism, and of New England colleges, emerged in Rev. Henry Alline, the poet of rapture and revolt, founder of the Maritime Baptists, and in Rev. Jonathan Odell, Tory satirist of Nova Scotia. The Tory mind of the Loyalist contrived a political

and social structure in Ontario. All this has developed into a congeries of regional patterns. For many years these cultural is. remained obstinately colonial, their writers and artists derivative in style, and their work saturated with nostalgia for other days and other ways. Subject to Westminster, fearful of the incipient imperialism of Washington, the young nation became inhibited and retarded. Divided in language and religion, overwhelmed by geography, by distance and sharply contrasting interests; escaping the blood-bath of crisis, and the purge of revolution that welded other conglomerate states; missing the liberal and progressive movements following Darwin, C. was late in awakening. Its survival of the shattering blow of the First World War was a miracle. It not only survived, but its greatness dates from then. Before then neither Canadian hist. nor Canadian literature received any recognition at a Canadian univ. The Canadian Authors' Association was born in 1920.

Eskimo and Indian culture have had no effect upon Canadian literature. The earliest, and still in some ways the best, books were the personal accounts of their travels by the great explorers—Cook, Thompson, Vancouver, Harmon, and so on down to Tyrrell, Stefansson, and others. It is a roll-call of immortals, and through such series as *The Makers of Canada, Canada and Its Provinces*, and *The Champlain Society publications*, the record is known round the world. To these annals may be added the travel books of authors and artists—Mrs. Sincoo, Mrs. Jameson, the Strickland sisters, Kane, Catlin, Heriot, Morris, and so on to Fredrick Philip Grove and Philip H. Gosell.

The first native-born Canadian poet, Oliver Goldsmith, a grandnephew of his Irish namesake, pub. *The Rising Village* in 1825. Eng., Scots, and Irish *émigré* poets, Kirby, McLaughlin, McGee, and many others were pale imitators of Scott, Byron, Gray, and Burns. Then appeared Charles Sangster and Charles Mair, the first consciously Canadian poets, followed by Isabella Valancy Crawford, and Canadian literature had at last begun. The preoccupation of Mair and Crawford with people, especially pioneer types, gave way to the Group of the Sixties, a man's-land of nature poetry. The chief men of letters were born around the sixties: Wm. Henry Drummond, Albert Durrant Watson, Pauline Johnson (Tekahionwake), Sir Charles G. D. Roberts, Bliss Carman, Archibald Lampman, Wm. Wilfred Campbell, Duncan Campbell Scott, Frederick George Scott, and Tom MacInnes. These poets were unchallenged. Their work inspired political orators, educationists, and the emerging arts. Following this 'golden age' came Theodore Roberts, Robert W. Service, Francis Sherman, John McCreas, Wilson Macdonald, Marjorie Pickthall, and E. J. Pratt. With Sherman the pre-Raphaelites died, with Pickthall the Celtic twilight faded, and with Pratt a fresh wind swept through Canadian letters,

The foundation was laid for the birth of the Montreal group. In no country have groups counted for so much, since they guaranteed comradeship and sympathetic understanding in a vast, lonely, and indifferent land. The Montreal poets, A. J. M. Smith, Leo Kennedy, A. M. Klein, and Frank Scott, opened wide the doors for the new day, and the movement gains strength every year. Raymond Knister was in a sense a founder of the movement; while belonging to it in time, but not in spirit, are Arthur Bourinot and Audrey Alexandra Brown. The new voices are many and varied, and a few of them seem destined for greatness. Among the more experienced of these poets are Earle Birney, Charles Bruce, Dorothy Livesay, Anne Marriott, P. K. Page, Patrick Anderson, Raymond Souster, L. A. Mackay, Louis Dudek, and James Wreford. The influence of Auden, Eliot, Spender, Thomas, and Pound has supplanted Wordsworth, Browning, Arnold, and Swinburne, but the poets are finding their proper themes, and are communicating something that is definitely a part of the new dominion and the new age.

For a long time fiction was the most representative of the literary forms, but it became too prolific and superficial and ceased to have any influence upon Canadian life. Wm. Kirby's *The Golden Dog* (1877) and John Richardson's *Wacousta* (1832) worked the Fr. regime and gained international recognition, as did Thomas Chandler Haliburton's *Sam Slick* (1837-40). There were many imitators until Sir Gilbert Parker's romantic tales ended the romantic cycle. *Sam Slick* fathered an entire age of preposterous nonsense in the humour of the U.S.A. Sentimentality continued in the novels of L. M. Montgomery, Ralph Connor, Nellie McClung, Arthur Stringer, Theodore Roberts, Marjorie Pickthall, and Lacey Amv, and in a multiplying group of regionalists, Norman Duncan, Robert Stead, and Laura Goodman Salverson. With the First World War came a profounder understanding of life and character, and the novels of Mazo de la Roche, Raymond Knister, Morley Callaghan, Frederick Philip Grove, Thomas Raddall, Gwethalyn Graham, Philip Child, and Hugh MacLennan, all of whom found markets abroad. The development of the Canadian novel illustrates the slow maturing of Canadian culture. It also illustrates the mid-position C. holds between the thought and life of the U.S.A. and the United Kingdom. The nature story, invented by Sir Charles G. D. Roberts, and taken up by his contemporaries, Ernest Thompson Seton, Marshall Saunders, W. A. Fraser, Arthur Heming, 'Grey Owl,' and others, was imitated everywhere. The earliest essays by Howo and others were either newspaper editorials or speeches, those of Goldwin Smith preachments, the essays of Sir Wm. Osler convocation talks, those of Thomas O'Hagan and John Reade polished journalism, Archibald MacMahan's superior tales of character and

incident. Sir Andrew Macphail and Cecil Francis Lloyd wrote literary essays in the high tradition, and W. A. Deacon began as one of our most charming casual essayists. Pelham Edgar was a commentator on letters, Peter McArthur a chronicler of the farm and countryside, Grove's descriptive pieces, Emily Carr's *memorabilia*, W. H. Blake's fishermen's tales, and E. K. Brown's critical papers indicate growing competence and ripeness. Canadian drama has had a fitful career. Charles Mair, Wm. Wilfrid Campbell, and Robert Norwood, poets with no knowledge of the stage, wrote a literary drama that is neither read nor acted. Marjorie Pickthall's *The Wood-carver's Wife* was the firstactable one-act play in verse, and synchronised with the emergence of the little theatre movement in Brit. Columbia, Montreal, and Toronto. With stages available welcoming experiment, drama clubs and leagues came into being, with new playwrights and ultimately the Canadian drama festival. From the biblical Shakespearean five-acters of Charles Heavyside to Merrill Dennison and Lester Sinclair is an entire age. The development of a Canadian type of humour in prose and verse, and in painting and sculpture, points to the growing maturity of the Canadian people. From T. C. Haliburton to Thomas Langan, from W. H. Drummond, Stephen Leacock, and R. W. Service to John Robins, E. J. Pratt, Watson Kirkconnell, B. K. Sandwell, and Robertson Davies is a long step. Canadian arts and letters still lack confidence in the presence of humanity.

2. French Canadian Literature.—During the Fr. regime there was no literature save the *Relations des Jésuites* and similar correspondence of rival religious orders printed in France. There was no printing press in C. under the Fr. kings, just as there was none for a long time in the Amer. colonies under the Eng. kings. Since the Conquest Fr. Canadian letters have developed more rapidly as an autonomous art than in Eng.-speaking C. While they followed the models of *la mère patrie* for style, the content was Canadian. The Fr. Canadian lived alone in an alien world, fearful alike of anti-clerical and republican France, and of the Protestant and predatory Eng. colonies. Shepherded by the clerical and professional *élite* of his own people, growing more intensely Catholic and Fr., jealous of their rights and folk-ways, and resentful of all foreigners, Fr. Canadian arts and letters were surcharged with racial and religious emotions. While there were Huguenots among the founders of New France, they were gradually excluded, and Protestantism to this day has no impressive foothold in Quebec. There has persisted, however, a small anti-clerical element among the Fr., opposing a too-complete domination of life by the clergy, that has even its clerical adherents. The Catholic Church inspires and supervises every phase of Fr. Canadian life. It has been the chief patron of the artist and writer, and has inspired the Prov.

Gov. to extend its patronage to the arts and letters as no other gov. in C. has done. The constant pressure of race and religion tends toward a certain inbreeding and over-emphasis.

The pub. of Fr. Canadian books during the past twenty-five years has been astonishing, both as to quantity and quality. The craft of bookmaking stands very high. Journalism from the days of Michel Bibaud and Etienne Parent to the present has been conspicuous for its style, and the apostolic vigour with which it has sponsored the interests of the people. The father of Fr. Canadian letters was Etienne Parent, editor of *Le Canadien*, with its flaming legend 'Nos Frères, Notre Langue et Nos Loix.' Hector Fabre, Arthur Buies, L. O. David, Henri Bourassa, J. P. Tardivel, J. C. Harvey, and T. D. Bouchard were all distinguished editors and journalists, and gathered about them the best poets and essayists of their day. The essayists in Fr. C. were no mere dilettantes. They were sensitive to style and good taste, but they nearly always sponsored a cause. Even literary criticism followed this tradition. No other literature devotes so much time to essays on writers and their books, to reviews of reviewers, but the central theme is often the same, evoking 'Our Master the Past,' communicating the will to survive, pleading loyalty to the imperishables. The list of writers in this *genre* is long, extending from Etienne Parent, Sir James LeMoine, and Hubert Larue, to Ernest Gagnon, Henri D'Arles, Louis Danton, Adolphe Rivard, Maurice Hébert, Mgr. Camille Roy, and Guy Sylvestre. Poetry, as in English-speaking C., has been the most representative branch of letters, both in volume and quality, and in the resulting influence upon the culture of the people. Frequently the models have been those of France, first the romantic and later the disenchanting, but for the most part only the pattern was borrowed. The content has remained persistently Canadian. From the doggerel of Michel Bibaud, the first poet, to Octave Crémazie, the first authentic poet, is a vast distance. The epic verse of Crémazie, the lyric of Louis Fréchette, the poetry of altar and soil of Pamphile LeMay, were followed by Wm. Chapman, Emile Nelligan, Albert Lozeau, Jean Charbonneau, Paul Morin, Alfred DesRochers, Paul Goun, Simone Routhier, Maurice Hébert, and Robert Choquette, increasingly competent in dealing with the lives of their own people. The novel began as a vehicle for the preservation of the faith and the folk-ways of the race and, while it has largely remained loyal to these ends, it has steadily developed as art. The distance between *Les Anciens Canadiens*, by Philippe Aubert DeGaspé, *Jean Rivard*, by Antoine Gérin-Lajoie, Laure Conan's *Angeline de Montbrun*, and Blanche Lamontagne's poems and novels and the modern novels of Louis Hébert, 'Ringnet,' Gabrielle Roy, Yves Thériault, and Roger Lemelin, to mention the most conspicuous, is considerable, but the genealogy is un-

mistakable. Their great strength is due to the fact that the authors are naturally but resolutely themselves, more and more a part of the world at large, but unwilling to forfeit the old faith for the new cosmopolitanism. The writing of hist. has been a profound maker of hist. in Fr. C., from the Anglophile Michel Bibaud, the first native-born poet and historian, on through F. X. Garneau, Abbé J. B. A. Ferland, Sir Thomas Chapais, and Sir James LeMoine, to Chanoine Lionel Groulx and Abbé Arthur Maheux. Hists., causeries, accounts of travel, tales of exploration, commentaries on men and events, lives of the *élite*—those have multiplied, some authors projecting single-handed entire series of vols. They not merely record events, but endlessly interpret them, underline their main lessons, and through them state and re-state the Fr. Canadian's case, always with deep emotion, often with distinction, and increasingly fairer to the other side. The contribution to Fr. Canadian solidarity of such biographers as Abbé H. lt. Casgrain, L. O. David, Sir Adolphe Routhier, Pierre Georges Roy, and Mgr. Olivier Maurault is incalculable. Publications on religion and theology, brochures conveying the mind of the Church on education, public morals, economic and industrial matters, sermons and inspirational literature, school texts and manuals of religious instruction, learned works of all sorts, are issued in swelling numbers, and often achieve great distinction of style and format. Drama is only now coming into its own, chiefly through the encouragement of the radio, and its strength is that its roots are in the native soil. The work of Yves Thériault is outstanding.

Eng. and Fr. letters in C. have tended more and more to go their own way, but there is a growing belief that ultimately the *bonne culture* will be consummated in a more perfect understanding. Eng. and Fr. Canadians are committed to live together as a people. The golden age of letters in England and France was born of a common source; in C. the two traditions meet again, and their roots are buried deep in a common soil. The idiom may vary, but henceforth the meaning will be increasingly the same.

Art.—Art in the colony of New France began about 1670 when the sojourning artist, Frère Luc (Claude François), transplanted the European style of religious painting into Canada. Shortly afterwards the more important art of sculpture in wood was introduced by Jacques Leblond de Latour and other carvers who came as masters to Bishop Laval's school of arts and crafts near Quebec. Though painting was for a century to remain in the thrall of folk art or the imitation of Europe, the carving of statues and of decorative work in churches developed in a more original way, reflecting but not imitating the Fr. style in its unfolding from the Louis XIV. to the Louis XVI. The Levasseur family in Quebec were the prin. exponent of this art during the era of relative isolation from France in the earlier eighteenth century. The art of

embroidery flourished under the nuns and often showed considerable originality.

The Brit. conquest of 1759 restored contacts with Europe to a limited extent. A reflection of Chardin and Fragonard was seen in François Beaucourt, the first Canadian painter to study abroad. Later, in the first half of the nineteenth century, the portraits of Antoine Plamondon and Théophile Hamel showed the influence of the Fr. classicists. The Brit. tradition by this time had also begun to play its important part in the formation of Canadian art. In Nova Scotia Robert Field carried the methods of eighteenth-century Brit. portraiture into the early nineteenth century. In Quebec the carvers of the *Baillairgé atelier* and the silversmiths combined Eng. neo-classic motifs with their traditional Baroque elements to produce an original and splendid style.

Landscape painting, however, was the most important legacy of Brit. art. A considerable number of topographical artists, both professional and amateur, from Richard Short (1761) to William Henry Bartlett (1836), visited the colony and recorded the Canadian scene. These inspired the same pursuit on the part of resident artists such as Paul Kane (1810-1871), whose study of the landscape and Indian life took him from Toronto to the west coast and back again between 1846 and 1848. Cornelius Krieghoff (1815-72), who was in C. between 1810 and 1866, painted the Fr. Canadian scene in the picturesque manner which he had learned in Holland and at Düsseldorf, but he also recognised the broad patterns and bold colours which belong to the Canadian landscape.

Around 1880, the romantic picturesqueness of Kane and Krieghoff gave way to a naturalistic treatment of the Canadian scene which developed through the work of Allan Edson, Henry Sandham, and Lucius O'Brien (with affinities to both England and the Hudson R. school in the U.S.A.) to the realistic *genre* and portraiture of Robert Harris (1849-1919), also the painter of the first Canadian mural picture, 'The Fathers of Confederation,' in 1881. This movement coincided with the founding of the first official art organisations, the Royal Canadian Academy and the National Gallery of C. (1880). In the nineties, realism yielded to the richer, more poetic mode illustrated in Horatio Walker (1858-1938), the painter of *humidant genre* in the Barbizon manner; Homer Watson (1855-1936), a landscapist influenced by Constable; and Wm. Brymner (1855-1925), the painter of dreamlike landscapes with a kinship to Inness in the U.S.A. Realistic sculpture, as practised by Hamilton MacCortby (1847-1939), also gave way to the elegance of monuments of Louis-Philippe Hébert (1850-1917).

A younger generation of painters who saw in Fr. Impressionism a new approach to the Canadian landscape played an important part in launching the modern Canadian school. Maurice Cullen (1886-1934) eliminated the European haze of atmosphere in his later works in order to

express the emphatic contours and colour-patterns of the N. landscape. Marc-Aurèle de Foy Suzor-Coté (1869-1937) took steps in the same direction; he was also a sculptor who specialized in *genre* groups. James Wilson Morrice (1865-1924), who lived most of his life in Paris in contact with all movements from Whistler to Matisse, had the immediate effect in his native country of encouraging the flat pattern and a further reaching one in establishing the idea of 'pure' painting.

But the first movement in Canadian art to be identified as national was initiated by a group of young painters in Toronto in the years following 1910. A. Y. Jackson brought from Montreal the influence of Morrice as well as his own passion for discovery, the untrained Tom Thomson (1877-1917) a native genius and a profound understanding of the N. woods, Arthur Lismer and Franklin Carmichael (1890-1945) a feeling for rhythmic movement, F. H. Varley a mastery of paint, J. E. H. MacDonald (1873-1932) a poetry of interpretation, Lauren S. Harris a dynamic vision of the forces of nature. The Group of Seven (including the foregoing with the exception of Thomson, and with the addition of sev. others at different times between 1920 and 1933) felt the impact of impressionism, post-impressionism, and expressionism, but national feeling was the catalyst which fused these influences into a new style, austere, unquiet, and uncompromisingly regional, which was hailed in England and France during the twenties before it was accepted at home. Contemporaries of the group in other parts of C. included Albert H. Robinson, Clarence A. Gagnon (1881-1941), and Marc-Aurèle Fortin, whose patterning of the Quebec countryside constituted a much gentler, more lyric and decorative art, while Walter J. Phillips exemplified the same tendency in his colour woodcuts and water-colours. Two other artists of the same generation developed individual styles of the highest order. David B. Milne's delicate, imaginative, quiet manner depends on patterns of a simple and exquisite sort, and elusive colour harmonies as personal as handwriting. Emily Carr (1871-1945), who painted all her life in Brit. Columbia, underwent an astonishing expressionist development after brief contact with the Group of Seven. Her canvases and spontaneous sketches are expressions of her enthusiastic response to the stylized forms of the Indian totems and her excited reaction to the luxuriant growth of the W. forests.

Recent trends include a further development of the style of the Group of Seven along broader and more varied and personal lines on the part of one important group. Charles Comfort with his clean, efficient line, Carl Schaefer with his subtlety and intimacy in water-colour, Wm. Ogilvie with his delicate stylized figures, Jack Nichols with his delicate and pathetic ones, and Prudence Howard (1891-1947) with her powerful ones all stem from the 'austere' school. A number of *genre* painters have moved somewhat

away from this sphere of influence, yet are bound to it by their attachment to the Canadian scene: these include Henri Masson, André Biéler, Pegi Nicol MacLeod, and Jean-Paul Lemieux, among others. These are also interested in the folk artists or primitives, who include S. Mary Bouchard (1912-45) of the Bale-Saint-Paul group. Finally, a Montreal group which has grown up since 1939 looks to Morrice and to John Lyman as the patron saints of non-particular art and has been

Stewart. Some of the most recent endeavours of Canadian artists have been in the realm of the film and industrial design. Art societies, which have grown greatly in numbers and effectiveness during the past twenty-five years, have played an important part in the stimulation of Canadian art. The work of the National Gallery of C., which for many years has carried on a nation-wide programme of travelling exhibitions, is now supplemented by a growing number

deeply influenced by contemporary European schools of 'pure' painting, abstraction, and expressionism, particularly of the school of Paris. It includes among others Alfred Pellin, Fritz Brandtner, Paul-Émile Borduas and Jacques de Tonnancour and Goodridge Roberts.

Sculpture has followed the same general pattern of development as painting. Walter Allward (Vimy Ridge Memorial), Frances Loring, Florence Wyle, Henri Hébert, Alfred Laliberté, and other contemporaries of the Group of Seven strengthened and simplified the forms of their figures, while Emanuel Hahn and Elizabeth Wyn Wood introduced landscape and other motifs from nature, stylizing them in an expressive manner almost to the point of abstraction. Contemporary sculptors exhibit a growing variety of influences, methods, and themes, as indicated by Sibyl Kennedy's elongated and expressive figures, Sylvia Daoust's decorative religious work, the powerful figures of Jacqueline Jones, and the incisive, nervous ones of Donald

of museums, galleries, and community centres.

Architecture.—Architecture in C. had its beginnings in the first dwellings of the St. Lawrence settlement in the seventeenth century. Unlike the wooden houses of New England, Canadian ones were built of stone. At the outset, they resembled buildings in the Norman Iles, and countryside, but about 1730 there appeared certain native features, the most noticeable of which was an exaggeration of the curving eave which, with the addition of posts, eventually formed the veranda. In only a very few buildings of the Fr. regime, designed by clerical amateurs or Fr. military architects, were there traces of the classicism of Paris; otherwise churches, religious houses, and dwellings alike shared a common simplicity of design.

The eighteenth-century Eng. settlements in the Maritime provs. followed a version of the Georgian similar to that found in New F. land, and Eng. influences mingled with local traditions in Fr. C. after 1759. The end of the eighteenth

century saw the introduction of the log cabin on the frontier, but in architecture reflected the Regency styles, with the Palladian version the favourite for larger buildings (Province House, Halifax, by John Merrick, 1811). The architects of this period were often Eng. military engineers (Quebec Anglican cathedral by Maj. Robt. and Capt. Hall, 1804), but during the first half of the nineteenth century the Gk. revival spread into C. from the U.S.A., dotting the country roads with 'Temple-type' buildings (St. Andrew's, Niagara, 1831).

The Gothic revival began with Notre-Dame in Montreal, designed in 1824 by James O'Donnell with assorted Gothic details and Georgian proportions, and an elaborate carpenter's Gothic sprang up at the same time. But later architects such as Père Félix Martin (St. Patrick's, Montreal, 1847) and William Thomas (St. Michael's Cathedral, Toronto, 1845, St. Paul's, Hamilton, 1857) based their work on a closer study of Gothic monuments, while Frank Wills approached true medieval proportions in the cathedrals of Fredericton (1845) and Montreal (1857). The most imposing monuments of the revival were Univ. College, Toronto (by Frederick Wm. Cumberland, 1856), built in the Norman style which was then considered a variety of Gothic, and the Parliament Buildings at Ottawa, which show Ruskin's influence (by Thomas Fuller and Frederick Stent, 1859). In the sixties and seventies the Renaissance style was also revived, particularly for use in office buildings and ambitious dwellings. The influences until this time were predominantly Brit., but in the eighties the massive and functional 'Romanesque' which stemmed from Henry Hobson Richardson in the U.S.A. and was carried out in sombre red or brown stone, became widespread in C.

In the nineties the naïveté of earlier decades was replaced by a studied correctness of design. The architects who around 1900 founded their professional schools and societies, became conversant with a variety of styles, applying their accomplished Renaissance to office and legislative buildings (Saskatchewan Parliament, Regina, E. & W. S. Maxwell, 1910), their learned Gothic to churches and parliament buildings (New Parliament, Ottawa, John A. Pearson, 1919), the Classic to banks and railway stations (Union Station, Toronto, 1919, Ross & MacDonald, Hugh Jones and J. M. Lyle), the Georgian and Tudor to villas or the now familiar Fr. 'château style' to hotels—as site or function seemed to demand.

Skyscrapers—the Daily Star Building, Toronto, Chapman & Oxley, 1928; the Aldred Building, Montreal, Barott & Blackader, 1930; and the Canadian Bank of Commerce, Toronto, Darling & Pearson, 1930, are among the largest examples—which depended on structural steel and reinforced concrete; sometimes had the exterior of a cathedral or palace.

Evidences of a new style, which frankly acknowledged the new materials and techniques and expressed new functions,

were found in the early part of the present century in utilitarian structures such as factories and grain elevators. More recently the new architecture, sometimes reflecting features of the European 'international style,' sometimes with an attempt at a distinctive Canadian treatment, has been applied to many other types of buildings. Groups of architects are now engaged in community and tn. planning and in industrial design.

America. It is a wild goose which sometimes breeds in Europe, and it is closely related to the Barnacle Goose (q.v.).

Canadian Sea, see HUDSON BAY.

Canal (Lat. *canalis*, a channel), artificial water-course serving the purpose of drainage or irrigation, or more frequently for the transportation of merchandise in boats, barges, or ships. Cs. have undoubtedly been in existence since very early times. Herodotus and Strabo both speak of a C. across the isthmus of Suez which was begun in 616 B.C. by Necho and completed by the year 521 B.C. The first use to which Cs. were put was doubtless irrigation, but navigation soon followed. In ant. Egypt, India, and China Cs. undoubtedly existed; in Egypt the Nile has from time immemorial been noted for its extremes, and traces of waterways which the ant. Egyptians constructed still remain. The Imperial or Grand C. of China is of great antiquity; it commences at Hang-chau, near the mouth of the Tsen-tang-kiang R., and crossing the Yang-tze-kiang at Chinkiang, terminates at Tientsin. The total length is about 650 m., but the depth is seldom more than 6 ft. That which did more than any other invention to revolutionise C. traffic was the invention of locks. According to some authorities, the Dutch were the first to make use of locks, according to others the Its. A lock chamber enclosed by a pair of gates was said to have been constructed by two brothers Domenico in 1481, and Leonardo da Vinci six years afterwards completed six locks which united the Cs. of Milan. The Languedoc C., or C. du Midi, may be looked upon as the prototype of modern European Cs. This C. connects the bay of Biscay and the Mediterranean. It has a length of 148 m., and there are 119 locks, which have an average lift of 61 ft. The Cs. of some time ago were only available for barge traffic or boat traffic, but gradually the size increased until, with the growth of commerce and the increase in engineering skill, Cs. have been constructed to take ocean-going ships. A C. must either be constructed all on one level, which is rarely feasible, or the rise and fall of the surrounding country must be adapted in some way. This is done by the construction of a series of level reaches at varying heights above a datum line; each reach is closed by locks. The bases of the hills and the winding of the valleys must provide the general route for these reaches, but at various places it will be found necessary to cross an upward slope by a cutting or a tunnel, or a downward slope by an embankment or an aqueduct. The channel of the C. has a flat bottom and sides which slope outwards from the bottom. In dists. the soil of which is not calculated to withstand the erosion of the water, it is necessary that the sides should be lined with 'puddle.' This is the name given to a compound of tempered clay mixed with water, which is worked into the sides to a distance of 2 or 3 ft. Sometimes the sides are faced with stonework or concrete where there is much traffic, and durability is the main consideration. As regards the water supply for a C., it is, of course, essential that there should be sufficient water to supply the C. through-

out the year if it is to be a profitable and useful undertaking. If the natural supply cannot be depended upon, reservoirs must be built which will hold sufficient. The situation, catchment area, etc., of such reservoirs will be governed by the same considerations as in reservoirs for drinking water, save that the cleanliness of the water is not so essential. The dimensions of a C. are naturally regulated by the size of the boats which are used thereon. In order that the resistance of the water should be as small as possible, a table of various measurements has been calculated. According to this the breadth of the C. bottom should be at least twice as much as the greatest breadth of the boat using the C.; the depth of the water in feet should be at least one and a half times the draught of the boat; and the area of the waterway should be six times the greatest midship section of the boat. The width of an ordinary inland C. in this country is from 25 to 30 ft. at the bottom, which is flat, and from 40 to 50 ft. at the level of the water. The depth is about 4 or 5 ft., and the angle of slope of the sides varies with the nature of the surrounding soil. A C. must not only be able to supply any deficiencies in the natural water supply, but must also cope with a too abundant quantity; for this purpose a number of waste weirs to discharge surplus water is necessary. If any portion of the bottom or sides of a C. is defective, it is obviously impossible to run off all the water in the C. while repairs are being carried out; the damage must be confined. For this purpose stop-gates are necessary at short intervals. The locks, which are the most general means of transferring boats from one level to another, are chambers made of wood, brickwork, etc., and provided with gates at each end. The lock is of sufficient size to take the largest vessels which use the C.; it is placed at the termination of the lower reach, and rises to a slightly greater height than that of the water in the upper reach. The gates of the lock, which are very strongly made, open against the direction of the current, and are slightly more than half the width of the lock chamber, so that they meet before they form a straight line, and are kept firmly in place by the pressure of the water. Sluices are placed in each gate near the bottom, and can be worked from the top of the lock independently of the gates themselves. When a boat or barge is about to ascend from the lower to a higher reach of the C., the upper gates and sluices, commanding the flow from the upper reach, are closed. The sluices at the lower end of the lock are opened, and when the level of the water in the lock chamber is the same as that of the lower reach, the boat enters the lock. The lower gates and sluices are then closed, whilst the sluices only in the upper gate are opened. The water in the lock then gradually rises until it reaches the level of the upper reach, when the upper gates can be opened and the boat passes out of the lock into the higher reach. When a boat descends from a higher reach to a lower,

the procedure is reversed; the vessel enters the lock when the water is at the higher level and, after the lower gates have been shut and the sluices opened, passes out on the lower reach. In large locks the sluices may be carried through the walls instead of being in the gates. The material of which the gates are composed is generally hardened oak; in small narrow locks a single gate at each end is sufficient. The gates are opened and closed by balance beams projecting over the lock side, which are worked either by gearing or by a hydraulic ram. The locks are not much larger than the vessels they are required to take. The Eng. C. boat is from 70 to 75 ft. long and 7 or 8 ft. wide; a barge is the same length, but double the width, i.e. from 14 to 15 ft. The average lift of a C. lock is from 8 to 9 ft., sometimes as low as $1\frac{1}{4}$ ft. In Belgium, on the Canal du Centre, the locks have a lift of 17 ft., whilst one lock on the Saint-Denis C. has a lift of $32\frac{1}{4}$ ft. When there is a very big difference in the levels of the two reaches of the C., it is sometimes overcome by a flight of locks, in which the lower gates of one lock form the higher gates of the one below it. On many of the Eng. Cs. an inclined plane is placed at the side of the lock for the use of pleasure boats; the boats are placed on the rollers which form the plane, and hauled over by hand. The same principle is sometimes used for barges, but as such a method is liable to strain the timbers, etc., of large vessels, a more common arrangement is for two counterbalancing tanks to be used. Each of the tanks holds sufficient water to float a boat, two lines of rail are used, on which the tanks run, and they are connected by chains running on pulleys in such a way that as one ascends the other descends. Vertical lifts are also employed on some Cs.; they are only used where the difference in the levels of the reaches occurs in a short length of C. to obviate the construction of embankments, etc. At Anderton there is such a lift, which deals with barges of as much as 100 tons burden, and has a lift of 50 ft. The horse is still used for haulage on the smaller Cs. Steam towage was first introduced about the beginning of the nineteenth century, but tugs towing a string of barges are only practicable when there are no locks on the C., or when the locks are so constructed as to take the tug and all the barges at the same time. If the vessels have to be taken through the locks separately, the time which is spent in going through the locks more than counterbalances the time gained on the rest of the journey. Barges having a steam engine of their own are now utilised; on a portion of the Telfow C. in Germany, an electric system of traction was put into use. The speed at which the least expenditure of energy is necessary is the speed of free propagation of the primary wave raised by the motion of the boat. This fact was taken advantage of by the fast passenger barges which used to run on some Cs.; when the wave had attained a fair speed, the boat was jerked forward

and travelled on the top of the wave. By this means a speed of 12 or 15 m.p.h. was attained. The ordinary speed of a horse-drawn C. boat is from 2 to 3 m.p.h.; if an excessive speed is attempted, the wave raised washes away the sides of the C. much more quickly, and the water is disturbed for a long distance along the C.

Canals in the United Kingdom.—Great Britain was one of the last nations to make any use of Cs. The first C. was that connecting Manchester and Worsley, which was proposed by the duke of Bridgewater in 1755. The use for which the C. was designed was the transportation of the coal from the duke's collieries at Worsley to Manchester. The work was successfully accomplished by Brindley, the engineer, who overcame all the difficulties. There are immense embankments on the old C., viaducts, and bridges; two branches went from the Mersey at Runcorn Gap, one going to Manchester, the other to Pennington. The length was 40 m., and the fall 2 ft. in a m.; the waterway was 5 ft. deep and 52 ft. wide. The successful accomplishment of this work encouraged others, and before the introduction of the railways the length of the navigable Cs. in Great Britain was estimated at 3000 m. The largest Cs. in Great Britain are the Caledonian C., the Crinan C., the Forth and Clyde C. in Scotland, and the Gloucester and Berkeley Ship C. (17 m.) in England. Other main Cs. in England and Wales are the Manchester Ship C. (35 $\frac{1}{2}$ m.), the Grand Union (280 m.), the Birmingham (160 m.), the Leeds and Liverpool (190 m.), the Aire and Calder (90 m.), and the Trent Navigation System (120 m.). The Caledonian C., constructed by Thomas Telford, is remarkable for its locks, which are on a par with those in the Gotha C. at Trolhätten. The length of the C. from its southernmost point at Corpach to its N.E. terminus at Clachnaharry on the shore of Beaulieu Firth is 60 m. The first C. to be modernised in England was the Grand Union, which links London with Nottingham and Birmingham. The work of dredging and deepening was completed in 1934, and the C. can now carry motor-driven barges at greater speed. The Nene R. was also canalised with locks to take ships of 15-ft. beam, and linked with the Grand Union, thus providing a through waterway from the Wash to the Bristol Channel, and, at the same time, joining Birmingham and Manchester with London. There are in all 3641 m. of waterway in England and Wales, 184 m. in Scotland, and 848 m. in Ireland. The total extent of Cs. in use in Great Britain is about 2500 m., of which until 1948 about 1000 m. were railway-owned. In 1948 most of the important inland waterways (2000 m.) in Great Britain were taken over under the Transport Act, 1947, by the Brit. Transport Commission and placed in the charge of the Docks and Inland Waterways Executive and organised into five areas (Northern, North-west, Eastern, Southern, and Western) with headquarters in Leeds, Northwich, Nottingham, Gloucester, and London.

The Bridgewater, Manchester Ship, and Thames Conservancy are not included in these arrangements. The ann. tonnage carried by them is about 15,500,000 tons. The proprietors of Brit. Cs. are common carriers, and governed by such Acts as the Railway and Canal Traffic Acts of 1854 and 1858. These Acts oblige them to provide in a reasonable manner for the needs of the public by settling and publishing rates for carriage and providing facilities for transshipment. If a C. is unnecessary, or if the proprietors leave it in an unfit state for navigation for the period of three years, the Board of Trade may authorise the proprietors to abandon the C., which may then either be abandoned or handed over to other proprietors.

News Chronicle

THE CANAL SYSTEM OF ENGLAND

In 1939 10,000 boats had registered and 40,000 people lived on the system. The sanitary condition of C. boats when used as dwellings and the registration of such vessels by the local sanitary authorities are provided for by the Canal Boats Acts of 1877 and 1884. The Ministry of Health appoints inspectors to see that the law is duly carried out; if the provisions of the Canal Boats Acts are not complied with, both masters and owners are liable to fines recoverable on summary conviction. Surviving from the Second World War, and until the nationalisation of Cs., the Central C. Committee advised the minister of transport on the policy governing inland waterways and co-ordinated the work of six regional C. committees, which exist to ensure that the resources of the C. system as a whole are put to the best use. The total tonnage carried on the 873 m. of the Brit. Cs. (Aire and Calder, Birmingham, Bridgewater, Grand Union, Leo and Stort, Leeds and Liverpool, Manchester Ship, Sheffield and S. Yorks, and Trent

Navigation) in 1938 was 18,274,000 tons, as against 20,254,000 tons for 1937. The ann. average tonnage carried by inland water transport during the war years was 11,200,000, a relatively small mileage of waterway in the N. of England accounts for a large proportion of this wartime total tonnage, and, by comparison, the contribution of the whole of the midlands C. network was small. It might therefore seem that the Cs. are a wasting asset, one problem being to formulate a post-war policy. Statements of waterway policy have often appeared during the past half century, but have not been implemented. The C. Association and the Inland Waterways Association have done much to obviate neglect of Brit. waterways. Some Cs. are choked with weeds and mud, rendering navigation impossible; often the lack of adequate dredging, together with leaky locks, greatly delays traffic; there is no uniform system of tolls; each system has its own fees, regulations, and size of lock key; and even those Cs. which are navigable are in need of more attention, such as the removal of weeds and the renovation of banks and sluice machinery—in which the Grand Union C. set an admirable lead.

Continental Canals.—Belgium occupies a foremost place in inland navigation; it had, before the First World War, a length of Cs. amounting to 1360 m., which is 1 m. of waterway to every 34 m. of ter. To-day, the total length of Cs. and navigable rivs. is still over 1000 m. The Albert C., connecting Antwerp and Liège, a distance of some 80 m., was completed just before the outbreak of the Second World War. It can carry barges up to a burden of 2000 tons, and is over 80 ft. wide at its narrowest, with a depth of 16 ft. Work was also carried out to widen and deepen the Charleroi-Brussel C. To the Netherlands, the Princess Juliana Ship C. was opened in 1935, 20 m. in length with a depth of 16 ft. and a width of 50 ft. Another modern C. is the Twente C. from Zutphen to Enschede, opened in 1936. Since the days of the first C. in France, which was constructed between 1605 and 1641, the Fr. have on the whole been keenly alive to the advantages of this method of transport. The second C. ever constructed in France joined the bay of Biscay with the Mediterranean, and was thus the forerunner of the modern ship Cs. It is only 6½ ft. in depth, however, and thus is not adapted for the accommodation of ships of over 100 tons burden. The Fr. Gov., whilst developing the railways of the country, did not overlook the Cs., and there are 6000 m. of navigable waterways with a total traffic of about 40,000,000 tons. Many of these waterways are maintained entirely by the State, and no tolls are levied. The Fr. Gov. in 1879 passed a law to secure uniformity in the dimensions, etc., of the prin. Cs. By the above law all Cs. must have a depth of 6½ ft., locks 126½ ft. by 17 ft., and a space under bridges of 12 ft., thus enabling boats which will enter the locks, of about 300 tons burden, to travel along all the prin. Fr. Cs. Prior to the outbreak of war in

1939, considerable work was carried out in improving the existing waterways and in installing electrical machinery at many of the locks on, for example, the Rhine-Rhône C. and elsewhere. In Germany, between the two world wars, an ambitious scheme was launched for joining, by canal, the Rs. Oder, Elbe, Weser, and Ithine, extending to nearly 7000 m. of C. The last link in this chain was completed in 1938, the Mittel-land C. from Magdeburg through Brunswick and Munster to the Rhine, joining with the Dortmund-Ems C. Russia is another country which greatly developed its inland waterways in

increased, and now the locks are 270 ft. in length, 45 ft. in width, and 14 ft. in depth. A C. at Sault Sainte Marie connects Lake Superior with Lake Huron to avoid riv. rapids. The Chesapeake and Ohio C. was begun in 1828, and by 1850 extended from Georgetown on the Potomac to Cumberland. This C. connects Maryland with Washington, D.C., thus enabling coal to be brought from the Cumberland region to the Potomac R. It is 184 m. long and has 73 locks. The Erie C., which connects Lake Erie with the Hudson R., is 365½ m. in length; the width at the bottom varies from 53 to 79

Canadian Government

LOCKS AT SAULT SAINTE MARIE, ONTARIO

recent years. The Soviet Gov. has aimed at making Moscow an important inland port, linking it with the Volga and thence with the White Sea, the Baltic, the Black Sea, and the Caspian. The Moscow-Volga C. was completed in 1937, giving about 80 m. of navigable waterway, and work was then begun on the Volga-Don C. between Stalingrad and Rostov. It will thus be seen that the continent of Europe is far in advance of Great Britain in the development and use of Cs., but it must be added that the major installations of the C. system in N.W. Europe and in Russia suffered from bombing during the Second World War.

Canals in the U.S.A. and Canada.—In America there are numerous Cs. which connect the separate riv. navigations. The St. Lawrence C. between Lake Ontario and Montreal, and the Welland C. join Lake Erie and Montreal—which last-named is nearly 27 m. long and rises by means of locks to over 320 ft. (see WELLAND). The size of these Cs. has been

ft., that at the surface from 70 to 98 ft., whilst the depth ranges between 7½ to 9½ ft. The Delaware at Phillipsburg and the Hudson R. at Jersey City are connected by the Morris C., which crosses a spur of the Alleghenies by a system of inclines; it is 102 m. in length. The Chesapeake and Delaware C., a part of the toll free Atlantic inland waterway, was taken over by the State in 1919. The Dalles and Celilo C., completed in 1915, allows of riv. navigation up the Columbia and Snake Rs. for nearly 600 m. from the ocean. The ship Cs., generally, of the U.S.A. are of great economic importance, but the same cannot be said of the inland C. system. One fairly recent experiment is the State Barge C., New York, which connects New York city with Buffalo by a deep-water route of 790 m. and has a minimum depth of 12 ft., but it costs the taxpayers of the state \$7,000,000 annually, and only a negligible fraction of the expected traffic passes over it. It was, however, deepened in 1941

to a depth of 14 ft. between the Hudson R. and Lake Ontario. The Cape Cod C., built in 1914, to connect Buzzard's Bay with Massachusetts Bay, was taken over by the State in 1923 to become a toll-free section of the Atlantic inland waterway, and it has since been deepened and widened. Work on the canalisation of the Ohio R. was undertaken to provide a greater depth for the whole 1000-m. length. The Chicago Drainage C., constructed to discharge the Chicago drainage into the Upper Mississippi Valley instead of into Lake Michigan, has now, through the construction of a connecting Illinois waterway, become a link in a waterway from the Great Lakes to the Mississippi.

Ship Canals.—Cs. signed to admit large ocean-going vessels are constructed with one of two purposes. They are either to place inland tns. in communication with the sea, or to shorten the distance by sea between two points by cutting across an isthmus. The Manchester Ship C. and the Amsterdam Ship C. are the best examples of the former class, and a short account may be given of them. The Amsterdam Ship C. serves the peninsula of N. Holland and unites the IJssel Meer (Zuider Zee) with the N. Sea, but its real object was to allow the trade of Amsterdam a more direct outlet, as the N. Holland C. and the IJssel Meer were too shallow. Only a narrow strip of land had to be excavated between Velsen and the N. Sea, as the direct route passed through Lake Y and Wijker Meer. Banks were formed along the C. by the soil which was dredged from the bottom in order to deepen the C., and by this means a considerable extent of ter. was reclaimed from the sea, and so a portion of the cost was realised. The C. is suited for large vessels, having a bottom width of 88 ft., and a width at the water level of 186 ft., and a depth of 23 ft.; it is 16½ m. in length. The level of the C. is kept only 14 m. above low water in the N. Sea in order to maintain the drainage of the reclaimed lands. The inflowing water from these lands and from the branch Cs. is pumped into the IJssel Meer by pumps situated in the dam which shuts off the C. from the IJssel Meer. The entrance channel is protected by two converging concrete breakwaters, and the C. is controlled by locks near each end with gates pointing both ways. The C. was begun in 1865, and finished in 1876, at a cost of about £2,600,000. The Manchester Ship C. was first discussed in 1882, and although it met with opposition in Parliament from the railway interests, the desired Act was obtained and the C. sanctioned in 1885. The three tidal locks of this canal at Eastham have chambers 600 ft. by 80 ft., 350 ft. by 50 ft., and 150 ft. by 30 ft.; the sills of these chambers are respectively 28 ft., 25 ft., and 16 ft. below the normal water level of the C., so that vessels can enter and leave at about half tide. The lift of these locks is 16½ ft. The Manchester Ship C. is the first large ship C. constructed with locks raising vessels 60½ ft. and carrying them inland, so turning an inland city into a port. The time taken to pass through the C. is about

seven hours, including about half an hour for passing through the locks. The swing aqueduct for the Bridgewater C. is one of the most notable features of the C.; it was constructed by Sir E. Leader Williams to replace Brindley's fixed aqueduct. When the aqueduct is closed traffic can pass along the Bridgewater C., but it is opened for the passage of masted vessels along the ship C.; communication between the two Cs. is maintained by a hydraulic lift. The C. was commenced in 1887 and finished in 1894; the cost was estimated at £5,330,000 but in reality came to £15,500,000. (*See also MANCHESTER SHIP CANAL.*) Among other Cs. of this nature may be mentioned the Bruges Ship C., which renders Bruges a seaport; the Ghent-Terneuzen C., which provides an outlet for Ghent by a C. joining the estuary of the Scheldt at Terneuzen, enlarged and deepened in 1870 so that vessels of 1400 to 1700 tons can reach Ghent; and the Leningrad and Kronstadt Ship C., which enables sea-going vessels to reach Leningrad. This C. starts from the Neva and goes S.W. for about 2 m., when it curves and proceeds in a straight line to Kronstadt. It was begun in 1877 and finished in 1884, at a cost of £1,240,000. The first C. which cut across an isthmus to enable ocean-going ships to use a shorter route was the Suez C. This C. connects the Mediterranean with the Red Sea; it is about 100 m. long, and has a depth of 26 ft. The traffic increased so much and the advantages of an increased draught are so evident that the bottom width of the C. was widened to about 230 ft., and the depth made 29½ ft. In 1879 M. de Lesseps, the constructor of the Suez C., brought forward a scheme for connecting the Atlantic and Pacific oceans by a C. across the Isthmus of Panama. The route which he proposed for the C. to take was across the narrowest part of the isthmus, between Aspinwall (Colon) and Panama. The C. along this route was begun in 1882. It was to be 47 m. long, and the original intention of de Lesseps had been for the C. to be level throughout, like the Suez C. The increased cost, however, and the difficulty which was experienced in raising funds for the carrying on of the work, were instrumental in de Lesseps's resorting to a locked C. It was to have a width at the bottom of 72 ft., and at the top of 160 ft., and a depth of 27 ft. save through the rock cutting of the Culebra, where the width at the bottom was to be 78 ft. and at the top 92 ft., with a depth of 29½ ft. The scheme fell through, however, and the company became bankrupt; the C. was thereupon acquired by the Amer. Gov. This gov. put the construction of the C. in the hands of the U.S.A. Corps of Engineers, under the leadership of Col. G. W. Goethals. With the whole resources of the U.S. Gov. at his back, Col. Goethals built the C. in about ten years. Of this period about seven years were spent in actual construction, the first three being preparatory. Not only had plant and labour to be assembled and railways constructed, but, most important of all, the dist. had to be made fit for white

men to live in. Yellow fever, the scourge of the country, had to be combated by a ceaseless hygienic warfare on the disease-carrying mosquito. The work was finally completed in 1914, and on Aug. 3 of that year, on the day that Europe was rushing to arms, the first ocean steamer passed through the C. The C. is undoubtedly the most important piece of C. engineering in the world. Its length from shore to shore is a little over 40 m., but the approaches on either side have been dredged for about another 10 m. A vessel coming from the Atlantic travels for nearly 7 m. until it comes to the first locks at Gatun. These are three in number and give a lift of 85 ft. The ship next enters the Gatun lake, which it traverses for nearly 24 m. to Gamboa, where the celebrated Culabra Cut begins. The cut is through a hill, which is much given to 'slides,' and requires constant dredging. After travelling along the cut for 8 m. the vessel reaches the Pedro Miguel lock, where it is lowered in one lock 31 ft. to the small Miraflores lake. At Miraflores tn. there are two locks with a fall of 54 ft. to the sea level of the Pacific, which is reached in another 8 m. Traffic on the canal is continuous, for it is so well lighted and buoyed that it can be operated at night, and all locks are in duplicate so that ships can pass each other even at the locks. The locks are the finest in the world. They are uniform in size, being 1000 ft. long and 110 ft. wide, and the walls and bottom are constructed of concrete. All lock walls are 81 ft. in height, except at Miraflores, where an extra foot has been added because of the extreme Pacific tides. The walls of the locks are on rock foundations. The gates, composed of two leaves, are 65 ft. wide and from 47 to 82 ft. high and of great weight, varying from 300 to 730 tons. In all cases except one there are intermediate gates so that smaller vessels can be worked through more expeditiously. The depth of water on lock sills is 40 ft., and the time required to fill or empty a lock is from 8 to 12 min. A ship takes about an hour to pass the Gatun locks, half an hour at Pedro Miguel, and three-quarters at Miraflores, the passage of the entire canal being made in about 7 hours. (See also PANAMA CANAL.) In very early times it was proposed to build a C. across the isthmus of Corinth, and traces are found of works for such an undertaking begun in the time of the Emperor Nero. The C. was begun in 1882 and finished in 1893, at a cost of between £1,000,000 and £2,000,000. It is 4 m. in length, with a bottom width of 72 ft., and a depth of 26½ ft.; the entrances at each end are protected by solid jetties built out into the sea. The Holstein C. connects the R. Elber by the Baltic near Kiel, but is only 5¼ ft. wide at the bottom, and 9½ ft. deep, being only useful for small vessels. The Baltic Ship C. was therefore built between the Baltic and N. seas, starting from Holtenau near Kiel, where a great lock was constructed, and joining the Elbe at Brunsbüttel. The length of the C. is 60 m., width at the

bottom 85 ft., 190 ft. at the top, and depth 28 ft. The C., which saves the vessels using it a distance of 237 m., was begun in 1887 and finished in 1895, at a cost of about £8,000,000. Other recently opened ship Cs. are the Welland, mentioned above, a Canadian ship C. reconstructed in 1929-30 (see WELLAND), and the Princess Juliana Ship C. in the Netherlands, (see above). See S. Smiles, *Lives of the Engineers*, 1864; R. C. R. Minikin, *River and Canal Engineering*, 1920; H. R. de Salla, *Bradshaw's Guide to the Canals and Navigable Rivers of England and Wales*, 1928; G. Cadbury and S. P. Dobbs, *Canals and Inland Waterways*, 1929; A. Wilson, *The Suez Canal: its Past, Present, and Future*, 1939; L. T. C. Rolt, *Narrow Boat*, 1941; F. Eyre and C. Hadfield, *English Rivers and Canals*, 1945.

Canale, Antonio, called **Canaletto** (1697-1768), Venetian painter, first distinguished himself by painting decorations for theatres. In 1719 he went to Rome to study the works of the old masters; and on his return to Venice painted many views of that city. He paid visits to London in 1746 and 1761, and painted some views of the city. The Louvre has six of his pictures, the National Gallery eleven. See K. T. Parker, *The Drawings of Antonio Canaletto in the Collection of H.M. The King at Windsor Castle*, 1948.

Canalejas y Méndez, José (1854-1912), Span. statesman. b. in Ferrol. Took degree of doctor of law at eighteen. Member of the Cortes at twenty-seven. Became chief of a democratic group that was prominent about time of execution of Ferrer. Prime Minister, Feb. 1910. Shot dead by anarchist in Madrid, Nov. 12, 1912.

Canaletto, see CANALE, ANTONIO.

Canalgre (*Rumex hymenosepalus*), plant of the S. United States. A tanning substance is obtained from the rootstock, which gives a rich orange colour and imparts softness of touch to hard leather.

Canandaigua, vil. and co. seat of Ontario co., New York, U.S.A., 30 m. S.E. of Rochester; manufs., bricks, ploughs, flour, and tin ware; it is the seat of the Ontario Orphan Asylum, Brigham of the S. United States. A tanning substance is obtained from the rootstock, which gives a rich orange colour and imparts softness of touch to hard leather.

Canar, see AZOGUES.

Canara, see KANARA.

Canaris, Constantine, see KANARIS.

Canary Bird, or **Canary Finch** (*Serinus canarius*), passerine bird of the family of Fringillidae or Finches. It is found in large numbers in the Canary Is., Madeira, and the Azores, but has been domesticated in Europe since the sixteenth century, and is one of the most common of cage-birds. In its wild state the plumage is green, sometimes streaked with brown, and resembling that of a linnet or skink, the prevalent yellow of the domestic species being the result of artificial selection for breeding purposes. The artificial selection has also resulted in increasing the average size of the bird,

the domestic variety being from 6 to 8 in. in length, while the wild variety is only from 4 to 5 in. long. The wild C. builds its nest of moss, feathers, and hair, in thick high shrubs or trees, and produces two or four broods in a season, but it breeds readily in confinement, sometimes laying from four to six eggs, pale blue in colour, four times a year. The work of building the nest and of incubation is generally the part of the female, while the cock-bird usually feeds the young. The natural song of the C. is loud and clear, and during the mating season the males seem to compete with one another in the ardour and beauty of their melody. It can be taught various notes, and readily imitates the notes of other birds. Their chief foods are canary and millet seed; groundsel, chickweed, and sugar are appreciated luxuries. Cs. mate readily with siskins, goldfinches, greenfinches, and linnets; the cross-breeding of Cs. is a favourite occupation in the Tyrol. The chief varieties of the domesticated C. are the Norwich, which is the hardest, and of a very rich colour; the Belgian Fancy, the most beautiful and costly; the Lizard, so called from its spotted back; the Cinnamon, so named from its colour; the Yorkshire, a long, thin, closely feathered bird; the Lancashire Cobby, the largest variety, with a crest of feathers on its head; the London Fancy, a little yellow or biscuit-coloured bird with black wings and tail; the Scotch Fancy, a large imposing variety, bred largely in Scotland; and the Roller C., a very small bird, bred chiefly for its unusually beautiful song. There are sev. varieties of finches very closely allied to the C. and often sold as such, but they are generally very inferior as song birds. See F. J. Chatterton, *Canaries and how to keep them*, 1924; C. B. Upton, *The Breeding and Management of Canaries*, 1934.

Canary Islands, thirteen is. in the Atlantic Ocean. They are of volcanic origin, and form a prov. of Spain. The prin. is. are Tenerife, Grand Canary, Palma, Ferro or Hierro, Lanzarote, Gomera, and Fuerteventura; the other six are exceedingly small: Graciosa, Roca, Alagranza, Santa Clara, Inferno, and Lobos. Administratively, they form two provs. of Spain, named Las Palmas (which comprises Grand Canary, Lanzarote, Fuerteventura, and the six small is. mentioned above) and Santa Cruz de Tenerife (which comprises Tenerife, Palma, Gomera, and Hierro). From their position, and their nearness to Africa, the is. probably form a continuation of the great mt. system of N. Africa. They are all of a rugged and mountainous character, the chief peaks being those of El Cumbre in Grand Canary (5842 ft.), and the Peak of Tejde in Tenerife (12,182 ft.). They are most healthy, as during the summer and autumn there is hardly any rainfall; the rainy season lasts from Nov. to March. The products of the Cs. are sub-tropical in character. Since the demand for cochineal was temporarily ended by the discovery of

aniline dyes, bananas have been the prin. product of the Cs. Tomatoes and potatoes are also largely exported to England. The pop. is mainly Sp., with an infusion of Guanche blood. The Guanches or aboriginal inhab. were only conquered by the Spaniards after prolonged fighting during many years. In 1402 Jean de Béthencourt, a Norman gentleman, subdued some of the is. in the name of the king of Castile, but it was not until the end of the century that the whole were conquered. In Gomera conversation is still carried on by whistling at a distance of 3 m. or more. The 'blood' of the dragon tails, which is still an article of commerce, was used for preserving the mummies. Columbus called at the Cs. on Sept. 7, 1492, and Capt. Cook slept on shore in 1772. In 1656 Robert Blake attacked Santa Cruz, Tenerife, and sank sixteen galleons, laden with treasure. In 1797 Nelson met with his only defeat there and lost an arm; two of his flags are still to be seen in one of the Santa Cruz churches. Of recent years bananas have filled the is. with new motor cars running on new roads, and even cochineal is in demand for lipsticks. Areas about 2808 sq. m., pop. 563,000. See D. A. Bannerman, *The Canary Islands*, 1922.

Canary Wood, timber of two trees of the Canary and Madeira Is., *Persea indica* and *P. canariensis* respectively, belonging to the Lauraceae family.

Canberra, federal cap. of Australia. The Commonwealth has set out to make it one of the most beautiful cities in the world. Parks have been made, roads constructed, and trees planted, and a temporary Parliament House was opened by the duke of York on May 9, 1927, twenty-six years after the opening of the first federal Parliament at Melbourne by his royal father, King George V. It is 2000 ft. above sea level, from which it is distant 75 m. It is 204 m. from Sydney and 429 from Melbourne. The federal Capital Ter., which includes 28 sq. m. at Jervis Bay, is 939 sq. m. in area and includes a cluster of peaks 5000 ft. in height. There are sev. centres for scientific research, the more important being the Australian Institute of Anatomy, the Plant Industry and Entomological laboratories of the Council for Scientific and Industrial Research, the Australian Forestry School, and the Commonwealth Observatory at Mt Stromlo. Pop. of ter., 15,000.

Cancellieri, Francesco (1751-1826), Fr. historian, b. at Rome. He was made director of printing at the Propaganda in 1802. His literary activities were varied, and included vols. of memoirs, pamphlets, lectures, etc. His works include: *De secretariis veterum christianorum et basilice vaticane* (1786); *Bibliothèque pompienne* (1813); *Les Sept Choses fatales de la Rome antique* (1812).

Cancer (Lat. *cancer*, Gk. *karkinos*), in zoology, a genus of the crustacean order Decapoda (see CRAB); in astronomy, a constellation represented as a sign of the zodiac by a crab; its chief importance

lying in the fact that it denotes the N. limit of the sun's apparent course in the heavens in summer; hence the Tropic of Cancer (see Tropics) is that meridian on the earth's surface marking the northern boundary of the lat. where the sun has at any time an altitude of 90° ; in

cells, and is usually less malignant than other types of C. because the abnormal growth of these cells is strongly resisted by their normal neighbours and by cells of the connective tissue. The diseased cells are consequently either completely enclosed by fibres or their growth is at least

pathology, any malignant growth, but specifically applied to growths of two types, the carcinoma and the endothelioma.

A C. consists of a *stroma*, or framework of connective tissue surrounding nests of cells which have undergone a particular form of degeneration. In the carcinoma, these cells are of an epithelial type, that is, similar to those cells which form the outer skin lining of all canals which have communication with the external air. Epithelial cells differ in nature according to their function, which may be merely protective, or secretory or glandular, and such Cs. may be classified according to the structure and nature of the cells which compose them. An epithelioma, for instance, is a carcinoma of the squamous epithelium covering the skin and lining the mouth and oesophagus. In the sarcoma the cells which have degenerated are simpler ones of the type found in connective tissue. Such cells are capable of more active growth, particularly in young people, so that the sarcoma is more malignant in the young than in the old. Sarcomata also are subdivided according to the type of tissue they attack, e.g. an osteosarcoma occurs in bone, an adenocarcinoma in glandular tissue. The endothelioma consists of nests of endothelial

cells, and is usually less malignant than other types of C. because the abnormal growth of these cells is strongly resisted by their normal neighbours and by cells of the connective tissue. The diseased cells are consequently either completely enclosed by fibres or their growth is at least considerably hindered. When normal development of an individual takes place, the cells grow and divide, and become specialised for certain work, that is, they become differentiated. In C., these differentiated cells degenerate, returning almost, but not quite, to their primitive condition, and in so doing they regain some of their primitive capabilities. They resemble embryonic cells in their power of extensive multiplication, but differ from them in retaining some semblance of their differentiated form; e.g. a C. of the liver contains cells which have the form, and may actually retain some of the secretory activity, of normal liver cells, and even though such a C. may migrate to another part of the body, such as the eye, or even to bones, and continue its growth, the tissue in which it was originally formed can be detected by examination of the cancerous cells. It is this power of migrating and forming secondary growths (metastases) in other parts of the body which forms one of the chief distinctions between C. and other tumours. Arising at first as a minute area—perhaps only as a single cell—the C. spreads centrifugally by cell growth and division. The growth obstructs the tissues in which it arises and eventually pushes against connective

tissue which endeavours to resist its growth and sometimes encloses it. The C. takes the path of least resistance, and the cells increase rapidly through the lymph spaces. Different varieties of C. differ in their rate of growth; in general it may be said that soft Cs. show the greater activity. The symptoms in the early stages of a growth are not usually very reliable. If the location be internal it may develop painlessly until either its great size interferes with the proper functioning of some organ, or the breaking down of the growth produces dangerous hæmorrhage. General weakness usually accompanies the formation of an internal C., and there is a more definite symptom in the yellowish pallor which is to some extent characteristic. The decrease in vitality in old age, and the cell degeneration that normally occurs in senescence, may partly account for the majority of cases of C. being found in the old, though it should be noted that C. formation is due to *abnormal* degeneration. On the other hand, though C. is rarely found in young people, when it does occur, it is usually more malignant in character than in the aged. An external growth occurring on the breast, lip, or tongue should be promptly examined by a medical man, and it is not too much to say that any abnormal swelling should be attended to without delay, as the surgeon's only hope is early operation. C. of the rectum should also be suspected in cases of 'piles.' The need for a certain amount of care in this matter should not occasion alarm; because although on the one hand the indefinite nature of the early symptoms and medical lack of knowledge of the nature of cancer has caused its name to be universally dreaded, it must not be forgotten that the chances are enormously in favour of any slight manifestation ultimately being traced to a much less serious condition. Truly scientific prevention and cure of C. cannot be carried out until our knowledge of the causes of the disease is much more definite.

The truth is that we do not know what is wrong with the cancer cell. It has been found that certain things may cause C. and other things may cure it, but the inner mechanism of the normal cell and cancer cell are alike dark to us. All that can be said is that a great deal of research has elicited a few fundamental facts about the cancer cell. First, and perhaps most important, is the discovery of Roux, that C. is not inherent in the cell as a whole, but that the juice of certain growths from which all cells had been filtered can transmit the disease. Barnard and Gye, and later Gye alone, showed that the filtered juice contained exceedingly minute particles which transmit such diseases as rabies, influenza, and foot-and-mouth disease; but yet C. could not be an ordinary virus disease for it arose, as it were, spontaneously, and without any of the circumstances of contagion. The most general method of treatment is that of excision, and the operation is usually successful if the C. has not developed too extensively, and particularly if there are

no metastases. Although surgery still remains the best method of treating C., good results have also been obtained in suitable cases with X-rays and with radium. Combinations of the three methods can also be used, e.g. following removal of the C., X-rays can be applied to prevent a recurrence. Radium can be applied externally, or internally in radium needles, or as 'seeds' containing radium gas. C. of the prostate gland has been treated recently with injections of stilboestrol, a synthetic hormone. All other kinds of treatment are worse than useless, and none of the so-called 'cures' of quacks will stand the test of investigation. Sixty or more years ago a permanent cure was an extreme rarity: to-day some 35 per cent. of all C. patients could be cured by modern resources of radium, X-rays, and surgery, if they would but seek skilled advice on the first sign of trouble. In actual fact over 70 per cent. of C. patients, when they are first seen by the doctor, are untreatable, and probably less than 5 per cent. are restored to health. When cure is impossible or hopeless, the treatment aims at alleviating pain; and sometimes operation is resorted to with no further end in view than temporarily to relieve the patient.

The cause of C. is still unknown. It is probable that many different causes may operate, and good work has been done in investigating probable causes by researches conducted under the auspices of the Imperial Cancer Research Fund. The able administration of this fund and the unselfish co-operation of medical men and scientists throughout the empire has led to the accumulation of a body of statistical and experimental knowledge, which, though it has had no very definite results, has put the inquiry on a proper footing. Many investigations have been conducted with a view to finding a specific micro-organism for C., but without satisfactory results. None of the claims made to have isolated a C. bacillus have been estab.; but a new direction to the study of C. has been given by the discovery that the disease may be produced experimentally by the application to animals of synthetic chemical compounds of known molecular structure. The arguments appear to be rather against a bacterial origin, for no real evidence of infection has been produced, and it is somewhat difficult to understand how the hypothetical organism picks out widely separated groups of cells in the same individual and leaves unaffected cells with no greater apparent protection. Cases are quoted too, which appear to show that an embryo escapes the disease although the uterus may be diseased, and on the other hand, a child may be born from a healthy womb with C. developed at an early period in its foetal life. The effect of irritation in the formation of cancerous growths has been widely discussed. There is no doubt that irritation is often at least a predisposing cause, and chimney-sweeps' C., to which sweeps at one time were peculiarly liable, was caused by the irritating effect of soot.

as was first noticed in 1775 by an Eng. doctor, Percival Pott. The active carcinogenic principle of coal tar has never been isolated as benzopyrene; other similar substances are also being investigated. The chewing of betel-nut and the eating of hot rice in China have been shown to be associated with cancerous growths. Irritation may also be produced within the body by chemical means, e.g. alcohol is known to promote the degeneration of cells, and arsenic to stimulate their activity. Over-exposure to X-rays or to ultra-violet rays, or to radium-causes the rapid and premature degeneration of cells and the formation of C. There is probably a personal factor in all cases, so that some people would be less likely than others to get the disease, and it is at least possible that there is sometimes a psychological cause. Statistics have been collected for the purpose of tracing any possible connection between certain varieties of diet and C., and although statements have been made about fish-eating people and rice-eaters as being peculiarly liable, they probably do not represent a substantial part of the truth. The disease seems to be more common in civilised than in uncivilised communities; this may be due to the fact that civilisation favours the prolongation of life and the preservation of the physically unfit and also provides a very special environment. Moreover, many more cases are diagnosed and recorded as C. in civilised communities than in savage races. Civilisation has effected great changes in the habits of people, particularly with regard to feeding and reproduction, and this is significant in view of the reported comparatively high rate of incidence of C. in the digestive and reproductive organs amongst civilised nations, compared with the relative freedom of less civilised peoples from this disease.

With regard to the question of heredity, more satisfactory information has been obtained through long extended experiments with many generations of mice; and it has been estab. that mice with a cancerous ancestry are more liable to C. than those born from a healthy line. Such a strain of mice showing a hereditary tendency to develop, for instance, a mammary C. can only be maintained by constant in-breeding such as would never occur in humans. It is only when information is gathered upon the comprehensive scale adopted by the Imperial Research Fund committees that reliable statistics can be obtained. Those at present available show that, as in mice, C. in man is rarely directly inherited. People who lead a normal healthy life, fully occupied but free from strain, using all the organs of the body reasonably, are less liable to develop C. than those who are under-nourished, or who live in a highly artificial environment. With the possible exception of C. of the lung, there is no conclusive evidence that C. is increasing in frequency in individuals of any one age-group; it is however diagnosed more often than formerly, and therefore appears to be more common. People live

longer nowadays and hence more of them die from C., which is essentially a disease of middle and old age. See W. B. Bell, *Some Aspects of the Cancer Problem*, 1930; J. Cope, *Cancer: Civilization, Degeneration*, 1932; B. Fischer-Wasels, *Die Vererbung der Krebskrankheit*, 1935; W. S. Handley, *The Prevention of Cancer*, 1936; E. L. Hoffman, *Cancer and Diet*, 1937.

Cancer, name of a genus of decapod crustaceans to which belongs *C. pagurus*, the edible crab. The species live in pairs in holes of rocks. See CRAB.

Cancer, or **The Crab**, fourth of the twelve constellations of the zodiac, denoted by the sign ♋, and marking the limit of the sun's course northward in summer. It contains a large, loose cluster of stars known as Praesepe, the Beehive, which appears as a nebula to the naked eye, and Xi Canceri, a triple star whose two close stars revolve about each other in a period of sixty years, and a third which revolves about the other two, in the opposite direction, in seventeen and a half years. The latter has an irregular motion, which leads to the supposition that it is the satellite of a close, invisible body which itself revolves around the other two stars.

Cancer-root, see BEECHDROPS.

Cancer, Tropic of, that meridian on the earth's surface marking the N. boundary of the lat. where the sun has at any time an altitude of 90°.

Cancionero, Sp. (and Portuguese Cancioneiro) word used to describe a collection of early lyrical poems, especially such a collection as was made by the poetic guilds which flourished in the Middle Ages. The oldest is that of John Alfonso de Baena, a converted Jew, who was secretary to John II. Its poems belong to the fourteenth and fifteenth centuries. A later C., attributed to Lopez de (Stunica) Zúñiga, contains songs by poets who accompanied Alfonso V. of Aragon to Naples, and afterwards in his imprisonment at Milan. The first *Cancionero General* (pub. in 1511) was that of Juan de Fernández embracing lyrics by over a hundred writers, the earliest of whom is the marquess of Santillana. The earliest of the Portuguese collections is that of King Diniz (1279-1325); the best known is Garcia de Resende's *Cancionero Geral*, 1516. These books of poems are important, because of the flood of light they throw on contemporary manners and ideals. The word C. has also been used to describe a series of poems by different authors, which deal, however, with the same subject. See Vollmüller, *Les Cancioneros et Romanceros Espagnols*, 1909.

Cancroma, see BOATRIL.

Candaba, tn. in ts. of Luzon in the Philippines, on the Panayanga, some 20 m. from Bacolor. Has textile industries and good fisheries near Candaba Lake. Pop. 15,000.

Candace, queen of the Ethiopians at Meroë. She was defeated by the Rom. governor, Petronius, when in 22 a.d. she made an incursion into Egypt, and was obliged to recognise Augustus as emperor.

Candahar, see KANDAHAR.

Candeish, see **KHANDEISH**.

Candela, com. in the prov., and 22 m. S. of the bn., of Foggia in Apulia, Italy. Pop. 9000.

Candelabrum (Lat. *candela*, a candle), large candlestick, and also a lampstand. Candelabra were used by the Romans for domestic purposes and also in sacred rites. They were generally made according to one design, with a base formed of three or more feet of some animal, the shaft branching off into arms which ended in spikes for candles or in flat disks from which lamps could be suspended. Specimens have been found in Pompeii, Herculaneum, and Etruria. Some are beautifully wrought in various metals; others are more massive and are carved in marble.

Candia, largest city in the is. of Crete; a name once given to the whole of the is. It is situated to the N. of Mt. Ida, almost in the centre of the N. coast. The city once was in the possession of the Venetians, from whom the Turks captured it in 1669 after a siege of twenty-four years. Hostilities between the Moslem and Christian inhab. have been frequent. In 1897 Greece became involved in a war with Turkey on behalf of the Christian residents of the is., when for nearly a year C. was under blockade. The tn. is very picturesque with its bazaars and mosques and old Venetian fortifications. There are numerous exports, including soap, oil, dried raisins, and almonds; steamers run regularly to Constantinople, Athens, Smyrna, etc. C. is now officially called Heraklion, being on the site of the port of the anc. Cnossus, the marvellous city of Minos where fighting bulls slew captive youths and maidens. Pop. 39,000. See **CROSS**.

Candidate (Lat. *candidatus*, white-robed, because Rom. candidates wore white), term applied to any one who takes steps towards fulfilling his aspirations for any office, post, or honour, and especially one who is willing to stand in a parl. election. Technically there is no legal decision as to when the aspirant becomes a C. Thus he is popularly recognised as such the instant he enters on an active campaign for the promotion of his object, whilst certain judges regard the appointment of the election agent as the definite sanction of his candidature. The Corrupt and Illegal Practices Prevention Act, 1883, gives the following definition of a parl. C.: 'Any person elected to serve in parliament, and any person who is nominated as a C., or is declared by himself or others to be a C. on or after the day of issue of the writ, or after the dissolution or vacancy in consequence of which such a writ has been issued.'

Candle, source of artificial light. Cs. are usually cylindrical in shape and are made of wax, tallow, or of some other solid fatty material, enveloping a wick of cotton, flax, or linen thread. Until the middle of the eighteenth century, wax and tallow were the only materials employed in the manuf. of Cs., but now they are made of spermaceti, paraffin, palm and coco-nut oils, and stearin. The methods

of manuf. vary according to the material used. They are either dipped, moulded, or rolled. (1) Dipped Cs. are made as follows: A number of wicks of a suitable length are suspended from a frame, so that the distance between each wick is equal to about double the intended diameter of the Cs. to be made. The wicks are dipped in turn into a trough of melted tallow. This operation is repeated again and again, the tallow being allowed to cool before a second immersion, until finally the required thickness is obtained. The outside edge is then smoothed and polished by machinery. (2) Cs. of spermaceti, stearin, and paraffin are usually moulded. For moulding Cs. a frame, holding together a great number of well-polished metal tubes, is used. Through the centre of each tube the wick is securely fixed; all the tubes are connected with a trough, so that when the melted material is poured into the trough, the tubes are filled simultaneously. The Cs. are left in the tubes to set hard. Moulding is now the most usual method of manufacturing Cs., as the whole process of pouring in and removing superfluous melted fat can be accomplished by machinery, and as many as five hundred Cs. can be moulded at one time. (3) Wax cannot be moulded, because in cooling it contracts to a great extent and sticks to the mould. Wax Cs. are, therefore, basted and rolled. The wick is first dipped into melted wax, until a sufficient quantity has thickened round it; then the C. is well rolled between two flat pieces of smooth wood, before the wax has set. Formerly, wicks were made out of the pith of a rush, and later of cotton fibres. The imperfectly consumed portion of the wick had to be removed from time to time by snuffers, an instrument resembling a pair of scissors with a small box attached into which the wick-ends fell. In 1825 Cambrères invented the plaited wick, which, when sufficiently burnt, mechanically falls outside the flame, and, by contact with the oxygen of the air, becomes completely consumed. Wicks are now always manufactured so that they are self-consuming and leave practically no ash. Tapers are made much longer than Cs. They have a thick, loosely twisted wick, thinly covered with wax. Night-lights, on the other hand, are very short and thick, their object being to burn slowly and dimly for a long time. Self-draining Cs. are also made, with three or more small pipes the whole length near the wicks. The usual standard of candle-power, or the illuminating power of a candle, taken as the unit for estimating the quality of any other illuminating agent, is a sperm candle burning 120 grains an hour.

Candleberry, see **BAYBERRY**.

Candle-fish, or **Oulachan** (*Thaleichthys*), name of a genus of malacopterygious fishes of the family Salmonide; it is closely allied to the smelt. It inhabits the Pacific coast of N. America and contains so much oil—more perhaps than any other animal—that it will burn like a candle.

Candlemas, feast of the Purification of

the Virgin Mary, celebrated by Rom. Catholics on Feb. 2. The festival gets its name from the fact that on that day there is a procession of candles, and those candles which will be required in divine service for the ensuing year are consecrated. The festival is also observed by the Church of England and by the Armenian Church. It has been compared with the Rom. festival held in honour of Februa, mother of Mars, when candles were burnt; possibly the old custom was utilised by the Church and turned into a Christian ceremony. In Scotland C. Day is the first of the quarterly terms, when interest, taxes, rent, etc., must be paid. The state of the weather at this time is said to determine that of the year.

If Candlemas is fair and clear,
There 'll be two winters in the year.

See also J. Brand, *Observations on Popular Antiquities*, 1849, and L. Duchesne, *Christian Worship*, 1903. G. L. Apperson's *English Proverbs and Proverbial Phrases* (1929) has three columns of proverbial sayings relating to Candlemas Day.

Candlenut (*Aleurites triloba*), tropical species of Euphorbiaceæ which is grown on account of the oil and the dyeing properties contained in the nut. The flowers are large and white, and the fruit is the size of a walnut.

Candlish, Robert Smith (1806-73), Scottish preacher, graduated at Glasgow Univ. in 1823, and after three years' study in divinity, accepted a tutorship to a Scottish boy at Eton. His appointment to St. George's, Edinburgh, at once brought him into prominence. After his first speech in the Assembly in 1839, he came to the forefront of those who later constituted the Free Church, and the part that he played in securing the Disruption was second only to that of his friend and leader, Dr. Chalmers. Moderator of the Assembly in 1861, he accepted the principalship of New College, Edinburgh, in the following year. C. worked unceasingly to secure the union of the various dissenting Presbyterian sects, and the speedy advancement of public education.

Candolle, Augustin Pyramus (1778-1841), Swiss botanist, b. at Geneva, of an anct. noble Provençal family. He came to Paris in 1797 for the purposes of study, and pub. (1802) *Astragalogia*. Two years later he obtained his doctor's degree for a thesis, *Essai sur les propriétés Médicales des plantes comparées avec leurs formes extérieures et leur classification naturelle*. His system of natural classification of plants, which was opposed to that of Linnaeus, introduced him to Cuvier and Lamarck. Both prompted him to undertake the pub. of the *Flore française* (1803-15). He began to lecture in the Collège de France in the same year, and in 1806 pub. four vols. of the *Flore française*, followed by six vols. in 1815. The Fr. Gov. employed him to carry on research work in botany and agriculture in France and Italy during the years 1806-12.

He was appointed to the professorship of botany at Montpellier Univ. (1810-16), and held the same chair at Geneva (1816-1841). C.'s most important work was *Regni Vegetabilis Systema Naturale* (2 vols., 1818-21), which was reissued under another name as *Prodromus Systematis Naturalis Regni Vegetabilis* (17 vols., 1824-73), to which he did not contribute more than the first seven vols. His valuable herbarium was bequeathed to his son, Alphonse Louis. See his *Mémoires et souvenirs* (ed. by his son in 1862) and W. de la Rive's *De Candolle*, 1851.

Candon, city in the Ilocos Sur prov., near the W. coast of the Is. of Luzon in the Philippines. Has cotton factories. Pop. 20,000.

Candy, see KANDY.

CANDYTUFT

Candytuft (*Iberis*) genus of Cruciferae which flourishes in Europe and Asia. It is noted for the peculiar corymbs of flowers, in which the outer petals are of greater length than the others and give it a more showy appearance. The species are often cultivated in Brit. gardens as herbs or small shrubs, annuals, or perennials. *I. amara* grows wild in Britain and receives the various names of wild, or bitter, C., clown's mustard, and scitica cross; the term C. itself is said to have been derived from Candia in Crete. *I. alpina* and *I. Gibraltaria* betray their habitats by their specific names; *I. semperflorens* and *I. sempervirens* are the broad-leaved and evergreen C. respectively.

Cane, name applied to sev. plants, but most properly to those belonging to the genus of palms known as *Calamus* from which rattan canes are made. The stems of these plants are thin and reedy, and they are used in bottoming chairs, in making ropes and baskets. The rattan C. which is used as a walking-stick is the thick stem of *Calamus Scipionum*. All the plants which yield rattan come from tropical regions of Asia, Africa, and

Australia. The sugar C. is really a grass which is cultivated in the tropics for the sweet juice it contains; its botanical name is *Saccharum officinarum*. The Cs. which are employed in making fishing-rods are the plant stems of the large grass, *Arundo Donax*.

Canea, or Khanla, cap. and chief commercial tn. of Crete, situated on the N.W. coast, 70 m. from Candia. The tn. was built on the anct. site of Cydonia by the Venetians, whose colonists settled here in A.D. 1252. The tn. was captured by the Turks after a two years' siege in 1646, or two years before the capture of Candia. There is a fine, though somewhat shallow, harbour, and an export trade in soap, oil, and leather. Pop. 27,000; prov., 112,000.

Canella, small genus of Canellaceæ, occurs on the coast of the W. Indies, especially of Jamaica, and on the mainland of S. America. *C. alba* yields the C. bark which is used as a tonic and stimulant. The bark is freed from its outer rind, is white in colour, and smells like cinnamon, whence it is also called white cinnamon.

Canelli, com. in the prov. of Alessandria, Piedmont, Italy, 13 m. S.E. of Asti. Pop. 8000.

Canelones, or **Guadalupe**, cap. of the dept. of C., in the S. of Uruguay, 24 m. N. of Montevideo. Pop. 4000.

Canes Venaticæ, 'Hunting Dogs,' a small constellation, added by Hevelius in 1690. They are close behind Ursa Major, and near Bo-tes and Coma Berenices. The chief stars are Cor Caroli, so named by Halley after Charles II., which is a double star of magnitudes three and six; a spiral nebula, discovered by Lord Rosse, 1845; and a cluster of 900 stars of the eleventh magnitude.

Cañete, Manuel (1822-91), Sp. writer. He was for many years Spain's prin. dramatic critic, and strove to raise the standard of the drama of his country. He also did much to make known the hist. of dramatic art in Spain, and to popularise the works of its dramatists. Among his works are: *Un Rebato en Granada* (1845); *El Duque de Alba* (1845); and lyrics, odes, and letters.

Caneva, Carlo (1845-1922), It. general, b. at Tarcento (Venezia). Entered army 1866. Served in Abyssinian campaign of 1897; lieutenant-general 1902. He commanded the troops embarked for Tripoli at the end of Sept. 1911. The conquest of the coast tns. was all that he could accomplish, his forces being insufficient. Much cruelty was alleged against them. He was recalled in Sept. 1912, and was not prominent again until he presided over the commission that inquired into the great disaster to the It. forces at Caporetto (q.v.), Oct. 1917.

Canfield, Dorothy, Amer. author, b. at Laurence, Kansas, Feb. 17, 1879; educated in U.S.A. and Paris, finally graduating at Ohio Univ., where her father was president. In 1907 she married John Redwood Fisher, and settled on a farm near Arlington, Vermont, where most of

her life has been spent, except for intervals of travel in Europe and three years of relief work in France during the First World War. From 1921 to 1923 she was the first woman member of the Board of Education in Vermont, and later (1938) became president of the Amer. Adult Education Association. Her writings on educational subjects have been both numerous and influential, but represent only one part of her literary work, which covers novels, short stories, plays, literary criticism, and miscellaneous writing. Her translation of Giovanni Papini's *Life of Christ* became a best-seller in 1923. Her knowledge of Europe and of European languages is considerable. Among her novels, which are for the most part studies of the problems of middle-class married life, may be mentioned *The Bent Twig* (1915); *The Brimming Cup* (1921); *The Deepening Stream* (1930); and *Seasoned Timber* (1939).

Cang, Cangue, or Kea, instrument of punishment used in China. It is a ring or heavy wooden yoke, the weight of which varies according to the nature of the culprit's offence. The man's head and shoulders are fastened into this cage so that he is unable to lie down or feed himself. On the C. is inscribed his name, the nature of his offence, and the duration of his punishment. He is paraded through the streets, and finally left in some open thoroughfare, or at the city gates, till his sentence has expired, which may last for some weeks or even months.

Cangas de Onís, tn. of N. Spain, in the prov. of Oviedo; of considerable historic interest, and has in its environs numerous remains of Rom. occupation. The abbey of Covadonga is in its neighbourhood. The cave of Covadonga, among the inaccessible mts. of Asturias, was the legendary place of refuge of Pelayo, a member of the Visigothic royal family, who rallied his followers there against the Arabs. Pop. 10,000.

Cangas de Tineo, tn. of N. Spain in the prov. of Oviedo, engaged in farming, leather, cloth, and pottery industries and in copper mining. Pop. 24,000.

Cange, Charles Dufresne, Sieur du, see DU CANGE.

Cango, dist. of S. Africa, about 20 m. N. of Oudthoorn. It is famous for its magnificent caves, where some of the finest stalactites in the world are to be seen.

Canicatti, tn. on the Naro in Sicily, in the neighbourhood of famous sulphur mines. Pop. 32,000.

Canicular Days (*Dies Caniculares*), see DOG-DAYS.

Canidæ, the dog family, which includes wolves, foxes, jackals, etc., constitutes the group Cynoidæ of the Carnivora, and is placed between the cats and the bears. Huxley divided the species into two series, the Thooold, or wolf-like (such as *Canis lupus*, *C. aureus*, etc.), and the Alopecoid, or fox-like (containing *C. argentatus*, *C. vulpes*, etc.), but different zoologists favour various diva. All the members of the family are carnivorous, but some will eat vegetables and insects as well. They

are cosmopolitan and nearly always hunt in packs; they are found abundantly in fossil state with many extinct species. The number of teeth varies in the genera, but the commonest form is that with forty-two—three incisors, one canine, and four premolars on each side of the upper and lower jaw, with two or three molars on each side of the upper, three on the lower jaw. The origin of the domestic dog, *C. familiaris*, is unknown, and wild dogs abound in S. America, among them *C. Cancrivorous*, the crab-eating dog, *C. vulpes* is the common fox, *C. lagopus* the Arctic fox, *C. dingo* the dingo, *C. lupus* the wolf, *C. aureus* the jackal, *C. latrans* the prairie wolf; *Icticyon*

Canis Minor, constellation of the S. hemisphere, N. of C. Major. Its prin. star, Procyon, lies on the line between Sirius and Pollux.

Canister Shot, see CASE SHOT.

Canitz, Friedrich Rudolf Ludwig, Freiherr von (1854-99), Ger. poet, b. in Berlin. He was gentleman of the bedchamber to the elector Frederick William, councillor of state under Frederick I. and Leopold I, created him a baron of the empire. He wrote many satirical poems in the style of Boileau, with odes, hymns, and other poems. His *Poetical Recreations* were popular in his time.

Canker, name of a plant disease which attacks fruit trees, such as the apple and

CRAB-EATING DOG

venaticus is the bush-dog; *Otocyon megalotis* is a solitary African species; *Lycan pictus* is the Cape hunting-dog.

Canigou, The, mt. of France, at the extremity of one of the lateral chains of the oriental Pyrenees. It is of granite formation and is clothed with vegetation almost to its summit, the orange, vine, chestnut, potatoes, fir, birch, rhododendron, and juniper flourishing at their respective altitudes. Its anct. manganese mines are still worked.

Canina, Luigi (1795-1856). It. architect and archaeologist, b. at Casale in Piedmont. He was prof. of architecture at Turin, then he went to Rome, where he spent many years studying its anct. buildings. The results of this work are embodied in *L'Architettura antica descritta e dimostrata coi monumenti*, and in a topographical plan of old Rome. He also directed the excavations of Tusculum, Veii, and the Apian Way.

Canis Major, or *Orion's Dog*, constellation of the S. hemisphere, below Orion. Its chief star is Sirius, by which the constellation may easily be found, this star being on the extension of the line through Orion's belt.

sometimes forest trees, as the larch. It may usually be found to be present when the bark begins to split, or when the ripe fungus protrudes from the wounded bark. Many varieties of low plants may cause the disease, but the ones to which most importance is attached are the fungi *Dasyphypha calycina*, causing larch C., and *Nectria galligena* (not *N. difissima* as was formerly supposed), producing C. of apple and pear. The best methods of curing the tree of C. are to cut off the diseased branches or to cut out the affected parts, and to smear over the wound with an impermeable substance. Some varieties of apples, e.g. Brauley's Seedling and Newton Wonder, are much more resistant than others such as Cox's Orange Pippin; resistance also varies with the dist. and the type of soil.

Canmore, Malcolm, see MALCOLM III.

Cannabis sativa, hemp-plant, forms a genus of Moraceae, or, according to some botanists, of a smaller family Cannabinaceae. It is a native of Central Asia, and is cultivated both for the fibre known as hemp which it produces and for the drug it contains. The hemp is made

from the tough bast-fibres, and is used for making ropes and in weaving; from the resin it exudes hashish is made in the E., and bang from the mature leaves, together with the resin they contain. The flowers are dioecious (i.e. staminate and pistillate flowers occur on different plants) and resemble those of their near relative *Humulus lupulus*, the hop.

Cannaceæ, monocotyledonous family of plants which is frequently united by botanists to **Marantaceæ**. It contains a single genus of plants, all of which are tropical or subtropical. *Canna indica* (Indian shot) is a handsome ornamental plant often cultivated on account of its appearance. The inflorescence is terminal, the flowers are hermaphrodite, asymmetric, and epigynous, with three free sepals and three united petals; the fruit is a capsule. The androecium is represented by a number of petaloid bodies in which the posterior stamen of the inner whorl bears a bilocular anther on its edge; of the petaloid structures, the *staminodia*, one is larger, turns back on itself, and is known as the *labellum*. The gynoecium is inferior and consists of three carpels which are trilocular, have a petaloid style, and contain numerous ovules. Nearly all the species of *Canna* have a great deal of starch in their rhizomes, and arrowroot is made from *C. edulis*. This plant has large, tuberous roots, smooth leaves, and stems coloured at the base.

Cannæ, anct. city of Apulia in S. Italy, near the mouth of the Aufidus (now Ofanto). The tn. is celebrated for the great battle in Rom. hist. when Hannibal inflicted a crushing defeat on the Rom. army, led by the consuls *Emilius Paulus* and *Terentius Varro*, 216 B.C.

Cannan, Gilbert (b. 1884), Eng. novelist and playwright, b. in Manchester. He was called to the Bar in 1908 after graduating at Cambridge Univ., also worked as dramatic critic. His first novel, *Peter Homunculus*, was pub. in 1909, and was followed by a number of other novels, including *Young Earnest* (1915), *Three Pretty Men* (1916), and *The Shuco House* (1917), which estab. his reputation as a writer of the realistic and psychoanalytic school. His plays include *Miles Dixon* (1910); *James and John* (1911); *Mary's Wedding* (1912); *The Perfect Widow* (1912); *Wedding Presents* (1912); and *The Harbour of Refuge* (1913). He has also written books and essays on social and literary subjects, and was the translator of Romain Rolland's *Jean Christophe* in 4 vols., 1910-13.

Cannanore, seaport and one-time military station of the Malabar dist., Madras, India; came into Brit. possession in 1791; exports pepper, timber, grain, and coconuts. Pop. 27,700.

Cannel Coal, coal containing an unusual amount of ash and volatile ingredients, and burning with a clear, candle-like flame. Valuable as a source of gas and oil. Occurs in Eng. coalfields.

Cannes, watering place of the Riviera,

in the dept. of Alpes-Maritimes, France. The tn. is pleasantly situated on the gulf of La Napoule, and is famed for its climate. Among the interesting features of the tn. are the watch-tower of a medieval castle, built by Abbot Adelbert in 1070; the bridge called *Pont-de-Rion*; a museum of antiquities; and the Albany Memorial church of St. George of England, visited by Queen Victoria in 1887. The tn. was founded by the Romans on the *Via Aurella*, and has suffered repeatedly from bombardment. Lord Brougham, to whom a statue is erected on the prin. promenade, the *Allée de la Liberté*, lived at C. and founded its reputation as a winter resort. There are many orange orchards and flower plantations, which form the chief industries; there is also trade in soap, olive oil, and salted fish. A conference was held here Jan. 6-14, 1922, respecting the Ger. reparation payments. See **CANNES CONFERENCE**. Pop. 45,500, a great number of whom speak It.

Cannes Conference, held by the Supreme War Council on Jan. 6 to 13, 1922, for the purpose of framing resolutions which were to be the basis of a further conference at Genoa on March 8, 1922. Mr. Lloyd George submitted the following resolution which was accepted in principle: (i.) That all Prime Ministers of European powers should attend an Economic and Financial Conference at which a united effort should be made to stimulate European trade as a means of relieving the widespread suffering of European peoples. (ii.) That the allied powers consider that the fundamental conditions upon which alone this object can be effected are that each nation must be free to regulate its own system of ownership, internal economy, and government, and that foreign investors must be guaranteed that their dealings will be respected. The conference also dealt with finance and currency, subversive propaganda and aggression against neighbours. The trifling extent to which these laudable principles have since been applied may be gauged by the failure ten years later of the World Economic Conference of 1932 (see **ECONOMIC CONFERENCE, WORLD**). See also **GENOA CONFERENCE**.

Cannibalism, or **Anthropophagy** (Gk. *άνθρωπος*, man *φαγείν*, to eat), the practice of eating human flesh. The word is a variant form of Carib, Caribes or Charalibes a fierce man-eating tribe of the W. Indies. Caliban is probably another variant. C. has, at some time or other, existed in almost every part of the globe, in N. and S. America, Europe, Africa, India, New Zealand, and Australia. Strabo asserted that C. existed in Ireland, and the authority for the report that the practice once prevailed in Scotland is St. Jerome. As late as 1782 gipsies were executed in Hungary for practising C. It is still known among the tribes of W. and Central Africa, New Guinea, and Melanesia. C. may often be traced to an economic cause. Even among modern civilised races it has been resorted to in cases of dire necessity, such as siege,

famine, shipwreck, etc. Savage tribes may be prompted by hunger to kill and eat men when the flesh of animals is not available. The taste for human flesh when once acquired grows into a fierce desire, which no other form of meat will satisfy, so that a gluttonous, depraved taste may sometimes account for C. Among certain African tribes, the Niam-Niam and Mombutu, human flesh was formerly put up for sale in the market-places, and corpses of relatives were consumed as food. A. S. Amer. tribe used formerly to breed from their captive women, in order to procure a constant supply of human flesh to satisfy their needs. Higher motives for C. are those due to superstition or religion. It was thought that a man acquired the qualities of the thing he ate. Thus the heart of a lion consumed by a chief, would make him valiant in the fight. Accordingly, a man would eat his enemy in the hopes of acquiring his courage or perseverance. This motive for C. existed among the Isodones of Central Asia, mentioned by Herodotus (iv. 26). The Maoris, Australians, and Indians of N. America believed in the transmigration of souls. The eating of the enemy might, therefore, prevent his finding another resting-place for his spirit, and would secure the murderer against being haunted by the ghost of the murdered. In Australia certain tribes felt that the most fitting burial place for the deceased was within their living relatives. Such funeral feasts were attended by many religious rites. Children ate their parents so that their virtue might be retained in the family, and likewise parents occasionally ate their children. Among the anc. Mexicans and the natives of Fiji human flesh was regarded as the only fit offering to the gods, and the victims thus offered were afterwards not infrequently devoured by the onlookers. Another superstitious motive for C. existed among the 'Hametzon,' magicians of N.W. America, whose rule it was to eat human flesh for admittance to their order. Consult R. Andree, *Die Anthropophagie*, 1887; P. Bergemann, *Die Verbreitung der Anthropophagie über die Erde*, 1893; J. H. Wilks, *Among Congo Cannibals*, 1913; K. J. Beatty, *Human Leopards*, 1915.

Canning, process of preserving meat, fish, fruit, etc., by sealing up in cans or tins. The principle upon which this process is based is that of excluding the air from the produce it is desired to preserve. Before C. was thought of, many methods of covering the cooked food with an air-tight coating were experimented with. These all failed for the reason that, although the air was thereby excluded, the germs contained in the air were not; these were imprisoned in the food and caused putrefaction. In C. the air is expelled and the germs killed at one and the same time by subjection to intense heat. Removal of oxygen may also be secured by exposure under pressure to an inert gas, such as nitrogen. The meat or other food is packed in cans, which are then either placed in a steam

oven, immersed in boiling water, or stood in a vat partially filled with a solution of calcium chloride and water, and then subjected to a heat of 270°F., for a length of time that varies according to the character of the food. Thus the germs and spores are destroyed; air and steam escape through a pin-hole which has been left in each can. The holes are then soldered up and the tins allowed to cool. Food thus preserved should, if the process has been perfectly carried out, remain in good condition. Experiments have proved that even after twenty years there is no sign of deterioration. This could occur only if the process were not thorough, and the presence of putrefaction could be detected by a bulging of the can due to gases developed in the course of decomposition. C. was probably invented by M. Appert of Paris about 1810, but many others made experiments in the same direction. The twentieth century has seen an enormous increase, not only in the variety of foods to be canned, but also in the quantity produced. Now canned meats, fish, soups, fruits, and vegetables of all kinds can be obtained at all seasons of the year, all over the world, the diet of each individual country being thus greatly extended. The U.S.A. still leads, as it always has done, in the canned foods industry, but the Brit. dominions are a formidable rival. In Great Britain itself the trade has increased, as it has in Norway, Spain, Portugal, Italy, and other European countries. In Japan and in the Malay States, where pineapple canneries have been started. The past twenty years especially have seen a considerable development of the C. industry in the United Kingdom and there are now a large number of factories for canning fruit and vegetables. The Campden Fruit and Vegetable Preservation Research Station, attached to Bristol Univ., gives useful scientific advice to the industry. See F. H. Woodcock and W. H. Leslie, *Canned Foods and the Canning Industry*, 1933; O. and T. W. Jones, *Canning Practice and Control*, 1941; J. G. Baumgartner, *Canned Foods*, 1943.

Canning, Charles John, Earl (1812-82). Eng. statesman, governor-general of India during the mutiny of 1857. He was the son of George C., was educated at Eton and at Christ Church, Oxford; represented Warwick in the House of Commons in 1836; and entered the House of Lords on the death of his mother, who had been raised to the peerage. Under Peel's administration C. was under-secretary of state, chief commissioner of woods and forests in 1846, and postmaster-general, 1852-55. In 1856 he became governor-general of India, and when the mutiny broke out his strong moral qualities, good administrative ability, and clear judgment enabled him to deal with the situation in a masterly way, little expected of him by many who felt that his powers were not equal to the occasion. His policy of conciliation towards the native princes and his devotion to the work of reform and development of the country stood him

in good stead in a difficult position. His dealing with the rebellion in Oudh caused much controversy, but at the close of the troubled period he received the thanks of both Houses of Parliament. See Duke of Argyll, *India under Dalhousie and Canning*, 1865; Sir H. S. Cunningham, *Earl Canning*, 1891.

Canning, Elizabeth (1734-73), Eng. criminal around whose case raged excitement and controversy, into which Fielding entered with his *Clear State of the Case of Elizabeth Canning*, 1753. She told a mysterious tale of detention in the house of a 'Mother Wells.' Her story led to a condemnation, but on its being afterwards proved to be false she herself was transported.

Canning, George (1770-1827), Eng. statesman, was educated at Eton and Christ Church, and even in those early days showed himself possessed of unusual abilities. Favouring the Whig policy at first, the Fr. Revolution drove him, as it did so many others, to support the political party that opposed it, and when he entered Parliament in 1794 it was under the Tory banner. A couple of years after he took his seat Pitt made him under-secretary for foreign affairs, and promoted him to the office of commissioner of the Board of Control (1799), and then to paymaster-general (1800). When Pitt retired, C. did not join the Addington administration, towards which, although nominally a supporter, he acted the role of 'candid friend.' When Pitt returned to office in 1804, C. became treasurer of the navy; and, on the death of his leader two years later, he declined to serve in the Cabinet of 'all the talents.' He became Foreign Minister under Lord Liverpool, but disagreeing with Lord Castlereagh's conduct of the war, and urging his dismissal, caused him to fight a duel with the war minister on Sept. 21, 1809, in which he was slightly wounded. When Perceval came into power, C. took a long holiday abroad; but in 1816 he went to the India Office under Lord Liverpool. As a friend of Queen Caroline, he declined to take any part in the proceedings against her in 1820, and tendered his resignation, which was eventually accepted. Two years later he accepted the appointment of governor-general of India, but on the eve of his departure Castlereagh committed suicide, and he stayed at home, going again to the Foreign Office. On Liverpool's death, C. became Prime Minister and Chancellor of the Exchequer, but, quarrelling with many members of his own party, he had to rely for continuance of office on the support of the Whigs, albeit he sacrificed nothing of his policy. He only enjoyed his high office for a few months, for he d. on Aug. 8, 1827. C. had literary as well as political interests, and in 1797-98 he printed many pieces in the *Anti-Jacobin* (q.v.), including the well-known *Needy Knife-grinder*. The Contributions to the *Anti-Jacobin* were written in collaboration with George Ellis and John Hookham Frere. The *Needy Knife-grinder* was the joint production of C. and Frere. His poems were collected

in 1823. He also has a place in literary annals as a founder, with Sir Walter Scott and George Ellis, of the *Quarterly Review*, but to this periodical, so far as is known, he contributed little, though it is probable he inspired many articles. In his writings, and in letters to his intimate friends, he showed himself possessed of a fine sense of humour. As a statesman, in spite of what has been said to the contrary, C. was consistent in his views, though the frequent changes and interchanges of party do not always make it clear at a first glance. He was what may perhaps be called a progressive Tory. It was asserted, too, that he was

GEORGE CANNING

After Gainsborough

not sincere in his speeches, but that charge, too, has broken down, and a careful study of his life shows that he always spoke from the heart. As an orator, for excellence of phrasing, for admirable delivery, and for sound common sense, he has had few rivals. His speeches were pub. in 1828. There is a political biography by A. G. Stapleton, 1831. See also J. A. R. Marriott, *George Canning and his Times*, 1903; H. W. V. Temperley, *Life of Canning*, 1905, and *The Foreign Policy of Canning*, 1925.

Canning, Sir Samuel (1823-1908), Eng. engineer and one of the pioneers of submarine telegraphy. His first cable was the one connecting Cape Breton Is. with Newfoundland; then he assisted in laying the first Atlantic cable. He laid the Atlantic cable of 1865-66, inventing the grappling machinery for recovering the lost cable of an unsuccessful first attempt.

Canning Town, industrial dist. of E. of London, in the bor. of West Ham, Essex. Here are situated the extensive Victoria

and Albert docks. It has a station on the L.N.E.R. and lies at the junction of the E. India Dock Road and Barking Road.

Cannock, mkt. tn. of Staffordshire, England, near Walsall. C. Brownhills, Chase Tn., Hednesford, and other small tns. are situated in the dist. known as C. Chase, formerly a royal preserve, now a rich coalfield. Its prin. industries are mining, tool, boiler, brick, and tile making. Its pop. has grown from 2099 in 1851 to 35,000.

Cannon, see GUN.

Cannon, Joseph Gurney (1836-1926), Amer. statesman, b. in N. Carolina. As a youth he worked in a prov. store, during which period he studied law. Called to the Bar of Illinois, he soon won a successful practice, and was state attorney for seven years. In 1873 he became a member of Congress. Was a member of the U.S. House of Representatives for forty-six years, and as Speaker, which position he held from 1903 to 1911, he ruled the House with adamantino severity.

Cannon-ball Tree (*Couroupila guianensis*), species of Lecythidaceae which is found in S. America. The fruit is a large, round, woody capsule, and this has earned for the plant its popular name.

Cannstatt, or *Cannstadt*, tn. of Württemberg, Germany, on the E. bank of the Neckar, 3 m. N.E. of Stuttgart. It is noted for its mineral springs, of which there are about thirty; it is thought that these were known to the Romans. There are machinery manufs., foundries, and brick works. Fruit and wine are produced in the dist. The Fr. under Moreau defeated the Austrians under Archduke Charles in the neighbourhood in 1796. The tn. was incorporated with Stuttgart in 1905.

Cano, Alonso (1601-67), Sp. painter, sculptor, and architect, b. at Granada. He studied painting under Francisco Pacheco, the master of Velázquez, and sculpture under Juan Martínez Montañés. In 1637, in consequence of a duel, he was obliged to flee from Seville to Madrid, where he was befriended by Velázquez. Through the influence of his fellow artist, he was appointed court painter and royal architect. C. excelled in the three arts, and on account of the universality of his genius was called the Michelangelo of Spain. He executed two colossal statues of St. Peter and St. Paul. There are beautiful specimens of his work in the cathedral of Granada, and in the Prado, Madrid.

Cano, Juan Sebastian del, Sp. navigator. He sailed under Magellan, who was killed in the Philippines. C. continued the voyage, doubled the Cape of Good Hope, and landed near Seville in 1522, being the first to circumnavigate the world. Charles V. gave him a pension and a globe inscribed with the motto *Primus me circumdedit*. He d. in 1526.

Canobus, see CANOPUS.

Canoe (from a Caribbean word through the Sp. *canoa*), term for a boat which has both ends pointed and which was formerly

propelled by paddles only, but now sometimes by sails alone or in conjunction with paddles. The paddles are manipulated without mechanical contrivances like those used to hold oars in position. The paddler paddles first on one side of the boat, then on the other, sitting in the 'well,' a characteristic feature of the modern C., as distinct from the primitive boat, which was open from end to end. The primitive C., used by the anc. Britons, the Eskimo, the N. Amer. Indian, etc. was simply the hollowed trunk of a tree, or else a simple frame of wood covered with skins or bark. This C. called a 'dug-out,' made from trunks, was hollowed either by fire, stone implements, or shells. Many of these have been unearthed in the Brit. Is., and they are still used by the Africans. A famous example of this C. is exhibited in the New York National Hist. Museum; it is 63 ft. long, and nearly 4 ft. wide. Canoeing as a modern sport in England began with the lectures of John MacGregor and the construction of his renowned C., the *Rob Roy*, together with the publication of his books, *A Thousand Miles in the 'Rob Roy' Canoe*, and *The 'Rob Roy' on the Baltic, the Jordan, and the zuyder zee*, 1850-66. The *Rob Roy*, designed for long journeys in the waters of the E., was built of oak with a cedar deck, was 14 ft. long and 26 in. wide; it had 7-ft. paddles, and its sails were dyed blue on account of the glare of the sun; its weight, everything included, was 70 to 72 lb. The *Rob Roy* became the type for the Brit. C. The sailing C. is about 15 ft. long, has a deck seat and tiller, its cockpit is small and its sail area correspondingly augmented, it contains air and watertight bulkheads, and is fitted generally with two sails. W. Baden-Powell with the *Nautilus* and his book *Canoe Travelling* was the pioneer of the cruising C. The Royal Canoe Club (founded 1866) lays down the rule that these Cs. may not weigh more than 200 lb. and that their sail area may not exceed 75 sq. ft. These vessels can attain a speed of 40 m. a day in smooth water, racing Cs. can cover 8 m.p.h.; these are 20 ft. long and 18 in. wide. Present day crews sometimes sit on the side of the deck, and not in the well; this device helps to balance the wind pressure. The cruising C. is equipped with paddles and sails, the racing vessel has sails only. Modern Brit. Cs. are usually made of oak, cedar, or pine; there have been Cs. made of paper, of tin, and of india-rubber. Amer. Cs. are generally built of cedar, mahogany, or bass-wood, or on the lines of the Indian birch bark C., and made of painted canvas, bark, or compressed paper. The 'Canadian,' a type of the former, is constructed on a mould over which alternate strips of dark and light timber are laid while still moist from a steaming process they have undergone. The strips are grooved, bound, and glued together; this forms the outer skin; the inner skin is composed of broader strips placed crosswise. 'Folding' or 'collapsible' Cs. built somewhat on the lines of the Eskimo kayak, are a favourite

craft. In these, the two halves of the framework of ash rods and metal cross-frames are slipped into each end of the skin, and the central flooring locks everything correctly into position. See W. J. Luscombe and L. J. Bird, *Canoeing*, 1936, 1948.

Canon (Gk. *κανών*), a straight rod, hence measuring rod, or rule; metaphorically, anything which regulates or keeps straight), term used in a number of special senses as shown below; applied in early times to various rules of faith. By the fourth century the word had come into use to describe the rules of faith and practice put forward by councils of the Church. Thus there are the Cs. of Nicaea in A.D. 325, and the Cs. of all the councils since that date. The term also describes the list of saluts honoured by the Church, and also the central portion of the liturgy, including the consecration of the sacred elements. For an account of Cs. in general see **CANON LAW**.

Canons of the Church of England.—A body of 141 Cs. or eccles. constitutions drawn up by the Convocation of Canterbury in 1604, and approved by the Convocation of York, being finally sanctioned by the king. They were drawn up as a result of the Hampton Court conference, to the conclusions of which they were designed to give effect. In 1640, Convocation (*q.r.*) remained sitting after the Parliament had ceased to sit, and, after revising the 1604 Cs., pub. seventeen more which never received parl. or royal sanction. Their binding force has, in consequence, been much questioned, and in consequence of their unpleasantly aggressive character, they are generally discredited. Except for those parts which have been superseded by later regulations of equal or greater authority, such as the rubrics of the Book of Common Prayer, 1661, the 1604 Cs. are still binding on the clergy, who at their institution to a benefice promise *canonical* obedience to their bishop. A Commission under the chairmanship of the archbishop of York (Dr. C. F. Garbett) was appointed in 1939 to prepare a revised body of Cs. Its report, which was not pub. until May 16, 1947, would, if accepted, have far-reaching effects on the religious life of the nation and involve a new relationship between Church and State. A tribunal to hear nullity suits and, in appropriate cases, overrule for religious purposes, the decision of the civil court so as to permit the parties to remarry with the rites of the Church of England is one of the recommendations. The report also proposes widespread new powers for eccles. courts to exercise greater discipline over clergy and laity. The Commission also recommends that the jurisdiction of the Privy Council as an appeal court be abolished, and a new court estab. consisting of the archbishop of the prov. and four other members, of whom two shall be members of the Upper House of Convocation and two members of the Church of England, who have held or hold high judicial office. It also recommends that a court for the trial of bishops be

estab. in each Prov. The Report emphasises the need for the study of eccles. law and suggests the setting up of clergy, historians and lawyers to this end. The Report came before the Convocation in the following year.

Canons, Book of.—In Scottish eccles. law, a body of constitutions for the regulation of the Church in Scotland prepared by the bishops of that country and confirmed by letters patent under the Great Seal in 1635, after they had been revised by Laud. In the next year they were pub. at Aberdeen, and caused discontent throughout the country on account of the stringency of their regulations. The king's supremacy in matters eccles. was emphasised.

Scriptures.—The C. of the O.T. and N.T. comprises those books which are held to be authoritative and of divine inspiration. See further under **BIBLE**.

Church Minister.—The institution of bodies of clergy, known as Cs., living a cenobite life under no very clearly defined rule dates from early times. In the early part of the fourth century the clergy at Vercelli were so united, and St. Augustine of Hippo also followed this system in the following century. At the Lateran at Rome there was also an early foundation of the same kind. The practice became more general in the eighth century, when Chrodegang, bishop of Metz (742-766), drew up a definite rule for Cs., founded largely on the Benedictine rule, but owing something to the traditional rule of the Lateran. In 816-17 Louis le Débonnaire made this rule binding on all Cs. throughout the empire. In course of time the institution deteriorated, and a distinction between Cs. regular and Cs. secular was made. The former observed the rule, while the latter, frequently laymen, were mainly administrative dignitaries. Various attempts were made at reform, notably by the papal synods of 1059 and 1063. These councils insisted on the original plan of the common life, and also urged the necessity of poverty, for canonries were often considered merely as lucrative sinecures. A new rule, founded chiefly on the writings of St. Augustine, was now made, and those observing it were known as Augustinian Cs. There were over 200 houses of Augustinian Cs. in England at the Reformation. Since that date few attempts have been made to improve the system of Cs. regular. The chief orders of the kind in the Rom. Church are those of the Lateran and the Premonstratensians. Many foundations were entirely abolished at the Reformation. In both the Rom. and Anglican Churches the title is also used for those clergy who are connected with cathedral churches, and form the cathedral chapter.

Music.—A C. is a form of composition, based on rule and written in strict imitation. The introductory theme or melody is taken up and repeated note by note in succession, and at set intervals, by the other part or parts. This kind of composition was introduced about the twelfth century, and, with the fugue, is the most

difficult study in the art of musical composition.

Canon, *see* CANYON.

Canonbury, dist. of London, in the bor. of Islington, with a railway station. C. Tower in C. Place, dates from the sixteenth century.

Canon City, co. seat of Fremont co., Colorado, U.S.A., situated 90 m. from Denver on R. Arkansas. It has rich coal-mines, and there are large quantities of copper, iron, petroleum, and limestone. The zinc-lead smelting works are the largest in the world. It is an important health resort owing to its hot mineral springs and mild climate. Pop. 6000.

Canoness (Lat. *canonica*; Ger. *Kanonissin*). In the eighth century, chapters of Cs. were instituted throughout the Frankish empire, in imitation of the chapters of canons. These consisted of associations of women, generally of high birth, under a somewhat lax rule, bound by the vows of chastity and obedience, but not by that of poverty. They had a common table and dormitory, and were bound to the recitation of the Breviary, but they were not cloistered. Generally, they were engaged in education and needlework, teaching the embroidery of vestments and the transcription of religious books. As in the case of the canons, a distinction was ~~drawn~~ drawn between regular and secular Cs., the latter being mere feudal princesses. At the Reformation many of these institutions became Protestant, and remained almost intact, with slightly altered rule, surviving to the present day.

Canonica, Luigi (1762-1844), It. architect. He designed the arena or amphitheatre in Milan, which was begun in 1805 by order of Napoleon, who hoped to propitiate his Milanese subjects by embellishing their capital. He executed many public and private buildings at Milan, the chief being the Casa Canonica, the two theatres, Rê and Carcano, and the interior of the Palazzo Orsini.

Canonical Hours, certain hours of the day and night appointed by the Rom. Catholic Church for the reciting or chanting of the different parts of the divine offices. They are not now strictly adhered to as a general rule, but many of the monastic orders continue to observe them regularly. The hours are called Prime at 6 a.m.; Terce, 9 a.m.; Sext at noon; None from 2 to 3 p.m.; Vespers about 4 p.m.; Compline at 7 p.m.; Matins and Lauds at midnight or daybreak.

Canonicals, term used to describe the official dress of the clergy. *See* under VESTMENTS, SACRED.

Canonisation, declaration by which the pope publicly proclaims a servant of God to be numbered among the saints honoured by the whole Rom. Church. In the early ages there was no formal act of C., as it was only in their own locality that martyrs were venerated. The first traces of a judicial procedure appear in Africa, but this was demanded chiefly by the peculiar position of the Church there. During the early Middle Ages, it rested with each bishop to decide what saint

shall be honoured in his diocese, and on what day. However, much carelessness crept in, and several scandals arose from the seventh to the tenth century, men of evil life being inscribed among the saints. The policy of centralisation also tended to bring the act of C. under the papal power. The earliest known case of C. by the pope is that of Ulric of Augsburg by John XV. in 993. At the end of the twelfth century, by decrees of Alexander III. (1170) and Innocent III. (1200), the right was exclusively reserved to the Rom. Court. This rule was made more stringent by Urban VIII. in two constitutions (1623 and 1634), and the procedure of the process was then laid down. With slight modifications it is in force at the present day. It was strictly forbidden publicly to venerate in any fashion any person not papally canonised. Two exceptions were made, those who had received immemorial *cultus*, and those whose *cultus* had been sanctioned by preceding popes. Those falling in either of these classes receive what is known as *equipollent* C. The procedure of *formal* C. is as follows: Fifty years must elapse after the death of the candidate. A court is then instituted by the ordinary of the dist. where the claim is made, and material is gathered on which the case may be judged. The materials are then sent on to the Congregation of Rites at Rome, and after a lapse of ten years, the case is *introduced*. The claimant may now be called *Venerable*. After proof of two miracles performed at the candidate's intercession, and also that the candidate possessed Christian virtues to a heroic degree, his *beatification* (q.v.) is performed. After the proof of two more miracles since beatification, the pope then proceeds to canonise the *Beatus*, assign him a feast day, mass, and propose him for universal veneration. Finally there is a solemn mass of the new saint in St. Peter's preceded by a reading of the bull of C.

Canon Law, body of law by which the government of the Church is carried on by ecclesiastics. The canons are enacted by general councils or prov. synods, and are often enforced by the civil power, which ratifies them and makes them legally valid. The body of E. C. L. is easy of access and small in extent. It may be found in the *Nomocanon* of Photius of Constantinople (800), and the *Synodikon* of Bishop Beveridge (Oxford, 1672-82). The W. C. L. is extremely voluminous, and is in a confused state owing to accretions, interpolations, forgeries, etc. At the Council of Basle all previous collections were gathered together as the *Corpus Juris Canonici*, but this ed. must now be supplemented by many papal decrees, the canons of later councils, etc. It is in force throughout the Rom. Catholic Church. During the Middle Ages the study of C. L. was the prin. and most lucrative occupation of candidates for eccles. offices.

Canon Law in England.—In England the C. L. affects the laity only very slightly; but in the Middle Ages its operation and force were a matter of

frequent experience. Thus, all questions appertaining to the probate of wills, the contract of marriage, and all cases in which one of the parties was a *clericus*, fell within the prov. of the C. L. Furthermore, the Church possessed a formidable hierarchy of courts in which to prosecute suits and enforce penalties. Early Eng. historians, inspired by the Tudor rejection of foreign jurisdiction, maintained the theory that 'the canon law of Rome, although always regarded as of great authority in England, was not held to be binding on the courts.' But modern research has estab. that the pope's jurisdiction did prevail and that the Rom. C. L. was in operation precisely as elsewhere in W. Christendom. Yet there were stages and degrees in the hist. of the operation of this law in England; thus, with the Norman Conquest, came the famous decree of William I. separating the eccles. from the civil courts, thereby opening the way to Lanfranc's introduction of a collection of canons, including the forged decretals (see ISIDORIAN DECRETALS) and, later, to Henry II's conflict with Becket, which led to the substantial victory of the papacy, though in some respects, notably in matters relating to eccles. patronage, England continued to follow its own course and to ignore the C. L. In these earlier times there were peculiarities of eccles. procedure which could not be expected to find favour with the laity, e.g. the presumption of guilt in the accused until he could prove his innocence (the converse rule prevails in common law). Hence it is not surprising that in the sixteenth century the jealousy of the civil lawyers over the exclusive jurisdiction maintained by the practitioners of the C. L. readily combined with the anti-papal attitude of the Tudors to overthrow much, but by no means all, of the medieval system. By the Act of Submission of the Clergy of 1534 provision was made for a commission to survey the existing C. L. which meanwhile was to continue to prevail except when repugnant to the royal prerogative or to the customs and laws of the realm. The failure to implement this revision of the C. L. led to considerable uncertainty as to which parts retained their validity. Under the Act of 1534 the convocations were empowered to make new canons, subject to royal assent. Thus James I. authorised the 141 canons of 1604 made by Canterbury Convocation. Coke, however, held that only the clergy, and not the laity, were bound by them. Meanwhile, Thomas Cromwell greatly prejudiced the academic study of C. L. by ordering the univs. in 1535 to substitute lectures in civil law for those in C. L., while in 1540 Henry VIII. founded regius professorships in civil law at Oxford and Cambridge. Further, by an Act of 1545, laymen who were doctors only of civil law were permitted to be judges in the eccles. courts. Thus, in principle, the victory of the civil over the C. L. was won, and although Doctors' Commons continued until 1857 as a centre for lawyers learned

in C. L., both the eccles. law and the Church courts fell into increasing abeyance, especially after the Toleration Act of 1689. The projected (1948) Anglican revision of its C. L. cannot, of course, presuppose a return to any degree of its medieval influence; what is aimed at is merely the restoration amongst clergy and laity of the estab. Church of an agreed body of eccles. rules to form the basis of consensual obedience.

Canonsburg, bor. of Pennsylvania, near Pittsburgh, U.S.A. Pop. 12,000.

Canopic Vases, called after the anct. tn. of Canopus, used by Egyptian priests to hold the viscera of embalmed bodies. The jars were generally made of stone, and the lids were frequently shaped like four human heads, supposed to represent the four genii, the sons of Osiris.

Canoppi, Antonio (1773-1832), It. artist. He was first engaged as a fresco-painter by various It. nobles; later he became a scene-painter at the Venice Theatre, Venice, and afterwards at Mantua. In Moscow, where he sought refuge during the Napoleonic wars, he decorated the hall of the senate and other public buildings, but his work was destroyed in the great fire of 1812. In 1811 he went to St. Petersburg, where he remained till his death. At the Imperial Theatre he executed a number of architectural scenes, including those for the operas of the *Zauberflöte* and *Semiramis*, which excited the highest admiration. Author of *Opinion d'Antoine Canoppi sur l'architecture en général et en spécialité sur la construction des théâtres modernes* (1830).

Canopus, or **Canobus**, anct. city of Egypt, situated about 14 m. E. of Alexandria, on W. mouth of the Nile, called after the city the Canopic mouth. C. was the pleasure resort of the anct. Alexandrians. Ruins of the famous temple of Serapis were excavated in 1893 near the modern village Aboukir.

'**Canopus**,' name of a first-class Brit. battleship of 1897 class, launched in 1898, and of 12,950 tons burthen. Just after outbreak of First World War this ship joined Admiral Craddock's squadron. Owing to its being old and slow, Craddock did not bring it into action at the battle of Coronel (Nov. 1, 1914). After the battle it escaped to the Falkland Is., and was there when Admiral Sturdee sank von Spee's fleet on Dec. 8, 1914. The name was first used in the Royal Navy in 1798, and was associated with the engagement off San Domingo, 1806, and the passage through the Darienelles, 1807.

Canopus, second brightest star (magnitude -0.9) in the heavens, situated in the constellation Argo. It is extremely remote, and of enormous luminosity. Proper motion 2 in. per century.

Canopy (Gk. *καλυπτριον*, from *καλύπτω*, a gnat, Lat. *canopium*). The word was used by Herodotus (book ii.) in speaking of the nets with which the Nile fishermen protected themselves from mosquitoes. Hence it is used for any covering, but in particular for such as is projected at a height over a bed or throne, or over a conveyance in state processions. In

architecture the word denotes the projection over an altar or tomb, a feature of the decorative period in Gothic architecture. It is also used of a moulding overhanging a door, porch, or window.

Canosa di Puglia, tn. of S. Italy, in the prov. of Bari, 13 m. S.W. of Barletta. It occupies the site of the ant. Apulian city Canusium. The tn. contains the cathedral of San Sabino (built 1101), which holds the tomb of Bohemond I.; a ruined castle, built by Charles I. of Naples, and the remains of an amphitheatre and an old aqueduct. Many interesting relics of antiquity have been found at C. and removed to the museum at Naples. The Rom. bridge was blown up in the Second World War, but all the other monuments were undamaged. Pop. 27,000.

Canossa, vil. in the prov. of Reggio nell' Emilia, Italy, 14 m. from Reggio. Noted for its castle, now a ruin, where the Emperor Henry IV. humiliated himself before Pope Gregory VII. in 1077.

CANOVA

An engraving from a painting by
Sir T. Lawrence

Canova, Antonio (1757-1822). It. sculptor and painter, b. at Possagno, in the prov. of Treviso. He came of a family of stone-cutters, and at the age of fourteen entered the atelier of the sculptor Torretti, through the help of his patron, Giovanni Falleri, a Venetian senator. C. accompanied his master to Venice, and, after Torretti's death, studied under his nephew Ferrari and at the Venetian Academy. At the age of fifteen C. executed statues of 'Orpheus' and 'Eurydice' (according to some he worked on the Orpheus statue in 1773-75), and at twenty-two he had finished his famous 'Dædalus and Icarus,' now in the Venetian Academy. In 1779, through the influence of his friend Falleri, C. was awarded a pension by

the Venetian Gov. In 1780 he went to Rome to study, and, finding little to attract him in the conventionality of modern art, he found his inspiration in classic sculpture. He exhibited in 1782. Before long, he was acknowledged as the first sculptor of his day. C. was three times summoned to Paris by Napoleon. He carved the well-known bust of Napoleon in the Pitti Palace, and also Pauline Borghese as a reclining Venus, and the Empress Maria Louisa as Concordia. C. also executed many commissions for the pope, on whose account he suffered exile during the revolution of 1798-1800. In 1816 he was created marquis of Ischia, and his name was inscribed in the Golden Book of the Capitol. He d. at Venice, and was buried in the church he himself built at his bp. His famous 'Cupid and Psyche' is in the Louvre. Among his other well-known pieces are 'Hercules throwing Lichas into the Sea,' 'Perseus,' 'Venus and Adonis,' 'Hebe pouring Nectar,' 'Theseus and the Centaur,' and 'Mars and Venus.' See lives by Quatremère de Quincy, 1834, and A. G. Meyer, 1898.

Canovas del Castillo, Antonio (1828-1897), Sp. statesman and historian, b. at Málaga. He became a member of the Cortes in 1854, was made minister of the Interior 1860-61, was Premier 1875-81, and held this office six times at intervals up to 1897. C. was a member of the Sp. Academy from 1867 till his death. He ed. and directed the publication of *Historia General de España*, and pub. many works. In politics he was the leader of the Conservatives. He was assassinated by an anarchist at Santa Agueda.

Canrobert, François Certain (1809-95), marshal of France, b. at St. Céré in dept. Lot. He first became noted through his valour, displayed in the Algerian wars of 1835 and 1841-51. He also rendered Louis Napoleon great service in his *coup d'état* of 1851. When the Crimean war broke out he was given command of the first div. of the Fr. army, but on the death of Marshal Saint-Arnaud he was made commander-in-chief. Although twice wounded, he completed the lines of investment at Sebastopol. He resigned his command in May 1855 through a disagreement with Lord Raglan. He fought at Magenta and Solferino in the It. wars in 1859, and in the Franco-Ger. war, 1870. He was besieged at Metz, but had to surrender, and was thereupon imprisoned in Germany.

Canso: 1. Cape in Nova Scotia, on the N.E. extremity, and on the S. side of Chedabucto Bay. 2. Strait, 17 m. long, between Nova Scotia and Cape Breton Is.

Cant, in architecture, term applied to the corner of a square cut off octagonally. In building a C. brick is one cut on the slant. It is also applied to a ship's timber, forward or aft, lying obliquely to the keel.

Cant, Andrew (1590-1663), Scottish preacher and leader of the Covenanters. He became minister of Pittslo in Aberdeenshire in 1633; of Newbattle, Midlothian, in 1638; and of Aberdeen in 1640

In July 1638 he was made a commissioner for the purpose of converting people to Presbyterianism, and in the same year he took an active part in the celebrated assembly which was held at Glasgow.

Cantabile, terms used in music to express great smoothness in manner of performance. Often trans. as 'to be played in a singing manner.' Its opposite might be said to be the term *maestoso* See CANTILENA.

Cantabri, anct. race of mountaineers, living in the N. of Spain to the S. of the bay of Biscay, which was called after them, Oceanus Cantabricus. They were of Iberian origin, and are now represented by their descendants, the Basques of the Pyrenees. The Cantabrian war which they waged with Rome lasted for six years (25-19 B.C.), and was finally concluded by Agrippa. Rom. garrisons were stationed in their country, but they never gave up their independence.

Cantabrian Mountains, range of mts., W. of the Pyrenees, and stretching for 300 m. along the N. of Spain.

Cantacuzenus, Gk. family of royal birth. (1) Johannes C. (c. 1292 - c. 1380), Byzantine soldier and historian, b. at Constantinople. He was chief adviser to Andronicus III., 1328-41, who left him as guardian and regent to his son, Johannes V., then a boy of nine. C. was suspected by the queen-mother, fled from Constantinople, and proclaimed himself emperor. After a civil war lasting six years, peace was made; he was declared joint emperor, 1347, and his daughter married to the young Johannes. In 1354 C. was forced to abdicate. He retired to a monastery, where he wrote a hist. of his times from 1320 to 1357, and a defence of Christianity. (2) Matthias d. 1383), his son, waged war for two years, after his father's retirement, against Johannes V., but was unable to make himself emperor. (3) Manuel (d. 1380), the brother of Matthias, and governor of Peloponnesus.

Cantal, central dept. of France, in the S. part of the old prov. of Auvergne. It has an area of 2217 sq. m. The region is occupied by an extinct volcanic mass, the highest peaks being Plomb de Cantal (6095 ft.) and Puy Mary (5850 ft.). Cattle are bred, and part of the country makes good arable land. Rye, potatoes, and chestnuts are the chief products. The only two rivs. of any importance are the Truyère and the Dordogne. Cap., Aurillac. Pop. 197,000.

Cantaloupe, small, round, ribbed musk melon; so called from the castle of Cantalupo in the Marca d'Ancona, Italy. The word is much used in the U.S.A. and in Canada, where it is applied to a variety of edible melon much grown in those countries and marketed in great quantities.

Cantarin, Simone (1612-48), It. painter, called Pesarese, or Simone da Pesaro, b. at Orpeza, near Pesaro. He was first a disciple of Parmigino and Claudio Ridolfi, and afterwards of Guido Reni, whose style he approached very nearly. Unsuccessfully started a school at Bologna. He painted the portrait of the duke of Mantua, but was mortified at the result,

and d., possibly of poisoning, at Verona. C. was a good colourist, but his work lacked character and originality. He dealt chiefly with religious subjects; his best known paintings are: a portrait of Guido in Pesaro; the 'Assumption' in the Bologna Gallery; 'St. Thomas placing his fingers in the side of Christ' at Naples; and 'Joseph and Potiphar's Wife' in the Dresden Gallery.

Cantata (Lat. *cantare*, to sing), in music, term applied to certain forms of composition for solo voices and chorus, with instrumental accompaniments; sacred or secular in character. In the former case it resembles an oratorio, but is shorter; in the latter it may be compared to an opera, but it has no stage accessories. Originally, a C. was a musical theme sung by one person to a single instrument.

Canteen, refreshment house attached to a barrack. In the Brit. army, men are supplied with certain rations, and have to buy their other necessities at the C. Cs. were once kept by civilians but in 1857 they were put under the control of the War Office, and became a recognised army institution. They were managed by a small committee of officers, and the goods were sold at practically cost price, any profit being spent for the benefit of the corps. A C. consisted of a beer shop, a grocery shop, and a coffee bar. The last-named supplied all kinds of non-alcoholic drinks. In America the sale of intoxicants has long been prohibited in Cs. In France, the C. is a club room used by the whole regiment for social purposes. The word has also come to be applied to the place where meals are provided by an industrial or other organisation for the benefit of members of its staff.

The First World War revolutionised the Brit. C. system. The existing organisation proved inadequate to provide for millions of men and women in the fighting services in all parts of the world. In 1915 an organisation called the Expeditionary Force Canteen (E.F.C.) came into being to conduct the C. business overseas. After paying working expenses and repayment of loans, all profits were devoted to the general welfare of the troops at the discretion of the Army Council. In 1916 the Navy and Army Canteens Board (N.A.C.B.) was formed, whose main business lay in the United Kingdom, but it also maintained Cs. in permanent stations overseas. The profits were dealt with in a manner similar to those of the E.F.C. The E.F.C., being a purely war-time concern, ceased to exist in 1919, and its stock, etc., was taken over by the N.A.C.B. In 1920 an inter-departmental committee recommended that the N.A.C.B. should be enlarged and made permanent, and this found effect in the Navy, Army and Air Force Institute (N.A.A.F.I.), which is under the control of a council of members of the three services. The surplus profits of the E.F.C. and N.A.C.B. were handed over to the United Services Fund, after the dominions, colonies, and U.S.A. forces had been given an agreed share. The operations of the N.A.A.F.I. extend to

every station at home and abroad where there are Brit. sailors, soldiers, and airmen, and a percentage of the profits in each locality are paid into unit funds. The N.A.A.F.I. system and its overseas counterpart, E.F.I. (Expeditionary Forces Institute), operated satisfactorily throughout the Second World War.

Cantelan, tn., prov. Mindanao, Philippine Is., 47 m. S.E. of Surigao. Pop. 7500.

Cantelupe, Thomas de (c. 1218-82), Eng. bishop, nephew of Walter de C. He studied at Oxford, Paris, and Orleans, and became chancellor of the Oxford Univ. (1262-63), and lectured in theology at Paris and at Oxford. He was appointed Lord Chancellor of England (1265), and was consecrated Bishop of Hereford in 1275. He became involved in a dispute with Archbishop Peckham in the Council of Reading (1279), who excommunicated him in 1281. C. appealed to Rome, and on his way to Italy d. at Orvieto. He was buried in his own cathedral, and was popularly regarded as a saint, owing to the miracles that were worked at his tomb. In 1320 Pope John XXII. canonised him as St. Thomas of Hereford.

Cantelupe, Walter de (d. 1266), Eng. bishop. He held sev. rich rectories in plurality, and strongly resisted the interference of papacy in England. He was consecrated bishop of Worcester at Viterbo in 1237. He defended pluralities against Otho (1237), opposed the papal demand of a tenth for King Henry III. (1252), and the further encroachments on Eng. liberty made by Rome in 1251 and 1255. He supported the barons in 1264-1265, and was summoned to Rome, but d. before leaving England.

Cantemir (or **Kantemir**), **Demetrius** (1673-1723), member of a noble family of Moldavia. He was elected prince of Moldavia in 1710, owing to the fact that war with Russia seemed imminent. C. obtained an alliance with Peter the Great in the following year, with a promise of help against the Turks. Peter was defeated in his campaign to the Pruth, and C. took refuge in the Russian capital. He was one of the founders of the St. Petersburg academy, and wrote in Lat., Gk., Rumanian, and Turkish. His chief works are *Historia de Ortu et Defectione Imperii Turcici* (trans. into Eng. by N. Tindal in 1756); *Descriptio Moldaviae*; a geographical, ethnographical and economic survey of Moldavia, and a hist. of oriental music, which is no longer extant. This treatise was written in Turkish and is said to have been the first musical treatise produced in Rumania.

Canterbury, city, parli. and co. bor. of England, in the co. of Kent, on the R. Stour, 56 m. E.S.E. of London. It is a cathedral city, the see of the primate, and the eccles. metropolis of all England. C. occupies the site of the Rom. *Durovernum*. It was an important fortress and military station, being situated on the highway to London from Dover. To the Saxons it was known as *Cantwara-byrig*, 'town of the men of Kent,' and was the cap. of the kingdom of Kent. The see was founded

about 597, when St. Augustine became archbishop of Canterbury, and from this centre Christianity spread through England. (See **CANTERBURY CATHEDRAL**.)

The King's School, founded by Henry VIII. in 1541, is attached to the cathedral. There are many anct. churches in C., the most notable being St. Martin's, part of which is built of Rom. brick and tile of the sixth century; in its font St. Augustine is supposed to have baptised King Ethelbert; and St. Dunstan's, containing the burial-vault of the Roper family, with the head of Sir Thomas More. C. has the ruins of a Norman keep, a guildhall (1439; rebuilt 1697), and a hospital for poor brethren, founded by Archbishop Lanfranc. The Chequers Inn, immortalised in the *Canterbury Tales*, and an anct. artificial mound, Dane John, possibly a corruption of donjon, are of special interest. The most famous archbishops have been St. Augustine, St. Dunstan, Lanfranc, Anselm, Becket, Crammer, and Laud. The archbishop of C. is the first peer of the realm, and crowns the sovereign in Westminster Abbey. The city's chief trade is in hops and grain. The industry of weaving, introduced by the Walloon and Huguenot refugees, who settled in C. in large numbers, at one time employed 2000 persons and has of late years been to some extent revived in the old, gabled, half-timbered houses of the C. weavers. Charles Dickens used to stay at the Fleur de Lis Hotel, which retains a thirteenth-century window. The author of *The Ingoldsby Legends* was b. here. An engine built by George Stephenson in 1825, and used on the C. and Whitstable railway is preserved here. The Buffs' war memorial is in St. Michael's Chapel in the cathedral, the Kent co. war memorial on the bowling green, and the city of C. war memorial opposite Christ Church gate. The cathedral escaped destruction in the Second World War but of the rest of C. damage from air attack extended over one quarter of the city area. Subsequent demolitions revealed considerable Rom. remains. One of the most important discoveries since excavation was begun in the bombed area of C., to ascertain the layout of the Rom. city, was made in 1948, with the finding of the massive remains of the Rom. public baths of the city, with walls more than 5 ft. thick. The city returns one member to Parliament. Pop. 22,000.

Canterbury, prov. dist. in the centre of S. Is., New Zealand. It covers an area of 14,040 sq. m., 3900 sq. m. of which form the C. plains sloping from the mts. to the coast. The wheat-growing and sheep-rearing for which this part is noted are all carried on in this dist. It is from here that the celebrated C. lamb and mutton of the Eng. market comes. Dairy-farming and cheese-making, also cocksfoot grass seedling, are the principal industries of Banks peninsula, a volcanic region with rich soil. The cap. is Christchurch, and the chief ports are Lyttelton in the N. and Timaru in the S. Pop. 233,000.

Canterbury Bells, see CAMPANULA.

Canterbury Cathedral. The earlier church, said to have been given by King Ethelbert, together with his own adjoining palace, to Augustine and his monks, was almost entirely destroyed by fire in 1067. This earlier cathedral was planned on the lines of the old basilica of St. Peter's, Rome. Archbishop Odo (942-59) raised the walls and rebuilt the roof. After the fire of 1067 Lanfranc decided to rebuild the shattered church anew and completed the work in a few years. Anselm rebuilt part of Lanfranc's building and Prior

present, the predominant styles being the Transition-Norman and the Perpendicular. The E. part of the cathedral illustrates the whole period of the transition from Norman art to Pointed, and is consequently one of the most valuable buildings in Britain for the purpose of study, as well as one of almost unrivalled beauty and splendour. The present building is therefore a hist. in stone of eccles. architectural progress covering nearly four centuries from Lanfranc to Goldstone. The numerous chapels originated from the great wealth of relics

CANTERBURY CATHEDRAL

Will F. Taylor

Conrad completed the choir. In 1172 the whole edifice was again devastated by fire, but the disaster gave an opportunity of building a cathedral on a scale worthy of the martyred St. Thomas à Becket. The chief artificer during the twelfth century was a Frenchman, Wm. of Sens, and by 1184 the choir, much as it exists to-day, was complete. The side screens were added by Prior Henry de Estria in the opening years of the fourteenth century. Between 1376 and 1410 Lanfranc's nave was replaced by that of Prior Chillenden and, with the addition of the latter's transepts and Cardinal Morton's great central tower, the building was completed in 1495. The cathedral is in the form of a double cross, with a central and two W. towers. The total length is 522 ft., the E. transept measuring 154 ft. Various styles of Gothic architecture are

possessed by the Church and the necessity of finding shrines for them. These relics included those of the martyred bodies of saints—Blasius, Dunstan, Wilfrid, and Alphego—but of course the most important was that of Becket, whose shrine stood in the Trinity chapel immediately behind the high altar. It is not too much to say that in the Middle Ages C. C. owed its European fame and great riches to the fact that it contained this shrine. The body was first interred in the crypt, but in 1220 it was translated to the then newly erected chapel on the site of that in which Becket had first solemnised mass after becoming archbishop. The universal veneration inspired by the martyr is illustrated by Chaucer's *Canterbury Tales*. Yet in 1538 Henry VIII. solemnly issued a writ of summons against Thomas à Becket sometime archbishop of Canter-

bury, accusing him of treason and contumacy, and the shrine was dismantled—the very pavement on which the shrine stood being destroyed by the king's commissioners—and the gold and jewels removed from the shrine, which, from the early thirteenth century had been enriched by numerous costly gifts from royal and other pilgrims. Further destruction was wrought by the iconoclasm of the Puritans, notably by Richard Culmer. The windows were shattered, the choir stripped, and the monuments defaced. In 1872 fire destroyed the outer roof of the Trinity chapel. Since that time the Bell Harry tower was restored. Christ Church gate, by which the precincts are entered, was built in 1517 by Prior Goldstone II., and though weather-worn remains a striking example of Perpendicular work. The S.W. porch, the principal entrance to the cathedral, was built by Chillenden, c. 1400, but the figures in the canopied niches are of much later date.

The Nave.—Lanfranc's nave survived till the fourteenth century, when it was rebuilt with the exception of one W. tower, taken down in 1834. Chillenden's nave resembles that of Winchester which was erected about the same time. The aisles are narrow and lofty. The clustered pillars resemble a natural forest of stone. Owing to the crypts the choir is raised well above the level of the nave, which is very high in proportion to its length. The monuments in the N. aisle include that to Archbishop Benson (1896). The font, which is of extraordinary shape, dates from 1636. Near the E. end is a marble monument to the men of H.M.S. *Kent* (battle of the Falkland Isles, Dec. 8, 1914). The easternmost window of the N. aisle is to the memory of Dean Stanley. In the S. aisle is a tablet to Dean Farrar (1903). The piers supporting the central tower are the original piers of Lanfranc's building, but cased with Perpendicular work by Chillenden. From one pier hangs the flag flown by H.M.S. *Canterbury* at the battle of Jutland.

The *Choir* is the most important specimen of Transition-Norman work in the country. Both the pointed and rounded arch are used. It was the work of William of Sens (killed by injuries received in a fall from the scaffolding in 1197) and of his successor William the Englishman (1174-84), finished under the direction of Prior Conrad, whence its description as the 'glorious choir of Conrad.' The Decorated screen which surrounds the choir was constructed by Prior de Estra (1304). Gervase of Canterbury (*q.v.*) in chronicling the difference between the new work and the older Romanesque choir of Conrad, describes the changed mode of workmanship and design. The pillars were elongated by almost 12 ft. In the old capitals the work was plain, in the new ones exquisite in sculpture. In the old, the arches too were plain or sculptured with an axe rather than with a chisel. There were no marble columns; here were many. There in the circuit around the choir, the vaults were plain, but in the

new they are arch-ribbed and have key-stones. In the old was a wooden ceiling decorated with excellent painting; but here is a beautifully constructed vault built of stone and light tufa; and finally the single triforium has given place to two in the choir and a third in the aisle of the church. The monuments in the choir are nearly all of eccles. dignitaries, the most conspicuous being that in memory of Archbishop Chichele (1414-1443), founder of All Souls', Oxford. The S.E. transept is an adaptation of the work of Ernulf by William of Sens conformably to the new design of the choir.

St. Anselm's chapel forms part of the tower of the same name and was originally dedicated to Saints Peter and Paul. Above it is a small watching chamber in which a guard is supposed to be placed at night to protect the treasures of Becket's shrine. Trinity chapel was built to receive the shrine; and the whole of this part of the choir from the screen eastward is the work of William the Englishman. The site of the shrine is shown by the marks worn in the stones by many generations of pilgrims. The curious mosaic pavement resembles that round the shrine of Edward the Confessor in Westminster Abbey. Near this site is the tomb of Edward the Black Prince (1376) and facing it is the tomb of Henry IV. and his consort, Joan of Navarre. The circular chapel at the E. end of the cathedral is known as Becket's Crown. Near is the tomb of Cardinal Pole, the last archbishop who acknowledged the supremacy of the pope. In the centre is the Purbeck marble 'Chair of Augustine.' Tradition has it that this was the throne on which the old kings of Kent were crowned and that it was given by Ethelbert to Augustine, from whom it descended to the archbishops of C. C. The most reliable authorities place it at the beginning of the thirteenth century. Here too is a memorial to Archbishop Temple whose grave is in the cloister garth. Opposite Becket's tomb is the chantry of Henry IV. (1435). Down the steps on the right hand is the chapel of St. Andrew, corresponding to that of St. Anselm on the other side of the choir, and one of the oldest parts of the building. The N.E. transept is chiefly notable as exhibiting the skill of William of Sens in adapting the work of Ernulf and Conrad in order to make it harmonise with his own choir. Scarcely any portion of the N.W. transept or chapel of the Martyrdom (of Becket) remains as it was at the time of the murder. It was much altered by Chillenden when rebuilding the nave. Chillenden also built the S.W. transept. Leading out of it is St. Michael's or the Warrior's chapel, in the Perpendicular style, interesting as containing the coffin of Stephen Langton, leader of the barons at Runnymede.

The *Crypt* is entered from the S. transept. The westward portion was built by Prior Ernulf in Anselm's time. It is one of the finest examples of Norman work in existence. The E. end or crypt of Trinity chapel was the work of William the Englishman. It is loftier than the

other portion and is notable for its Norman arcading. Here Becket's body was placed for fifty years before its translation into the shrine in Trinity chapel. Here also Henry II. did penance and was scourged by the church's representatives.

Exterior and Monastic Buildings.—It must be remembered that the cathedral, imposing as it is, formed only part of the old monastic settlement. The cloisters are on the N. side; they are 144 ft., square and were rebuilt by Chillenden at the same time as the nave, to which the tracery of the arches and the vaulting closely correspond. Parts of Lanfranc's earlier cloister may still be found. The N. wall has some beautiful Early Eng. arcading. From the N.W. corner of the cloister a splendid view of the great central tower or 'Bell Harry' is obtained. The chapter-house (Lanfranc's chapter-house) was rebuilt by Henry de Estria (1304). The lower portion of the wall arcades are his work. The roof and windows are the work of Chillenden and date back to 1400. The chapter-house was restored and reopened in 1897 as a memorial of the thirteenth century of the landing of St. Augustine. The W. window depicting historical events connected with Canterbury is a memorial to Dean Farrar.

The cathedral narrowly escaped destruction from air attack on Britain during the Second World War. But the structure was shaken, particularly on the night of May 31, 1942, when a number of buildings within the precincts were destroyed or severely damaged by high explosive and incendiary bombs, including the medieval school room, canonical houses, the deanery, and the King's School dining-hall. Of the cathedral itself only the library was totally destroyed, but the concussion which the fabric sustained made necessary a major work of restoration, plans for which were made in 1946. See R. Willis, *The Architectural History of Canterbury Cathedral*, 1845-69; C. R. S. Taylor, *The Story of Canterbury*, 1912; M. A. Babington, *Canterbury Cathedral*, 1948.

Cantharidæ, or Meloidæ, family of coleopterous insects in the div. Heteromera, known popularly as blister-beetles or oil-beetles. The species, of which about 1500 are classified, are subdivided into winged Cantharidæ, and wingless Meloidæ, and many of them are remarkable for their power of raising blisters when in contact with the skin. The term 'Sp. flies' is a commercial term. *Cantharis vesicatoria*, is the true Sp. fly. *C. vesicatoria* being known as blister beetle. *C. (or Lytta) vesicatoria*, occurs in Spain, France, Italy, and S. Russia, and has this property. Species of *Mylabris* yield the so-called China cantharides, the 'fely' of India (*Mylabris cichorii*) giving twice as much cantharidin as the ordinary *C.* They are about three-quarters of an inch long, bright green in general colour, with legs and antennæ bluish-black. When touched they feign death and emit a penetrating odour. The larvæ feed on the roots of plants, but those of the *Sitaris humeralis* feed on the eggs of

a bee, while the young of *Epicauta vittata* live on the eggs of a locust. The drug called cantharides is prepared from the dried bodies of *C. vesicatoria*, and is used on account of its blistering properties.

Cantharus, the typical genus of a section of *Sparidæ*, or sea-breams, is to be found in the Mediterranean, the Atlantic, and off the coasts of Africa and India. The species lack molar and vomerine teeth, are carnivorous and edible. *C. lineatus* is known both as the black sea-bream and as old-wife.

Cantharus. Gk. two-handled, open-footed cup, but varying in size and form. Dedicated to Bacchus, whence anct. examples often show decoration with Bacchanalian scenes.

Cantho: 1. Dist., Lower Cochin China, on the Mekong, covering 830 sq. m. Rice largely cultivated. Pop. 310,000, mainly Annamites. 2. Cap. of the dist. on the W. arm of the Mekong, 43 m. from its mouth, is a busy riv. port.

Canticum (Lat. *canticum*, dimin. of *canticum*, a little song), book of the Heb. Scriptures, commonly known in Eng. as the Song of Solomon, or the Song of Songs, this latter being a translation through the Vulgate *Canticum Canticoorum* of the original Heb. title. The book is a short erotic lyric on the subject of chaste love, arranged in dramatic form in a dialogue, as is apparent from changes of number and gender in the original. Its interpretation, since it seems to be considered that its place in the scriptural canon demands some secondary significance, is still disputed. It was first explained by the rabbis as an allegory of God and His people, and as such was admitted to the canon by the Massoretes. The early Christian theologians, such as Origen, made it refer to Christ and His Church. This view is still accepted in some quarters. Other symbolic interpretations have been brought forward, but it appears improbable that anything more than the literal meaning is really to be found in the book. There are two variants of this idea: the dramatic, held by Deitzsch and Ewald, which considers that Solomon, the Shulamite maiden, and, according to Ewald, the shepherd lover, are represented; and the lyrical, held by Karl Budde, which considers the book as a collection of peasant nuptial lyrics. In any case *C.* must be regarded as an exquisite example of Heb. poetry, full of feeling for nature and passionate description of pure and faithful love. The language of many portions is of great beauty. The date and author of the book are hypothetical, but internal evidence tends to place it not earlier than the third century B.C. See S. R. Driver, *Introduction to the Literature of the Old Testament*, 1891; J. W. Rothstein, in J. Hastings's *Dictionary of the Bible*, 1898; T. K. Cheyne's article in the *Encyclopædia Biblica*, 1899-1903; and the works of Herder, Umbreit, Magnus, Hitzig, etc.

Cantigny, Battle of, battle of the First World War; the first independent operation of Amer. troops after the U.S.A. entered the war. The 1st Div., about

30,000 strong, took over the Montdidier sector from the 45th Fr. African Div. of shock troops. Facing them in a salient of which C. was the main feature, was the Seventh Ger. Army, under Gen. von Boehn. On May 28, 1918, the Amers, attacked after a two hours' bombardment, and with splendid dash reached their objective, advancing one mile. The 28th regular U.S. Infantry then stormed its way up the hill on which C. village was situated, took it and a number of prisoners, and beat off three Ger. counter attacks.

Cantilena, in music a term, almost synonymous with *cantabile* (*q.v.*) denoting smooth, melodious, and not rapid vocal writing, or performance in that style. The term also denotes in old church-song the plain or *canto-fermo* sung in unison by one or more persons to an organ accompaniment; and also the singing exercises in medieval music, in which were introduced all the intervals of the scale, etc.

Cantilever, originally a term applied in architecture to a structure supported only by one fixed base, beyond which it projects horizontally, *e.g.* a beam supported at the centre is said to have two C. arms. Cs. are largely used as supports for balconies and projecting portions of buildings, where they serve a double purpose of use and ornament; for sidewalks constructed outside the trusses of a bridge; and for the roofing of is. platforms at railway stations. Perhaps the most important use of the C. principle is its application to bridges. The idea has been applied to the bridging of spaces too wide to be crossed by a single plank from the earliest times, and, in its simplest form, is still employed by many E. nations. In these primitive C. bridges, two planks, firmly fixed in the banks, project over the stream, and are connected by an independent truss overlapping the end of each. The principle has recently been greatly developed, and applied in cases where girders or suspension bridges are impracticable. The modern practice is to erect in the bed of the riv., at a convenient and equal distance from each bank, a pier supporting two C. arms, one of which extends to the shore and the other over the stream. These outer ends are connected by another truss. The first modern bridge erected on these lines was one over the Niagara R., designed by Charles C. Schneider in 1882; and another famous example is the Forth bridge, Scotland, with its two great C. spans of 1760 ft. The Cs. of the Lansdowne bridge over the Indus at Sukkur are supported by the bank itself. The bending stress of a C. causes it to bend with a convex curve upwards, in the opposite direction to the curve of a bridge supported at both ends. See also BRIDGE.

Cantire, see KINTYRE.

Canto Fermo, the simple, unadorned melody of the anct. hymns and chants of the Church (often used in eighteenth-century literature synonymously with 'plainsong'). Also denotes any simple subject of the same character to which counterpart is added. See also CANTILENA.

Canton, cap. of the prov. of Kwantung, China, and one of the first cities in China. It stands on a riv., almost on the seaboard, 90 m. N.W. of Hong Kong. Until recent years it was surrounded by walls, and has narrow, crooked streets. A great part of the pop. live in boats on the riv. A municipal council was estab. in 1918, and demolished the old city wall, replacing it by a motor road 6 m. long. C. has now four parks. The entire circuit of the city is 10 m. Its mint formerly issued coins, all bearing a picture of Dr. Sun Yat-sen. Owing to labour troubles and excessive taxation, many factories

E.N.A.

THE GREAT PAGODA, CANTON

moved to Hong Kong or Macao, but there are factories and sev. hundred workshops for producing hosiery, matches, silk, porcelain, metal goods, and fancy goods. Its exports included tea, silk, and cassia, but how far its commerce and industries have been affected by the Jap. occupation is not known. There are numerous temples (chiefly Buddhist), pagodas, and many curio shops, a Rom. Catholic cathedral, a Church of England church, and a masonic hall. The new premises of the Hong Kong and Shanghai Banking Corporation cost half a million dollars in 1921. Sev. lines of railway start from C., but few have reached their intended termini. The trade of the port always tended to expand in spite of strikes, boycotts, high taxation, and constant political upheavals. The pop. has been estimated at 2,500,000 by the customs authorities, but more conservative estimates put it at between 800,000 and 900,000. From 1917 there has been much turmoil and fighting at C.

In 1924 £4,000,000 worth of damage was done while Dr. Sun Yat-sen was suppressing the Merchants' Volunteer Corps. In 1925 the foreign concession, Shameen, was besieged for four months. An attempt to estab. a Communist regime in Dec. 1927 was crushed after three days, but only after many lives were lost and much damage done to property. An administration was then set up known as the S. China Gov., which for the next ten years acted in semi-independence of the central gov. at Nanking. C. was the centre of the nationalist spirit in China, and was the base of the republican revolutionary movement. Dr. Sun Yat-sen being himself a Cantonese. For this reason the Jap. encountered stiff resistance in C. during their invasion of China, but after a period of severe bombing the city fell to the Jap. on Oct. 21, 1938, and remained in their hands until the end of the Second World War. The centre of the city was reduced to ashes, and large areas, including industrial works, were demolished by the Chinese army before their retreat from the city. While in the possession of the Jap., C. was subjected to further bombing by the U.S. Air Force at intervals during 1942-45. There were anti-Brit. riots in C. in Jan. 1948 during which the Brit. Consulate was destroyed. The riots arose out of demonstrations resulting from the eviction by the Brit. authorities of some 2000 Chinese 'squatters' in Kowloon.

Canton: 1. Co. seat of Stark co., Ohio, U.S.A., 52 m. from Cleveland; a great number of different articles are manufactured there. Potter's clay, coal, and limestone are exported. It was the home of President McKinley. Pop. 108,000. 2. Tn. of Fulton co., Illinois, U.S.A., 24 m. from Peoria, in a coal dist. There are large tobacco factories and flour-mills, and agric. implements are made there. Pop. 11,000. 3. Co. seat of St. Lawrence co., New York, U.S.A., 18 m. from Ogdensburg on the R. la. Grasse. St. Lawrence Univ. is situated here. Butter and cheese are made, and small boats and launches are built. Pop. 5000. 4. City in Norfolk co., Massachusetts, U.S.A. Pop. 6000.

Canton: 1. Geographical area in Switzerland, having its own laws and a local gov. which looks after all domestic affairs such as taxation and control of public money. Foreign policy, control of the army, etc., are left to the central gov., whose headquarters are at Berne. 2. In France a term meaning a subdivision of the arron. under a Justice of the peace.

Canton, John (1718-72), Eng. scientist, b. at Stroud; spent most of his life in London, part of the time as a school teacher. His researches in physics were mainly in the field of electricity, for discoveries in which he was made a fellow of the Royal Society about 1750. Among his other work may be mentioned the invention of the pith-ball electrometer, the verification of Franklin's identification of lightning and electric fluid, and his demonstration of the compressibility of water, for which he received the gold

medal of the Royal Society. He wrote sev. treatises in the *Philosophical Transactions*. See also CANTON'S PHOSPHORUS.

Cantoni, Simone (d. 1818), It. architect, b. at Maggio; studied at Rome, and spent most of his life at Milan, where he erected the Palazzo Sorbelloni, the Palazzo Mellerio, and other fine mansions. He was also responsible for the rebuilding of the great council hall in the palace of the duke of Genoa, which had been burnt down in 1770, and for sev. palaces in Como and Bergamo.

Cantonments, military term applied to a temporary resting-place for troops. On active service, troops in C. are quartered actually in a tn. or vil., and the term is also used when they are detached and quartered in sev. neighbouring tns. The most common use of the word was in relation to military settlements in Brit. India, where C. were equivalent to permanent barracks, situated at a short distance from a tn., or to isolated military stations. See also BILLITING.

Canton River (Chinese Chukiang, pearl riv.), arm of the delta Sikiang in the prov. of Kwangtung, China. It is the lower portion of the Peking R. About 45 m. below C. the riv. is called Boca Tigris, or Tiger's Mouth. The estuary of the riv. S. of Boca Tigris is called Outer Waters. The celebrated Bogus Forts, taken by the Eng. in 1841 and 1856, guard the entrance to this part of the riv.

Canton's Phosphorus, form of calcium sulphide which, after exposure to sunlight, itself emits light for some time. Pure sulphide (CaS) does not show the same property. It was discovered by John Canton (q.v.) in 1768 by heating oyster shells with sulphur.

Cantor, Georg (1845-1918), Ger. mathematician, b. at St. Petersburg (Leningrad) and educated at Berlin and Göttingen. Prof. of mathematics at the univ. of Halle. C. created a new field of mathematical investigation and in the application of his deductions to analysis, and in some measure also to geometry, he provided a powerful instrument for dealing with the foundations of mathematics and for stating the inevitable limitations to which so many mathematical results are liable. In 1870 he solved the question of the uniqueness of the representation of a function by Fourier's series. His chief work is *Contributions to the Founding of the Theory of Transfinite Numbers* (pub. in London and Chicago in 1915), in which he developed the theory of sets of points. For his research in pure mathematics he was awarded the Sylvester medal in 1904. D. at Halle.

Cantor, in architecture, the N. side of a choir on which the cantor or precentor sits facing the Dean. From the fact that the precentor sits opposite the dean, the two sides of the choir are named Decani (i.e. 'of the Dean') and C. (i.e. 'of the Precentor'). It is often distinguished by its desk and raised seat.

Cantu, tn. in Lombardy, Italy, 5 m. S.S.E. of Como, with furniture manufacturing. It produces cereals and silk. Pop. 15,000.

Cantù, Cesare (1807-95), It. historian and novelist, b. at Brivio near Milan. He was a prof. of It. literature and language at Como, Milan, and Sondrio. He was thrown into prison between 1832 and 1833 for remarks made against the policy of the Austrian Gov. In his book *Ragionamenti sulla Storia Lombarda nel Secolo XVII*. While in prison he wrote his historical novel *Margherita Pusterla*, pub. in 1838. His great work is his *Storia Universale* (1836-42) in 35 vols., which brought him in £12,000 in royalties. It is of value both from a literary and a polemical point of view. His books for young people are *Letture Giovanili* and *Il Galantuomo*. Among his other works are *Storia degli Italiani* (1855-57), which is in 6 vols., and *Italiani Illustri, Ritratti* (1870-72), in 3 vols.

Canuck, popular term in the U.S.A. for all inhab. of Canada. In the dominion itself it is more often applied to the Fr. Canadians. The word is supposed to be of Indian origin.

Canute (Cnut) the Great (d. 1036), second king of Denmark of his name, and king of England. The son of Sweyn, king of Denmark, who, after conquering a great part of England, and driving Ethelred, the Saxon king, into exile in Normandy, d. in 1014. C. succeeded to his Eng. conquests, defeated Ethelred, who had returned, and overran the whole country with the exception of London, where Ethelred retired and d. in 1016. His son, Edmund Ironside, vigorously opposed C., but after being defeated at the battle of Assandun, consented to a div. of the country, by which he took Wessex and C. Mercia and the N. In 1017 Edmund was murdered and C. became king of England. He banished the sons of Edmund, married Emma, the widow of Ethelred, and divided the kingdom into the earldoms of Mercia, Northumberland, Wessex, and E. Anglia. He gained the favour of his people by sending back many of his adventurers to Denmark, placing Saxons in power, and by his general prudent policy and piety, and was accompanied by Saxon warriors on his expeditions against Sweden and Norway. He became king of Denmark in 1018, and of Norway in 1030. C. d. at Shaftesbury, leaving three sons, Sweyn, Harold, and Hardicanute. The story of his rebuke to his flattering courtiers comes from Henry of Huntingdon. See A. Olrik, *Viking Civilisation*, 1930.

Canvas, heavy, strong cloth, made of jute, hemp, or flax. The strands or fibres are woven in exactly the same way as in linen. Although the C. used for sailcloth is sometimes made from hemp and other fibres, the best and strongest kinds are made from flax, and generally in widths of 24 in. A piece, or bolt, is 40 yds. long. There are different kinds of C., varying according to weight. Artists' C., used for oil paintings, is one of the finest kinds of C., and the sails of racing yachts are often cotton-duck. The term C. is also used to denote a coarse type of plain cloth having hard twisted yarns.

Canvassing, term used for soliciting

votes at an election. It is also applied to the soliciting of trade or business by commercial travellers. In order to gain votes it was a practice to use illegal methods whereby the number of votes could be increased. The illegal methods adopted were such as treating, undue influence, and aiding and abetting on the part of the canvassers, and it was to cope with these irregularities that a law was passed against 'Corrupt and Illegal Practices.'

Canvey, is. in the Thames estuary, off the Essex coast, 30 m. E. of London. It has an area of 7 sq. m. It was reclaimed from the sea in the seventeenth century. It is reached by rail, the station being at Benfleet, with which it is connected by a bridge and also at low tide, by a causeway. Pop. 3600.

Canyon (Sp. *cañon*, a gorge), deep and narrow valley or gorge which has been cut by the action of a riv. In Colorado the Grand C. is a most perfect and beautiful example of this natural formation of the earth's surface. The riv. here has carved its way through solid rock, in parts to the depth of 6000 ft. and not a mile in width. The walls are of sandstone and limestone with varying colours, quite bare of vegetation, and also cut into buttresses and terraces by the action of the atmosphere. There are other causes for these deep cuttings besides the work done by the stream itself; one is the continual uplifting process which maintains the rapid flow of the riv., and the other the dry climate which keeps the rocky walls from being crumbled away by frost and springs. At Niagara there is also a fine gorge below the falls, due to erosion by the water in a 'young' land.

Canzone, form of poetry used principally for love lyrics, though occasionally for religious and other subjects. The earliest specimens from Provence date from the twelfth century, and those of Italy from the thirteenth century. The number of stanzas was generally five or six, but they varied sometimes, and the last stanza was often shorter than the others. In Provençal Cs. the same set of rhymes went through all the stanzas, but in the It. a fresh set was introduced for each stanza. Dante, Petrarch, Tasso, and Leopardi all wrote this form of poetry. Drummond of Hawthornden wrote the best examples of Eng. C.

Canzonet (dimin. of *canzone*), in music, applied to a short song in parts, and to musical settings of trifling verses.

Cão, Diago, see CAM.

Caobang: 1. Dist. in Tongking, covering an area of 3000 sq. m. The country is mountainous, and sulphate of tin, iron, and galena are found there. There are also fine forests. Pop. 70,000. 2. Cap. of above dist., 72 m. from Langson. Rice, maize, sugar cane, and betel-nut are grown there. Pop. 6000.

Cautehouc, see RUBBER.

Capablanca, José Raoul (1888-1943), Cuban chess player and diplomat. b. in Havana. At the age of twelve he won a formal match against the chess champion of Cuba. Graduated at Columbia Univ., New York. In 1909 he beat Frank

Marshall, the chess champion of the U.S.A., and, in 1911, took the first prize at the international tournament at San Sebastian. Financial disagreement postponed his meeting with Dr. Emanuel Lasker for the world's championship for nine years, but in the intervening period the two met as competitors in the St. Petersburg tournament, when Lasker won by half a point. At Cuba in 1920 he at length met and defeated Lasker easily, Lasker complaining of the climate. C. held the championship from 1921 to 1927, losing it at the first challenge to Dr. Alekhine—he won 3, lost 6, and drew 25 games but dictated the style of the play. He continued to win remarkable victories, including his win over Dr. Kuwe in 1931 and tie with Botvinnik—5 points ahead of Lasker in the Moscow tournament of 1935. The characteristics of his play were simplicity, mathematical exactitude, and a perfect sense of timing. Wrote two admirable text-books in Eng.: *Chess Fundamentals*, 1922, and *A Chess Primer*, 1935.

Capacity, in law, means competency or ability to do any legal act or hold any office, and the state of possessing the necessary discretion to be chargeable for one's crimes. In the law of contracts, e.g., lunatics and infants are, generally speaking, incapable of entering into binding contracts. In criminal law children under seven are absolutely incapable of committing a crime. Between seven and fourteen the infant is still presumed to be *doli incapax*, but the presumption may be rebutted by evidence of discretion in the infant.

Capacity, power of containing a quantity. *Cubic C.*, the number of units of volume in a solid or closed space. *C. for heat*, the amount of heat required to raise the temp. of a body one degree. *Electrical C.*, the quantity of electricity required to raise the potential of a conductor from 0 to 1.

Capacity, Measure of, *see under* WEIGHTS AND MEASURES.

Capaneus, Gk. hero who took part in the first expedition of the Seven against Thebes. While he was trying to scale the walls of Thebes he was struck by lightning by Zeus.

Capanori, large commune in the prov. of Lucca, Italy. Pop. 46,000.

Cape Breton Island, rocky is. at the E. extremity of Nova Scotia, Canada; separated from the mainland by the Gut of Canso, 1 m. broad. The greatest length of the is. is 110 m., the greatest width 85 m., and the area 3120 sq. m. It is bisected by the waterway formed by the inlet of the Bras d'Or, on the E. coast, the lake into which it widens, and the St. Peter's Ship Canal, which joins this lake to the Gut of Canso. The Bras d'Or lake is 50 m. long, 20 m. broad, and from 12 to 60 fathoms deep. It is surrounded by beautiful scenery, and renders practically the entire is. accessible by water. The N. portion of the is. is much more mountainous and rugged than the S., and rises to an elevation of 1800 ft. at N. Cape. The coast is deeply indented by numerous

bays and harbours. The climate is milder than that of the mainland, but very moist. The harbours are open all the year round. A certain amount of grain is grown, and there is considerable mineral wealth, coal and iron (in the Sydney dist.), copper, marble, granite, limestone, slate, gypsum, and salt being mined and exported. Timbering and shipbuilding form an important industry, and C. B. is the centre of the cod fisheries. The is. is a great tourist resort. The pop. of N. C. B. is mainly of Scottish highland descent, and Rom. Catholic by religion. Gaelic is still largely spoken. In the mining dists. there are many Irish and Ita. There are also some Fr. Acadians and Micmac Indians. The is. is divided into four cos.; Richmond, Inverness, Victoria, and C. B. The chief tns. are Sydney, Arichat, Port Hood, and Louisbourg. C. B. was ceded to France in 1654 at the peace of St. Germain; the Fr. settled and fortified Louisbourg in 1712-13. The is. was frequently taken and lost by Great Britain, but finally became Brit. in 1763. It was made a separate prov. in 1784 with Sydney as cap., but in 1820 it was annexed to Nova Scotia. Over 3,000,000 tons of coal are now shipped yearly. Pop. 150,000. *See* A. C. Walworth, *Cape Breton: Isle of Romance*, 1947.

Cape Coast, tn. on the W. coast of Africa in the colony of Gold Coast. Formerly the cap. There is a large trade in palm oil. Pop. 19,000.

Cape Cod, I-shaped sandy peninsula of Massachusetts, U.S.A., 65 m. long and 1/2 m. broad. It is a favourite summer resort, and there are numerous small vils. and settlements.

Cape Colony, *see* CAPE OF GOOD HOPE PROVINCE.

Cape Fear River, N. Carolina, U.S.A., formed by the junction of the Deep and Haw Rs., enters the Atlantic at Cape Fear, 20 m. S. of Wilmington.

Capefigue, Jean Baptiste Honoré Raymond (1802-72), Fr. historian, antiquary, and politician, b. at Marseilles. His works are still read for their vivacious and picturesque style, but they are neither very deep nor accurate. Their number extends to well over 100 vols., and includes *Histoire de Philippe-Auguste* (1829); *Histoire de la Restauration* (1831-33); *Richelieu*, *Mazarin*, *et la Fronde* (1835-1836); *Philippe d'Orléans, régent de France* (1838); and *La Ligue* (3rd ed., 1843).

Cape Flights. The continent of Africa is particularly well adapted for air transport. Not only is it populous, a factor making for economic work, but it possesses a climate not given to great extremes, both its N. and S. extremities being sub-tropical. For this reason flying is possible throughout almost the entire year, Africa being perhaps the best of any continent for aviation. These advantages, combined with the fact that its vast distances have been little opened up by rail, early attracted the attention of the pioneers of civil aviation. The following is a brief account of the earlier flights from England to the Cape, which 'blazed the trail' for

the commercial services which have since followed.

The first attempt to fly the Cape from England, made in the early part of 1920, ended in a creditable failure, the Vickers-Vimy machine of Capt. Cockerill and Broome crashing at Tabora, Tanganyika. They, however, covered a distance of 2700 m. in 36½ hrs. and thus showed that the complete flight to the Cape was a possibility. The African section of this flight had begun at Heliopolis, Cairo's aerodrome, on Feb. 6. On the 22nd of the same month another Vickers-Vimy machine, the *Silver Queen II*, started from Cairo on the same quest. The pilots were S. Africans, Col. Van Ryneveld and Fl.-Lt. Brand. Bulawayo, the cap. of Rhodesia, was reached in 13 days, an air distance of 3880 m. Here the machine crashed, but the journey to Cape Town was continued in a new machine, a de Havilland. The whole flight was accomplished in exactly four weeks.

Next the Imperial Airways Company of Great Britain decided to survey the Cairo-Cape route and chose the well-known aviator Alan J. Cobham (later Sir Alan Cobham) for this task. He used a de Havilland machine, with air-cooled engines, more suitable for tropical flying. He was not attempting to break records, of course, and his flight was a leisurely affair. On Nov. 16, 1925, he set out, and arrived at Cape Town, in the same machine, on Feb. 17, 1926, covering a distance of 8500 m. in about 94 hours of flying time. Turning back after a few days' rest, he decided to try a quick flight home. He left Cape Town on Feb. 26 and arrived at Cairo on March 7. The total distance this time was 5500 m., accomplished in 9½ days, and the remaining distance to London was done in 4 days more. In 1930, the Fokker machine of the late duchess of Bedford, piloted by Capt. Barnard, with the duchess as passenger, did the London-Cape Town and back flight of 18,800 m. in 20 days. The chief C. F. since then are: 1932—J. A. Mollison, England to Cape Town, 4 days 17 hrs. 30 min.; Amy Johnson, solo flight from Lympne to Cape Town 6250 m., in 4 days 6 hrs. 54 min., and back to Croydon, 6200 m., in 7 days 7 hrs. 5 min.; 1933—Sqn.-Ldr. Gayford and Fl.-Lt. Nicholls, Cranwell to Walvis Bay, 5341 m., in 2 days 9 hrs. 25 min.; 1936—Fl.-Lt. Rose, Lympne to Cape Town in 3 days 17 hrs. 31 min.; return flight in 6 days 6 hrs. 57 min.; Amy Johnson, Gravesend to Cape Town, 6400 m., in 3 days 6 hrs. 25 min.; back to Croydon, 7885 m., in 4 days 16 hrs. 17 min.; 1937—F./O. Clouston and Mr. Kirby Green, Croydon to Cape Town, 6870 m., in 1 day 21 hrs. 6 min.; back to Croydon, 7135 m., in 2 days 9 hrs. 23 min.; 1938—Capt. D. C. T. Bennett and First Officer Harvey in seaplane *Mercury*, launched pick-a-back from *Maia*, flew 6045 m. in 42 hrs. 6 min., namely from Dundee to the mouth of the Orange R. (while attempting a non-stop flight to Cape Town (6340 m.)); their average speed

being 144 m.p.h. An R.A.F. Lancaster Arles flew from Britain to Cape Town in 1946 in 32 hrs. 21 min. An R.A.F. Mosquito piloted by Sqn.-Ldr. H. B. Martin, with Sqn. Ldr. E. B. Sismore as navigator, reached Cape Town at 5.35 p.m. May 1 (1947) having flown from London in 21 hrs. 29 mins. This beat the previous official solo record from London (Alex Henshaw's, set up in 1939) by 17 hrs. 56 min.; and the dual record set up by F./O. Clouston and Mrs. Kirby Green by 23 hrs. 37 min.

Cape Golden Mole, see CHRYSOCHLORIDE.

Cape Henry, Action off. The Brit. in 1781 occupied Portsmouth on the James R. in Chesapeake Bay, N. America, and the Fr. squadron at Newport, Rhode Is., proceeded thither under the command of Commodore des Touches. He was met by Vice-Adm. Marriot Arbuthnot off C. H. on March 16. A fight followed which was indecisive, the Fr. losing heavily. The result of the battle was that the Eng. once more gained command of Chesapeake Bay.

Cape Horn, headland on a small is. of the Fuegian Archipelago, forming the southernmost point of S. America. It was sighted by Drake in 1578, and named by the Dutch in 1616.

Cape Hunting-dog, see HYÆNA DOG.

Capek, Karel (1890-1939), Czech author and playwright, b. at Malé Svatonovice, Bohemia. Became famous in 1920 by his play *Rossum's Universal Robots* (or *R.U.R.*), which added a new word to the world's vocabulary, a robot being an automatic servant or workman. Another successful play of his was *The Macropulos Secret*; and in two others he collaborated with his brother Josef—*Adam the Creator* and *The Life of the Insects*. His last play, *Power and Glory (The White Scourge)*, is anti-war propaganda and was performed in London in 1938. His reputation as a dramatist gave wide circulation to his novels, which show traces of the influence of H. G. Wells, especially *The Factory of the Absolute*, *Krakatit*, and the clever satire *War with the Neutrs* (1937). In fiction he wrote a trilogy forming a convincing picture of Slav peasant life: *Hordubal* (1934), *Meleor* (1935), and *An Ordinary Life* (1936). His other publications include travel books: *Letters from Italy* (1923) and *Letters from England* (1928), a witty description of Eng. life; *Travels in the North* (self-illustrated) (1939) short stories, essays, and fairy tales; *Money* (1929), *Tales from Two Pockets* (1932), *Fairy Tales* (1933), *The Stolen Cactus* (1937), and *The Gardener's Year* (illustrated by his brother, 1929). His stories are often very poignant and many have been trans. into Eng. In *President Masaryk tells his Story* (1929-31) (Eng. ed. 1934) he records his appreciation of the statesman whose liberalism he fully shared. C. was Czechoslovakia's most outstanding author. See O. Elton, in *Essays and Addresses*, 1939.

Capel, Arthur, first Baron Capel of Hadham (c. 1610-49), Royalist soldier, member of the Short and of the Long Parliament.

He acted as the king's lieutenant-general in Cheshire and N. Wales. He accompanied the queen to Paris in 1646, and helped Charles to escape from Hampton Court in the following year. With Sir Charles Lucas and others, he gallantly defended Chester, but was obliged to surrender in 1645. He was imprisoned in the Tower, escaped, and was re-arrested, tried, and beheaded.

Capel, Arthur, Earl of Essex (1631-83), Brit. diplomat. He fought for the king in the Civil war, and, on the accession of Charles II., was appointed lord-lieutenant of Hertfordshire. He was sent as ambassador to Denmark (1670) and made lord-lieutenant of Ireland. He opposed the court party and supported the Exclusion Bill. He took part in the Monmouth conspiracy (1682), for which he was committed to the Tower, where he was found with his throat cut.

Capell, Edward (1713-81), Eng. Shakespearean critic, b. at Troston Hall, near Bury St. Edmunds; lived mainly in Hastings and London, where he was deputy-inspector of plays. His ed. of Shakespeare in 10 vols. with introduction, appeared in 1767-68. The complete ed. in 3 vols. of his *Notes and Various Readings to Shakespeare* was first pub. after his death in 1783. The first portion, consisting of notes to nine plays together with the glossary, had appeared in 1771 but had been withdrawn; the first vol. was printed in 1779, the second in 1780, but pub. of both was held up. The third vol., *The School of Shakespeare* was pub. in 1783.

Capella, or **Capra**, star of the first magnitude (0.2) in the constellation of Auriga, of which it is the brightest. In 1899 the astronomers, Campbell and Newall discovered it to consist of two sun-like bodies revolving round each other once in 104 days. The luminosity of C. is at least 100 times as great as that of the sun. Proper motion 4.1 in a century.

Capella, **Martianus Mineus Felix**, Rom. writer living about the fifth century. His chief work was an encyclopædic compilation, being a medley of prose and verse, expounding the principles of the various liberal arts.

Cape May, city in C. M. co., New Jersey, U.S.A., on the Atlantic coast, 80 m. S.E. of Philadelphia. It is a favourite watering-place. It has glass works and canneries of vegetables and fruit. Pop. 3000.

Cape of Good Hope Province, or **Kaapland** (formerly **Cape Colony**), the most southerly portion of Africa, forming a prov. of the Union of S. Africa. It is named after the promontory on the S.W. coast discovered by Bartholomew Diaz in 1488 and named then Cape of Storms, but afterwards re-named Cape of Good Hope by the king of Portugal. The boundaries of the prov. are Bechuanaland Protectorate on the N., S.W. Africa, formerly Ger. S.W. Africa, on the N.W., and on the N.E. and E. the Transvaal, Orange Free State, Basutoland, and Natal. The breadth of the prov. may be measured by its diameters (N.E. to S.W. and N.W.

to S.E.), which are respectively 750 and 800 m. long. It comprises Brit. Bechuanaland and the extremity of the African continent S. of the Orange R., including the Transkei ter., and Natal. It is nearly twice the size of the United Kingdom. The total area is 277,170 sq. m. (the prov., 260,615 sq. m.; Transkei ter., 16,555 sq. m.).

Coastline.—The coastline from the mouth of the Umtamona on the E. to the mouth of the Orange on the W. measures some 1300 m. The estuary of the Kynsna, on the S. coast, provides the only good natural harbour of the prov.; the bar at its entrance is never less than 1 ft. deep. Skirting the coast westward, the traveller will pass the mouths of many mt. torrents, broad stretches of forest, and the green slopes of mt. ranges. Further to the W. he will see Cape Agulhas and the Cape of Good Hope, which rises 840 ft. above sea level. If the traveller doubles the Cape, he will find himself in Table Bay, above which towers the flat-topped cloud-girt Table Mt. (3549 ft.). Cape Town, the cap. of the prov., extends along the coast and the lower slopes of the mt., on the side of the peninsula opposite False Bay, which lies on the S. So far the shore has been fertile and well watered, and the scenery often picturesque, but along the W. the coast is covered with white sand and scrub, and presents a barren aspect. Saldanha Bay, 20 m. N. of Dassen Is., is a safe and sheltered roadstead. Robben Is., outside Table Bay, is the only other is. of importance, and is fortified by the Brit. Gov. as a naval base.

Ocean Currents.—The Agulhas current rushes south-westward from the S. and E. coasts so forcibly that a counter-current, running in a north-easterly direction, is set up. Ships going towards Natal from Cape Town avail themselves of this back drift. At the S. extremity the warm Agulhas current meets the cold W. drift from the Antarctic. The current flowing northward along the W. shores is really part of this W. drift, though its course is diverted.

Rivers.—Beginning on the E. coast the Buffalo rises beyond King William's Town, which is on its bank. At its mouth lies E. London, the third port of the prov. Port Alfred is situated at the mouth of the Kowie, which rises in the Zuurberg Mts., and is noted for the beautiful country through which it flows. The source of the Kei is in the Stormberg. Further S., the Great Salt R. enters the sea. It is formed by the flowing of the Kat, which rises in the Winterberg, into the main stream, there called the Great Fish R. Rising in the Zuurberg, the latter, like the Sunday and the Groote, crosses the Great Karroo; it is remarkable alike for its swollen waters after rains, and for its tortuous course. At one time it makes a great circular sweep of 20 m., the two ends being less than 2 m. apart. The Sunday joins the Indian Ocean in Algoa Bay after watering a very fertile dist. The Groote is the more important of the two streams, which are known after their

junction as the Gamtoos. It takes its rise, like the Gamka, in the Neuwveld Range. The Gamka unites with the Olifants to form the Gouritz, which is fed by the trib., Groote (125 m.), just before it pierces the coast range. The most westerly riv. of importance on the S. coast is the Broedo, which rises in the Warm Bokkvelde. Breaking through the mts. at Mitchell's Pass, it afterwards receives the streams from the celebrated Hex R. Pass. On its banks are the picturesque cities of Ceres and Worcester. Unlike most of the rivs., whose mouths are silted by sand-bars, it is navigable for

weather they shrink to the size of brooks or dry up altogether.

Though the prov. has no lakes, there are many 'salt pans,' the largest being Commissioner's Salt Pan, some 20 m. in circumference. Situated in the barren N.W. flats, this natural basin, like the rest, rapidly loses its waters in the dry season, so that the salt layers at the bottom may be reached. Near Knysna and elsewhere are shallow basins, called *reieis*, which overflow into one another in time of flood. These pools vary in bulk according to the humidity of the atmosphere.

THE CAPE OF GOOD HOPE

some 35 m. There are three rivs. flowing into the Atlantic Ocean N. of Cape Town, namely, the Berg and the Buffalo, each 125 m. long, and between them the Olifants, 150 m., which, rising in the Winterhoek Mts. and cleaving a passage between the Cedarberg and Olifants chains, maintains a fair depth throughout its lower course. The great waterway of the Orange, which stretches almost from the Atlantic to the Indian Ocean, forms a N. boundary to the prov. The Zak, Ongers, and Brak unite with the middle courses of this riv., whilst the united Modder and Riet from the S.E. and the Harts from the N.E. both effect their junction with the Vaal, the greatest of the Orange offshoots, within the confines of the colony. The inner mt. range is the main watershed. Unfortunately hardly any of the rivs. are navigable for any distance. As they tear down the mt. sides, cutting deep ravines, they grow into splendid streams after heavy rainfall, but in the hot

Mountains and Tablelands.—For the most part the three mt. chains are well defined and their configuration is simple to grasp, since they follow the coastlines. Within the coast plain, which rarely rises to 600 ft., the abrupt S. slopes of the coast range ascend to a plateau some 30 m. wide, known as the Little Karroo (Hottentot for arid). The terraced formation is continued by the second chain of mts., which give on to the Great Karroo, a tableland whose area is something like 28,000 sq. m. The main belt of heights, shutting in this plateau to the N., fringes the immense plain of S. Africa, a strip of which only lies in this prov. Thus in spite of a perplexing nomenclature, the structure of the high lands is plain. Passing E. to W. the coastal chain is known successively as the Uitenhage, Langeberg, Zondereinde, Drakenstein, and Olifants Mts. The prov. E. of the Kei R. is very hilly, the S. portion being occupied by the Stormberg peaks and the N. by the flanks of the

lofty Drakensberg. The central range E. to W. includes the Zuurberg, Winterhoek, Grootte R., Grootte Zwartberg (greatest elevation 6989 ft.), and the Cedarberg Mts. Great gorges called kloofs have been pierced in this chain by the rushing streams. The third mt. rampart, running 120 m. inland from the shores, is variously named the Nieuwveld, Sneeuwberg (in which is Compass Berg, attaining the greatest altitude in the prov., 8500 ft.), Zuurberg, and Stormberg ranges. The E. coast is flanked by the Roggeveld and Komsberg Mts., which continue the Nieuwveld. It is true that the contours of the mts. are often imposing, yet these hardly compensate for the monotony of the bare stretches of veld, and for the marked deficiency in water and trees. The flowering shrubs and grasses have no sooner sprung up on the Bushmanland plateau (in the N.W.) than they are withered away by the hot suns, which undo the fertilising work of the heavy rains. Cattle, however, often find good pasture by the vleis, if the soil is not too brackish. The vast, treeless tableland to the N., whose average altitude is 3000 ft., is broken only by the great Orange R. which cuts across its whole length.

Geology.—The geological structure of the mt. ranges is fairly uniform, most of them consisting of huge masses of quartzose sandstones on granite bases. Whilst the granite when it occasionally crops out has rounded contours, the formation of the sandstone, as on Table Mt., is flat. The latter often covers the primitive rock to a thickness of 1750 ft. The Stormberg chain alone presents traces of recent volcanic action. Ferruginous reddish sands and argillaceous clays, resting on blue slaty rock, form the surfaces of the karroos and N. plateaux. The three systems are known as the Cretaceous, Karroo, and Cape systems, whilst there are also pre-Cape rocks that are little understood.

Climate.—The climate of the prov. is healthy. As a rule the air is remarkably dry and clear. The mean ann. temp. may be taken as less than 65° F., although the daily range is considerable, the average variation on the Karroo being as much as 27° F. The drawback is the prevalence everywhere of dust, which is blown by every wind. The climate mainly depends on two factors: the elevation of the land and the expanse of ocean in the lower hemisphere. It is the cold currents of the latter which give to Cape Town so low a mean temp. as 63° F., the same as that of the It. Riviera, which is 8° farther from the equator. The mt. chains exhaust the rains of the moisture-laden winds from the E. and S.E. Thus these winds fertilise in plenty the coast-lands, but, as the more they advance into the interior the drier they get, most of the prov. is subject to frequent drought. Along the W. coast, N. of the Olifants, rain does not fall for years together. A line from Walvis Bay to Port Elizabeth, on the S.E., roughly divides the prov. W. and E. into the

areas of winter and summer rainy seasons respectively. W. of 23° E. the mean ann. rainfall is under 10 in. By the W. coast and on the Little Karroo it varies from 10 to 20 in., but on the S. and S.E. coasts it is over 25 in., and in the Cape peninsula sometimes rises above 40 in. The thunder-showers, which usually follow the dry hot N. wind from the desert, are the one source of rainfall to the arid N. dists. Dec. and Jan. are the hottest months, and June and July the coldest. On the N. plateaux and on the Karroo the mean minimum temp. is 49° F., and the mean maximum 77°. Though the hot westerly winds make the daytime often oppressive, the nights are cool and refreshing. Frosts are frequent in the winter, and whilst snow rarely falls on the coasts, it often caps the high mts. for months together.

Flora.—Along the coast the flora is rich. Of the 10,000 varieties of species, some 450 are found only in the prov. Prickles and thorns are common characteristics of the plants. There are over 400 genera of the bush and heaths; the abundant pink rheenoster bush is not unlike heather. Aloes, 'everlasting flowers,' and the castor-oil plants are also indigenous. Among flowers the iris and arum lily are conspicuous, whilst the spurge plants, the elephant's foot, and the stapelia, or carrion flower, may be noted among plants structurally eccentric. Forests of trees rarely more than 30 ft. high cover some 550 sq. m. of the S. seaward slopes. The yellow-wood (of the yew species), the silver-tree, black ironwood, the melkhout, and the heavy, hard stinkhout are indigenous, whilst oaks, which grow luxuriantly, pines, and poplars have been introduced with success by settlers. Though the native fruits, including gourds, water-melons, and hard pears, are rare, most of the varieties introduced from other countries grow well. In the spring the blossoms of the dwarf mimosa on the Karroo are splendid. A coarse yellow grass covers the tablelands of the interior.

Fauna.—The fauna is varied, though lions and rhinoceroses have been expelled and the blaauwbok and quagga exterminated. Zebras, elands, antelopes, gnus, buffaloes, and elephants now require special protection. Not so the cheetahs and leopards, which, like other carnivora—the silver jackal, wild cats and dogs, aard-wolf, and hyena—are still fairly common. Springboks herd on the open veld, whilst other species of Ungulata are the steinbok, the klipspringer, and the dassie rabbit. There are also baboons, otters, pangolins and other ant-eaters, mongooses, jerboas, and hares. Among reptiles may be mentioned puff adders and other snakes, lizards, and tortoises. There is a great variety of game bird, including the ostrich, the huge kori bustard, the quail, teal, snipe, wildgeon, and many others. Eagles, falcons, owls, and aasvogels, besides flamingoes, pelicans, and cranes, are also found. Most of the birds belong to the Passeres order. Larks, weavers, and starlings—the Eng. starling

is the only naturalised European bird—are the commonest varieties. Of endemic insectivora, the 'golden mole' is notable for the splendid lustre of its yellow fur. Jumping shrews, tarantula spiders, scorpions, toads and frogs, and the poisonous tsetse fly are also native to the prov. The large baba and yellow-fish occur in fresh water, whilst in the sea are found seals, sharks, whales, steenbrass, snook, and many edible species.

Agriculture and Allied Industries.—Artificial irrigation is much needed to promote the cultivation of large tracts of land, whose one deficiency is water. Mealies (Indian corn), oats, wheat, barley, and rye yield good crops. The vegetable produce consists chiefly of potatoes, mangolds, peas, and beans. Most of the farmers live by sheep-rearing; the number of sheep in the prov. amounting to nearly 20,000,000; of cattle there are over 2,000,000, and of goats 3,500,000. The number of domesticated ostriches on the farms had declined in 1931 to about 100,000, showing a very considerable decrease since 1912, and the total to-day is much below that figure. Oudshoorn was, and still is, the great ostrich farming centre of S. Africa, but the industry was at its peak from 1906–12, when there were 400,000 birds in that dist. alone. By 1939 the number had dropped to fewer than 20,000, and feathers, which had previously sold at any price from £20 to £100 per lb., sold at no more than 22s. per lb. Mules are bred on the veld. In the W. dists. of the Cape, the vine is grown and produces an abundance unknown in other countries. There is only a limited demand for the Cape wines in Europe in spite of the fine flavour of the grapes. The export trade has, however, improved. The tobacco crop is becoming increasingly important, and cotton, also, is grown. Great improvements in transport have made it worth while for fruit-growers to cultivate grapes, apricots, oranges, and peaches for foreign markets. The ann. harvest of each fruit runs into millions, and S. Africa supplies the Brit. market with fruit of all kinds during the winter months. Great quantities of wheat and maize are annually ground in the flour-mills, which are second only in importance to the diamond mines as a source of industrial wealth.

Mining.—The diamond mining is carried on in Kimberley, which yields more diamonds than all the other mines combined. Hopetown, Griqualand W., and other places near the Orange R. Up to the end of 1938, the total value of diamonds mined in the prov. was over £225,000,000. The industry was severely hit by the First World War, when many of the mines closed down, and there was another serious slump in 1921. Diamond output is, however, now controlled by an agreement fixing quotas of members of the Diamond Producers Association. There are a number of collieries in the Stormberg dist., and copper, gold, tin, and salt are also found.

Trade.—The prin. exports are diamonds, gold, wool, ostrich feathers, hides, and maize, whilst textiles, foodstuffs, hard-

ware and machinery, iron and steel goods, paper, rubber, etc., are the staple imports. Since the Union of S. Africa came into effect, no complete record of the trade of the separate provs. has been kept, but it is estimated that the value of goods sent from the Cape to the United Kingdom has averaged annually some £14,000,000 in the past decade. Goods imported from the United Kingdom were valued at an equivalent amount. Transit of goods to and from the Transvaal and other parts of the Union considerably augments the commerce of the prov.

Posts and Telegraphs.—Besides a well-organised postal service, the prov. is connected with Europe by four distinct cable routes, is in complete telegraphic communication with all the S. African provs., and has estab. within her own boundaries an excellent telegraphic system under state control. The telephone service has been instituted in the tns. The prov. is also in wireless communication with the United Kingdom.

Railways.—The railways are for the most part owned by the state. The first was built in 1859 from Cape Town to Wellington as the result of private enterprise, but in 1871 Parliament began to construct railways at public expense. The Western, Midland, and Eastern are the three chief systems. Of the first system the main line runs from Cape Town through Kimberley, Vryburg, Mafeking, Bulawayo, and the Victoria Falls (1623 m.) on to the Belgian Congo frontier. Branch lines connect Cape Town with Johannesburg, Pretoria, Salisbury, and Beira (2037 m.). The terminus of the Midland system is Port Elizabeth. The main line passes through Cradock and Naauwpoort to Norval's Pont, and thence is continued to Bloemfontein, Johannesburg, and Pretoria. The Midland and Western systems are connected by branch lines at De Aar. The Eastern system runs from E. London to Springfontein (314 m.), which is a junction for the Bloemfontein railway. A series of railways crosses the prov., running E. and W. parallel to the coast. There is a total mileage in the prov. of over 5000 m.

Other Communications.—The W. route to the Cape is via London or Southampton to Cape Town, the E. is via the Suez Canal and Natal. There are steamer connections also with Australia and India, and Cape Town may also be reached by air. Wingfield airport being situated 6 m. from the city.

Races and Population.—Of the two indigenous tribes, the Bushmen (q.v.) and the Hottentots (q.v.), the former have retreated before the settlers and have been much reduced in number, and the latter are now nearly all half-breeds of Hottentot, Dutch, and Kafir blood. The Kafirs come from the Bantu negroid stock, their chief tribes being the Bechuana, who live N. of the Orange, and the Fingoes, Tembus, and Amasosa. The Griquas are half-castes of Dutch-Hottentot blood. A number of Malays, whose bond of union is their Muslim religion, have settled round Cape Town. The

country is chiefly populated by Afrikaner (and Ger.) farmers who speak *Afrikaans*, a corrupt form of their own original tongue. Eng. is commonly spoken in the tns. In the 1936 census the European pop. numbered 791,600. By 1941 this pop. was estimated to have increased to 826,000. Of the non-European pop. (1936), 2,045,600 were Bantu, 10,500 Asiatic, and 682,000 mixed or other races. Notwithstanding the great numerical superiority of the coloured races, in the S.W. corner of the prov. the white pop. is actually numerically the stronger. Only a very small proportion of the people live any distance inland. The majority of the coloured pop. is engaged in agric. or domestic employment. Since early years there has been a steady stream of immigration. In 1903, after the Boer war, the number of immigrants was phenomenal, namely 61,870, that is, 30,000 more than the emigrants. But in 1905 the outgoing figures (34,533) were actually more than those of immigration (33,775), and the number of immigrants continues to be low.

Chief Towns.—The cap. of the prov. is Cape Town (*q.v.*). Kimberley (18,900) is the only inland tn. of importance. Port Elizabeth (64,700) and E. London (39,600) come next in importance to Cape Town as seaports. In the W. half of the prov. the chief tns. are Paarl (10,900), Mossel Bay (7000), Oudtshoorn (8100), Worcester (7200), George (7300), Graaff Reinet (4400), Cradock (3000), Middelburg (2000), and Caledon, Malmesbury, Wellington, Stellenbosch, Beaufort W. In the E. half the most important tns. are Uitenhage (11,000), Grahamstown (8900), Queenstown (8100), King William's Town (6100), and Aliwal N. and Somerset E. Simons-town is a naval station with large docks. In each case where the pop. is given, it is the number of whites only. In the provincial cities, streets running at right angles are generally grouped round a central market place.

Religion.—Of the European pop. (in the 1936 census) the Dutch Churches claim 459,000 adherents and the Anglican Church 140,000. Other denominations: Methodists, 51,000; Rom. Catholics, 33,000; Presbyterian, 25,000; Baptists, 11,000; Lutherans, 11,000; Congregational, 5000; Christian unspecified, 22,000. There were 28,000 Jews, and 6500 unspecified.

Education.—There is a state system of free primary education, which is compulsory for white children. School boards and school committees conduct the local school administration, the prov. being divided into 111 school dists. There are special day and industrial schools for the natives. The elementary schools are non-denominational. The chief univ. is that estab. in 1874 at the Cape. It was modelled on the London Univ.

Law.—The administration of justice is well systematised. What was the supreme court of the Cape became, like those which sit at Kimberley and Grahamstown, local divs. of the Supreme Court of S. Africa after the Act of 1909.

History.—The hist. of the prov. of the Cape of Good Hope falls easily into two sections, with 1814—the year when it was finally recognised as an Eng. colony—as the dividing line. Two Portuguese, Bartholomeu Diaz (in 1486) and Vasco da Gama (1498), were the first explorers to round the stormy Cape. Though from that time onward Portuguese, Dutch, and Eng. traders rarely went to the E. by the Cape route, the first definite step towards acquisition was taken by the Dutch E. India Company in 1652, when it estab. a fort at the foot of Table Bay, and made a small settlement, with the object of ensuring a fresh-water supply for their merchant vessels in their passage to the E. Indies. But the company was early induced to cultivate the fertile earth and to found a colony as well as a water station. Unfortunately, it did not encourage individual colonists to co-operate, with the result that the latter sent home many protests against its jealous monopolies—protests, however, which proved quite unavailing. When France seized Holland, the latter appealed to England for help. The effect of this at the Cape was that an Eng. force held the colony in trust for the mother country till the peace of Amiens (1810), when it was given back. After about four years' rule under stato administration, this time, instead of the company's, an Eng. force (about 4000 strong) was again landed in the colony to forestall any efforts the common enemy, France, might make to capture so prosperous a land. Gen. Janssens, the Dutch general, was obliged to capitulate. Thus, after a military occupation which extended over some years, the colony was recognised by the European powers as a Brit. possession. Once the company with its narrow, selfish ambitions was removed, agriculture and industries, especially sheep-rearing for wool, advanced by leaps and bounds. But in the course of its rapid development the colony encountered other disturbing forces. It happened that the native Kafir tribes were expanding southward at the same time that the colony was pushing N. The contact of Kafir and colonist led to a series of wars, the obvious cause of which was the cattle-lifting propensities and the predatory habits of the former. But the wars were really an expression of the inevitable conflict between tribal laws and European administration, a conflict which allowed of no settlement by compromise. The disastrous battles at last brought home to the Eng. Gov. the need of controlling native tns. by imperial administration. This was actually carried into effect by the Scanlen ministry. Paternal gov. of the natives outside the colony was substituted by the Ullington-Sprigg ministry. Jameson, who in 1896 made an unsuccessful raid into the Boer ter. of the Transvaal, was a doctor at Kimberley. The colony, especially Kimberley, played an important part in the S. African war (*q.v.*) (1899–1902), but the Cape rebellion ended early in 1900. Cecil Rhodes, who was president of the colony from 1890 to 1896, pursued an imperial

policy in sharp contrast to that of the Bond party. The latter, stimulated by the active encouragement of the famous Afrikaner Bond, hoped in vain to establish a Dutch republic. See SOUTH AFRICA, UNION OF.

Constitution.—The constitutional development of the colony was much more rapid than in the older countries. As in the first instance the governors of the colony were autocrats, it was a fortunate thing that many of them proved men of ability and public spirit. The first executive council was called in 1825, and ten years later the first legislative council, one half of which was nominated by the governor, the other by the Crown from its officials. In 1853, at the instance of the council and with Crown support, a House of Assembly and a Legislative Council were conceded to popular wish. Finally, responsible gov. was put altogether in the hands of the colony in 1872. As early as 1829 it was decreed that men of all nationalities were to enjoy alike the advantages of the common law, and every slave was emancipated in 1838. By the South Africa Act of 1909, the colony entered the Union of S. Africa, sending fifty-one representatives to the House of Assembly and eight to the Senate. Its former constitution was naturally revoked. A prov. council, elected for five years, consisting of sixty-one members, and presided over by an administrator appointed for five years by the governor-general, and an executive committee of four members, controls local taxation and all matters that concern the prov. only.

The Cape Native Franchise.—When in 1902 the Brit. Gov. annexed the Boer republics the terms offered included not only the promise of self-gov., but an assurance that no native franchise would be given until this had been attained. It was conceded, however, that political union implied a unified native policy, and a Native Affairs Commission, appointed in 1903, investigated (*inter alia*) the question of the franchise. The commission found that in the Cape there were 8117 registered native voters out of a total electorate of 135,168 and that in seven constituencies out of forty-six the native vote could determine the issue of an election. The commission concluded that this was a dangerous position and therefore proposed the creation in each colony of S. Africa of native constituencies in which Africans should vote separately from Europeans. In 1908-9 when the National Convention met to decide the Constitution of the Union the Cape delegation proposed a uniform franchise dependent upon a civilisation qualification, which would have admitted some natives, but the delegations from outside the Cape preferred the abolition of any native franchise. It was eventually decided to retain the then existing position the Cape franchise being 'outrenched' by the provision in the South Africa Act that it could be modified only by a two-thirds majority of both Houses of Parliament sitting together. The right of natives to sit in Parliament, which had been im-

plicitly theirs in the Cape, was now withdrawn. The question of the franchise was raised anew as an element in the policy of racial segregation when the Nationalist Party came into power in 1924 but a Bill for the abolition of the Cape franchise failed to secure a two-thirds majority. The attack on the native franchise (then 2·7 of the Cape electorate and 1·2 of the Union electorate) was renewed in 1934-35. The fact that the policy of segregation was already effective throughout the Union was a strong argument for the separation of the natives from the European electorate. The Representation of Natives Act passed in 1936 provided (*inter alia*) that the Cape and Transkei should be separately represented. The Act as originally introduced would have abolished the Cape native franchise but in its final form it made a compromise, it maintains the Cape native franchise but provides for separate election by the Cape native voters of three members of the House of Assembly and two members of the Prov. Council, who are additional to the existing members and hold office for five years irrespective of a dissolution. The next threat to the Cape franchise came in 1948 with the defeat of the Smuts Gov. by the Nationalists under Dr. Malan, when the new gov. threatened to make certain changes in both the coloured and native franchise by the ordinary process of legislation regardless of the entrenched clauses of the South Africa Act.

Capercaillie (Capercailly, or Capercaillie are variants in spelling, the *c* being pronounced *y*), or *Tetrao urgallus*, species of grouse of the family Phasianidae, and is the largest gallinaceous bird of Europe. Also called wood-grouse, or cock of the woods, the latter a trans. of Gaelic *capull coille*. The C. is about the size of a turkey and resembles the blackcock in appearance and polygamous habit; the general colour of the male is blackish-grey above, black below, with dark green chest, while the female is smaller, mottled, and has a reddish breast barred with black. The feathers on the legs and feet are longest in winter time, and the toes are quite naked. At breeding-time the male indulges in curious love-songs and antics to attract a mate, and fights between rival cocks are of common occurrence. The food of the birds consists of insects, worms, berries, and young pine-shoots. The C. is widely distributed in countries where pine forests abound; at the end of the eighteenth century it was exterminated in Scotland, but in the middle of the nineteenth it was successfully reinstated. See J. G. Millais, *Game Birds*, 1892.

Cape River, otherwise known as *Coco*, *Segovia*, or *Wanks*, in Nicaragua. It forms the boundary between Nicaragua and Honduras. It is 300 m. long and flows into the Caribbean Sea. Navigable for 140 m., though its mouth is barred by a sandbank.

Capern, Edward (1819-94), Eng. poet, b. at Tiverton in Devonshire. He wrote sometimes under the pseudonym of 'The Rural Postman of Blideford.' *Ballads and Songs* was pub. in 1853; *Devonshire Melodist*, with music, in 1862; *Wayside Warbles* in 1865; and *Sun Gleams and Shadow Pearls* in 1881.

Capernaum, anct. city of Palestine, mentioned in the N.T. It is usually identified with the modern Tell Hum, on the N.W. coast of the sea of Galilee, but occasionally with Khan Minieh, a little further S.

Capers, see CAPPARIDACEÆ.

Cape Sable Island, situated at S. extremity of Nova Scotia. C. S. is the most southerly point.

Capesterre, or *Le Marigot*, tn. in Guadeloupe, Fr. W. Indies, 12 m. E.N.E. of Basse-Terre. Pop. 10,000.

Capet, family name of the third Frankish dynasty, founded by Hugh C. (q.v.). This family ruled France in a direct line from 987 to 1328, and through the collateral branches of Valois and Bourbon until the revolution in 1789.

Capet, Hugh (987-96), king of France, b. about 940, the son of Hughes the Great, count of Paris. In 987, at the death of Louis V., the last of the Carolingian line, he assumed the sovereignty of the whole of France, and founded the third, or Capetian, dynasty. He was accepted by most of the nobles, but his claim was contested by Charles of Lorraine, the rightful heir of Louis V., whom, however, he defeated. His rule was wise and moderate. He rallied the great nobles round him as grand vassals, and made feudalism a recognised part of the constitution. He also estab. hereditary succession to the monarchy, and made the king's eldest son 'master of the palace.' He was succeeded by his son Robert.

Cape to Cairo Railway. Cecil Rhodes evolved the scheme of running a railway right from end to end of the continent of Africa, traversing Brit. ter. as much as possible and acting thereby as a connecting link between all Brit. possessions in Africa. The distance between Cape Town and Cairo is about 5000 m. The first passenger train arrived at the Victoria Falls on June 22, 1904. At this spot the Zambesi R. is spanned by a steel cantilever bridge, which is 380 ft. above flood water, and the highest bridge in the world, the next highest being the Viaduct du Vianr in France, that being 375 ft. In the year 1910 the railroad from Cairo had reached Sennar, except for the riv. gap between Assouan and Wadi Halfa. This was a length of line about 1000 m. The line from the Cape had by 1906 reached Broken Hill, a length of 2017 m. The scheme has since resolved itself into a combined rail, road, and steamer route. The journey from Cairo to Khartoum is

made by rail, thence by steamer on the Nile to Juba, and from Juba by motor road to join the Cape railway either at Broken Hill through Nairobi and Livingstone or at Bukama in the Belgian Congo. The time taken for the complete journey varies from thirty to forty days.

Cape Town or *Kaapstaad*, seaport, the legislative cap. of the Union of S. Africa, seat of the Cape Prov. Council, and the metropolis of S. Africa; it is 5979 m. distant from Southampton (transit by mail steamship 13-16 days, and by air mail, 8 days). It is situated on the N. side of the Cape peninsula in the S.W. of the colony, on Table Bay, and at the foot of Table Mt., 30 m. N. of the Cape of Good Hope. The central portion lies in an amphitheatre, which extends down to Table Bay towards the N.E. and is backed on other sides by the precipitous face of Table Mt. (3580 ft.) and its outlying masses, Devil's Peak on the E., and Lion's Head and Signal Hill on the W. This part of the city is built on the slopes at the foot of these mts. and extending down to the shores of Table Bay. Table Bay is not a good natural harbour, being exposed to N. and N.W. gales, but a breakwater of 3640 ft. has been constructed to shelter shipping, and there are commodious wet docks, opened 1870, a dry dock, and a gov. patent slip with a lifting power of 1000 tons. The recently constructed outer harbour has a minimum depth of 27 ft. (new harbour fortifications are in process of construction). The tn. is the terminus of sev. railway lines. It was laid out after the Dutch fashion with geometrical precision, is well drained and paved, and has a good water supply coming from Table Mt., and an electric tram service and a suburban railway. The chief buildings are the two cathedrals, Anglican and Rom. Catholic; sev. Muslim mosques; the S. African College; the museum and public library (the gift of Sir George Grey); the observatory (1820), which is the finest in the S. hemisphere; the castle (a fort 400 years old); the Houses of Parliament; Government House; the buildings of the univ. of the Cape of Good Hope (1873), which is an examining body only, and is built on a splendid site on the Groote Schuur estate, Rondebosch; and the botanic gardens. The city hall can accommodate 6000 people and the Dutch Reformed Church, the earliest edifice for public worship in S. Africa, 3000. Since 1910 the Union Parliament has met in a new wing added to the original Houses of Parliament. The Gov. Gardens, containing a fine oak avenue, serve as a public park. Some fine old buildings of the Dutch period still survive, the chief being the castle, begun in 1666, and to-day the oldest building in S. Africa; and the Koopmans de Wet Museum, a Dutch house of the early eighteenth century, containing specimens of old Dutch furniture and antiques. C. T. has a modern and well-equipped aerodrome, Wingfield Airport, 6 m. from the centre of the city. There are numerous fine and populous

suburbs, including Green Point, Sea Point, Woodstock, Maitland, Mowbray, Rosebank, Rondebosch, Newlands, Claremont, and Wynberg. A chain of well-armed forts extends along the shores of Table Bay. The climate is somewhat similar to that of the Riviera, the mean ann. temp. being 62.3° F., Jan. 69.9° F., July 55.1° F., with a maximum of 102° F. and a minimum of 34° F. The mean ann. rainfall is 24.8 in. The city, which is an important port of call, was founded by the

possession of Portugal, in the Atlantic Ocean, off the W. coast of Africa, about 300 m. W. of Cape Verde. The is. may be divided into three groups: 1. The W. Windwards (Barlavento), comprising Santo Antão (246 sq. m.), São Vicente, Santa Luzia, São Nicolau, and the small is. named Branco, and Razo. 2. The E. Windwards, comprising Sal and Boa Vista. 3. The Leewards (Sotavento) comprising Maio, Santiago (São Thiago) (396 sq. m.), Fogo, Brava, Grande, and Bombo. The

CAPE TOWN: PARLIAMENT BUILDINGS

Dutch in 1652. It is perhaps the most beautifully situated city in the world. It has become a recognised health and holiday resort. The public library contains 150,000 vols. In the S. African Museum are a number of 'post office stones' beneath which captains of ships outward bound placed their letters for conveyance home. In the Jewish synagogue, which cost £40,000, is a memorial to local Jewish victims of the First World War. A striking war memorial and a memorial to Capt. Scott, who perished in the Antarctic, are near the entrance to the pier, which was completed in 1914 at a cost of £85,000 and is 1800 ft. in length. Total pop. (1936) 336,400; European 171,600 (1946, 214,201), and non-European 164,800. The rateable value, in 1930 £2,054,204, is now nearly £40,000,000.

Cape Verde, most westerly cape in Africa, situated in Senegal. It was discovered in 1443 by Nuno Tristão in the time of Henry the Navigator.

Cape Verde Islands, archipelago, in the

total area is about 1516 sq. m., and ten of the is., the chief being Santiago, São Antão, Fogo, Brava, and São Nicolau, are inhabited. The is. are all mountainous and largely of volcanic formation, but some anc. granites and gneisses point to a continental origin, and on some is., as Maio, there are sedimentary deposits. The main peaks are the volcano of Fogo (8800 ft.), which was active in 1847; the Pico da Antonia, on Santiago (7330 ft.); and the Pão de Açúcar, on Santo Antão (8000 ft.). The climate is tropical, though tempered by sea breezes. There is only a short rainy season in Aug. and Sept., and much distress and famine are caused by drought. The soil is not very fertile, and trees are especially rare, but coffee, sugar, Indian corn, beans, oranges, grapes, peanuts, cacao, cotton, tobacco, cinchona, and indigo are grown and exported. Iron is found in the S. is., and sev. have guano deposits, while salt, amber, archil, and red coral are also largely exported. Cattle-rearing is carried on, and the coasts abound

in turtles. The inhab., mainly Negroes and mulattoes, speak a debased Portuguese. Porto Grande, on São Vicente (20,000), is a coaling station. The cap. is Praia (6000). The Portuguese discovered the is. in 1441-56. Pop. 153,000 (mulattoes, 96,000; Negroes, 55,000). See A. Lyall, *Black and White Make Brown*, 1938.

Cape Wrath, most westerly point on the N. coast of Scotland, in the co. of Sutherland. It is one of a series of wild cliffs formed of gneiss, and is 300 ft. high.

a fine, or perform some other legal obligation. The writ of attachment for contempt has replaced the old C. for all practical purposes.

Capillaire, sort of syrup concocted from the maidenhair fern. It is used in medicine as a pectoral and sometimes as an astringent.

Capillarity (Lat. *capillaris*, pertaining to the hair), the phenomenon which occurs when a fine tube, open at both ends, is placed vertically in a liquid; the surface of the liquid within the tube is usually

A diagram illustrating the change from arterial to venous systems in the network of capillaries.

Capgrave, John (1393-1464). Eng. theologian and historian. He was b. at Lynn and became an Augustinian friar. He wrote in Lat. Bible commentaries and *Nova Legenda Angliæ* in the year 1416. This was printed by Wynkyn de Worde, 1516, and is the only complete work of C.'s to have been printed. He also wrote *Vita Humfredi Ducis Glocestrie*. His chief Eng. works were *The Chronicle of England from the Creation to A.D. 1417*, and a metrical *Life of St. Catherine*.

Cap Haitien, tn. in the republic of Hayti, and an episcopal see, situated in a magnificent harbour 5 m. from Port au Prince. Under the Fr. gov. it was the cap. of Hayti. It is connected by cable with France, S. America, and San Domingo. In 1842 it was the scene of a terrible earthquake, and in 1865 the tn. suffered great damage through bombardment by the Brit. Pop. 20,000.

Capias (Lat., 'you may seize'), term once used in legal practice to denote writ directed to the sheriff, commanding him to arrest some person named in the writ to come up for judgment, discharge

either above or below the surface outside. The condition is only observed when the diameter is small, hence tubes which exhibit this property are called capillary or 'hair-like' tubes. A similar effect is produced when two glass plates are held vertical and parallel a short distance apart in a liquid; the liquid forms a film between the two plates. If the plates are pulled gently apart at one side so as to form a very acute angle, the surface of the contained film presents a curve (an equilateral hyperbola), having its greatest distance from the free surface of the liquid at the point of the angle. Thus C. diminishes as the distance between the walls increases, the ascent between smooth glass plates being, however, only one-half of the ascent in a tube of the same diameter. Every liquid has at its bounding surface between it and another medium (say air or glass) a surface tension, or tendency for the surface to withdraw itself into the smallest possible area. In small amounts of liquid, this tendency is sufficient to overcome the effects of gravity; thus a minute quantity of mer-

cury becomes on a flat surface a globe that is practically spherical, whilst a large amount simply shows a convexity at the edges, gravity having produced that horizontal surface which we look upon as characteristic of liquids. In the instances mentioned it should be noticed that there are three substances in contact, such as glass, air, and water, and the form taken by the visible fluid surface, i.e. that of the water, depends on the relative attracting power of the three substances on each other. Thus whilst water rises in a capillary tube and presents a concave surface upwards, mercury is depressed and has a convex surface. C. is a widespread phenomenon; oil rises in the wicks of lamps, moisture in the roots and stems of plants, by virtue of C. All substances with pores of sufficient size are capable of sucking up water, e.g. blotting paper, sponges. See ABSORPTION; SURFACE TENSION.

Capillary Vessels, smallest blood-vessels in the body. The arteries which convey blood from the heart are split up into myriads of branches which vary from a five-hundredth to three-thousandth part of an inch in diameter. By their means the blood is supplied to every part of the body, the flow depending on the direction of the central intelligence. The capillaries reunite in the veins, by means of which the impure blood is returned to the heart.

Capistrano, Giovanni di (1385-1456), It. theologian, b. at Capistrano in the Abruzzi. He entered the order of the Franciscans in 1416. He helped to reform his order in conjunction with Bernardino of Siena, and he preached against many heretical orders which had come into existence in Italy, especially the Fraticelli. He was twice made vicar-general. He converted many of the Hussites of Moravia back to the Rom. Church. He had been sent to Moravia as papal legate in 1451. When in Silesia he incited the people to persecute the Jews, and many were burned. He also preached against the Turks after the fall of Constantinople. He took 10,000 Christians to Belgrade in 1456 to help John Hunyadi, and also assisted to release that tin. from the hands of the Turks. He was canonised in 1721.

Capital (and Capitalism). C. may be shortly defined as that part of wealth which is accumulated in order to assist future production. In commerce the term is used to express the stock of the merchant, manufacturer, or trader, used in carrying on his business, in the purchase or manuf. of commodities, and in the payment of wages of labour; in this sense it includes not only money, but also buildings, machinery, and all other material objects which facilitate commercial operations. In a more extended form C. embraces not only the C. of particular individuals, but the entire C. of a country, in which latter sense it may be defined as the products of industry possessed by the community and still available for use only or for further production. C. may be applied either directly in the employment of labour, or

directly in aid of labour; it may be spent in the food and clothes of labourers, or in tools and other auxiliary machinery, to assist their labour and increase its productiveness. The former is usually termed circulating C. in political economy, and the latter fixed C. While the foregoing may be accurate deductions from current politico-economical theories of C. it is to be observed that C. in social polemics is regarded by some schools of thought as that which is radically opposed to labour. Karl Marx, starting from the position that the economic structure of society, i.e. the method of production and distribution of the products of labour, is the basis upon which everything else rests—the juridical, the religious, the political, the social life of the people—argued that while political economy was right in holding that the consumption of surplus products by productive labour was a feature of accumulation, it was wrong in holding that all surplus value that is changed into C. became such C. as was represented by labour power. With the same critical analysis of prevalent principles of economists, Marx considered that private property, based upon the labour of its owner, had become by the evils of our civilisation replaced by what he termed 'capitalistic' private property, based on the labour of other persons than the owner of the property. Henry George, in *Progress and Poverty*, contended that the wages of labour were paid from the value of that which labour produces, and that therefore labour produced its own remuneration. Opposing theories of political economy assert that the accumulated savings of labour and of accruing profits reserved for development, and generally to extend the means of progress necessary to an advancing community, constitute a collective abstinence on the part of both capitalist and labourer for the ultimate good of all, and that, because the capitalist postpones or denies himself the present enjoyment of a portion of his means of consumption in the expectation of prospective reward, C. is justified in claiming such reward, whether by way of rent or interest or profit. It is further argued that wages are paid not out of labour but out of C. It may be said that the ultimate source of both wages and profits is the value of that which labour and C. combine to create, and that no progress can be made in any sphere of industrial activity without the help of reserve funds, controlled by few or more persons who risk those funds for the sake of progress. From the moment at which a man produces more than he consumes, he is creating C.; and the accumulated surplus of production over the consumption of the whole community is the C. of a country. Those parts of the products of labour which are reserved for the reproduction of other commodities, and those intended solely for use or consumption, have constituted a distinction amongst political economists. Adam Smith classed the one as C. and the other as revenue. Both, however, are generally regarded as forms of C., although it is true

that the accumulation of C. proceeds slowly or rapidly in proportion as one or other of these modes of expenditure is most prevalent. As to the relation of profits to accumulated C., John Stuart Mill laid it down that in proportion as C. increases the rate of profit falls, because the competition of C. with C. is more active than that of labour with labour (*Principles of Political Economy*). It is generally agreed that a high rate of profit is favourable to accumulation; also that rich and populous countries are denied this advantage; that, if they enjoyed it, their C. would continue to increase more rapidly than it does in fact increase; but that, under ordinarily favourable circumstances, the masses of inherited C. and the aggregate savings of vast numbers of capitalists still facilitate accumulation in a greater ratio than the increase of population, which a high state of civilisation has a tendency to check. In ordinary parlance C. and money are synonymous; but it is entirely erroneous to suppose that C. and money can be the same thing. If they were so, it would be untrue to say that C. was one of the requisites of the production of wealth, for money in itself does not assist in the production of wealth. The bank deposits of a country form what is called its 'floating C.' Such deposits may be withdrawn soon or late, or, on the other hand, may continue to accumulate for a long period; but in any case they are actual money values of wages, rents, profits, commodities, and interest, placed temporarily or permanently at the service of the community for social uses in exchange for a rate of interest. Such deposits are not convertible into an equal amount of bullion, much of them being in the form of bills, securities, etc., and a country is deemed richer in proportion as these deposits increase in amount, because such increase favours an extension of resources for employment. It is usual, indeed, to distinguish between the money market and the C. market, though in both markets it is not money but the command of C. which is the purpose of an exchange transaction whether for a long or short term.

History of Capitalism.—It has been rightly observed that the accumulation of wealth is necessary for the creation of a capitalist society, but that such a society is not the result of a simple process of evolution from the mere existence of C. The accumulation of surplus wealth or C. was fostered by means of commercial transactions, more especially when these were carried through on a large scale and involved the use of credit. On the termination of the crusades and the estab. of peace between E. and W. after several centuries of intermittent warfare, the E. began to pour her treasures into Europe. From their geographical situation the large cities in Italy were the first to profit from this new commerce, and a capitalist state of society began to show itself in the city states of Italy. This economic stimulus had its repercussions. At convenient points on the trade routes leading from Italy to the N.W. of Europe, fairs

were estab. These existed at first for the exchange of goods—barter pure and simple. But later the use of money became necessary, and from the variety of coins in use a new type of merchant came into being. This was the trader, who carried on the business of money exchange, and the foreign exchange of to-day had its beginnings with him. The *lettre de foire* (fair letter) was the forerunner of our modern bill of exchange. Another development was the system of transferring and cancelling these letters as they fell due at the fairs, which thus came to perform, in addition to their normal functions, the actions of the clearing-houses of to-day. From commercial C. to financial C. was but a short step, and the troubled times of the Middle Ages rendered it necessary for the heads of states often to borrow money. These borrowings enriched all who took part in the money trade—tax-collectors, lenders, bankers, all had their profits, and thus helped in the accumulation of large stocks of C. A development of the fair was seen in the estab. of exchanges, which assumed a growing importance in the sixteenth century. In the fairs the business of buying, selling and settlement could only be carried on intermittently (i.e. when the fairs were held at their different seasons), but the estab. of the exchanges rendered such operations a matter of daily routine. Although the Church had long forbidden the lending of money at interest, govts. were soon forced to recognise the legitimacy of this transaction, being moved by the value and increasing multiplicity of exchange operations. Lending money at interest is one of the props of modern capitalism. The business of fairs and exchanges brought negotiable securities into use, and these contributed to the increase in speculation. As the estab. of trade between the E. and W. after the crusades gave rise to a regeneration of the economic life of Europe, so did the discovery of America give additional impetus to this economic life, and in particular to the larger nations of W. Europe. Maritime and colonial commerce expanded, and Europe was enriched by the receipt of the tropical products of the Far E. and the gold and silver from the mines of the New World. Another development which must be noticed at this time was the estab. of large colonial trading corporations such as the Eng. and Dutch E. India Companies. It appears, therefore, that capitalism, first developed along commercial lines and later along financial lines. The rise of Holland as a great economic power in the seventeenth century was due to her success as a commercial and financial nation. Her maritime trade was considerable, and she conducted a lucrative business in negotiable securities. But by the beginning of the eighteenth century, Holland's rapid expansion had ceased. She was primarily a commercial country, and industrialism had now set in, bringing England and France to the forefront by their ability to export not only natural products, but also the products of their

manufacturers. The rise of England and France marks another stage in capitalism which, in addition to its commercial and financial functions, now began to exert its influence upon manufacturing industry. This at first had been in the hands of small men who had little C. These were gradually ousted by larger merchants who sought to control the rural and domestic industries. They collected the products and found the customers. To them went a larger share of the profits than to the artisan or craftsman, who lost control by degrees. Industrial C. has been extended by the growth of large corporations, which were at first formed to control industries where the initial outlay of C. was very high, but which now control practically every branch of modern manufacturing industry. It may be said that the three forms of C.—commercial, financial, industrial—now operate concurrently. In modern times the influence of C. has made itself felt in practically every field of economic effort. At its commencement the colonial system assisted greatly in the development of C. but this development was in turn responsible for the overthrow of the trade monopolies which had been estab. for the benefit of the mother country. These monopolies came to be regarded as obstacles to the natural expansion of commerce, and the rise of industrial C. may be said to have brought about the fall of the colonial system. To understand the capitalism of to-day one must understand the process of its evolution. Karl Marx studied it in relation to labour, but this does not go far enough. His great achievement lies in the fact that he drew attention to the social effects brought about by the evolution of capitalism. He demonstrated that it had created social classes characterised by economic rather than other distinctions, the effect of which has been to make society much more mobile and less hemmed in by the barriers of former times. Nor is it apparent that class consciousness in the labouring classes, which resulted from economic changes, showed itself as a sudden manifestation. Even at the dawn of the capitalist system social unrest made its appearance. This was particularly noticeable in the Low Countries, where thousands of workmen became dependent upon the merchants engaged in the export trade. Then, as now, commerce had its good and bad times, and it was the workmen who suffered during the bad periods. Rising, often accompanied by bloodshed, were far from infrequent, and, by degrees, the craftsmen took their place in the gov. of the Flemish towns. They seemed to be moved by a guild rather than a class spirit. It is worthy of remark that at the beginning of the Industrial Revolution (q.v.) in England it was the workmen who opposed innovation. They were in reality the conservatives who demanded the maintenance of the old order of things. But in the end the policy of *laissez-faire* as opposed to intervention prevailed, and the new industrialists developed their

manufacturing businesses with little or no interference from the State. There is little doubt that the labouring classes in England suffered during this period of transition. A picture of Europe in the years before the First World War was drawn by J. M. Keynes in his *The Economic Consequences of the Peace*, 1920. He states that 'Europe was so organised socially and economically as to secure the maximum accumulation of C. While there was some continuous improvement in the daily conditions of life of the mass of the pop., society was so framed as to throw a great part of the increased income into the control of the class least likely to consume it. The new rich of the nineteenth century were not brought up to large expenditures, and preferred the power which investment gave them to the pleasures of immediate consumption. In fact it was precisely the inequality of the distribution of wealth which made possible those vast accumulations of fixed wealth and of C. improvements which distinguished that age from all others. Herein lay, in fact, the main justification of the capitalist system. If the rich had spent their new wealth on their own enjoyments, the world would long ago have found such a regime intolerable. But like bees they saved and accumulated, not less to the advantage of the whole community because they themselves held narrower ends in prospect. The immense accumulations of fixed C. which to the great benefit of mankind were built up during the half century before the war could never have come about in a society where wealth was divided equitably. The railways of the world, which that age built as a monument to posterity, were, not less than the Pyramids of Egypt, the work of labour which was not free to consume in immediate enjoyment the full equivalent of its efforts.'

It is perhaps true to say that in recent years, and particularly since the development of class consciousness, the C. system has been more widely, more bitterly criticised than any other human institution. Its detractors point to its blemishes, but rarely indicate the blessings which it has conferred. These are too often taken for granted. The world has yet to await the outcome of the greatest experiment ever undertaken by man in an endeavour to ameliorate the lot of his fellows by the overthrow of the C. system and the imposition of a State Socialism. At present it is impossible to foretell how Russia will finally emerge from this experiment. A striking expression of opinion in defence of C. in relation to unemployment will be found in Adolf Weber's pub. lectures. His opinion is that the credit for Germany's power to absorb large numbers of her unemployed was due not to any political policy, but to the versatility of capitalism. But the Nazi regime disproved his thesis and showed that Ger. labour was for many years regimented, no less than her C. resources, in the one aim of rearmament.

In the closing period of the First World

War and immediately succeeding years there was a prevalent opinion that co-operation must take the place of competition if the horrors of another war were to be avoided. Additional impulse was given to social reform by the spectacle of the many enriched at the expense of the masses. Definite expression was given to this mental attitude in those sections of the Versailles Treaty which deal with the relations of capital and labour, relations which were explicitly recognised as matters of international concern. In its condemnation of the conception of labour as merely 'a commodity or article of commerce,' the treaty made a concession to the humanitarians; and, in the creation of the International Labour Conference, it provided the machinery for giving practical expression to changed views. Prior to the treaty, the Brit. Labour party, in Jan. 1918, had in its 'reconstruction' programme, expressed the belief that the 'individualist system of capitalist production had received a death-blow, and that with it must go the political system and ideas in which it naturally found expression.' It is more than doubtful whether many of those in the party to-day would endorse these somewhat emotional opinions. Ger. scholars, like Sombart and Schmalenbach, have also advanced theories which ignore the falsification of Marxian theory in its fundamental positions. Nowhere in the present state of society is there any sign of evolution on the lines of Marxian prophecy, which, broadly stated, is that the smaller capitalist would be engulfed by the few largest and that this process of centralising the means of production must at length reach the point of incompatibility with the capitalist system, and capitalist private property becomes thereby 'socialised' and at the disposal of the previously expropriated working class. Only in Russia has a serious attempt been made to exploit this conception of society. If the Marxian theory of concentration has now been very generally abandoned, it is because theoretical investigation has invalidated every step in its hypothetical development. Facts continue to multiply the evidence in favour of the capitalist system: contrary to Marx, the system does not involve economic crises; nor depress the condition of the working class; nor does it, through the introduction of ever-improving technical machinery, reduce the chances of employment—all of which consequences are repeatedly asserted in Marxian theories and by the followers of Marx. But if theoretical investigation has refuted Marxism, the communistic experiment in Soviet Russia has supplied the most powerful arguments to those writers who defend the capitalist system. Russia, hit by the First World War far less than most of the other belligerents, has only very slowly shown a power of recuperation in any way comparable to the rest of Europe, in spite of her unlimited potentialities. So impracticable did Lenin find his anti-capitalist organisation, that he had perforce to introduce his 'new eco-

nomic policy,' which allowed a restricted degree of free exchange in the capitalist sense. Lenin's attempt to save the situation by the introduction of free price fixing for marketed products was foredoomed, for the reason that it could have been effective only in regard to capital. It had no relation to a system which, temporarily at all events, abandoned private property in capital. There came to be a private money market in Russia on a limited scale, and, as may be supposed from Russia's difficulty in obtaining credit from other nations, this market showed phenomenal private discount rates. A significant development of C. after the First World War was the growth of cartels (*q.v.*). It has been argued that the formation of cartels is the necessary consequence of ruinous competition, and that one important factor in this competition as it affects cartels is the growth of fixed costs, *i.e.* the costs which form a permanent part of every concern irrespective of demand. The relationship of fixed and liquid capital is of great importance in the process of trustification, but so long as there is no external authority to regulate competition the cartel has to assume responsibility for fixing prices. There is, thus, no essential connection between fixed prices and the formation of the cartel, and a defence of cartels is that they are organisations which convert ill-judged and ruinous into regulated competition and, in the light of their tendency to increase in number, are a strong affirmation of the competitive and, therefore, capitalistic system. See H. Withers, *The Case for Capitalism*, 1920; Sir E. J. Benn, *Confessions of a Capitalist*, 1925; H. Sée, *Modern Capitalism* (trans. by H. R. Vanderblue and G. F. Doriot), 1928; A. Weber, *In Defence of Capitalism*, 1929 (trans. by H. F. Stenning, 1930); J. M. Keynes, *The General Theory of Employment, Interest, and Money*, 1936; R. G. Hawtrey, *Capital and Labour*, 1937; and M. Dobb, *Political Economy and Capitalism*, 1937, *Studies in the Development of Capitalism*, 1946, and *Soviet Economic Development since 1917*, 1948.

Capital, in architecture, see COLUMN.

Capital, of a company, see under COMPANY AND COMPANY LAW.

Capital Account, see under BOOK-KEEPING.

Capital (Lat. *capitalis*, pertaining to the head) in typography, larger and differently formed letter placed at the head of a paragraph, at the beginning of lines of poetry, of sentences, of proper names, etc., to help the eye and so facilitate reading. The anct. never used Cs. (*majuscula*) and small letters (*minuscula*) concurrently; either all Cs. were used or all small letters. All the old MSS. are in Cs. alone up to the seventh century. After this time Cs. began to be used only at the beginning of books and chapters; they were often elaborately illuminated and decorated: 'We writeth capital letters with red colour...' Trevisa's explanatory notes in Higden's *Polychronicon* i. 129. These illuminated Cs. were very much bigger than the small letters, and not, as in ordinary

typography, about twice the size. There were two chief types of Cs.—the square and the rustic; the latter were characterised by curves and by finer strokes. Cs. are in general use at the present day in nearly all languages, and their use is chiefly to help the reader. In the Ger. language every substantive has an initial capital; in Eng. Cs. were formerly used much more freely than they are now. Adjectives derived from proper nouns, as *English*, *French*, etc., have initial Cs. in Eng. though not in Fr. or Ger.; so also have all nouns and pronouns referring to God. The pronoun I is always written with a capital; the Latins did

THE CAPITAL 'I' AT THE OPENING OF COVERDALE'S EDITION OF THE BIBLE

not think it necessary to write in this way an *i* standing alone: the Lat. verb *ire*, to go, had in the imperative *i*, and so it was written.

Capital Levy. After the First World War the national debt of the United Kingdom, which had stood at £650,000,000 at the beginning of hostilities, was more than ten times as great in 1920, when it reached the unprecedented total of £7,830,000,000. The question arose as to how this debt was to be paid. The facile and illusory idea that the losers of the war should pay all its costs was not treated seriously by any economist or statesman of repute. The debt had therefore to be paid in the main by the Brit. people, and the question resolved itself into the query, How and by whom? It was suggested that this might be done by means of a levy upon capital. The first recorded demand for a C. L. was made by a private member in the House of Commons in Nov. 1914. It was put forward in the early days of the war as a 'business proposition,' i.e. as an alternative to a high income tax. But as the war continued so-called ethical factors came into the problem. Firstly, it was said that as

'life' was being conscripted, 'wealth' should be conscripted too; secondly, despite the heavy income-, super-, and excess-profits taxes, enormous fortunes were being made by some, while others were being impoverished. The suggestion of a C. L. at first found some supporters in each political party, and among the Conservatives Mr. Bonar Law was said to have had some sympathy with the idea. It remained a definite part of the Labour party's programme until 1927. The basis of assessment was to be individual and not corporate. Companies, co-operative societies, and the like would not be liable, though the shareholders would if their incomes exceeded a certain figure. It was proposed that those whose total net wealth exceeded £5000 should become liable to the operation of the levy. This was the same figure as that proposed by the Board of Inland Revenue in 1919 in its scheme for the taxation of war fortunes. This minimum would have exempted small property owners and those then exempt from income tax, and have brought within the scope of the measure between 300,000 and 400,000 persons. An illustration of the scale of levy proposed in that scheme was that a man worth £6000 would pay £50, or 1.2 per cent of his total fortune; one worth £10,000 would pay £550, or 5.5 per cent; one worth £100,000, would pay £32,800, or 32.8 per cent; and a millionaire would pay £502,800, or 50.3 per cent of his fortune. The Colwyn Committee on Taxation and the National Debt, appointed by the Labour Administration, in 1924, in its report of 1926, rejected the scheme, and even the minority report of that committee was favourable only to the levy 'provided it were generally approved.' Among other European countries, during the period between the two world wars, Czechoslovakia attempted to launch a C. L., but was not very successful, for the payment of it by instalments practically reduced it to a heavy income tax. Switzerland, in a referendum, rejected a C. L. In Oct. 1937, the It. Gov. imposed a C. L. of 10 per cent on limited and joint stock companies, and a year later the levy was extended to cover private firms earning an income over 10,000,000 lire. A similar experiment was made in Hungary in March 1938, when a large-scale defence plan was announced as being financed by a C. L. on incomes of over 50,000 pengoes (£2000 approx.).

Capital Punishment, punishment by death for crime in conformity with the sentence of a properly constituted tribunal, civil or military. Whatever may have been its origin, whether in feelings of revenge, regularised by the *lex talionis* (the law of 'an eye for an eye and a tooth for a tooth'), or in theories of retribution or deterrence, C. P. is a term opposed to all irregular modes of punishment such as the Amer. 'lynch law,' or any modern survival of 'blood-avengers.' C. P. is so named from the Lat. *caput*, because hanging or decapitation was the most usual mode of C. P. In Rom. law, however, the term included any of the

various forms of *capitis deminutio*, or loss of status, i.e. deprivation of liberty, citizenship, or family rights, as a consequence of certain acts. In more primitive societies, when civil tribunals were far from being of certain authority or possessed of adequate machinery for enforcing their decrees, the punishment of murderers or other homicides was, as in the case of most other kinds of criminals, a matter for self-redress. A modern survival of this is to be found in the Corsican *vendetta*. Subsequently, in England during Saxon times, man-slaying became the subject of compounding by the payment of what was known as *wergild*, or blood-money, the amount of which varied with the degree of importance in the social scale of the murdered person.

History of Capital Punishment.—In pre-Norman times there were various forms of C. P., including hanging, decapitation, burning, and hurling from rocks, after the manner of the Rom. custom of throwing malefactors from the classic Tarpeian Rock. After the Conquest, mutilation seems to have been substituted, and this is the punishment mentioned in the assizes of Clarendon and Northampton (*temp.* Henry II.). The law was variable for some time after that but gradually crystallised into such a condition that C. P. became the common punishment for a great number of crimes, comprising treason and all felonies except larceny and mayhem (wounding). This state of things continued down to 1826, at which time there were nominally no fewer than 200 crimes punishable by death. The law and practice were, however, somewhat divergent, and as Bentham points out in his *Theory of Legislation*, both juries and judges resorted to all manner of subtleties to evade the literal harshness of the law. The strict letter of the common law was also subject to the mitigating influence of the curious privilege of benefit of clergy (*q.v.*). Benefit of clergy exempted clergymen in certain cases from criminal punishment by secular judges. Afterwards the privilege became extended to all, whether cleric or lay, who could read or stumble through the 'neck-verse.' Benefit of clergy was never permitted in cases of high treason or in offences not capital. At the present day in England the only capital offences are treason, murder, piracy with violence, and the crime of setting fire to His Majesty's vessels of war, arsenals, military or naval stores, and ships in the port of London. The sentence of C. P. may also be passed by courts martial in various cases of mutiny, desertion, or sleeping on sentry duty. There had been no execution for treason for a century or more until the case of Roger Casement (*q.v.*). All the old barbarous features of punishment for treason, comprising the drawing of the traitor's body to the place of execution on a hurdle, disembowelling, and quartering the body, have disappeared long ago.

Many countries in the Old and New World still retain the death penalty for treason and murder, and, in some cases,

for other crimes. The general trend of public opinion has not on the whole been averse from the death penalty as a fit sentence for murder at least. In England an attempt half a century ago to abolish it in the case of setting fire to arsenals and ships was defeated. The ferocity of our own law up to 1826 apart from the fact that the letter of the law was frequently ignored, was such as to occasion an outburst of indignation in the writings of Goldsmith and Bentham. In conformity with his general theory of punishments and rewards, that the evil of punishment must not exceed the advantage to the offender of the offence, and that punishment should be exactly and mathematically proportioned to the offence, Bentham would have abolished the death penalty in most cases, retaining it only for treason and murder. Bentham does not appear to have condemned publicity in executions, but rather favoured the idea of the *auto-da-fé*, provided only it were an act of justice, carried out with every solemnity of preparation and ceremony, and not regarded as an act of faith. Bentham was greatly influenced by the writings of Beccaria, and in one passage says that 'the more attention one gives to the penalty of death, the more will he be inclined to adopt the opinion of Beccaria—that it ought to be disused.' In an eloquent passage he conceives that 'the prodigal fury' involved in C. P. reveals an imbecility of soul which sees in the destruction of the convict the most convenient way of securing that he shall no longer be an object of concern to society; and he concludes his words on C. P. by denying the validity of the deterrent theory on the ground that most criminals fear death less than want, and humiliation. Beccaria, in his *Treatise on Crimes and Punishments*, first pub. in 1764, argues against the capital sentence being carried out in any case, denying the right of man so to punish, and maintaining that it is a less efficacious mode of deterring others than the continued example of a living culprit condemned by labouring as a slave to repair the injury done to society. Beccaria's work had the merit of attracting greater attention to the subject of crime and punishment; yet it contains many principles of doubtful value and some deductions that are not sound. Romilly's criticism that Beccaria's admission of the right of human tribunals to inflict certain more severe and effectual punishments than death involves an admission of the right to inflict the less severe penalty of death is almost fatal. The question of C. P. in the United Kingdom was considered by a royal commission, which submitted its report in 1866. The commissioners recommended, *inter alia*, the restriction of C. P. to high treason and murder; changes in the law as to child murder by women; the abolition of public executions, and the institution of varying degrees (as in America) in the legal notion of murder. Only the recommendation as to public executions has been adopted since 1866.

although women are never in practice sentenced to any but the lightest penalties—indeed, are often acquitted—for the destruction of illegitimate children. Since the First World War legislation has been passed in the United Kingdom enabling a judge to avoid a capital sentence on a woman in an infanticide case. Moreover, on Nov. 16, 1938 a resolution was passed by members of Parliament, 114 being in favour, and 89 against, recommending that the death penalty should be abolished for a five-year experimental period. The gov. did not, however, introduce the necessary legislation.

The report of the select committee of the House of Commons on C. P., issued in Dec. 1930, recommended the abolition of the death penalty for an experimental period of five years in cases of trial by civil courts in time of peace and that the substituted penalty should be that which is now attached to reprieved murderers. This report is hardly representative of national opinion, for it was not unanimous, and the six Conservative members of the committee withdrew from the proceedings altogether, through entire disagreement with the draft report of the chairman.

In the proceedings in the Commons on the Criminal Justice Bill in 1948 some 200 members supported an amendment to suspend the death penalty for five years, but the House of Lords struck out the amendment. The gov. then proposed their own amendment to establish two degrees of the offence of murder and to suspend the operation of the death penalty upon murderers found guilty only in the second degree. To constitute murder in the first degree there must be, first, 'express malice or an intention at least to maim and an act which might reasonably be expected to endanger life; and, secondly, the crime must fall into one of a number of categories: murders by poisoning, murders incidental to certain grave crimes, such as rape or robbery; murders of policemen and others in resisting arrest; murders of prison officers by prisoners; and second murders. The period of suspension of C. P. for murder in the second degree remains five years. The murderers relegated to the less heinous class will be predominantly those who under the existing law would be recommended for reprieve. The new clause will not affect the home secretary's power to recommend clemency for murderers sentenced to death. In a White Paper on C. P. presented to Parliament in May 1948 by the home secretary (Cmd. 7419) it is stated that between Jan. 1, 1920, and March 31, 1948, of 267 persons convicted of murder in Great Britain and whose death sentences were commuted to penal servitude for life, 209 were released after detention of five years and over, and 58 after less than five years. The latter category included those who committed murder from merciful motives, survivors of suicide pacts, and those concerned in cases where exceptional circumstances reduced the moral guilt.

Countries in which and Crimes for which Capital Punishment is inflicted.—In Great Britain there are four capital crimes: high treason, wilful murder, piracy with violence, and setting fire to arsenals, dockyards, etc. Broadly, the codes of most of the Brit. dominions and European countries where C. P. still obtains prescribe the penalty for treason and for murder 'with aggravating circumstances.' In New South Wales, the following crimes are also punishable with death: rape, carnal knowledge of a girl under ten years of age, attempt to murder (in various specified ways), and setting fire to a dwelling-house with the knowledge that some person is within. In Victoria, robbery with violence and burglary with wounding are added to the Brit. list. In Canada, under the Criminal Code of 1906, only treason, murder, piracy with violence, and rape are capital crimes, but in 1924 the practice of hanging women was reintroduced after an intermission of a quarter of a century. In Newfoundland, W. Australia, and S. Australia the law is much the same as that of Great Britain; while in the Union of S. Africa, rape is added. In Australia, Queensland abolished the death penalty and New Zealand abolished it in 1941 after remitting all death sentences from 1936 onwards. In India, under the Penal Code of 1860, the list of capital crimes includes waging war, abetting mutiny, murder, attempt to murder by a life-convict, causing the execution of an innocent person by giving false evidence, and dacoity with murder. In Germany under the Republican and Nazi regimes, C. P. was inflicted for murder, criminal uses of explosives, and conspiracy against the lives of the members of the gov. In normal times, death was the sole penalty in Japan for injury or attempted injury to the person of the emperor; causing a foreign country to make war on the empire; and surrendering a fortification, troops, etc. In France extenuating circumstances enable the court to impose a sentence of imprisonment for life instead of the death penalty, and the President of the Republic may also substitute life imprisonment. *Lèse-majesté*, high treason, and premeditated murder are punishable in Hungary by death, but the first-named would seem to be anachronistic since the estab. of a republic; and in Yugoslavia murder is a capital crime, but except when an attempt was made on the life of the sovereign, the penalty was not inflicted for political crimes. C. P. also prevails in Spain and Turkey. A woman was hanged in Hungary for murder in 1931, the last previous execution of a woman in that country being in 1921. In the U.S.A. the position is as follows: Treason against the Federal State is punishable with death, or imprisonment, or a fine; murder in the first degree (equivalent to premeditated) is punishable, under the Federal statutes, with death by hanging, but in various states is also punishable with death by electrocution, or lethal gas, or with life imprisonment. C. P. without possibility

of alternative exists in only five states: Connecticut, Massachusetts, New Mexico, N. Carolina, and Vermont. In the Federal courts rape is also punishable with death by hanging; but in some of the states imprisonment is an alternative punishment. Arson, though also a capital offence under the Federal laws, is punishable with death in Delaware, Alabama, Illinois, N. and S. Carolina, and Virginia, or with life imprisonment in a number of other states. Kansas and S. Dakota have both reverted to the use of the death penalty.

Countries where Capital Punishment has been abolished.—C. P. was abolished in Argentina by the Penal Code of 1922.

In Brazil, it was abolished in 1891, when penal servitude for thirty years was substituted; though it may still be inflicted under the Constitution for certain crimes committed when the country is at war. Other S. and Central Amer. countries in which imprisonment for varying terms has been substituted for the death penalty are Columbia, Costa Rica, Dominican Republic, Ecuador, Honduras, Panama, Peru, Uruguay, Venezuela, and in a number of the states of Mexico. In the Netherlands it was abolished in 1870, but it had been discontinued in practice long before the statute of that year; imprisonment for life, which generally means for twenty years, is substituted, and solitary confinement is inflicted for the earlier portion of the term. In Italy after C. P. was abolished in 1889, imprisonment for life was the punishment for murder with premeditation, parricide, etc.; but under the Fascist regime C. P. was reinstated. The new It. constitution provides for the abolition of the death penalty. In Norway, C. P., though still prescribed for certain cases of crimes committed when the country is in a state of war, was abolished by the Criminal Code of 1905. Portugal abolished the death penalty in 1867; Sweden by a law of June 1921, when penal servitude was substituted; (in Sweden during the years 1932-47 twenty prisoners convicted of murder were released after periods of detention averaging fourteen years); and Switzerland by the Federal constitution of 1874, though in 1879 an amending Act gave the cantons liberty of action in the matter since when ten have reintroduced the penalty. In 1942 the death penalty was abolished for the whole of Switzerland, and life imprisonment is laid down for murder. In Belgium, Denmark, and Finland C. P. exists in theory, but is not actually carried out. No one has been executed in Belgium since 1886, persons under sentence of death being invariably reprieved and sentenced to life imprisonment; in Denmark no execution has taken place for the past forty-six years, though in theory it may be inflicted for high treason and murder; while in Finland no execution had taken place for almost a hundred years prior to 1918, in which year many death sentences were carried out under martial law during the insurrection of the Finnish Communists. The new code for Czecho-

slovakia, replacing the Austrian and Hungarian laws for the constituent countries, made no provision for C. P. In 1947 Russia declared that the death penalty would no longer be used and that 25 years' imprisonment would be the alternative. In the U.S.A. C. P. has been abolished in Maine, Michigan, Minnesota, N. Dakota, Rhode Is. (since 1852), and Wisconsin (since 1853). In Iowa it was abolished in 1873 and reinstated, and in Maine it was abolished, reinstated, and again abolished. It was also abolished in Washington, but a special verdict imposing the death penalty may be given by the jury.

See J. F. Stephen, *History of the Criminal Law of England*, 1883; Russell, *On Crimes*; F. Pollock and F. W. Maitland, *History of English Law*, 1895; E. Bowen-Rowlands, *The Judgment of Death*, 1924; E. R. Calvert, *Capital Punishment in the Twentieth Century*, 1927; and the Report of the Select Committee of 1929.

Capitanata, anct. prov. of the kingdom of Naples, Italy, now called Foggia (*q.v.*). It was bounded on the N.E. by the Adriatic, on the N.W. by the dist. of Samnio, on the S.W. by Principato Ultra, and on the S.E. by Basilicata. It is an agric. dist. Lemons, oranges, capers, oil, terebith gum, cheese, cattle, and ponies are exported.

Capitation Tax, see POLL-TAX.

Capito, Gaius Ateius, Rom. jurist of the time of Augustus. He became consul suffectus in A.D. 5, and curator aquarum publicarum in 13, and *d.* in 22. He studied law under Offilius, and was a rival of Labeo. C. founded the Sabinian school of lawyers in opposition to the Proculian school of Labeo. Only fragments of his works remain.

Capitol, **Capitolium**, or **Mons Capitolinus**, name given to the temple of Jupiter Capitolinus and the other buildings, such as the citadel and the Tabularium, built by Quintus Lutatius Catulus in 78 B.C., in which the public archives were kept, which stood on the Capitoline Hill (Lat. *mons capitolinus*) in anct. Rome. The temple was founded by Tarquinius Priscus about 600 B.C., and dedicated in 507 B.C. It was injured by fire during the civil wars of Sulla's time in 83 B.C., rebuilt, but destroyed again by fire in A.D. 69 and A.D. 80. It was again restored by Domitian. It formed the central point of the religious life of Rome, containing as it did the Sibylline books. To it generals went to make thank-offerings to the gods for triumphant campaigns, and consuls to record their vows, while the senate often met on the hill. The temple was surrounded by minor buildings, and by an esplanade on which were statues of gods and heroes. The steepness of the hill rendered it an admirable natural fortress. Near the temple was the Tarpeian rock from which traitors were thrown. On the N.E. peak—the Arx—stood the temple of Juno Moneta. In the Middle Ages all the buildings had fallen into ruins, and in 1534 Michelangelo was commissioned by Pope Paul III. to draw up plans for new buildings on the site.

The C. now consists of a square, containing a statue of the Emperor Marcus Aurelius, the Campidoglio, built by Michelangelo, but only an inferior example of his work, the Senatorial Palace (1579), the Capitoline Museum (1644), and the church of S. Maria in Ara Coeli. More than twenty imperial provincial cities built their Cs. on the model of that at Rome, the oldest being at Capua, and the most modern that at Washington. The C. of Toulouse still exists, and there are ruins at Brescia and Pompeii.

Capitularium (Capitularies) (Lat. *capitulum*, chapter, from *caput*, head), name applied to the constitution or laws promulgated by the Frankish kings. These laws were classed under different chapters, called capitularies. The first collection of these was pub. by Ansegisus, abbot of St. Wandrille in Fontenelle, in the reign of Louis the Pious. The best modern ed. is that of Boretius, *Monumenta Germaniae historica*, etc., Legum sectio II., vols. I. and II., 1883-97.

Capitulation, in time of war, an agreement for the surrender to a hostile armed force of a fortress, tn., piece of ter., or body of troops naval or military, with the detailed conditions under which the surrender is to be made. The term used to be restricted rather to the surrender of a beleaguered garrison. The agreement by which an army or a large div. of troops surrendered to a superior force or engaged to evacuate the ter. which it occupied when its strength and condition were yet such as to make itself respected by the enemy, constituted a set of circumstances known as a convention. Such was the convention of Cintra, made at Lisbon, between Gen. Dalrymple and the Fr. general, on the departure of the Fr. army from Portugal in 1808. When the provisions and ammunition of a garrison or force are nearly expended, and no chance remains of the siege being raised or the force succoured, the governor of the besieged town, or commander of the defeated force, is justified in entering into an agreement with the enemy respecting the terms on which he consents to surrender; and by the rules of war he is entitled to obtain an honourable C. It is to be observed, however, that if he should postpone surrender proposals till his provisions are entirely exhausted, the enemy may refuse to grant terms, and he can then only surrender at discretion. The conditions of C. vary greatly, and are necessarily determined by the circumstances of the case and the degree of generosity or patience of the victors. From the nature of the circumstances of most Cs., no previous instructions are or can be required from the capitulating party's gov. before the final determination of the conditions of C. The conditions generally include the surrender of the arms and military stores of the garrison or other capitulating body to the victors; the officers and troops retain only their private property, but are, or were, allowed to march out of the fortress or tn., or to their place of destination, with the honours of war, that is, with

drums beating and colours flying. Other very usual conditions are, or were, freedom of religion and security of private property. It must be admitted, however, that the rules of warfare on which an ordered C. depends do not always find a place in modern warfare as exemplified in the Second World War. Where a C. is made by an officer who is not invested with the proper authority, or who has exceeded the limits of his authority, the C. is called a sponson. Article 35 of The Hague Convention of 1899 requires a sponson to be confirmed by the express or implied ratification of the state or commander-in-chief on the side of the officer accepting the surrender, coupled with the consent of the other side to accept the ratification, in order to be binding. It is an implied term in the C. of a place that the capitulating force shall not destroy its fortifications, stores, or ammunition after the agreement has been concluded. *Authorities:* T. E. Holland, *The Laws of War on Land*, 1908; W. E. Hall, *Treatise of International Law* (ed. Higgins), 1924; W. Wheaton, *Elements of International Law* (ed. Wilson), 1936.

Capitulations denote the arrangements and confirmatory treaty by which foreigners are granted immunity from the civil or criminal jurisdiction of the state making such C. Such arrangements and treaties necessarily constitute a derogation from the inherent sovereign rights of an independent state, and are only resorted to as against states which can hardly be said to be sufficiently advanced in their civilisation to observe the general rules of international law. An instance of such C. is furnished by the arrangements made at various times since 1535 between the various powers and the former Turkish Porte. Even before the First World War, signs were not wanting that the era of C. was ending. Certain countries, such as Morocco and Tripolitania, had passed under the control and jurisdiction of great powers like France and Italy, whose laws were deemed adequate to the needs of all European nationals. Then other countries, of which Japan is an outstanding example, reached the full status of a great power, which would allow no derogation of their sovereignty. The First World War intensified national feeling, and few nations to-day would, without strong protest, grant capitulatory rights to foreigners. In large part, too, the willingness of a nation of 'backward people' to grant capitulatory privileges depended on the prestige attaching to a united Europe. When this unity was shattered by the First World War the 'backward' countries were encouraged to resist these encroachments on their sovereignty. Also the series of peace treaties at the end of the war deprived the nationals of the Central Powers of these rights, and the Soviet Union in some cases voluntarily abandoned these privileges. The present position is that so-called European nations have these rights and some have not. By the treaty of Lausanne, 1923, Great Britain gave up her C. in Turkey, and she

abandoned them in Albania in 1928. C. in some form or other for certain European powers continued, however, to exist in China, Egypt, Morocco, and Iran until the Montreux Convention of 1937. By the terms of this convention, which came into effect the following year, C. were abolished, and the former consular courts were replaced in the countries concerned by mixed tribunals set up for a period of transition of not more than twelve years.

Capitulum (Lat. dimin. of *caput*, head), botanical name for a particular form of racemose inflorescence in which the main axis is short and usually disk-shaped, and is covered with sessile flowers. It is typical of the Compositæ, e.g. the daisy and dandelion. This C., or head, is vulgarly confused with a single flower.

Capiz, prov. and city in the is. of Panay, belonging to the Philippines. The city is situated on the N. coast, on a riv. large enough for small steam craft. The climate, though hot, is considered healthy. Sugar and rice are cultivated, and to a lesser extent tobacco, cacao, and Indian corn. The manu. of alcohol, from the fermented juice of the nipa-palm, is extensively carried on, and also cotton and hemp weaving. The fisheries are important. Pop. of city 16,000; of prov. 293,000.

Cap Martin, pine-covered promontory which forms the W. extremity of Mentone, in the dept. of Alpes-Maritimes, France. The prin. feature is the huge hotel which is situated on the cape.

Capnomor, colourless volatile oil found in wood tar from which, with other products, it was first extracted by Reichenbach. It smells something like ginger, and burns with a sooty flame.

Capodistria, tn. of Istria, within the ter. of Trieste. It is a seaport tn. about 9 m. from Trieste, and is situated on an is. in the gulf of Trieste, the is. being connected with the mainland by means of a bridge. Its chief products are oil and wine. It also trades in salt, and its fisheries are of considerable importance. Pop. 13,000.

Caporetto, Battle of, battle of the First World War, which took place on the It. front from Oct. 24 to Nov. 18, 1917, resulting in a defeat of the It. armies. The battle, which was fought over a great area from the Carnic Alps to near Venice, was so named from the fact that the defeat began with the loss of C., a key position, on the Isonzo R., near Monte Nero, a loss occasioned by treachery as well as by military pressure, and so serious that it exposed first one and then another It. army to the risk of being outflanked and enveloped. In Oct. 1917 the main It. armies were still struggling with the Austrians in the broken country along the Isonzo. One It. army was on the Carso plateau fighting for the road to Trieste, another, based on Cividale and Gorizia, was attacking further N., and a third, still further N. on the Upper Isonzo, E. of C., on the Bainsizza plateau. It was then that Ludendorff (q.v.) planned a combined Ger. and Austrian offensive,

with the assistance of large forces of guns and men released from the E. front by reason of the Russian revolution. Ludendorff's strategy was to strike at the less tried It. troops on the Upper Isonzo so as to cut the communications of the It. armies both there and on the Carso and then to outflank them, so as to bring about a major disaster to the entire It. military machine and, by wiping out the It. front as an effective theatre of allied resistance, pave the way for a final offensive on the Fr. and Flemish front. On Oct. 24, Austro-Ger. artillery bombarded the Tolmino positions, outranging the It. guns. The Ger. troops then broke through and crossed the riv., whereupon two It. corps surrendered, thereby exposing C. and rendering It. forces southward liable to be outflanked. The It. retreat from the Bainsizza and Carso plateaux became almost a rout, and by Oct. 28 the Austro-Ger. forces had captured over 50,000 men and 500 guns. Then Cividale and Gorizia fell, and shortly afterwards Udine, the It. H.Q., and the Austro-Ger. armies were strongly entrenched in It. ter. on the Tagliamento R., the number of prisoners rising to nearly 200,000 and the guns captured to 1500. This resulted in the main It. armies withdrawing from the Isonzo and those defending the frontier through the Carnic Alps being driven from the mt. passes into a retreat by the valleys leading to the Piave and Tagliamento Rs. The retreat continued for days during Nov. The Austro-Ger. armies crossed the Tagliamento at various points, and, when Livinza was abandoned by the Its, they became masters of the line of the Piave (Nov. 18). This ended the battle, for Gen. Cadorna (q.v.) was superseded by Gen. Diaz, and strong forces of Fr. and Brit. guns and infantry arrived to strengthen the It. defence; while any further advance by the opposed forces, during the reorganisation of the allied resistance, was prevented by the flooding of country between the Piave mouth and Venice, thereby averting the threat to that city. C. is in Yugoslavia. See R. Cadorna, *La Guerra alla Fronte Italiana*, 1921.

Cappadocia, dist. in Asia Minor differing very much as regards its boundaries at different times during its hist. It was originally a prov. under Persian rule, and included all the N.E. portion of Asia Minor, bounded on the W. by the R. Halys and on the S. by the Taurus. Later on, while still under the rule of Persia, it was divided into two parts or satrapies, the N. one being called C. ad Pontum, afterwards shortened to Pontus—also called C. Minor—and the S. part C. (C. Major). In A.D. 17 C. became a Rom. prov. under Tiberius, and after this time the dists. of Melitene and Catalonia were added to it. Its two chief riva. were the Halys and Melas.

Capparidaceæ, dicotyledonous order of herbs or shrubs found in the tropics and warmer countries. The flowers are hermaphrodite, isobilateral, usually growing in racemes; the sepals are in two whorls of two the petals are cruciform and four

in number, the stamens are either four or more, the carpels are usually two in number, superior, syncarpous, and are borne on a gynophore. The fruit is a silique or a berry. The order resembles the Cruciferae in many respects, but few species are economically useful. The flower-buds of *Capparis spinosa*, which grows in S. Europe, are marketed under the name of capers.

Cappel, vil. of Switzerland. In the canton of Z. rich. 4½ m. N. of Zug, and 10 m. S.S.W. of Z. rich. It was here that the reformer Zwingli met with his death in the conflict of 1531, and a monument was erected to his memory in 1838. There is an old Cistercian convent of 1185.

Cappelletti, see CAPULETS AND MON-TAGUES.

Capponi, Gino, Marchese (1792-1876). It, historian and statesman, member of an illustrious Florentine family. He went to Vienna in exile with Ferdinand III., grand duke of Tuscany, but returned to Florence when the duke was reinstated. He devoted himself to travel in foreign countries and to study. Eng. institutions impressed him, and on his return to Italy he strove to improve the condition of the It. people. On the unification of Italy he became senator and president of the Historical Commission for Tuscany, Umbria, and the Marches. His prin. work is *Storia della Repubblica di Firenze*. He founded the *Antologia* on the lines of *Edinburgh Review*.

Capra, genus of Bovidae, including goats and ibex, distinguished by having both sexes with flattened horns and the males with a beard and a strong odour. The species inhabit the mts. of Europe and Asia. *C. ibex* is the Swiss steinhok, *C. pyrenaica* the Sp. ibex, and *C. agagrus* the wild goat of Persia. The last species produces 'bezoar stone' in its stomach.

Capraria, see CABREIRA.

Caprera, is. of Italy, situated to the N.E. of Sardinia, from which it is divided by a strait. It is 6 m. long, 2 m. wide, and about 6700 ac. in area. There are pasture lands and cornfields. Garibaldi had a residence here. Pop. 500.

Capri, is. at the extreme S. of the bay of Naples opposite Cape Campanella, about 9 m. in circumference. It is composed almost entirely of calcareous rocks, and the scenery is beautiful. Solaro commanding an extensive view, is the highest point in the is. C., the cap., is situated on one of the accessible spots on the is., and possesses a cathedral. The other tn. in the is., Anacapri, is reached by a narrow road cut in the rocks. N. of this tn. is the 'blue grotto,' for which the is. is famous. It is a cavern entered from the sea, and obtains its name from the reflections of blue seen everywhere. The Rom. Emperor Augustus resided in C., and his palaces were afterwards enlarged by Tiberius. The remains of the Villa Jovis, one of the largest built by him, are still in existence. It is said that Tiberius lived a life of crime and debauchery here, and that from a high rock on which one of his palaces was built he used to hurl people into the sea. The

chief products of the is. are wine, oil, oranges, and figs. Pop. 7500. During the Second World War the Gers. in their occupation of Italy left the is. in the hands of an It. garrison, with whose co-operation C. fell to the Allies on Sept. 18, 1943.

Capric Acid, or **Decolic Acid** ($C_{10}H_{20}O_4$), is found, together with caprylic and caproic acids, in butter, and also in coco-nut and fusel oils. It forms slender needle-like crystals, and has a faint odour somewhat like goatskin.

Capriccio, in music, a name which has been given at different times to different kinds of musical compositions. Thus it has been applied to a composition written not strictly according to rules of form and figure; to a piece composed on original subjects; to a brilliant transcription of one or more subjects by other composers. In the seventeenth-century it was applied to a kind of free fugue for keyboard. Those of the last century were studies with one figure predominating. Sev. examples of Mendelssohn Cs. differ only slightly from regular sonata or rondo forms. A C. is generally in quick tempo; but there is no essential quality except the general one denoted by the name (Scholes). Often the term 'fantasia' could be substituted. As a performing instruction, *a capriccio* means according to the 'caprice' of the performer.

Capricorn, Tropic of, S. of the two tropics, or one of the two parallels of terrestrial lat. corresponding to the celestial tropics. See TROPICS.

CAPRIFOLIACEAE: LILDER

Capricornus (the Goat), S. constellation which forms the tenth sign of the zodiac, usually represented by a sign consisting of the forepart of a goat and the hinder part of a lion. It marks the winter solstice and was regarded by the ancients as a precursor of good fortune. It contains no large stars, the most important being only of the third magnitude.

Caprification, anct. custom still practised in the Levant for the maturation of figs. It consists in planting wild fig-trees among trees bearing edible figs, grafting them on the cultivated plants or merely hanging the branches upon them. The *Caprificus*, goat, or wild fig, bears male

flowers, and the cultivated fig chiefly female, so that by introducing the former to the latter pollination may be effected by means of wasps and parasitic insects.

Caprifoliaceæ, monocotyledonous family of trees and shrubs, found in temperate countries. The flowers are hermaphrodite, actinomorphic, or zygomorphic, usually pentamerous, have epipetalous stamens, an inferior gynoecium consisting of two to five inferior syncarpous carpels with numerous ovules; the fruit is a berry, drupe, or capsule. The leaves are opposite and usually exstipulate. Many species are found in Britain, e.g. *Sambucus nigra*, the elder; *Viburnum Opulus*, the guelder-rose; *Lonicera Periclymenum*, the honeysuckle; and *Synphoricarpos racemosus*, the snowberry. *Diervilla* (*Weigelia*) is an ornamental shrub, often cultivated in gardens. (See illustration, p. 257.)

Caprifolium, genus of twining shrubs of the family Caprifoliaceæ (q.v.). Of this genus, the honeysuckle (q.v.) (*C. Periclymenum* or *Lonicera Periclymenum*) is the most familiar Brit. species. The *C. italicum* or perfoliate honeysuckle, sometimes called *Lonicera C.* resembles the Dutch honeysuckle, which is valued for its fragrance and early flowering. A native of central and S. Europe and naturalised in England, it differs from *C. Periclymenum* in having its upper leaves united at the base so as to form a kind of cup, and it bears whorls of flowers in the axils of these leaves as well as at the extremity of the shoot. Other cultivated species are *C. flavum*, a native of America, which has fragrant yellow flowers; the *C. sempervirens* or trumpet honeysuckle, an evergreen twining shrub also a native of America; and the *C. cilicium*, rather like the *C. italicum*, but with more obtuse and downy leaves; it is the kind most cultivated in France.

Caprimulgideæ, family of nightjars or goatsuckers, consists of coraciiform birds with soft, owl-like plumage. See GOATSUCKER; WHIR-POOR-WILL.

Caprino, tn. of Italy in the prov. of, and 10 m. W.N.W. from the tn. of, Bergamo, with manuf. of silk. Pop. 7500.

Caprivi de Caprera de Montecuccoli, Georg Leo, Graf von (1831-99), Ger. soldier and statesman. He fought in the campaigns of 1864 and 1866, and in the Franco-Ger. war of 1870 became chief of staff to the 10th Army Corps; he distinguished himself in the battles of the Loire. In 1884 he was made head of the Admiralty, and in 1888 commander of the 10th Army Corps. He succeeded Bismarck in 1890 as chancellor and foreign minister. He brought about a number of negotiations with the Eng. in S. Africa; these were on the whole advantageous to his country, though the colonial party attacked him for relinquishing claims to Zanzibar in exchange for Heligoland. C. passed the Army Bill in 1893 and retired in 1894.

Caproic Acid, or **Hexole Acid** ($C_6H_{12}O_4$), acid found in butter and coco-nut oil. It is obtained from the latter by saponification with caustic potash and distillation

with dilute sulphuric acid. It is a fermentation product of butyric acid. It is an oily liquid of unpleasant odour.

Capros, genus of boar-fishes, occurs in the Atlantic and Mediterranean in rather deep water. *C. aper* is not unlike the dory, but its mouth is more protracile, the body is covered with scales, and the dorsal spines lack long filaments. This species is about 6 in. long, a pale carmine colour above, and silvery-white beneath.

Capsella, genus of N. Crucifereæ, known in Britain chiefly from *C. bursa-pastoris*, the shepherd's purse (q.v.).

Capsicum, genus of Solanaceæ, which is of economic importance on account of the pepper obtained from some of the species. The shell of the fruit is fleshy, coloured, and contains a pungent principle which also exists in its seed. Both the fruit and the seed of different species are therefore valuable as a condiment, and are used in seasoning food and in the preparation of pickles. *C. annuum*, a weedy plant found wild in S. America and the W. Indies, is greatly cultivated, and its fruit and that of *C. longum* are known to us as chilli or red peppers; dried and ground they form cayenne pepper. *C. frutescens* is an E. Indian shrub with a small fruit, which is called goat-pepper.

Capstan (Fr. *cabestan*; Lat. *capistrum*, a halter; Sp. *cabestrante*), machine used on a ship for manipulating weights, such as anchors. Cs. were originally made of wood, but are now generally made of iron. The axis of this appliance is vertical, differing in this respect from a windlass, which has a horizontal one. The barrel, round which the rope is coiled, is larger at the top and bottom than in the centre, thus allowing the cable to be drawn towards the centre. It is also ridged so that a larger amount of rope may be wound at one time. The drumhead, which is fixed above the barrel, has a number of square holes in it, and the C. bars project from these holes like the spokes of a wheel. At the base of the C. are placed the pawls, or short bars of iron, bolted to the deck by means of the pawl rim. These are to prevent any recoil of the rope. The usual method of working Cs. at the present time is by machinery rather than by hand. Cs. are also used in railway goods yards for shunting trucks.

Capsule, name applied in botany both to dry dehiscent (splitting) fruits formed from more than one carpel and to part of the sporogonium of the Bryophyta, or liverworts and mosses. In the latter case the C., or theca, gives rise to spores, and thus is of importance in the asexual generation of the plants. The capsular fruits are developed from ovaries of which the carpels are fused, and there may be one loculus (chamber) or more than one; the dehiscence, or splitting open, is performed in various ways, and ought to be noted. If the splits run down the midrib of the carpels, e.g. iris, it is called *locuticidal*; if the fruit splits into its various carpels, e.g. rhododendron, *septicidal*; if the outer wall breaks and the seeds remain in the middle, e.g. thorn-

apple, *septifragal*. In the poppy the dehiscence is *porous*, the seeds falling from holes at the top of the fruit, and in the pink the fruit dehiscence by means of teeth. The Cs. of the scarlet pimpernel and the plantain split open by means of a lid; they are examples of *pyridia*.

Capsules, Suprarenal, see SUPRARENAL GLANDS.

Captain, title found in almost all languages to denote a chief of a small band of men (from Lat. *caput*, head, chief). This name is especially applied to a grade officer in the army or navy.

Navy.—Strictly the commanding officer of a man-of-war or of a frigate carrying at least twenty cannon. In the Brit. Navy and most others the C. is next in rank to the rear-admiral or commodore (almost corresponding to an army colonel). This rank was first clearly defined in the Brit. Navy 1747, originating probably from the time when navigating and fighting forces on war vessels were combined. In earlier times the 'master' had charge of the navigation and the fighting was done by soldiers under their military officer. A C. in the R.N. is responsible for military gov., navigation, and equipment of his ship, for the crew's discipline and health, and for neglect of duty in inferior officers. *Post-C.* merely means full C. (from the time when Cs. of large vessels were 'posted' on the permanent list of Cs., from among whom admirals were chosen). A *flag-C.* commands the admiral's ship. The C. of the fleet is a temporary official appointed by the Admiralty to keep up the discipline of the fleet. He acts under a commander-in-chief as adjutant-general of the force, and wears the uniform of rear-admiral. The title is applied by courtesy to all who command ships at sea, whether they hold that rank or not. It is also given to the chief sailor of particular gauges of men in charge of a certain portion of the ship's company, as C. of the 'top,' 'forecastle,' 'hold,' 'gun,' etc.

Military.—In the Brit. Army the commanding officer of a company, troop, or battery, ranking between a major and a lieutenant. This grade is the third in the order of promotion. Formerly the title of an officer of high rank (like the modern colonel), it is now restricted only to the head of a company or squadron. He is responsible for the arms, clothes, discipline, welfare, and efficiency of his unit. The C. also keeps all accounts and reports of the company. He selects the first sergeant, and recommends non-commissioned officers. The title *C.-general* meant chief commander of the army or militia, and is still so used in Spain; also for the governor of Sp. provs. or colonies.

'**Captain**,' ship name in the Brit. Navy closely bound up with Nelson's battles. But the best-known C. is that of the disaster of Sept. 7, 1870. This vessel was a turret ironclad of 6950 tons built in 1869; it capsized in a violent storm off Finisterre and was lost. The first ship of this name was built in 1678, and the following are important battles in which

a C. figured: Beachy Head, 1690; Barfleur, 1692; the battle off Cape Passaro, 1718; Minorca, 1756; Loughsbeg, 1758; the Quebec expedition, 1759; Toulon, 1793; Uthman's battle off Genoa, 1795; Hyères, 1795; at Corsica, 1795; Cape St. Vincent, 1797; Copenhagen, 1807; and Martinique, 1809.

Capua, tn. of Italy in the prov. of Caserta, about 17 m. from Naples. It is situated on the R. Volturno, and is a fortified tn. guarding the approach to Naples. Its fortifications were constructed by Vauban, and were enlarged in 1855. The soil round C. is noted for its fertility, producing quantities of fruit. This tn. is the see of an archbishop, and possesses a cathedral, and although a large part of the latter has been reconstructed, some very anct. columns still remain at the entrance. The church of the Annunziata is also noteworthy. The modern C. was built in the 16th century near to the site of the old city of Casilinum, but the anct. tn. of C. was about 3 m. away from this, standing on the site of the modern Santa Maria di Capua. The old tn. was founded by the Etruscans, but in the fifth century B.C. it was conquered by the Samnites. After the battle of Cannæ, 216 B.C., it went over to Hannibal, but was again taken by the Romans four years later. In the fifth century A.D. it was captured and destroyed by Genseric (q.v.) but evidently soon rebuilt. It was eventually destroyed by the Saracens who invaded Italy in A.D. 840. The ruins of its amphitheatre are among the oldest in Italy. Pop. 13,000. During the Second World War the city was bombed by the Allies in Aug. 1943, and subsequently captured from the Gers. by the Allied Fifth Army on Oct. 7, 1943. The cathedral was almost completely destroyed, but part of the apse and side chapels survived, and the bell-tower was slightly damaged. The Rom. bridge was completely destroyed but not much damage was done to the medieval outworks built by Frederick II. The library of the Campano Museum was also badly damaged.

Capuana, Luigi (1839-1915), It. novelist, playwright, poet, and critic, b. at Mineo in Catania. As dramatic critic to the *Nazione* of Florence and other periodicals he wrote the articles which form the volumes called *Studi di letteratura contemporanea, Libri e Teatro*, etc. But C. was at his best as a story-teller and novelist, and particularly when dealing with the world of his infancy and youth. Many of his novels and tales are known in trans. in England, France, Germany, and Russia. Among his best works are *Profil di donne* (1877); *Giacinta* (1879); *Il Profumo* (1890); *L'usciana* (1894); *Il Marchese di Roccarverduca* (1901).

Capuchin Monkey, name applied to either the whole genus *Cebus*, or sapajous, or else specifically to the individual *C. capucinus*, the weeper. A native of Guinea, it is distinguished by having the hair on the crown and back part of the head black, resembling a monk's hood or cowl, the remainder of the body

being greyish. The genus consists of monkeys which have a completely hairy tail, and a well-developed thumb, and the species are not woolly. They are found wild in S. America and are frequently kept in captivity, especially by organ-grinders. Their diet is chiefly vegetable, but they do not refuse insects and caterpillars.

Capuchins, order of friars in the Rom. Catholic Church, originally a branch of the Franciscans. It was founded by Matteo di Bassi in 1520, who, returning to what he believed to be the true habit of St. Francis, grew a beard, went barefoot, and wore a pointed hood (*capuche*) from which the order takes its name. In 1619 the C. became an independent order. They are numerous, wear a brown habit, and are occupied mainly in missionary labours.

Capulets and Montagues, Eng. names of two legendary noble Veronese families, the Cappelletti and the Montecchi, famous for their rivalry, their hereditary hatred, and bitter feuds. Their story is bound up with the It. traditions of the Middle Ages; both families belonged to the Ghibelline party, and they are referred to by Dante (*Purgatorio*, canto vi.). Shakespeare immortalised them in *Romeo and Juliet*.

Capus, Vincent Marie Alfred (1858-1922), Fr. dramatist and novel-writer, b. at Aix in Provence. He received the education of an engineer, but never followed the profession. His first novel, *Qui perd gagne*, appeared in 1890; it was followed by *Faux Départ* (1891); *Monsieur rent rire* (1893); and *Années d'aventures* (1895). His best-known plays are *Brigol et sa fille* (1895); *Innocent!* (in collaboration with Alphonse Allais) (1896); *Rosine* (1897); *La Veine* (1901); *La Châtelaine* (1902); *Les Deux Écoles* (1902); *Le Beau Jeune Homme* (1903); *Un Ange* (1909); and *L'Aventurier* (1910). C.'s works are pervaded by an optimistic fatalism; they are highly amusing and in general, reflect the life of Paris of his time.

Capybara, or **Carpincho** (*Hydrocherus capybara*), species of rodent of the Caviidae, or cavy family; also known as water-hog. It is the largest rodent in existence, being sometimes 4 or 5 ft. in length; the ears are small, there is no tail, the hair is rough. The anterior limbs are four-toed, while the posterior are three-toed, and all the digits are webbed, with hoof-like nails. It is an aquatic animal and does not move swiftly on land, but is a good swimmer and diver. See **CAVY**.

Caraballos Occidentales, range of mts. in the is. of Luzon in the Philippines. They extend in a northerly direction from the gulf of Lingayen to Mayraira Point. The highest peak is Mt. Data, 7364 ft. The range is complex in character, with a central ridge of spurs.

Carabidae, or ground-beetles, form a family of coleopterous insects, many of which are large and adorned with brilliant metallic colours. They are terrestrial, and few of the Brit. species are capable of flight. About 13,000 distinct members of the family are known to exist. The

larvæ destroy many smaller insects and worms.

Carabine, see **CARBINE**.

Carabineers, or **Carbineers** (from Fr. *carabinier*, soldier armed with a carbine), formerly the name given to all regiments of light horse. Their function was to act as skirmishers and harass the enemy. The name was abolished in the Fr. Army in 1870, and the 6th Dragoon Guards in the Brit. Army obtained the appellation of the C. See **DRAGOON GUARDS**.

Carabobo, state of Venezuela, bounded on the N. by the Caribbean Sea. The prin. port is Puerto Cabello, and Valencia is the chief tn. About 20 m. to the S.W. of the latter place is the small vil. of C., where a battle took place in 1821. Coffee, sugar, and cacao are grown. Pop. 147,000.

Carabus, typical genus of the family Carabidae (*q.v.*), represented in Britain, e.g. by *C. violaceus*, a metallic-coloured beetle. Some species are vegetable feeders, but others eat carrion, and some will attack living snails.

Caracal, tn. of Itumania, in the prov. of Wallachia, 95 m. W. of Bucharest. Its name is derived from the Emperor Caracalla, who in 217 built a tower there, the ruins of which still remain. Pop. 15,000.

Caracal, species of lynx found in Africa and S.W. Asia. It is a reddish-brown, with white under-parts and two white spots near each eye. The ears terminate in a long tuft of black hair. It is savage and powerful. The skin is made into coats by the Kafirs.

Caracalla Marcus Aurelius Antoninus Bassianus (186-217), Rom. emperor, eldest son of Septimius Severus; given the nickname of C. from his introduction of the long Gallic hooded mantle. He accompanied his father to Britain (208-11), and in 211 became joint emperor with his brother Geta, whom he murdered, thus becoming sole emperor (212). Amongst the friends of Geta who also perished was Papinian, the jurist. His reign was a series of cruelties and extortions. His 'Constitutio Antoniana' extended full citizenship to all free inhab. of the empire, merely so that he might get money from the provs. C. was murdered on a plundering expedition against the Parthians, at the instigation of Macrinus, who succeeded him. He built at Rome the Thermæ Caracallæ or Antoniniane, and the triumphal arch of Septimius Severus. See Gibbon's *Decline and Fall*, chap. vi., Meister's *Dissertatio de Caracalla*, 1792.

Caracara, or **Carancho** (*Polyborus tharus*), carrion-hawk of the family Falconidae, and common to America. The bird is a powerful flyer and a good walker. Its nest is sometimes built in trees and sometimes on the ground, and the eggs are three or four in number. It feeds on carrion and also on young animals which it captures alive.

Caracas, tn., the cap. of Venezuela. It lies in a vale of the Andes not far from its port, La Guaira. The soil is fertile, the water supply good, and the climate healthy, owing to its being about 3000 ft.

above the sea level. It has broad and well-built streets, while among its notable buildings are the cathedral, univ., gov. buildings, museum, and library. C. has been sev. times shaken by earthquakes, and that of 1812 destroyed 12,000 of the inhab. It is not a large manufacturing city, but is an important commercial centre. It was burnt down by the Eng. in 1596. Pop. 267,000; with suburbs, 377,000.

Caracci, or **Carracci**, name of three It. painters who founded the 'eclectic' school of painting in Bologna in the sixteenth century. A sonnet written by Agostino makes clear their ambition; they were to combine Michelangelo's power, Titian's 'truth and nature,' Correggio's 'purity of style,' and Raphael's symmetry. This movement was a reaction against the artificial mannerisms which had sprung up in the declining art of Italy; close observation of nature was to be a fundamental principle of the eclectic painters.

Ludovico Caracci (1555-1619) was the founder of the school, but finding that he could not carry out his plan without help, he persuaded his two nephews, **Agostino** (1557-1602) and **Annibale** (1560-1609), to join him. The three opened an academy in Bologna, which they maintained together for three years. Agostino, who had prepared himself by study under Pontana and then in Parma and Rome, was esteemed as an engraver as well as a painter. Annibale left Bologna at the invitation of Cardinal Odoardo Farnese, who commissioned him to decorate his palace in Rome. Here Agostino joined him and assisted in the work till the two brothers quarrelled and finally separated. 'Susannah and the Two Elders,' in the National Gallery, London, is a fine example of Ludovico's work. Agostino's masterpiece is his 'Communion of St. Jerome' (Bologna), while Annibale's work is well represented by 'Silenus gathering Grapes' (National Gallery).

Caraccioli, name of an ant. noble Neapolitan family, the most distinguished members of which were Gianni, Marino, Domenico, and Francesco.

Gianni Caraccioli (1480-1550), prince of Melfi and grand seneschal of the kingdom of Naples. He was on the Fr. side (except for a short interval) after the conquest of Naples by Charles VIII. For his gallant defence of Luxemburg in 1543, Francis I. rewarded him with the rank of marshal.

Marino Caraccioli (1469-1538), cardinal and statesman, created duke of Milan by Charles V.

Domenico Caraccioli (1715-89), statesman and economist; ambas. successively at Turin, Paris, and London. He d. as viceroy of Sicily.

Francesco Caraccioli (1748-99), admiral. He served in the Brit. Navy, then had command of a Neapolitan squadron. In 1798, when Naples fell into the hands of the Fr., he entered the service of its new Gov. After the battle of the Nile the coast of Naples was drawn into the war against France and the king and queen of Naples took refuge in Palermo under the

protection of Nelson. When Suwarrow drove the Fr. out of Italy again, the king and queen re-entered Naples on the faith of a treaty which amnestied their 'revolted' subjects, among whom was C. Nelson declared the capitulation of Naples null and allowed the vindictive creatures of the court to wreak vengeance on disarmed enemies and gave his sanction to the execution of C., who had served in the rebel cause only under compulsion, and C. was hanged on Nelson's ship (1799).

Caractacus, or **Caratacus**, Celtic hero, son of Cunobelinus, king of the Trinobantes and tribes of S.E. Britain, led the resistance to Rom. invaders under Claudius, A.D. 48-51. After the Roma. captured Camulodunum he retreated, but kept up the struggle till defeated in battle, 51. Betrayed by the queen of the Brigantes to the Roma., C. was sent to Rome, where he apparently d. Claudius rewarded his courage by granting him his liberty. The name survives in the Welsh *Caradoc*. See Tacitus, *Annales*, xii. 33; *Historiae*, iii. 45; Dio ix. 19-22.

Caradoc Formation, upper of the two strata into which the Lower Silurian rocks are divided. The name is derived from Caer Caradoc in Shropshire, which is an outcrop of the formation. The rocks are mainly sandstone, and are estimated to attain a thickness of 2500 ft.

Caradori-Allan, Maria Caterina Rosalbina (1800-65), lt. singer, b. at Milan. After singing in France and Germany, she came to London in 1822, appearing in *The Barber of Seville*. She was popular as a concert singer; she went to Venice and sang there for a season, returning to England, where she settled in 1830.

Caraffa, name of a famous Neapolitan family of which the following may be mentioned:

Oliviero (1406-1511), made a cardinal by Pope Paul II. in 1467, and legate to Alfonso of Naples by Sixtus IV. He was also admiral of the fleet in 1472 and captured Smyrna and Satalia from the Turks.

Giovanni Pietro (1476-1559), became Pope Paul IV. (q.v.)

Carlo (1517-61), nephew of Giovanni Pietro. After serving under the Spaniards in the Netherlands, he was made a cardinal by his uncle, who was then pope. As a result of the latter's favours to his nephews, war ensued with Philip of Spain, in which the C. family was victorious. When Pius IV. succeeded Paul IV. as pope, his hostility to the Cs. led him to bring about the death of Carlo in 1561. Giovanni, a brother of Carlo, shared to a lesser extent in both his brother's good and bad fortune; he was imprisoned by Pius IV., after having been appointed commander of the papal forces by land and sea, and was executed in 1561 on a charge of murdering his wife.

Antonio (1538-91), cousin of Carlo and Giovanni, was made a cardinal; his activities were literary, and among his labours may be mentioned the revision of the Bible, an exposition of the canons of the Council of Trent, an ed. of the *Septuagint*, etc.

Antonio (d. 1693), later member of the family, distinguished himself in the service of Austria, and became a field marshal. He was made governor of Hungary in 1685, but became an object of execration by his cruelty in the affair of the Tekeli conspiracy, and was recalled in 1687. Later he was largely instrumental in conquering Transylvania for Austria.

Caragiale, Ioan (1852-1912), Rumanian author and playwright, b. at Ploiesti in the com. of Margineri. His works are popular in Rumania, and include comedies and novels. His comedies are satirical; the best known of them are *Noctea furtunosa* (*A Stormy Night*) and *Scrisoare perduta* (*The Lost Letter*). In his greatest piece, *Napasta* (*Contempt*), he attained genuine tragic horror. Later in his life he wrote a number of short stories admirable for their psychological observation.

Caraglio, Giovanni Jacopo (c. 1500-51), It. engraver, b. either at Verona or Parma. His engravings—a large number of which are after Raphael—place him high in his profession. He also devoted a great deal of his time to the cutting of precious stones.

Caramania, or Karamania, region comprising most of the E. portion of the central tableland of Asia Minor, lying mostly within the prov. of Konieh. It has obtained its name from the tn. Caraman, at the N. foot of Mt. Taurus.

Carambola, or Caramba (*Averrhoa Carambola*), species of Oxaliaceae. It is found in tropical Asia, and is cultivated on account of its acid fruit, which has a pleasant flavour and is about the size of an orange. The fruit is often called the Coromandel gooseberry.

Caramel, substance produced by the application of heat to loaf sugar. When sugar is gradually heated and stirred constantly, it loses water and other substances. At the temp. of 220° C., the liquid which has been formed becomes frothy; it is maintained for some little time at this temp., and then poured out to cool. The solid thus produced is a dark-coloured brittle mass, with a characteristic smell and a persistent bitter taste. It is used for artificially colouring many things, such as beer, vinegar, gravy. The name is also given to a popular kind of sweetmeat.

Caran, see COURLAN.

Caran d'Aohe, see POIRÉ, EMMANUEL.

Caranco, see CARACARA.

Carangamite, or Corangamite, salt-water lake in Victoria, S. Australia, with an area of 76 sq. m., and a circumference of 90 m. It has no outlet, and is shallow on the S. side.

Caranx, see HORSE-MACKEREL.

Carapa, genus of Meliaceae, the order to which belong the trees yielding mahogany and the falsely named cedar-wood (*Cedrela*). The species are tropical and *C. moluccensis* inhabits muddy swamps. *C. procera* and *C. guianensis* both yield oil from the seeds.

Carapace, protective covering of many animals, particularly the arched bony plate which is characteristic of the

Chelonia (e.g. tortoise), and to the shield which protects the fore parts of the Crustacea (e.g. crab).

Carapegua, tn. of Paraguay, situated 37 m. S.E. of Asunción. It has schools and modern public buildings. The surrounding country is fertile, cotton, tobacco, sugar-cane, etc., being grown. Pop. 13,000.

Carat (Arabic *qirāt*, pod; Gk. *κερατιον*, fruit of the carob-tree), originally the name given to the seeds of the African tree of the genus *Erythrina*. These seeds, which were almost always of equal weight, were used first for weighing gold, and later for diamonds. The C. in gold is one-twenty-fourth part of a certain weight (such as lb. or oz.) troy, as the gold is divided for the purpose of designating the amount of alloy mixed with the metal. Thus in twenty-two C. gold there are two twenty-fourths alloy. With regard to diamonds the C. is a fixed weight.

Caratacus, see CARACTACUS.

Carausius, Marcus Aurelius Valerius, Rom. soldier, b. in Gaul during the third century. He was given a command in the Rom. army, but was suspected of trying to enrich himself by encouraging the pirates. Being sentenced to death, he retired to Britain, usurping the title of emperor, and the Emperor Maximian was eventually compelled to recognise his rule there. He was assassinated in 293.

Caravaca, tn. of Spain in the prov. of Murcia, situated on the C., a trib. of the R. Segura. It is noted for its wine and brandy. There are also manu. of woollen goods, leather, paper, soap, and oil. Marble is quarried in the hills near by, and there is a stalactite cavern at Barquilla. Pop. 18,000.

Caravaggio, tn. and com. of Lombardy, Italy, situated on the Gera d'Adda, in the prov. of Bergamo. It is 3 m. S.E. of Treviglio, 16 m. S. of Bergamo, and 24 m. N.E. of Milan. The church, L'Apparizione della Madonna, is famous for its paintings, and for the pilgrimages made thither. Pop. 7000.

Caravaggio, Michelangelo Amerighi, or Merigi, da (1569-1609), It. painter, b. at Caravaggio. He was originally a mason, and prepared plaster for frescoes. He studied painting without tuition, and his early works were attacked by his fellow artists. He was himself passionate and of a savage disposition, and these characteristics influenced his pictures. He painted from nature, defying all traditions and principles in art. Many of his scenes are of a violent nature, depicting quarrels and murders, and notable for their deep shadows and high lights. There are numerous pictures of C. distributed over Europe, his masterpiece being 'The Entombment of Christ,' in the Vatican.

Caravaggio, Polidoro Caldara da (1495-1543), It. painter, b. at Caravaggio. He was first employed to carry mortar for the artists, but Raphael noticed his ability, and he was taught to paint. After the sack of Rome he fled to Naples and then to Messina, where he amassed a large

fortune. He was robbed and murdered at Messina. One of his best-known pictures is 'Christ bearing the Cross'.

Caravan and Caravan Trade (Persian *karavan*, from *kāra* people, army), name in N. Africa and the E. for large companies of merchants, pilgrims, or others travelling together for security, especially across the deserts. From the very earliest times Cs. have been the chief means for transfer of merchandise in Asia. There are frequent references to them in the Bible (Gen. xxxvii.; Job, Isa., Ps.). Camels are largely used for transport of heavy goods, especially in arid, sandy regions, as their powers of endurance are so great. Some Cs. have as many as 1000 camels and mules, but from 400 to 600 is a more usual number.

before starting. He acts as general manager, spokesman, and arbitrator; but in the matter of trafficking, each member of the C. acts independently. In Arabia *kibb*, or *Qāfla*, is the equivalent of C. Other forms are *carouan* and *carrauan*. The word does not occur in Eng. before the late sixteenth century. The trade between Tripoli and the interior of Africa, between Darfur and Egypt, between Russia and China, used to be mainly carried on by Cs. The old Arab trade routes led to Egypt, Syria, and Mesopotamia; and between the eight and eleventh centuries A.D. Arab traders appear to have gone regularly as far as the Baltic. Many old Arabic coins have been discovered in N.W. Europe and in the Brit. Is. The pilgrim bands to Mecca should properly

A CARAVAN ON THE GOBI DESERT

E. N. A.

These are harnessed in strings of about fifty, following each other in single file, the leader being gaily adorned with trappings and bells. An unladen ass heads the procession, either for luck or guidance. In rocky, steep parts, mules and asses are employed for burdens. Heavy Cs. are those in which the camels have a load of 500 or 600 lb., going about 18 to 20 m. a day; in light Cs. they only have half that weight, and go about 22 to 25 m. a day. The ordinary seasons for trade Cs. are spring, early summer, and later autumn, Friday being the favourite day for the start. Each day's march has two stages: from about 3 to 10 a.m., and again from 2 to 7 p.m. There are often halts of a few days, arranged (together with the exact line of route) by common consent, unless a guide or military officer has been engaged to settle all such points. The five stated daily prayers of the Muslims are made to coincide as far as possible with the necessary halts. Many of the company ride, if possible, on horseback. All are armed, and they sometimes have a military escort. The leader of the trade C. is called *Karwan-Bashi*, or *Rais* (chief), and is chosen by the merchants

be called *Haji*, not Cs. The two chief start yearly, one from near Damascus (gathering up bands from Anatolia, Kurdistan, Irak, and Syria), and one from Cairo. After 1908 a railway was opened between Damascus and the Hejaz. Other smaller pilgrim Cs. are the N. African, Persian, Nubian, Indian, and Malay, and S. and E. Arabian. The leader of the Mecca Cs. is called *Emir-el-Hadj* (prince of the pilgrims). The Meccan C. from Damascus used to be under the protection of the sultan of Turkey, and consisted of thousands of pilgrims. Of late years a new type of passenger couch has been employed for use on the desert C. route between Bagdad and Damascus. It is over 20 yds. in length, carries between thirty and forty passengers, and is driven by motor engine. Some 30,000 passengers and 12,000 tons of freight traverse the Syrian desert annually and many new routes have been opened up. The great Indian C. from Muscat has been discontinued long ago. An important trade route starts from Timbuktoo, dividing later into two roads, one to Tendruf and S.W. Morocco, one to Tadlet in S.E. Morocco. There are

numerous other routes, as from Trebizond to Tabriz; across the deserts of Gobi (Asia) and Sahara (Africa). Horses, yaks, and sheep are used as well as camels and mules in different parts; also dogs, reindeer, and llamas. A fleet of Turkish or Russian ships (especially of merchant vessels and their convoy) is termed a C. The name is also applied to a covered cart, now usually a house on wheels, as a giray C.; and to two-wheeled trauilers drawn by a motor car for camping and touring. See Sir R. F. Burton, *Pilgrimage to El-Medinah and Meccah*, 1855; W. J. Junker, *Travels in Africa*, 1890; C. M. Doughty, *Wanderings in Arabia*, 1908; M. Rostoutzeff, *Caravan Cities*, 1932.

Caravansary, or **Caravanserai**, kind of unfurnished inn where the caravans are put up in E. countries. They are large quadrangular buildings with a spacious court, often containing a well in the middle. There are public and private Cs., the former of which are in some cases free.

Caravel, sailing boat of Portuguese origin, having three or four masts; much used by navigators of the fifteenth and sixteenth centuries. The oldest forms were entirely lateen rigged, the foresail being the largest; subsequent types had square sails fitted to the foremast. Another characteristic feature was the square stern.

Caravellas, seaport of Brazil, in the prov. of Espírito Santo. It is a centre of the whale fishery of the Abrolhos is. Pop. 8000.

CARAWAY

Caraways, ripe fruits of *Carum Carui*, or *Carvi*, a plant of the order Umbelliferae. The seeds, as they are vulgarly called, are the furrowed halves of the fruit, and their aromatic flavour makes them valuable to confectioners. They are also used as a carminative in medicine, liqueur is distilled from them, and the roots themselves are sometimes eaten in N. Europe.

Carayon, Auguste (1813-74). Fr. author. b. at Saumur. He joined the Society of Jesus, and from that time almost all his work was in connection with the

society. He edited the *History of the Jesuits of Paris*, by Père Garasse. Among his works may be mentioned *Banishment of Jesuits from Louisiana* (1855); *Unedited Documents concerning the Company of Jesus* (1863-75); *Historical Notes on Jesuits and the Parliament of the Eighteenth Century*, (1867).

Carballo, tn. of Spain, in the prov. of Corunna, 22 m. S.W. of that tn. It is noted for its baths and mineral springs. Pop. 15,000.

Carbamide, see UREA.

Carbamines, see ISOCYANIDES.

Carbazotic Acid ($C_6H_4(NO_2)_2 \cdot OH$), or **Picric Acid**, crystalline acid used in dyeing and as a high explosive under the name of lyddite or mellinite. See PICRIC ACID.

Carberry Hill, situated in Midlothian, Scotland, 7 m. S.E. of Edinburgh. It is noted in hist. as the place where Mary Queen of Scots surrendered to the confederate nobles in 1567.

Carbides, compounds of carbon with other elements. Many were unknown until they were prepared by H. Moissan in the electric furnace. The prin. C. are those of calcium, manganese, iron, aluminium, chromium, barium, strontium, lithium, etc. Of these the most important commercially is calcium carbide, much in demand for the production of acetylene, which is generated by bringing water and calcium carbide into contact (see ACETYLENE). Acetylene may be obtained in a similar way from lithium carbide. Other C., as aluminium and beryllium carbide, give methane, while manganese carbide gives methane mixed with hydrogen. Silicon carbide is a stable compound prepared by heating sand and coke in the electric arc; on account of its hardness it is used as a substitute for emery. Silver carbide and cuprous carbide are highly explosive.

Carbine, or **Carabine** (from Fr. *carabine*; corruption from O.F. *calabre*, from Med. Lat., *calabra*, an engine of war), fire-arm carried by horse-soldiers, usually attached to the saddle. It is shorter and smaller than the normal rifle. See CARABINEER.

Carbinol, see METHYL ALCOHOL.

Carbinol, Ethyl, see PROPYL ALCOHOL.

Carbo, Gaius Papirius, Rom. orator, a colleague of Tiberius Gracchus, and one of the chiefs of the democratic party. He was suspected of the death of Scipio Aemilianus. On being made consul after the death of Caius Gracchus, he seemed to change his opinions in favour of the aristocracy. He was now execrated by the populace, and on being accused by Crassus, the tribune, of peculation, he committed suicide in 119 B.C.

Carbo, Gnaeus Papirius, Rom. general who was b. about 130 B.C. He was one of the chiefs of the party of Marius, and was three times elected consul. When beaten by Pompey he fled to Sicily, where he was taken prisoner and killed in 82 B.C. After his death Pompey had his head cut off and sent it to Sulla.

Carbohydrates, see under FOOD AND FEEDING.

Carbolic Acid, Phenol, or Hydroxybenzene (C_6H_5OH), coal-tar product, formerly much used as an antiseptic. It was discovered in coal-tar by Runge in 1834, and has since been observed in the urine of certain animals. For commercial purposes *C. A.* is prepared from the fraction of coal-tar distillate which comes over between 150° and 200° C. This distillate is treated with caustic soda, which dissolves it out together with other substances. Water is then added, which precipitates some of the hydrocarbons; the solution is afterwards treated with sulphuric acid, when the phenols form an oily layer on top of the liquid. The layer is carefully removed and subjected to fractional distillation to separate the phenols. *C. A.* is manufactured for military and other purposes by fusing sodium benzene sulphonate with caustic soda. *C. A.* has a peculiar and characteristic odour, a burning taste, is poisonous, and has antiseptic properties. It crystallises in colourless rhombic prisms which melt at 43° C., and have a boiling point of 182° ; its sp. gr. at the melting point is about 1.066. At ordinary temps. it is moderately soluble in water, but it dissolves readily in alcohol, ether, glacial acetic acid, and glycerol. Upon exposure to light and air it deliquesces and assumes a red colour, but its other properties are apparently unaffected. Tests for *C. A.* are provided by the fact that it gives a violet colour with ferric chloride, and produces a white precipitate with bromine water. *C. A.* decomposes at a very high temp., benzene, toluene, naphthalene, and other substances being formed. Though called an acid, it is neutral to the usual tests, but forms salts called phenoxides or phenates. The phenates of the alkali metals may be prepared by dissolving the acid in a solution of alkali caustic with the exclusion of air. Phenol forms many substitution products, chlorine and bromine readily forming chlorophenols and bromophenols. It is used commercially for the manuf. of artificial colouring matters, explosives, plastics, dyes, aspirin, etc.

Therapeutics, etc.—*C. A.* is a general germicide, and is used to exterminate such fungoid growths as ringworm. When used in concentrated form it acts at first as a caustic, and afterwards produces local anaesthesia, which is maintained for some hours. It is readily absorbed by the unbroken skin, and may be used to treat a collection of septic matter near the skin surface, but its absorption in this way may produce symptoms of poisoning. A little cotton-wool soaked in *C. A.* often relieves toothache caused by decayed teeth. Internally, *C. A.* is taken in doses of $\frac{1}{4}$ to 2 grains, and is useful in fermentation in the stomach and as an intestinal antiseptic; it is occasionally used to stop vomiting.

Poisoning.—Phenol is a nerve poison, and, in concentrated form, a strong caustic. A quantity of 15 grains provides a very dangerous dose. The effects of the caustic may at once be seen at the mouth, tongue, and throat. As a

nerve poison, it produces paralysis of the respiratory centres, the breathing becomes shallow, a condition of collapse sets in, the patient is cold and clammy, and a state of coma precedes death. Diagnosis of poisoning by absorption is made by observing the condition of the urine, which assumes a characteristic dark green colour. Treatment includes getting rid of the poison remaining in the stomach, administering an antidote, and treating collapse. The removal of the poison must be carefully effected by means of the soft siphon, as the use of the stomach-pump is impossible on account of the probably injured state of the stomach lining. The usual antidote is sodium sulphate introduced either by the mouth or by intravenous injection; the action probably is that the phenol is converted into sodium sulphocarbonate, which is innocuous. Collapse should be treated by administering brandy, by placing hot-water bottles at the extremities, and by generally preserving the warmth of the body by the use of hot blankets.

Carbon, symbol *C*, atomic number 6, atomic weight, 12.01, non-metallic element of widespread distribution. It occurs in nature in practically a pure state as diamond, and a somewhat less pure state as graphite or plumbago. In combination with oxygen, it occurs in the atmosphere to a small extent, and in combination with metals, notably calcium, forms many important rocks. More important still, however, is its occurrence in every form of animal and vegetable life, and so many different compounds of *C.* are met with in living tissues that the study of them is set apart as a special section of the science of chem. under the title of organic chem., which might therefore be rendered chem. of the *C.* compounds. *C.* as the chief constituent of vegetable tissues has another special significance, as the proportion of *C.* determines the characteristic properties of those substances considered as fuel. Thus dry wood contains about 50 per cent of *C.*; peat, or vegetable matter partly decayed, contains about 58 per cent, if moisture be disregarded; brown coal contains about 66 per cent, excluding moisture; bituminous coal contains about 84 per cent, and anthracite contains sometimes 95 per cent of *C.* The extent to which the plant matter has been allowed to part with its gaseous constituents therefore determines the percentage of *C.*, and the heating power of a coal-like fuel and the extent of freedom from smoke increases with the proportion of *C.* Where the decomposition of the plant tissues proceeds with the elimination of all the oxygen, the resulting product is bitumen, and large deposits of this substance occur in many parts of the world. **Diamond** is a crystalline form of *C.* It is usually found as octahedra or cubes, but many modifications exist. It was first discovered to be a form of *C.* by Smithson Tennant in 1797, who succeeded in burning the substance in fused nitre and demonstrated the products of combustion to be *C.* dioxide only. The diamond owes its economic value to its excessive

hardness and great brilliance. It is found chiefly in S. Africa and S. America. *Graphite*, blacklead, or plumbago, is a mineral occurring in beds or plates amongst the older crystalline rocks, as in Cumberland, the Laurentian mts., Spain, Bohemia, and elsewhere. It is also artificially produced in electric furnaces, and the greater portion of the raw material for the manuf. of writing pencils is now obtained in this way. It is a dark grey or black mineral with a metallic lustre, and possesses a peculiar greasy softness, so that it leaves a mark on anything with which it comes fairly forcibly in contact. Besides its use for the manuf. of writing pencils, it is commercially important as a dry lubricant. *Amorphous C.* is obtained by burning many kinds of animal and vegetable tissue in a limited supply of air. C. does not readily enter into chemical composition except at high temps., and it is only when oxidation is rapid that C. burns to form C. dioxide. *Lampblack* is a form of C. prepared by burning tar, resin, or turpentine, and condensing the products of combustion. The C. thus collected is a densely black substance with impurities of hydrocarbons. It may be purified by heating in closed vessels, when a fairly pure form is obtained. Its most important property is that it does not reflect light from any angle and it is therefore in demand as a black pigment and as a constituent of printer's ink. *Gas C.* is a particularly hard and dense form obtained in the distillation of coal in gas-works, apart from the porous form known as coke. Gas C. is a bad conductor of electricity, and is used for the manuf. of rods for electric arc lights. There are various forms of charcoal obtained by the slow combustion of animal or vegetable matter. Wood charcoal is obtained by burning wood in a limited supply of air. The old method practised by the charcoal-burners of the forests of Europe from time immemorial consists in collecting branches of suitable length and thickness into heaps, which are closely packed in and then covered over with turf. The wood is ignited at the top and sides and allowed slowly to burn towards the centre, the charcoal-burner inspecting the heap from time to time to see that the combustion is regulated by a proper adjustment of the scanty air-holes at the base. Charcoal thus prepared is used as a fuel and as a reducing agent in smelting ores. *Animal charcoal*, or bone black, is obtained by distilling bones in iron retorts. It is usually very impure, but possesses considerable decolorising and absorbent powers, and is used for the purpose of decolorising raw sugar. Charcoal varies in its properties according to the structure of the substance from which it was prepared and the mode of preparation. It has the power of absorbing gases, being capable of absorbing such quantities that they must be in a state of compression analogous to the liquid state. It is to this property that charcoal owes its value as a deodoriser, its affinity for ammonia in particular being very marked. The practice of eating charcoal in the form

of charcoal biscuits is based on the expectation that gases causing pain and inconvenience in the stomach and intestines will be thus absorbed. *Active charcoal*, an even better absorbent, is made from ordinary charcoal, peat, or coal by various methods, e.g. by heating first with phosphoric acid, charring, and washing. It is used in respirators, for removing fusel oil from crude spirit, for recovering volatile solvents in dry-cleaning works, for decolorising sugar syrup, etc. Charcoal is used as a reducing agent in the laboratory to separate a metal from its ore. Charcoal, as has been said, is not chemically active at low temps., but at high temps. it combines readily with oxygen in an oxide, giving off C. dioxide, while the metal is extracted pure. Before the widespread use of coal in iron-furnaces, wood charcoal was commonly used to reduce the ore, and the process is still used where coal is scarce, as in Sweden. The compounds of C. are numerous and important. With oxygen two prin. compounds are formed. C. dioxide (CO_2) is produced whenever C. is burned in excess of air or oxygen. It is a colourless gas, heavier than air, does not support combustion, and is soluble in water, the solution having an acid reaction (see CARBONIC ACID). When wood or coal is burnt without sufficient excess of air, C. monoxide (CO) is produced, as in blast-furnace operations, etc. It is a colourless, tasteless gas of a poisonous nature (see CARBON MONOXIDE). C. dioxide in association with water acts as a dibasic acid, which forms two series of salts with metals, the carbonates and bicarbonates (see CARBONATES). C. is also capable of combining with metals directly in the electric furnace, giving rise to compounds called *carbides* (q.v.). It also combines directly with hydrogen when an electric arc is estab. between C. poles in an atmosphere of hydrogen. The resulting product is *acetylene* (q.v.). C. unites with fluorine to produce C. tetrafluoride (CF_4). When heated in sulphur vapour, C. unites with sulphur to form C. bi- or di-sulphide (CS_2), a very volatile, colourless liquid, boiling at 46°C . and giving off an inflammable vapour. It has remarkable solvent powers, dissolving fats, India-rubber, sulphur, iodine, and phosphorus, which are otherwise difficult to obtain in solution. C. *oxysulphide* (COS) is a colourless, odourless, inflammable gas, produced when C. monoxide and sulphur vapour are passed through a tube at a moderate heat. *Carbonyl chloride*, or *phosgene* (COCl_2), is a colourless, heavy gas with a pungent smell, prepared by the action of sunlight on C. monoxide and chlorine. It is very poisonous. C. and hydrogen unite in many different proportions, giving rise to bodies which are collectively known as *hydrocarbons*. The many other compounds of C. with oxygen, hydrogen, and nitrogen which are associated with forms of living matter are usually classed as organic compounds; their number seems to be without limit, for not only have new compounds been isolated through the efforts of chemical research workers, but hitherto

unknown substances have been synthesised in the laboratory. See also ALCOHOL, ALDEHYDES, FAT, STARCH, SOAP.

Carbonado (Sp., coal), form of carbon. It is black in colour, is found in pieces as large as the ball of the thumb, and is sometimes used for the boring of rocks.

Carbonara, tn. of Italy in the prov. of, and 4 m. from the tn. of, Bari. Pop. 10,000.

Carbonari (It., charcoal-burners), members of an It. political secret society, which appears to have been formed in the first instance by Neapolitan republicans during the reign of Joachim (Murat). It had for its objects the expulsion of strangers from the throne of the country and the estab. of democracy. Its ritual was taken from the trade which gave it its name; thus a lodge of the society was a *baracca*, or hut, an ordinary meeting was called a *rendita*, or sale; an important meeting an *alla rendita*. Mystic religious language was used to explain the aims of the society, 'clearing the wood of wolves was said to be their aim,' alluding to Christ as a lamb torn by wolves. The objects of the society were at first only the expulsion of foreigners, but members of the higher degrees soon became democratic and then anti-monarchical. There were four grades in the society, which practised mystic rites of initiation. The C. rapidly increased in numbers, and by 1820 included many of the most intelligent patriots in Italy. After the suppression of the Neapolitan and Piedmontese revolutions of 1821, Carbonarism was made high treason. After 1821 the C. never quite revived in Italy, and, though active again in 1830-31, they were superseded by the more extremist 'young Italy' of Mazzini.

Carbonates, salts of carbonic acid. Carbon dioxide dissolves in water to form a feebly acid solution, and therefore carbon dioxide is regarded as the anhydrous (i.e. without water) form of carbonic acid, H_2CO_3 , which, however, has never been isolated. The acid is dibasic, that is, it contains two atoms of replaceable hydrogen per molecule; when both atoms are replaced by a metal, the product is a carbonate, and when one atom only is replaced, the product is an acid carbonate, or bi-carbonate. The univalent alkali metals, such as sodium and potassium, yield both C. and acid C. with the general formulae $MC(O_2)$ and $MHC(O_2)$. The C. of sodium, potassium, and thallium are soluble in water, all the others are insoluble. Aluminium and chromium do not appear to yield C., and magnesium, bismuth, and copper yield basic C. If an acid be added to a carbonate, effervescence takes place with evolution of carbon dioxide, and most C. are decomposed by heat into carbon dioxide and the oxide of the metal.

Carbondale, city of Pennsylvania, U.S.A., in Lackawanna co., situated on the Lackawanna R. It is in the midst of the anthracite coalfield of the U.S.A. There are foundries and a trade in timber. Pop. 21,000.

Carbon Dioxide, see CARBONIC ACID.

Carbonear, port of Newfoundland, situated on Conception Bay, 4 m. N. of Harbour Grace. Pop. 4000.

Carbonic Acid, term applied to the substance H_2CO_3 , but formerly to the anhydride carbon dioxide CO_2 , or C. A. gas. Carbon dioxide occurs in the atmosphere to the extent of three to four volumes in 10,000, though in tns. the amount may be larger. It occurs also in solution in riv. and sea water, being carried down by rain or liberated from decomposing carbonates in the soil. The gas is produced in large quantities in lime kilns, being formed by the decomposition of the chalk or limestone from which the chalk is made. Fermentation and putrefaction give rise to carbon dioxide, which may exert considerable pressure if the processes are carried out in closed vessels. In the laboratory, carbon dioxide is prepared by treating marble or chalk with dilute hydrochloric acid, but it may generally be stated that all carbonates when treated with most acids yield the gas. Carbon dioxide is a colourless gas about 1.5 as heavy as air, moderately soluble in water; it liquefies at $0^\circ C.$ under a pressure of thirty-six atmospheres. The 'snow' form can be compressed into blocks and such solid has in air, i.e. at one atmospheric pressure, a temp. of $-78^\circ C.$ It is used in the preparation of aerated waters, quantities being dissolved in water under pressure to produce the sparkling effect when the pressure is at length removed by releasing the stopper of the bottle. Carbon dioxide plays an important part in the making of bread, being generated in the dough by the use of yeast in order to obtain the porous condition which makes bread light and palatable. In the vital processes of animals and plants, carbon dioxide is a necessary factor, for it is a product of the oxidation of waste organic substances occurring in the continuous change of material in the animal economy, and it forms the raw material from which plants obtain the carbon necessary to build up their tissues. Thus plants absorb carbon dioxide and give out oxygen, while animals breathe in air and expel air containing a larger proportion of carbon dioxide. Unless there is adequate ventilation in a room the increasing proportion of carbon dioxide interferes with the proper supply of oxygen to the lungs, and symptoms of suffocation may ultimately appear. Solid carbon dioxide is used as a refrigerant ('dry ice' or 'drikold'), e.g. in the ice-cream and engineering industries.

Carbon Monoxide (formerly **Carbonic Oxide**), CO , a gas formed during combustion when the supply of oxygen is not sufficiently large. It is found in chimney gases, in the gases of blast furnaces, and in the vapours arising from volcanoes. It is prepared in the laboratory by the action of concentrated sulphuric acid on oxalic acid, an equal volume of carbon dioxide also being produced. C. M. is a colourless, odourless gas slightly lighter than air. It is sparingly soluble in water and burns with a pale blue flame to form carbon dioxide; this flame may sometimes

be observed near the top of a coal fire when there is incomplete combustion in the lower part of the grate, or when the carbon dioxide first formed is turned into C. M. by passing over a heated mass of coal. CO is a very poisonous gas, and is particularly dangerous in coal mines, where it is sometimes formed in small quantities. It is, however, non-poisonous to green plants. Mixed with hydrogen, as 'water-gas' prepared by passing steam over red-hot coke, C. M. is largely used as an industrial fuel. 'Producer gas,' a mixture of C. M. and nitrogen made by burning coke in a limited current of air, is also an important industrial fuel. C. M. is the starting point for the commercial synthesis of many carbon compounds.

Carboniferous System, series of stratified rocks which contain the great coal-bearing strata of economic value. The system includes much more than the coal measures, and, on the other hand, coal is found in strata unconnected with the system. The C. S. lies above the Devonian or Old Red Sandstone, and below the Permian or Triassic systems. It comprises in the United Kingdom the lower C. S. or C. limestone, above which lies the millstone grit, and above that the coal measures. The C. limestone may usually be divided into lower, middle, and upper rocks. The lower consists of limestone shales in the S. and centre of England, and calciferous sandstone in Scotland; the middle consists mainly of mt. limestone; and the upper of black shales with thin limestones. The *millstone grit* separates the two great systems, and consists of grits, thin coal seams, and limestones. The *coal measures* may also be divided into lower, middle, and upper. The lower consists of shales, thin limestones, and coal seams; the middle of the prin. coal seams; and the upper of thin limestones and coal seams, sandstones, and clays. In England the greatest thickness is attained in the N. and W.; this is because the land was at the C. period covered by shallow water and received a considerable amount of sediment from the land to the N., while the S. and E. of England lay under some depth of clear water. The thickness of all parts of the system therefore varies considerably with the locality. With reference to the coal measures, these are found to a thickness of 8000 ft. in S. Wales, 6000 in Lancashire, 3000 in the midlands, Durham, and Northumberland, and about 2000 in Scotland. In Ireland the system is represented chiefly by mt. limestone. In Europe the C. rocks appear in Belgium, in France near St. Etienne, in Westphalia, Saxony, and Bohemia. In Russia the system extends northward as far as Spitzbergen, and this is continued through S. Siberia into China. C. rocks are also known in Australasia, N. Africa, and S. America, while in the U.S.A. the system is widespread, attaining its greatest thickness in the E., the beds of greatest economic importance being in Pennsylvania and the surrounding dists. In the C. period as represented by rocks in the

United Kingdom, the sedimentation is of two kinds: marine and continental or lagoonal. In the marine strata the fossils include crinoids, corals, foraminifera, and brachiopods. Remains of many fish are found, including sharks with piercing teeth and others with teeth adapted for crushing crustaceans, etc. In the continental strata are found six great groups of plants, including the club mosses, horse-tails, gigantic ferns, etc. Some of the tree ferns have been so well preserved that the minutest details of their structure can be studied, and some smaller ferns have been identified with still living species. The vegetation appears to have been luxuriant and abundant, and there is evidence that the climate was, if not hot, at least mild and moist; though the beds of coal found in Arctic regions and in the great Antarctic plateau seem to show that the period was exceptionally favourable to vegetation. It has been suggested that, owing to continual volcanic disturbances, of which there is abundant evidence, the air was charged with a greater proportion of carbon dioxide than it has now, so that vegetation was proportionately encouraged. The animals of the continental strata include fresh-water mollusca, ganoids, occasional salt-water fish, spiders, cockroaches, locusts, bees, etc., and in the later C. rocks are found large numbers of early amphibians. The economic importance of the C. S. lies mainly in the coal and oil found in Britain, Belgium, Russia, Japan, and America, but many other products are in continual demand. The C. limestone yields limestone for the manuf. of lime, bleaching powder, etc. The ironstone found in association with the coal, ores of zinc, lead, and antimony found in the limestone are worked. The sandstones are used for building purposes, and for grindstones, millstones, etc. Fire-clay and terracotta clay often occur, and the various shales are treated for the extraction of oil, sulphur, and sulphuric acid.

Carbonisation (Low Temperature). The manuf. of coke from coal has been carried on since the seventeenth century, and the gas industry was founded by Wm. Murdoch in 1792. In the ordinary or high-temp. process for producing gas and coke a temp. of about 1000° C. is maintained, but to produce a fuel, or semi-coke, suitable for use in open grates, and also to obtain a higher yield of liquid products, a temp. of about 600° C.—the so-called low-temp. C.—is resorted to.

In 1850 James Young, the founder of the Scottish shale industry, obtained a patent for the purpose, and in 1906 T. Parker took out a patent for the manuf. of 'coalite.' Numerous investigators have worked on the problem, prominent among them being Sir George Bailey (1850-1924). He studied fuel problems all his life, in particular those connected with low-temp. distillation either of shale or coal, and in 1917 was made chairman (honorary) of the newly formed Fuel Research Board. He hoped that the successful low-temp.

C. of coal would provide home supplies of fuel oil for the navy and mercantile marine, and he designed the National Fuel Research Station at E. Greenwich with this as one of the aims in view. He was responsible also for the introduction of the therm system of charging for company's gas. Sev. difficulties have appeared in connection with low-temp. C., chief among them being swelling of the coal during treatment and low rate of heat penetration. Many types of plant have been evolved to overcome these and other difficulties, though even now coals which can be treated successfully in one type of plant may be comparatively failures in another. This may be modified in the future by pre-treatment of the coal before C. The prin. low-temp. processes are readily divided into three classes: (a) externally heated systems; (b) combined external and internal heating systems; and (c) internally heated systems. All these classes include continuous and intermittent retorts or carbonising chambers.

Carborundum, trade name of a proprietary brand of silicon carbide (SiC). It is manufactured by heating together in an electric furnace sand and coke. It is a black crystalline solid, with hardness greater than that of ruby. Its great hardness makes it invaluable as an abrasive, and leads to its use in place of emery.

Carbuncle, variety of garnet, so called by the ancients, because of its appearance of a glowing coal in certain lights. Cut with concave surfaces it has a dark red colour, but owing to its relative softness it is not very valuable. The best specimens are found in E. Asia, notably Burma and Ceylon, but it is also found in Brazil.

Carbuncle, eruption of the skin similar to a large boil. It is caused by poorness of blood or similar cause, and accompanied by derangement of the liver and kidneys. It appears generally on the shoulder, nape of the neck, abdomen, and sometimes on the leg. It first appears as a hard red patch, and, attacking the subcutaneous tissues, gives rise to local pain. The redness darkens into purple, and small eruptions of matter appear on the surface of the skin, from which the liquid oozes. Simultaneously the skin is killed and comes off as a hard patch. Treatment usually consists in strengthening the patient with light, easily digested food, and stimulating the secretory organs so that the system assumes its normal working order. Poultices of various kinds are used, bathing with an antiseptic wash, and occasionally incision is resorted to, to relieve the place of fluid and prevent excessive loss of skin. Rest in bed is also essential. The eruption is much more serious than an ordinary boil, and medical advice should always be taken.

Carburettor, originally an apparatus for charging gas or air with carbon by passing it through a liquid hydrocarbon, usually with the object of increasing its illuminating power. The word is now used to describe a device attached to an

internal combustion engine, which uses volatile, spirituous liquid fuels, e.g. petrol, benzole. Before the fuel can be burned effectively within the cylinder of the engine, it must be finely broken up into very small particles and mixed with air in definite proportions, depending upon the chemical composition of the fuel: usually for petrol about 15 parts of air to 1 part of fuel by weight. This is the chief function of the C., to pulverise the fuel as completely as possible and to supply it to the engine thoroughly mixed with the correct proportion of air, under all conditions of load variation. In addition, the C. must provide a small reserve of fuel to enrich momentarily the combustible mixture for sudden acceleration or to ensure easy starting. When fixed to aero engines, provision must be made in the C. to alter the mixture strength to suit the conditions met with in the rarer atmosphere at high altitudes.

The earlier Cs. were of the 'surface' type, in which a current of heated air was drawn across cotton wicks saturated with petrol. This method usually resulted in an over-rich mixture, which had to be diluted by extra air before reaching the engine cylinder. The Cs. generally used to-day are known as the spray type, in which the liquid fuel is metered through one or more calibrated jets and discharged into a stream of air moving at high speed through a restricted passage called the choke. The effect of the petrol thus impinging causes it to be broken up and intimately mixed with the air. Liquid fuel reaches the jets from a small reservoir, called a float-chamber, where it is maintained at a constant level by a float which operates a small valve controlling the supply from the main fuel tank. *See also* AERO-ENGINES; MOTOR CARS AND MOTOR CYCLES; GAS ENGINES; INTERNAL COMBUSTION ENGINE.

Carbylamines, *see* ISOCYANIDES.

Carcagente, tn. of Spain in the prov. of Valencia, 25 m. S.S.W. of that tn. Rice is grown, and there is a trade in fruits, grain, and silk. Pop. 14,000.

Carcano, Giulio (1812-81). It. poet and novelist, b. at Milan. His first work was *Angiola Maria*, pub. in 1839. He then, with most other It. authors, took part in the fight for the freedom and unification of Italy, and was obliged to go into exile. On his return he became in 1859 prof. at the academy of Milan and was afterwards appointed senator. He wrote numerous works, best known among which are his novels and collections of short stories: *Racconti Semplici* (1813); *Damiano* (1851); *Dodici Norelle* (1853); his collections of *Poesie edite ed inedite* (3 vols.) (1861-70); and *Poesie varie* (1875); and his tragedies *Spartaco* (1857); *Ardonno* (1860); and *Valentina* (1870). He also trans. Shakespeare into It. (1874-82).

Carcar, tn. on the E. coast of the Is. of Cebu, belonging to the Philippines. Sugar is largely cultivated. Pop. 37,000.

Carcassone (Rom. *Carcasso*), city of France, cap. of the dept. of Aude, 60 m. S.E. of Toulouse. It owes its fame to the two walls and fifty-three towers

surrounding the 'city,' the finest fortifications in France. The church of St. Nazaire dates from the eleventh to the fourteenth century, the cathedral from the fourteenth. The city was captured by the Visigoths in 418 and by the Saracens in 725. Pop. 35,000.

Mémoire d'une autre vie (1934), and *Envoûtement de Paris* (1938).

Cardale, John Bate (1802-77), a writer upon religious subjects and one of the founders (1835) of the Catholic Apostolic Church, of which he was made first apostle. His more important works are:

D. McLeish

THE 'CITÉ,' WITH ITS DOUBLE ENCEINTE AT CARCASSONNE

Carcharodon, genus of the Lamnidae or mackerel shark family. It includes the largest living shark, 36 ft. in length, which occurs from the Mediterranean to Australia. Technically it is known as *C. rondeletii*, popularly as the man-eater or great blue shark.

Carchemish, anct. city on the W. bank of the Euphrates, N.E. of the modern Aleppo, was N. cap. of the Hittites (2 Chron. xxxv. 20). It is identified with the ruined Jerablus (Hierapolis).

Carco, Francis (b. 1886), Fr. writer, b. at Noumea, in the Fr. is. possession of New Caledonia. He went to Paris when quite a young man, and made his début in authorship with his poems *La Bohème et mon cœur* pub. in 1912. His greatest successes, however, have been with his novels and short stories dealing with the Parisian underworld and plentifully sprinkled with Apache argot. One of his best-known books is *Jésus-la-Caille* (1914). Another, *L'Homme traqué*, received in 1923 the grand prize for romances offered annually by the Académie Française. Later books of essays include *Prisons de femmes* (1933);

The Confession of the Church (1848); *The Doctrine of the Eucharist* (1856, 2nd ed. 1876); *Notes on Revelations* (1860); *The Certainty of Final Judgment*, (1864); *The Fourfold Ministry* (1871); and *A Short Sermon on War* (1876).

Cardamine, genus of plants of the order Cruciferae which is widely distributed. The species are usually smooth herbs, with stalked, entire, lobed, or pinnately cut leaves, and racemes of white or red flowers. The commonest Brit. specimen is *C. pratensis*, which bears large lilac flowers and is called by a number of popular names. From its bitter taste it is called bittercress, from its appearance in the spring it is known as the cuckoo-flower, and from its covering the meadows as though linen were bleaching, lady-smock. The flowers yield a bitter, volatile oil of slight medicinal use, and the plants reproduce vegetatively to a great extent. *C. bulbifera* reproduces by axillary bulbils, *C. chenopodiifolia* has two kinds of fruit and *C. impatiens* has an explosive fruit.

Cardamom Hills, range of hills in the prov. of Madras, India; altitude 2000 to 4000 ft.

Cardamoms, fruit of sev. species of Zingiberaceae from the genera *Amomum* and *Elettaria*. *E. Cardamomum* is an Indian plant in which the rhizome produces leafless shoots, and these bear the fruit which, when ripe, yield the spice C. In the species of *Amomum* the same thing occurs: *A. Cardamomum* is a native of Sumatra. *A. angustifolium* of Madagascar, the one producing small, the other large C. Grains of Paradise are the fruits of *A. granum Paradisi*, and are an inferior quality of C.

Cardan (Cardano), Girolamo (1501-76). It, physician, mathematician, and astrologer, b. at Pavia, illegitimate son of a well-known jurist of Milan. Educated at Pavia Univ. and at Padua Univ., where he took his medical degree. Excluded from the College of Physicians by reason of his birth, his earlier efforts in medical practice were unsuccessful and he was reduced to penury. But through the influence of a Milanese senator, whose child he had cured, he was admitted to the medical fraternity and, in 1534, through the same influence, appointed to the chair of mathematics at Milan. A few years later the pub. of his *Practice of Arithmetic* brought him into notice. This was followed in 1545 by a treatise on algebra, which is noteworthy for its exposition of the principle of cubic equations and its solution of geometrical problems by algebra—for the first of which he was indebted to some extent to his instructor Tartaglia. He had previously to this pub. a work on astrology, which in those days secured him more renown than it would have done in a more sceptical age. In 1551 his fame was established by his chief work, the treatise *De Subtilitate Rerum*—speculation in physical phenomena; and this was followed a few years later by its sequel, *De Varietate Rerum*, in which work too he seeks to explain ordinary physical phenomena, albeit in crude if ingenious manner. But the chief interest of this later work lies in its groping but advanced thought on the inorganic realm of nature, which he suggested was animated no less than organic nature. He afterwards continued the practice of medicine at Pavia and Bologna till 1570. While there he further studied astrology and pretended to cast the horoscope of Christ, for which he was imprisoned. After leaving Bologna he went to Rome, where he d. See H. Morley, *The Life of Geronimo Cardano*, 1934.

Cardboard, thick board made by compressing together sev. leaves of paper pulp in the process of manuf. Pasteboard is a form of C., produced by pasting together sev. sheets of paper. Bristol board is a finer kind of C. used for pen-and-ink drawings. Strawboard is a coarse yellow board made from straw pulp.

Carden, Sir Sackville Hamilton (1857-1930), Brit. admiral, son of Capt. Andrew C. of Templemore, Ireland. Entered the navy as a midshipman and first saw active service in the Egyptian war of 1882. Served in the Suakin operations and in the E. Sudan in 1894. In 1897 served under Sir Harry Rawson in the

Benin expedition, and attained flag rank in 1908. In 1914 he was admiral superintendent of Malta dockyard, and when Sir Berkeley Milne left the Mediterranean Adm. C. became commander-in-chief of that station. He was in command of the naval operations at the opening of the Dardanelles campaign and the destruction of the forts at the entrance, but resigned his command through illness, and was succeeded by Adm. Sir John De Robeck. Created K.C.M.G. in 1916 and promoted full admiral in 1917.

Cardenal, Pierre (d. 1306), Provençal troubadour. He was canon of the cathedral of Puy-en-Velay, his native tn., and his songs consist principally of sirventes, a name given to the satirical songs of the troubadours, dealing with the vices of the nobility and the clergy. The sirventes of C. are extremely forceful. He also supported the Albigenses against the crusade of the Catholics. His songs are to be found in *Mahn's Gedichte der Troubadours*, 1856-73.

Cardenas, seaport on the N. coast of Cuba, 75 m. E. of Havana, in the prov. of Matanzas. It is one of the chief sugar exporting tns. of the is. It has a good harbour and is well served by railways. Pop. 40,000.

Cardia, opening in the upper part of the stomach by which the oesophagus enters. As its name indicates it is close to the heart.

Cardiff (Welsh Caer Taff, or Caerdydd), according to some authorities, city of S. Wales, municipal co., and parl. bor., seaport tn. and the co. tn. of Glamorganshire. It stands on the l. b. of the R. Taff, quite close to its mouth. C. has made greater and more rapid progress than perhaps any other tn. in the United Kingdom, and this was begun by the opening of its first dock in 1839. The docks and basins are five in number, among them Bute Docks and the Glamorganshire canal basin. Formerly the property of the marquess of Bute, they are now under state control. C. is an important commercial centre, and has a large coal and iron trade, being connected with the S. Wales coalfield and the dists. of Aberdare and Merthyr Tydvil. It was formerly one of the largest ports in the world for exporting coal, but since 1946 the exports of coal have declined to negligible proportions. It exports also large quantities of iron, manufactured iron, and steel goods, and carries on a considerable industry in ship-repairing. The city itself is a very old one and contains the ruins of a Norman castle of the eleventh century, in which Robert, duke of Normandy, the eldest son of William the Conqueror, remained for twenty-eight years. This castle has been partially restored by its present owner, the marquess of Bute. C. also played some part in the hist. of England during the time of the Civil war. C. is noted for its parks and open spaces. Cathays Park is the civic centre of the tn., and is one of the finest in the world. Here are situated the city hall, notable for its statues of famous Welsh people, the

National Museum of Wales, the Glamorgan co. hall, the Temple of Peace, and the Welsh National Memorial, and other public buildings. C. is also the seat of the univ. college of S. Wales and Monmouthshire and there are various technical colleges. The cathedral of Llandaff is situated 2 m. to the N.W. of the city. The Royal Infirmary, which originated at an elsteddof held at C. Castle in 1834 under the patronage of Princess Victoria, was incorporated in 1923. The city was extended in 1922. The Corporation waterworks cost £2,500,000. C. fortunately suffered little from air attack during the Second World

War, and the docks and commercial parts were undamaged. The city sends three members to Parliament. Pop. (estimated 1947) 230,000.

Cardigan, James Thomas Brudenell, seventh Earl of (1797-1868), Eng. soldier, b. at Hambledon in Hampshire, and served in the Crimea, during which campaign he led the famous charge of the Light Brigade at Balaklava (1854). Afterwards inspector-general of cavalry (1855-60).

Valentine & Sons Ltd., Dundee

CARDIFF: CITY HALL AND THE NATIONAL MUSEUM OF WALES

War, and the docks and commercial parts were undamaged. The city sends three members to Parliament. Pop. (estimated 1947) 230,000.

Cardigan, James Thomas Brudenell, seventh Earl of (1797-1868), Eng. soldier, b. at Hambledon in Hampshire, and served in the Crimea, during which campaign he led the famous charge of the Light Brigade at Balaklava (1854). Afterwards inspector-general of cavalry (1855-60).

Cardigan, seaport tn., a municipal bor., and the co. tn. of Cardiganshire in S. Wales. It stands on the r. b. of the R. Teifi, about 5 m. inland from St. George's Channel. It contains the ruins of a castle supposed to have been built in the twelfth century. Pop. 3200. C. Bay is a wide inlet of St. George's Channel stretching from Brach-y-Pwll in the N. to Strumble Head in the S. It washes the shores of five Welsh cos., among them being Cardiganshire.

though the Teifi is the only one of any real importance, and this does not belong exclusively to the co. The chief tns. are Cardigan (the co. tn.), Aberystwyth, and Aberayron—on the coast—and Tregeron and Lampeter in the valley of the Teifi. C. is a great agric. co., producing barley and oats, while its chief industry is the rearing of livestock. Gloves and flannels are among its chief manufs.; there are also lead, copper, and zinc mines. There are, scattered over the co., traces of early Brit. camps, and also of Rom. roads and military stations, besides inscribed stones. The ruins of Strata Florida Abbey, to the S.E. of Aberystwyth, are also of interest. Most of the old customs of the co. have died out, though that of bidding, or sending for presents for betrothed people, still survives in some parts. C. sends one member to Parliament. Pop. 58,000.

Cardinal (principal, from Lat. *cardo*, hinge) title of the highest dignity, next

to the pope, of the Church of Rome. The word is still used adjectivally, meaning pre-eminent. Originally of more general application, the title was later reserved especially for members of the Sacred College at Rome (1568, by Pius V.). The pope is not obliged to consult them, but usually does, and they form his council or senate. They are all appointed by the pope alone. As early as the fourth century priests permanently ruling par. churches in Rome were called C. priests. There were also C. deacons, who administered the charities of a particular region of the city, and C. bishops in charge of the suburban sees of Rome (Porto and Santa Rufina, Sabina, Albano, Frascati (Tusculum), Palestrina, Ostia, and Veitcri). Hence the title was always given to one on whom eccles. affairs 'hinged,' but the three bodies did not form the one Sacred College till the twelfth century. The Cs. are the chief members of the twenty-one sacred congregations (standing eccles. committees) of the papal gov., such as holy office, rites, index, studies, propagation of the Faith. They meet in consistory, usually with the pope as president. They are most prominent on the pope's death, as they elect his successor, usually one of their own number, this being a special duty of the Sacred College. Pope Sixtus V. in 1586 fixed the number of Cs. at seventy (six bishops, fifty priests, fourteen deacons). The numbers always varied greatly before, and may still do so, but the number of C. bishops remains six. The majority are of It. birth and live in Rome, except the priests. Those of foreign birth are known as protectors. The first C. bishop (of Ostia) is dean of the Sacred College, and has the right of consecrating the pope, if he be not already a bishop at the time. The first C. deacon may proclaim and crown the new pope. The 'Camerlengo,' who rules the Church during a papal vacancy, is a C. Cs. have the title 'Most Eminent Prince' (Eminentissimo Signore). Among Eng.-speaking Cs. are the archbishops of Sydney (New S. Wales), Baltimore (U.S.A.), Westminster (London), and Armagh (N. Ireland). Cs. enjoy an income out of the papal treasury. They are often sent as papal representatives on delicate missions, as *legati a latere*. They wear a distinctive scarlet dress and red cap (biretta), given them by the pope. A red hat is also given them in a public consistory, but they do not wear it, and they receive the C.'s ring from the pope.

Cardinal-bird, or Redbird, species of *Cardinalis* of the passeriform Fringillidae, or finch family. The birds are very sweet singers which inhabit N. and S. America, and are often kept in captivity. The general colour of the male is red with a bright red crest and black forehead and throat.

Cardinal Points, see COMPASS, MARINER'S.

Cardinal Virtues, recognised by the ancients to be Justice, Prudence, Temperance and Fortitude and so named because all other forms of virtue were

regarded as hinging or turning upon them (Lat. *cardo*, a hinge). Such classification can be traced back to the time of Socrates. In the Catholic Church these virtues were classified as moral virtues in contradistinction to the theological virtues, Faith, Hope, and Charity.

Carding, process for combing the fibres of wool, cotton, etc. This is done to remove all impurities, and to separate the imperfect from the perfect fibres, and so prepare the latter for spinning.

Cardington, vil. of Bedfordshire, England, 3 m. from Bedford by rail, with aircraft works.

Carditis, inflammation of the heart. The term is now used as a synonym for *endocarditis*, or inflammation of the endocardium—the serous membrane lining the interior of the heart. The most frequent causes of the acute form of the disease are rheumatism and the infectious fevers; chronic *endocarditis* is usually associated with general arteriosclerosis. *Pericarditis* is inflammation of the pericardium, the membranous sac enveloping the heart. The causes are rheumatism, Bright's disease, and extension of inflammation from neighbouring parts.

Cardona, tn. of Spain, in the prov. of Barcelona, and 45 m. N.W. by N. of that place. In the vicinity, to the S.W. of the tn., is a hill composed of rock salt, some 500 ft. high, and 3 m. in circumference. It is worked like a mine. Pop. 4000.

Cardoon (*Cynara Cardunculus*), plant belonging to the Compositæ, closely related to *C. Scolymus*, the artichoke. The C. is edible, but it is the thick fleshy stalks and the ribs of the leaves which are eaten; they are cultivated and used much after the manner of celery, and come into season by the middle of Nov. Originally a native of Spain, it now flourishes in the Pampas, having been introduced into S. America for cultivation.

Cardozo, Benjamin Nathan (1870-1938), Amer. jurist, b. in New York, Mar. 24, of Jewish parentage; educated at Columbia Univ. He was admitted to the New York Bar, 1891, and elected justice of the Supreme Court of New York for term 1914-28. In 1927 he was made chief justice of the Court of Appeals of New York State. On the resignation of O. W. Holmes in 1931, C. was recommended by all the leading Bar associations as his successor, and on Feb. 15, 1932, he was appointed associate justice of the Supreme Court of the U.S.A. In many of his judgments he strongly supported President Roosevelt's policy of the New Deal. He was noted for his learning in the philosophy of the law as well as in its application. His publications include *The Nature of the Judicial Process* (1921), *The Growth of the Law* (1924), and *Law and Literature and other Essays* (1931).

Cardross, par. and vil. of Scotland in the co. of Dumbarton, situated on the frith of Clyde, 7½ m. N.W. of Dumbarton. Robert Bruce d. in C. Castle in 1329. Tobias Smollett, the novelist (1721-71),

was b. at Dalquhurn House, and a monument, 60 ft. high, which bears an inscription in Lat., written by Prof. George Stewart and John Ramsay and corrected by Dr. Johnson, commemorates the fact. Pop. 11,600.

Cards, Playing. The origin of P. C. is uncertain. It was long held that they were invented to amuse France's insane king, Charles VI. A reference is found in the registers of the *Chambre des Comptes* in 1392 to an item 'for painting three packs of cards in gold and different colours,' but no mention is made of invention. It has been asserted that they were introduced into Spain by the Arabs, who used them originally for purposes of divination, but this theory is too ill supported to receive credence. Leaving undecided the question of how C. reached Europe, it appears equally hard to discover in which European country they first made their appearance. They were known in Belgium in 1369, while a Swiss monk, Johannes, in a MS. dated 1377, now in the Brit. Museum, states that the game of C. came to Switzerland that very year. It is usually held, however, that they were originally used in Italy, while Dr. Willshire (*Catalogue of Playing Cards in the British Museum*, 1876) attributes to Venice the right of parentage. The Venetian pack at the beginning of the fifteenth century consisted of seventy-eight C., fifty-six numerals and twenty-two emblematic C. The numerals were of four suits, each consisting of four court C., king, queen, chevalier, and valet, and ten C. numbered from one upwards. The emblematic C. appear to have survived from still older times, when they were used for divination, and were subsequently combined with the numeral C. Such a pack was called a pack of tarots, probably from being *taroté*, or marked with diagonal crossings on the back. The emblematic C. were of higher value than the others, and were called *atutti*, *alouts*, or trumps. These emblematic C., however, soon disappeared from use, and the pack was reduced to fifty-two by the suppression of one of the court C. While there have always been four suits of the numbered C., there has been considerable variation of the signs employed. The earliest signs, cups, money, clubs, and swords, are still found in the ordinary It. and Sp. packs. The Gers. at first used hearts, bells, leaves, and acorns. In the fifteenth century the Fr. adopted the present signs, spades, hearts, clubs, and diamonds. The spade is the Ger. sign of the leaf, with the name *spada* of the corresponding It. suit of swords. The club is an imitation of the Ger. acorn, with the trans. It. name. The Ger. heart has survived without change, while the bell has become altered to the diamond, originally of circular shape, but now square. C. have been subject to excise duty in England since the reign of James I., when the duty was 5s. per gross of packs. It has varied greatly from time to time, and in 1801 was 2s. 6d. per pack, but was gradually reduced until in 1862 it became

3d. per pack. There is now an excise licence to sell of £1. The present import duty is 3s. 9d. a dozen packs. The number of packs made is estimated at 20,000,000 per annum. See W. A. Chatto, *Facts and Speculations on the Origin and History of Playing Cards*, 1848; W. H. Willshire, *Descriptive Catalogue of Playing and other Cards in the British Museum*, 1876; E. S. Taylor, *History of Playing Cards*, 1865; H. T. Morley, *Old and Curious Playing Cards*, 1931; W. G. Benham, *Playing Cards*, 1931. Also separate articles on the various games.

Carducci, Bartolomeo (1560-1608), It. painter, better known by the Sp. form of his name, Carducho. A pupil of Zuccaro, he helped him to paint the great cupola at Florence, and went with him to Spain, 1585. There he became painter to Philip II. and III. With Tibaldi he painted much in the Escorial. He also began frescoes in the Pardo, finished by his brother, Vincenzo (q.v.). His best work was 'The Descent from the Cross,' in San Felipe el Real at Madrid. Other works were the 'Immaculate Conception' and 'Nativity,' for the Jesuit church; 'St. Sebastian,' 'The Last Supper.' As architect and sculptor he studied under Ammanati.

Carducci, Giosuè (1836-1907), It. poet, b. at Val di Castello in Tuscany. He was the son of a physician, and began life as a teacher. He spent a youth of severe study, and was appointed in 1860 to a professorship of It. literature at the univ. of Bologna. This post he held until his death, with the exception of a short interval in 1867, when he was suspended for participation in the movement for the unification of Italy. In 1876, having become a supporter of the Savoy dynasty, he was made member of the It. parliament. His poetry bears the impress of his erudition, and is frequently pedantic and recondite. His earliest verses, afterwards pub. as *Juvenilia*, have little merit, and are modelled upon Alfieri and Manzoni. His best poems were written during the period 1860-70 following upon his appointment at Bologna, and were pub. under the title of *Decennalia*. They deal mostly with the political events of the time and include his famous poem, the *Hymn to Satan* (1863), which eulogises the spirit of revolt and resurgence against effete custom and worn-out institutions. The *Decennalia* show a liberation from the earlier influences, which become more complete after 1870, when C. adopted Hugo as his model and gave freer expression to his political views. His most esteemed poems are the unrhymed *Odi Barbare* (1877, 1882, and 1889), which, written in metres taken from Horace, place him, by their eloquence, dignity, and impressiveness, high in the ranks of classical writers. Though in form a classicist, C. has been placed by some among the It. 'naturalist' poets, on account of his revolutionary tendencies. His complete works were issued in *Opere* (21 vols.), 1889-1928, and *Poesie*, printed separately, 1902. See life by B. Croce, 1927.

Carducci, Vincenzio (1568-1638), painter, brother of Bartolomeo (*q.v.*), under whom and Zuccaro he studied. He went with his brother to Spain, 1585, and after his death finished the gallery of the Pardo for Philip III., adopting the hist. of Achilles instead of Charles V.'s life. He painted some fifty large pictures for the Carthusians of El Pualar; representing scenes from the life of St. Bruno, and martyrdoms and miracles of the monks of that order. Other works were 'Battles of the Thirty Years War,' 'St. Anthony of Padua,' 'St. Jerome' (unfinished). He wrote, in Castilian, *Dialogos de las excellencias de la Pintura* (1633).

Carduchi, race of people who formerly inhabited the mountainous dists. of modern Kurdistan and are probable ancestors of the Kurds.

Carducho, Bartolomeo, *see* CARDUCHI.

Carduus, *see* THISTLE.

Cardwell, co. and *tn.* of Queensland, Australia. The *tn.* is situated on Rockingham Bay, 800 m. N.W. by N. of Brisbane. The harbour is capacious and easy of access. Gold and tin are found in the dist., and there are extensive forests from which cedar is exported. There are sawed factories and works for tanning meat. Dugong fishing is carried on. Pop. 5000.

Cardwell, Edward (1787-1861), Eng. historian, *b.* at Blackburn in Lancashire. He was Camden prof. of ant. hist. (1826-1861), rector of Stoke Newington in Northamptonshire (1828), and principal of St. Alban's Hall, Oxford (1831). His publications include an ed. of Aristotle's *Ethics*; a students' ed. of the Gk. Testament (1837); *Documentary Annals of the Reformed Church of England from 1546 to 1716* (1839); *History of Conferences, etc., connected with the Revision of the Book of Common Prayer* (1840); *Reformatio Legum Ecclesiasticarum* (1850).

Cardwell, Edward Cardwell, first Viscount (1813-86), Eng. statesman, *b.* at Liverpool; educated at Winchester and Oxford. He became a barrister in 1838 and M.P. for Clitheroe in 1842. Sir Robert Peel made him secretary of the Treasury (1845-46). In 1847 he was returned for Liverpool, but lost his seat in 1852 owing to supporting the repeal of the navigation laws, and was in the same year returned for Oxford city. In Lord Aberdeen's ministry he was president of the Board of Trade (1852-55), and under Lord Palmerston became secretary for Ireland (1859-61), Chancellor of the Duchy of Lancaster (1861), and while secretary for the colonies (1864-66), put an end to transportation. In Gladstone's ministry he was secretary for war (1868-1874), and he carried out in 1871-72 his great plan of reorganisation, abolishing the purchase of commissions, introducing the retirement of officers, the short-service system, and, above all, infantry organisation of linked battalions (*see also* ARMY - *General Sketch of the History of the British Army*; HALDANE). He was, in company with Lord Stanhope, Peel's literary executor, and ed. his memoirs (1860-57). Raised to the peerage in 1874

as Viscount C. of Ellerbeck. *See* Sir R. Biddulph, *Lord Cardwell at the War Office*, 1904.

Care, or Carle Sunday, the Sunday preceding Palm Sunday, so called from the practice of eating carlings, i.e. peas roasted or fried in butter, on this day.

Carême, *see* QUADRAGESIMA.

Carême, Marie Antoine (1784-1833), Fr. chef, *b.* in Paris, who became cook to Talleyrand, the Fr. plenipotentiary. He accompanied his employer to the congress of Vienna. Subsequently he became chef to the Eng. prince regent (afterwards George IV.) and to the empresses of Russia and Austria. He was famed for the artistic nature of his dishes. He wrote *Les Dîners de l'Empereur Napoléon*; *La Cuisine française*; *Le Maître d'hôtel français*; and other culinary works.

Carentan, *tn.* of France, in the dept. of Manche, 25 m. W. of Bayeux. It has the ruins of an ant. castle. Pop. 3600.

Carew, George, Earl of Totnes and Baron Carew of Clapton (1537-1629), Eng. nobleman. He studied at Oxford, and afterwards held a command in the Irish wars against the earl of Desmond. In 1596 he led a successful expedition to Cadiz, and was afterwards appointed lord president of Munster, where he soon reduced the rebels to submission. He is often supposed to have written an account of the Irish war in the work *Hibernia Pacata*. But the virtual author of this book was Sir Thomas Stafford, reputed to be C.'s natural son, who had served with him in Munster. C. is also said to have written the hist. of the reign of Henry V., which is embodied in Speed's *Chronicle*. C. certainly preserved and annotated all letters and papers relating to Ireland of his own day, and many vols. of his MSS. on Irish affairs were placed by Laud in the Lambeth Library; while others are among the Harleian MSS. He lived on the closest terms of friendship with Sir Walter Raleigh for thirty years, and in 1618 pleaded with James I. on behalf of Raleigh, while Lady C. proved a kind friend to Raleigh's family after the execution.

Carew, John Edward (1785-1868), Irish sculptor, *b.* at Waterford, but came to London in 1809, where he d. He exhibited at the Royal Academy from 1830 to 1848. His best statues are 'Whittington listening to the London Bells,' 'The Death of Nelson at Trafalgar,' and 'The Model of a Gladiator.'

Carew, Sir Nicholas, Eng. courtier and favourite of Henry VIII., related to Anne Boleyn. He attended Henry in France, 1513, and was knighted before 1517, when he became keeper of Greenwich Park. He became Master of the Horse, 1522; envoy to France, 1527 and 1532. C. was M.P. for Surrey, 1529, and envoy to Charles V., 1529-30. He was executed for his share in the marquess of Exeter's conspiracy, 1539.

Carew, Sir Peter (1514-75), Eng. soldier, travelled largely in France and Italy. He served Philip of Orange, 1526-30. Henry VIII. made him a gentleman of the privy chamber. C. served in the Fr. war,

1544; was knighted, 1545; sheriff of Devonshire, 1546. He helped to crush the Devonshire rising, 1549. He opposed Mary's marriage with Philip, was imprisoned for a time, but became constable of the Tower, 1572. See life by Hooker (Vowell); *Catalogue of Carew MSS.*, 1515-74.

Carew, Richard (1555-1620), Eng. poet and antiquary. He studied at Christ Church, Oxford, and was sheriff of Cornwall. His *Survey of Cornwall* (1602) was held in high repute and was reprinted in de Maiseaux's ed. (1723 and 1769), and in Tonkin's (or Lord de Dunsterville's) (1811). His trans. of the first five cantos of Tasso's *Gerusalemme Liberata* (1594) is more correct than that of Edward Fairfax.

Carew, Thomas (c. 1598-1639). Eng. poet and courtier; educated at Oxford, afterwards leading a somewhat wandering life. For a time he travelled as secretary with his kinsman, Sir Dudley Carleton. He went on embassies to Venice, Turin, and to France (1619), and was later attached to the court of Charles I. C. wrote *Calum Britannicum*, a masque (1634), short poems, and sonnets addressed to a 'Celia.' His poems show Donne's influence. He formed one of the poetic circle that surrounded Ben Jonson, and was a friend of Sir John Suckling. His collected works were ed. by Arthur Vincent, 1890.

Carex (Lat. *carex*, sedge), genus of plants of the order Cyperaceae. The various species are for the most part inhab. of wet and swampy grounds, in bogs, fens, and marshes, in the temperate and N. parts of the world; in Britain they are known as sedges. The flowers are unisexual, sometimes dioecious, and are devoid of perianth-leaves. The male flower consists of a simple spike, the three stamens being situated in the axils of glumes; the female flower consists of two or three superior, united carpels. The leaves are stiff, with sharp or saw-like edges, and vegetative reproduction by offshoots is common. The tough, hard leaves are used in hop-grounds for tying the hops to poles, in Italy they are placed between staves of wine-casks and used for making chair-bottoms. In *C. sylvestris* they are combed and dressed and used for lining gloves and shoes in Lapland as a protection against frostbite. *C. arenaria* frequents sand-dunes; *C. dioica* and *C. scirpoidea* are dioecious specimens. Cotton 'grass' (*Eriophorum*), growing on moors, is also a member of the Cyperaceae.

Carey, Henry (c. 1690-1743), Eng. humorous poet and musician, reputed son of George Savile, marquess of Halifax. He studied music under Roseingrave and Geminiani. C. was author of the libretto to *The Dragon of Wantley* (music by Lampe, 1737); he pub. six cantatas (1732), and *The Musical Century* (1737). His famous *Chroniconthologos* (1731) is a burlesque on the moonshiny plays of his period. His *Poems on Several Occasions* (1729) were praised by Addison. His name is best remembered for the ballad *Sally in our Alley*, but the present tune is

not C.'s. C. was said to be author and composer of *God save the King*, but the claim was unfounded. His poem *Namby Pamby*, in ridicule of Ambrose Philips (q.v.), added expression to the language. His granddaughter was mother of Kean, the tragedian.

Carey, James (1845-83), Irish revolutionary, b. in Dublin. He became a member of the Fenian conspiracy and one of the originators of the Invincibles (1881). He took part in the murder of Lord Frederick Cavendish and Mr. Thomas Burke, permanent under-secretary for Ireland, on May 6, 1882, but tried to save himself by turning queen's evidence. He was, however, murdered soon afterwards on board ship, near the Cape, by Patrick O'Donnell.

Carey, Lucius, see FALKLAND, VISCOUNT.

Carey, Sir Robert (c. 1560-1639), youngest son of Lord Hunsdon, served Queen Elizabeth in various capacities, finally becoming Eng. warden of the Border Marches. He carried the news of her death to Edinburgh in the short space of sixty hours. He was created earl of Monmouth by Charles I. in 1626, but the title d. with him. His *Memoirs* (ed. 1808) contain an interesting record of Border hist.

Carey, William (1761-1834), Eng. oriental scholar, b. at Paulerspury in Northamptonshire. In 1787 he became minister first at Moulton in Northamptonshire, and afterwards at Leicester. Active in forming a Baptist missionary society, he was chosen in 1793 first Baptist missionary to India. He laboured ardently to spread Christianity and issued Bibles in forty different oriental languages and dialects. He also pub. grammars and dictionaries in Bengali, Marhatti, and Sanskrit, and ed. the *Rāmāyana* (1806-1810). He was from 1801 to 1830 oriental prof. at Fort William College, Calcutta. See his life (1835) by George Smith (Everyman's Library).

Carlin, vil. in par. of Bothwell, Lanarkshire, Scotland, notable for a grotto laid out on similar lines to that of Lourdes. Many Catholic pilgrims visit it annually. There are also collieries. Pop. 2000.

Cargados, or Nazareth Islands, group of 18, lying N.E. of Mauritius, of which they are a dependency.

Cargill, Donald (1619-81), Scottish Covenanter, b. at Rattray, Perthshire. He was made minister of Glasgow in 1655, but deprived of his living for opposing the Restoration (1660). He fought at Bothwell Bridge (1679), became a field preacher, and took part in the Sanquhar declaration (1680). Soon afterwards he excommunicated the king and his officials at Torwood, near Stirling, for which act a reward was offered for his capture. Executed at Edinburgh, July 17, 1681.

Cargo, see under BILL OF LADING, and FREIGHT.

Carham, par. in the co. of Northumberland, England. It is situated on the R. Tweed and has a railway station. Pop. 900.

Caria, anct. maritime prov. of Asia

Minor, bounded by Ionia and Lydia on the N., the Aegean Sea on the S., and Lydia on the E. The country is mountainous, its chief heights being over 3000 ft., while Mt. Latmus reaches the elevation of 4500 ft. The coast is irregular and deeply indented, being fringed with numerous is., chief among which are the Gk. is. of Rhodes and Cos. The Carians were originally a distinct nationality and maintained themselves in the interior against the Gks., but were afterwards subdued by the Persians. The country was conquered by Alexander the Great, and became finally part of the Rom. Empire. It now forms part of Turkey.

Cariama, *Dicholophus*, or *Serlema*, genus of S. Amer. birds, resembles the secretary bird, and is often placed near it among the Falconiformes. Internally, however, it is nearer to the Gruiformes, and the family *Cariamidae* is now usually classed under that tribe. *C. cristata*, the seriema or crested screamer, is a common species with long legs, short wings, short and slightly hooked beak, a well-developed crest, and long tail. Easily domesticated and will guard its owner's fowls when tamed.

Cariban, see **CARIBS**.

Caribbean Sea, part of the Atlantic Ocean that lies between the coasts of S. and Central America and the is. of Cuba, Haiti, and Puerto Rico and the Leeward and Windward Is. It communicates with the gulf of Mexico by the Yucatan Strait, and is divided into two deep basins, both in parts over 20,000 ft. deep, by a broad submarine bank less than 6000 ft. deep, lying between Jamaica and Honduras. The E. and larger basin has an area of 231,000 sq. m. The W. basin is considerably smaller. The two basins are united by a strait between Jamaica and Cuba and Haiti. The sea forms the turning point of the Gulf Stream. See G. H. Blakeslee (ed.), *Mexico and the Caribbean*, 1920; A. Waugh, *The Sunlit Caribbean*, 1948.

Caribbee Islands, name, chiefly of historical importance, sometimes applied to the whole of the W. Indies, strictly comprising only the chain of is. from Puerto Rico to the Venezuelan coast of S. America. They are known also as Lesser Antilles, the bulk falling into the two groups of Leeward and Windward Is. Some of the chief is. in the chain are St. Christopher (St. Kitts), Nevis, Montserrat, Dominica, St. Lucia, St. Vincent (Brit.); Guadeloupe, Martinique (Fr.); Saba and St. Eustatius (Dutch).

Cariboo, dist. of Brit. Columbia extending on both banks of the Fraser R., near its source. It is important on account of its gold mines.

Caribou, see **REINDEER**.

Caribs, or **Caribbees** (Charaibeos), name (first used by Columbus) of a predatory, warlike people of S. America, from whom the Cariban stock takes its name. They were expert seamen and, according to the latest views, spread from S. America northwards, occupying the Lesser Antilles, near what is still called the Caribbean Sea, by conquest of the original Arawakan

tribes. They were distinguished for ferocity and cruelty, and made a bold resistance to the Spaniards. C. is said to mean valiant man. They were cannibals, the word cannibal itself being a corruption of Columbus's 'caribal' (derived from their tribal name), perhaps referring to the 'canine' voracity of the C. See **CANNIBALISM**. To put an end to the constant disturbances caused by the C., the Eng. gov. in 1796 deported them nearly all from Dominica and St. Vincent to Ruatan Is. off Honduras. They numbered about 5000, and have since spread over the neighbouring mainland, the majority being now settled in Honduras and Nicaragua. Among the chief Cariban tribes are the Palenques in Brazil; Bakaris and Nahuquas on the Upper Xingu; Apotos and Waywal in Brazilian Guiana; Roncouyennes and Galibis in Fr. Guiana; Mucusi in Brit. Guiana; Kalinas in Dutch Guiana; Makirifares and Motlones in Venezuela. They are usually slight in figure, but strong and well-formed, though lacking muscle. They were described at the discovery of the new world as 'the strongest, handsomest, and most intelligent' natives of that part. They are reddish-brown in colour, with long, thick, black hair, and Mongoloid features. They drink quantities of *patuari* (liquor made from the cassava plant). Through admixture with negroes some are known as Black C. The C. were partly an agric. people, and made good pottery. The modern tribes are far more peaceful than the anc. They no longer have communal dwellings, but separate families, each in its own house. Their religion is ceremonial, and they practise the couvade (*q.v.*). The favourite weapon is a battle-axe of polished stone. The kinship of the various C. communities from Central America to Central Brazil is entirely linguistic. See also **AMERICAN INDIANS**.

Carica, typical genus of the order Caricaceae, which grows in tropical America. The best-known species is *C. Papaya*, the papaw, a tree which has many uses. It is eaten ripe, boiled as a vegetable, the milky juice is a vermifuge. The juice of the plant forms a cosmetic, the leaves are used in washing instead of soap, and animals fed on the plant become tender. *C. candamarcensis* has edible seeds.

Caricature (It. *caricatura*), a representation of some person or group in such a manner as to excite ridicule or contempt. The word is from the Low Lat. *Caricare*, to load a car, and its connotation is 'to charge or load with exaggeration,' and the It. word *caricatura* was first given its present meaning by Annibale Carracci as applied to drawings in this vein by himself and others of his school in Bologna in the sixteenth century. In Eng. the word is comparatively modern, having been first used by Sir Thomas Browne in his *Christian Morals* (part iii.), but the hist. of C. goes back certainly to Gk., possibly early Egyptian times. In Greece and Rome, however, pictorial as compared with literary satire held but a small place. With the exception of a few vase paintings which have survived, Gk. Cs. are only

known to us through references in Aristophanes and elsewhere, but many grotesque drawings have been uncovered in Pompeii and Herculaneum, and Pliny mentions painters skilled in burlesque portraiture. Both literary and artistic C. have always based themselves more or less on actual facts and features. Even physical deformity, which ought to excite pity, has often been made a subject for derision, and as religious wars have been among the most cruel, so religious Cs., as in the pagan mockeries of the early Christians, and the broadsheets issued during the Reformation, have been among the most venomous and insulting. Artists in the Middle Ages loved the grotesque; witness the monsters of the illuminated MSS. and the gargoyles of the cathedrals. In the tenth and eleventh centuries the story of Reynard the Fox, among others, was used by monkish writers for satirical and didactic purposes; after passing through many variations, the story as now generally known was printed at Lubeck in 1498, with illustrations to match the text. Caxton had already pub. an earlier version in Eng. A generation later Holbein produced his 'Moralities,' including the famous 'Dance of Death.' These prepared the way for the great development of the art of C. in the sixteenth and following centuries. Germany and Holland were at first most prolific, but Jacques Callot of Lorraine (1592-1635) struck out a new line, which was freely copied. As pictorial satire had played so great a part in religious disputes, it was now employed also in politics. Political C., unknown in the conditions of society in the Middle Ages, was only introduced with the art of printing. One of the earliest engravings which can be called a political C. was a Fr. drawing of 1499 entitled *Le Recers du jeu des Suisses* ('the defeat of the game of the Swiss'). The picture shows a card table round which are Louis XII. of France, Henry VII. of England, the king of Spain, and a Swiss noble, the lesson being that Louis has won the game, viz. his aspirations to it. i.e., despite the open hostility of the Swiss nobles. The majority of such Cs. as were produced in this early period were Fr. Cs. in France became comparatively frequent in the seventeenth century, but ceased with the curtailment of the freedom of the press under Louis XIV., though many were pub. in Holland or other countries and imported, Louis XIV. being the especial object of satire. In England political C. was unknown up to the sixteenth century, and only came into some vogue with the political struggles of the Stuart period. The earliest victims of such satire were the Episcopalian party in the Church and the cavaliers, whose insolence supplied the caricaturist with his cue. A famous Eng. C. of this period was one entitled 'An Embleme of the Times,' produced in 1647; it represents war as an armed giant trampling on mutilated bodies, while Hypocrisy, a two-faced woman, is seen fleeing towards some distant city. Playing-cards were not seldom the medium for C., directed against the Commonwealth, Gen.

Lambert being a favourite subject, the inspiring force behind these Cs. being the Court party, who were the equals of the reformer in appreciating the power of C. on popular imagination. In 1710 there was a veritable storm of Cs. in England, provoked by hatred of Dr. Sacheverell; while in the same period the Whigs began to make full use of the weapon. Many if not most of these Cs. were actually produced in Holland, to which country modern political C., though originating in France, owes its development. With the accession of George I. (1714) the public appetite for political and social C. increased greatly, and became almost a necessity of social life; but it was rather in the time of Walpole that Eng. political C. received its great impetus, when both Whig and Tory made use of it. Women of the period took so great an interest in politics that Cs. of that time were often introduced on fans and on other articles of a personal nature. Yet even then the popular idea of a C. was indeterminate. Cs. were called 'hieroglyphics,' because they were so full of mysterious allusion and not comprehensible to the ordinary mind. During the eighteenth century C. in England reached its height in the works of Hogarth, whose 'Marriage à la Mode' and similar Cs. have never been excelled. In politics, the S. Sea Bubble and the abuses of Walpole's administration invited and received satire, and with the outbreak of the Fr. Revolution came also a furious cartoonists' war, Gillray and Rowlandson being matched against Fr. rivals of equal virulence if less power. Gillray, whose first Cs. were directed against the Shelburne Ministry and developed with malicious pungency against George III. (as e.g. in the famous C. of 'The King and the Apple Dumpling') was the greatest caricaturist of his age, and his works form a hist. of the more important part of the reign of George III. Champléury's *Histoire de la Caricature*, gives an idea of the savage, often disgusting, work of that era in France. During the nineteenth century these grossnesses were quite abolished in England and largely so abroad. A great impetus to Fr., and indeed to European, C. was given by the Fr. periodical, *La Caricature*, founded by Charles Philippon (1806-62) in 1830, followed two years later by *Le Charivari*. In these and in *Le Journal de Paris*, which was started in 1847, Philippon encouraged a distinguished body of Fr. caricaturists, which included such celebrated names as Honoré Daumier, Paul Gavarni, H. T. Mounier, 'Grandville' (Jean Gérard), and Gustave Doré. Following the Fr. example, *Punch*, or the *London Charivari* was founded in England in 1842, and similar periodicals were produced in Germany, Italy, and in most, if not all, European countries, each country developing its own style of C. with strongly marked national characteristics. Among Ger. caricaturists T. H. Heine with his bitter satire deserves particular mention, and in France 'Caran d'Ache' (Emmanuel Poiré) and 'Cham' (Vicente de Noé), with many others carried on the brilliance

of their predecessors. To return to Great Britain, George Cruikshank comes between the school of Gillray and the later one of *Punch* with a style all his own. With his brother Robert, he began as a bitter political caricaturist, but is chiefly remembered for his later drawings depicting the social life of his time. Since his time Great Britain has been exceedingly rich both in caricaturists proper and in draughtsmen whose work is sometimes

Among other political cartoonists of the time mention must be made of W. Bowcher in the periodical *Judy* and Gordon Thomson in *Fun*. The introduction of photo process-engraving in the early seventies freed artists from their hitherto dependence on wood-cut technique, and was thus an important encouragement to C. of a wider range and versatility. The charming sketches of Randolph Caldecott (1846-86), the fun and pathos of Phil May,

THE NEW DUTY OF SCIENCE

A *Daily Herald* cartoon (1933) by Will Dyson, reproduced with permission.

difficult to classify (e.g. the famous cartoon 'Dropping the Pilot' by John Tenniel). John Leech (1817-64) with his political cartoons (this word being first applied by him to a C. drawing). Richard Doyle (1824-83). Sir John Tenniel (1850-1900), C. S. Keene (1851-1891), Du Maurier (1860-96), Linley Sambourne (1871-1910), Harry Furniss (1880-1925), E. T. Reed (1890-1920), Sir Bernard Partridge (1901-1925), and others gave much of their best work in *Punch*, either in political C. or in illustration of jokes. Cs. of prominent people gained an especial vogue in the pages of *Vanity Fair* with the work of 'Ape' (Carlo Pellegrini) and 'Spy' (Leslie Ward),

and the brilliant work of artists such as 'F. C. G.' (Sir Francis Carruthers Gould), Max Beerbohm, and others, have helped to place Eng. humorous art in the very first rank. Gould was the first cartoonist to draw daily for a newspaper, the *Westminster Gazette*, and Max Beerbohm's wit found expression in his drawings of humorous situations in which he placed the leading figures of his day, mostly from the world of letters. His drawings were of the simplest in outline. Phil May, although Eng. born, began his career with his work for the *Sydney Bulletin*, a periodical in which an Amer. artist, Livingstone Hopkins, also made a name for political and social satire. Will

Dyson also graduated from the *Sydney Bulletin* to become well known in England during the First World War and for many years after it for his hard-hitting political cartoons, reminiscent of Gillray. Australia has continued to provide a flourishing field for the caricaturist. Norman Lindsay is only one among many names. Another Australian paper, the popular *Smith's Weekly*, provides an outlet for well-executed cartoons, although somewhat gross in taste, on political topics. As mentioned above, the word C. has to-day given place to cartoon, and this latter word, which in its primary significance meant a picture of a larger size than usual in a paper or periodical, is now applied to any political or social C. of any size whatsoever. In connection with humorous illustration, which is a C. of life and often combined with the creation of characters, mention must be made of Wm. Heath Robinson with his whimsical inventions, George Belcher, and Bruce Bairnsfather, the creator of 'Ole Bill,' a prominent character of the First World War. In the thirties, however, the illustrated joke began to show a decline in popularity, and the comic situation picture with little or no explanation in words came into vogue. In this connection H. M. Bateman, 'Fougasse' (Kenneth Bird), and 'Pont' became acknowledged masters. Meanwhile, the London daily newspapers, taking their lead from the *Westminster Gazette*, made a regular feature of the cartoon. Some prominent cartoonists, e.g., 'Poy' (Percy Farson) of the London *Evening News*, delighted in very small cartoons of no pretensions to artistic merit, with serial characters like 'John Citizen' and 'Dilly Dally,' symbolical of the gov. 'mandarin,' which became familiar through repetition. David Low, on the other hand, the Australian-born cartoonist and probably the best-known cartoonist in England of his day, indulges in bold outlines with considerable artistic merit. He possesses a keen political sense, and his satires in the London *Star* and, later, in the London *Evening Standard* on political and social life, are full of sting but sometimes coarse. In particular, his cartoons on Hitler, Goering, and other Nazi leaders before and during the Second World War were unrivalled. In a lighter vein the cartoons of Sidney Strube, the creator of the 'Little Man,' though intentionally devoid like those of 'Poy' of artistry, were always popular and apposite. W. K. Haselden of the London *Daily Mirror* became known for light social satire, and the work of the cartoonist as a sports cartoonist found its pioneer in Tom Webster. In the U.S.A. political C. for a hundred years kept pace with that of Europe, deriving from Gillray, whose influence was brought to America by Wm. Charles, a Scottish immigrant. From the time of the Civil war, political satire received a tremendous impetus in the U.S.A., achieving its greatest prominence in the work of Thomas Nast; and both in caption and draughtsmanship the cartoons of such papers as *Judge* and *Life*

were ahead of those of almost any other country. During the last forty years the work of Amer. cartoonists has given rise to the outstanding popularity of the 'comic strip,' without which a newspaper is hardly complete in the U.S.A. Comic strips portray a series of episodes in the lives of imaginary but typical cartoon characters. Harry Herschfield, Reuben Goldberg, George McManus (of 'Bringing Up Father' fame), Rudolph Dirks (creator of the Katzenjammer Kids), Harold Gray, Bud Fisher (creator of Mutt and Jeff) are a few names among many artists who have achieved fame in the art of the comic strip, which also gained greatly in popularity in Great Britain during the Second World War.

Caries, necrosis (death) of harder tissues, i.e. bones and teeth, of the body. It resembles the ulceration of the softer tissues, but by reason of the constitution of the parts attacked, it is of a more serious nature, and the inorganic constitution of the tissues renders them less easy to replace, and therefore to heal. It is generally caused by an injury, but also accompanies scrofula, syphilis, phosphorus poisoning, and tubercle. The chief seats of the disease are the cancellated (spongy) bones, the bones of the vertebral column, and those of the fingers and feet. The diseased bone becomes soft and red, and particles come off, while the ulceration of the bone itself comes to the surface and forms a fistula. The matter of the ulceration must be removed, and the part treated antiseptically when the bone may heal, or the result may be obtained by gouging or excision. A course of calcium phosphate promotes formation of new bone. Dental C. (see DENTISTRY) is chronic decay of the teeth.

Carigara, tn. on the coast of Leyte, Philippine Is. It is a port of call for steamers coming from Manila. Pop. 16,500.

Carignan, tn. of France, in the dept. Ardennes, on the R. Chiers. Its original name was Yvois. It is a very old tn. and its industry is supplied by the iron mines. Pop. 2300.

Carignano, tn. of Italy, situated S. of Turin (Piedmont). The name of this tn. is that of a branch of the Savoy family—Savoy-Carignan. Pop. 6700.

Carijos, one of the original tribes of Brazil. When the Portuguese colonised Brazil they received them and were not hostile in any way. Later on, however, they rose when attacked, and this led to their almost total extermination.

Carillon, set of bells upon which tunes can be played. This is done by some kind of keyboard mechanism, actuated by hand or by electric power. A C. differs from chimes by the bells being fixed instead of swinging and struck on the outside by hammers. In some parts of Europe C. playing has for centuries been important. There are famous Cs. in Holland, notably at Bruges. As a war memorial the idea of installing keyboard Cs. was adopted after 1918 at Loughborough and at Wellington (New Zealand). C. music exists mostly in MS. Schott,

in 1862, pub. an important selection of preludes, fugues, and minuets from the works of Matthias van den Gheyn (1721-1785), which was ed. by van Kleyck in collaboration with the organist Lemmens. In more recent years, J. Denijn and J. A. F. Wagenaar wrote specially for the C. Elgar composed a special *Memorial Chime* for the opening ceremony of Loughborough C. in 1923. C. music must exhibit an intimate knowledge of clavier technique. Two-part writing, with clearly defined harmonic suggestion, is regarded as the most effective. A school of C. playing was inaugurated at Malines (or Mechlin) in 1922, with Denijn as director. In England a comprehensive course was adopted by Prof. Granville Bantock (q.v.) at Birmingham Univ., where a lectureship was instituted in campanology, including bell-making and tuning, acoustics of bells, C. and C. music and chime tunes, the composing of bell music, etc.

Carilocus, see CHARLIEU.

Carimata Islands, group of more than 100 is. situated W. of Borneo. They are separated from the is. of Hilliton by the strait of the same name. The largest one of this group Grand C., is woody and mountainous. Pop. 500.

Carina, or **Keel**, term applied to two of the petals of a papilionaceous flower, e.g. pea or lupin; also, which are fused together and form a boat-shaped structure.

Carinaria, genus of gastropod mollusc, is to be found in tropical seas and the Mediterranean. The shell is shining in appearance, small and conical in shape, the foot is long and the visceral sac is small. *C. mediterranea* is a common species.

Carinatae, the larger of the two groups of living birds, the other being the *Ratitae*, e.g. emus and ostriches. It receives its name from the fact that the sternum is always keeled except in flightless forms, e.g. dodos, but nearly all the species have well-formed wings capable of flight. See BIRD.

Carini, tn. of Sicily in the prov. of Palermo. It is situated in a hilly country and has a Gothic castle. Pop. 14,300.

Carinthia (Ger. *Kärnten*), prov. of Austria, E. of Tyrol, of area about 1000 sq. m. The dist. is mountainous, bounded on the N. by the Hohe Tauern and Styrian Alps (with Gross Glockner, Hochnarr, Ankogel, Hafner Eck, Konigsstuhl, etc., ranging from about 8000 to 12,000 ft.); on the S. by the Carnic Alps and Karawankas (Dobratsch or Villacher Alp, Och Obir, Petzen, etc., ranging from about 7000 to 9000 ft.). The R. Drave flows through the prov. from E. to W., its valley separating the two mt. chains. There are many beautiful lakes (Wörther, Millstätter, and Weissen), and valuable mineral springs. Among the many passes across the mts. are the Pontebba or Pontafel Pass, through which goes one of the chief Alpine roads from Italy to Austria (with the fortress of Malborgeth near by, overwhelmed by Fr., 1809); the Predil, through which goes the main road from C. to the coastland (with Predil fort

near by, also stormed by the Fr., 1809), the Loibl, Seeburg, and Arlscharte. Klagenfurt is the cap. and centre of the railway lines. Only a small part of the prov. is adapted for tillage, most of the productive land having forests. Rye, wheat, oats, buckwheat, and clover-hay are the chief crops. Valuable horses and livestock are reared. The mineral resources are very great. C. is one of the chief lead producers for Europe. Iron, coal, and zinc are also found. Bessemer steel rails, wire, bar-iron, and wire nails are manufactured. Machinery, textiles, wood-pulp, leather goods, firearms, and cement are exported. Under the Austrian Constitution of 1920, C., like the other provs., sent its quota of members to the Bundesrat in proportion to its pop. (this is approximately 5.67 per cent of the total pop.). About 70 per cent of the people are Gers., 30 per cent Slovenes or Slavs. The majority are Rom. Catholics. Many tns. in C. are becoming popular resorts. C. was part of Noricum under the Rom. Empire. The Carni were overwhelmed by Slavs (c. sixth century); Charlemagne annexed it to the Frankish Empire; then for 500 years it was ruled by various dukes, finally coming under archdukes of Austria, 1335. Since then, except when held by the Fr., 1809-13, it was directly subject to Austria. A small part of C. was transferred to Italy in 1920 and another to Yugoslavia. Pop. 405,000. See A. Horner, *Kärnten*, 1930.

Carinus, Marcus Aurelius, Rom. emperor c. A.D. 283-85, son of Carus, and governor of W. Empire under him. He fought against Ger. tribes, then returned to Rome and luxury. On the death of C.'s brother, Numerianus, Diocletian was proclaimed emperor in Mesia. C. won a battle against Diocletian on the Margas, but was afterwards killed by his own soldiers. See Vopiscus, *Carinus*.

Caripuna, tribe of savages occupying parts of S. America. They are found in Brazil, on the banks of the Madeira R.

Carisbrooke, par. in the Isle of Wight in the co. of Hampshire, England. It lies to the S.W. of Newport, and was once the cap. of the is. C. Castle, partly in ruins, is the distinguishing feature of the tn. It dates back to very early times, and was the scene of the imprisonment of Charles I. for a time. Pop. 5000.

Carissa, genus of thorny shrubs of the order Apocynaceae, found in Asia, Australia, and Africa. *C. Carandas*, Christ's thorn, or the carandas-tree, is used for fencing in India, and the edible fruit is pickled, preserved, or eaten raw. *C. Xylocarpus*, the bitter-wood, is a native of Madagascar.

Carissimi, Giacomo (c. 1604-74), It. musician. He was chapel master at the church of Sant' Apollinari, and is famous for his reform of the recitative, and for being practically the inventor of the cantata. His music is distinguished by its pure style and its exquisite melodies, while among his followers may be numbered such men as Bassani and Alessandro Scarlatti. He wrote a number of oratorios and cantatas, the most famous

among the latter being *The Sacrifice of Jephthah*.

Carit Etlar, pen-name of the Dan. dramatist and novelist, Johan Karl Christian Brosbøll (1816-1900). He was b. at Fredericia, and studied painting for some time at the academy of Copenhagen. He then took up literature, and pub. *Slægtskabet* in 1839. His works include historical romances, tales of Dan. life, and dramas. His *Skrifter* (collected works) appeared at Copenhagen in 1859-1868, and a fresh collection was pub. from 1873 to 1879. Among individual works may be named *Livets Conflicter* (1844); *Skyggebilleder, Nordenskjold* (1879); *Arabere og Kabyler* (1868).

Caritat, Marie Jean Antoine Nicolas, see CONDORCET, MARQUIS DE.

Carle Sunday, see CARE.

Carlén, Emilie Smith Flygare (1807-1892), Swedish novelist, b. at Strömstad, the daughter of Rutger Smith, a trader. In 1827 she married Dr. Flygare. She was left a widow after about six or seven years, and she then began her literary career, writing *Waldemar Klein* in 1835. Shortly after this she married Johan Gabriel C., a poet, and settled in Stockholm. Among her works, many of which have been trans. into Eng., are *Gustav Lindorm* (1839); *Fosterbroderne* (1840); *Rosen på Tistelén Berörelse från Skargörden* (1842); *Jungfrulörnet, Sjöroman* (1848).

Carlentini, tn. of Sicily, situated 19 m. from Syracuse. It was founded by the Emperor Charles V. Pop. 10,000.

Carli, or Carli-Rubbi, Giovanni Rinaldo, Count (1730-95), It. political economist and antiquary. Senate of Venice made him prof. of astronomy and navigation, 1744-50. President of Council of Commerce in Milan, 1753. He persuaded Joseph II. to abolish the Inquisition. His most celebrated work is *Delle monete e dell' istituzione delle zecche d' Italia*, on the coins of Italy (1754-60). Others are *L'Uomo, Libero* (1772); *Lettere Americane* (c. 1780); *Delle antichità italiane* (1788-91).

Carlile, Richard (1790-1843), Eng. reformer, b. at Ashburton, Devonshire, the son of a shoemaker. He was educated at the vil. school, and after having endured many hardships during his apprenticeship to a tinman, he became a journeyman tinman in London. After reading books on the subject, he became an extreme Radical, and underwent sev. terms of imprisonment for publishing some of these books which had been suppressed, especially those of Thomas Paine—whose effigy he had helped to burn when a boy—and also for writing his *Political Litany*, a work of the same kind. He was set free in 1825, and became editor of the *Gorgon*, a political paper. He pub. the *Moralist* (a series of moral essays), and a large number of pamphlets. C.'s activities did a great deal toward securing the freedom of the press and he certainly won the admiration and sympathy of powerful friends who took good care to keep in the background. Cobbett, and others, however, deprecated the idea of establishing the theological

or even the medical freedom of the press as mischievous. Consult G. J. Holyoake, *Life and Character of Richard Carlile*, 1849; G. A. Aldred, *Richard Carlile, Agitator*, 1923.

Carlile, Wilson (1847-1942), founder of the Church Army, b. at Brixton, Jan. 14, of Scottish descent on his father's side; educated London College of Divinity. In early life he entered business, travelled much on the Continent, and studied music. He was influenced by the Moody and Sankey mission of 1875, and in 1880 was ordained in the Church of England. Two years later, while working in the slums of Westminster, he founded the Westminster Mission, from which the Church Army developed. A breakdown in health caused him to accept a living at Notteswell, Essex, in 1891, but a year later he became rector of St. Mary-at-Hill, London, where he remained until his retirement in 1926. His evangelistic and social work grew in value, and in 1896 the Church Army mission was carried to prisons and reformatories. In 1906 C. became prebendary of St. Paul's Cathedral, and shortly after travelled on the Continent to study labour conditions, publishing on his return *The Continental Outcast*. After the First World War, during which the Church Army did notable work, the movement spread overseas, taking root particularly in the U.S.A., which C. visited in 1926. Awarded C.H., 1926; Hon. D.D., Oxford Univ., 1915, and Toronto Univ., 1926. C. had outstanding gifts of leadership and organisation, and as founder and hon. chief secretary of the Church Army his active missionary work did not cease until his death on Sept. 26, 1942. Pub. *The Church and Conversion* (1882); *Spiritual Difficulties* (1885); *Baptism of Fire* (1907). See Sidney Dark, *Wilson Carlile*, 1944.

Carlina, genus of Compositae, spreads over Europe to the middle of Asia. *C. vulgaris*, the carline thistle, is a native of Britain; it has the curious habit of opening widely in dry weather, and in wet seasons the white inner leaves of the surrounding bracts cover over the flower-heads, leaving the prickly outer bracts exposed to the rain. *C. acaulis*, the weather thistle, is abundant in the Alps and has the same characteristic action. The purgative obtained from the roots is used in veterinary practice.

Carling, Sir John (1828-1911), Canadian statesman and capitalist, b. in London, Ontario. His father, Thomas C., was a native of Yorkshire, and left England for Canada in 1818. In 1862 he held the post of receiver-general of Canada, and later became commissioner of agriculture and public works. He was afterwards minister of agriculture, and in 1882 postmaster-general. He also founded the Agric. College in Ontario. K.C.M.G. in 1893.

Carlingford, tn. of Eire, in the co. of Louth in the prov. of Leinster. It stands on the sea-coast on the bay, or lough, of the same name, and is noted for its oyster fisheries. Pop. 600.

Carlisle Lough, part of the Irish Sea between co. Louth and co. Down. It is 10 m. long and 2 m. wide, and can accommodate the largest ships.

Carlisle, city in Macoupin co., Illinois, U.S.A. Pop. 4000.

Carlisle (Rom. *Luguvallium*, Brit. *Caer Luel*), parl., city, and co. bor., cap. of Cumberland, England, stands on a fertile tract of land about 10 m. from the Scottish border on gently rising ground surrounded on three sides by the Rts. Eden, Caldew, and Petteril. It is on the N.W. line of communication from England to Scotland by road and also an important railway junction with many lines converging into it, attached, since the railway merger, to the great London, Midland and Scottish and the London and N.E. systems (now Brit. Railways). It is also the centre of an efficient local and long-distance bus service. The city is just S. of Hadrian's Wall from the Tyne to the Solway Firth and was once a Rom. civil settlement—the great cavalry fort of *Petrianus* being half a mile distant on the N. side of the riv. During the Dan. invasions it was attacked and burnt and lay in ashes until the coming of the Normans. William Rufus realised the importance of a place lying so near to the N. frontier of his kingdom and gave orders for its re-building. He also caused a keep and walled enclosure to be erected (1092). By 1170 the castle, further enlarged and strengthened, was playing its part both in the continuous border warfare, that only ceased with the Union, and also in greater national struggles—particularly in the Civil war when it was besieged and captured by the parl. forces under Gen. Lesley. Edward I. held his last Parliament in the castle and Mary Queen of Scots was kept here for some time, virtually a prisoner, by Elizabeth. In 1745 it surrendered to Prince Charles Edward but was quickly retaken by the duke of Cumberland. At the beginning of the nineteenth century great portions of the castle were pulled down (amongst them the banqueting hall where Edward I. had held his Parliaments). As it now stands it is in the care of H.M. Office of Works and is used as barracks and depot for troops of the Border Regiment. It also serves as the museum for the Border Regiment—the old 34th (Cumberland) and 55th (Westmorland) Regiments. The bishop's see was founded by Henry I. in 1133 and included the cos. of Cumberland, Westmorland, and regions of Lancashire lying N. of Morecambe Bay. The cathedral, originally the church of an Augustinian priory, built between the years 1092 and 1419, was once a noble edifice, cruciform in shape, but since the time of the Civil war, when the greater part of its Norman nave was pulled down and the stones used for military purposes, it has had the truncated appearance it now presents. It has a beautiful Early Eng. choir whose clustered columns have their capitals decorated with carved figures and flowers representing the occupations of the months

of the year. The choir stalls with their carved miserere seats are surmounted by graceful tabernacle work. The E. window, measuring 60 ft. by 30 ft. and having nine lights filled in with beautiful tracery, is considered to be the finest Decorated window in the kingdom.

The chief streets lead from the marketplace in front of the tn. hall. There are sev. interesting public buildings and institutions, including the old Guildhall, a well-equipped modern public library, and also a splendid museum and art gallery—the museum being rich in Rom. remains and having one of the best natural hist. collections to be found in the provs. C. grammar school was founded in 1170. The city is engaged in a great variety of industries, of which the chief are the manufacturing of textiles—calico, cretonnes, muslins, velvets, artificial silks, and Cumberland tweeds—also of carpets, hats, biscuits, sweets, tin boxes, and cranes. The centre of a large agric. area, it has also important live-stock markets. By the Licensing Act of 1921 the wholesale and retail licensed trade of Carlisle was transferred to the home secretary. With the object of supplying all reasonable demands whilst at the same time taking all possible care to avoid excess, the number of licensed houses was reduced and the others greatly improved—food being provided and served in rooms set apart for the purpose. The inns are in the care of managers with a district manager as head. The results of the scheme as far as C. is concerned are good. The estimated pop. of the city and co. bor. in 1947 was 64 000. It sends one member to Parliament.

Carlisle, tn. in Cumberland co., Pennsylvania, U.S.A., about 19 m. from Harrisburgh. Dickinson College was founded here in 1783, and there is also in the tn. an industrial training school for Amer. Indians. Pop. 14,000.

Carlisle, Sir Anthony (1768–1840), Eng. surgeon, first apprenticed to practitioners in York and Durham, then studied under John and Wm. Hunter in London. Member of College of Surgeons, and surgeon-extraordinary to the prince regent (George IV.); 1793–1840 surgeon to Westminster Hospital; F.R.S. 1800, contributing various treatises on physiology; 1808–25 lectured on anatomy at Royal Academy; knighted 1820; became president of the College of Surgeons, 1829. C. introduced the thin-bladed, straight-edged amputating knife. His writings were largely on anatomy; also on artistic and scientific subjects. One pamphlet, written in collaboration with W. Nicholson in 1801, was on galvanic electricity. See T. J. Pettigrew, *Medical Portrait Gallery*, ii., 1840; J. F. Clarke, *Autobiographical Recollections of the Medical Profession*, 1874.

Carlisle, Frederick Howard, fifth Earl of (1748–1825), Eng. statesman, educated at Eton and Cambridge. Up to the time of his appointment on a commission sent by Lord North to America he had spent his life in pleasure-seeking, but although

this commission had no result he proved himself capable of holding such posts. From 1780 to 1782, as lord-lieutenant of Ireland, he maintained peace and prosperity in that country. From 1789 until the Fr. Revolution he was in opposition to Pitt, but at that time he joined the opposite party, and after voting against the Corn Laws in 1815 he retired into private life.

Carlisle, George William Frederick Howard, seventh Earl of (1802-64), Eng. statesman, educated at Oxford, where he distinguished himself as a scholar. In 1826 he went to Russia, and in the same year was elected to represent Morpeth, having become Lord Morpeth in 1825. In 1830 he became member for Yorkshire, and in 1832 was elected to represent the W. Riding. From 1835 to 1841 he was chief secretary for Ireland, and in 1850 was made chancellor of the duchy of Lancaster. In 1855 Lord Palmerston appointed him lord-lieutenant of Ireland, which office he held till 1858 and from 1859 to 1861. He wrote a tragedy, *The Last of the Greeks* (1828), and two lectures, on the poetry of Pope and on his own travels in America (1850).

Carlists, the name given to the followers of Don Carlos de Bourbon (1788-1855) and his successors, who have in turn laid claim to the Sp. throne. Don Carlos was the brother of Ferdinand VII. (1808-1833). In 1824 many Spaniards were so discontented with Ferdinand that a plot was organised to depose him in favour of Carlos, but the latter firmly refused to countenance any rebellion. In 1830 Ferdinand was persuaded by his queen to alter the existing Salic law and appoint his infant daughter as his successor, to the exclusion of Don Carlos. The clerical party again tried to persuade the prince to head a revolt, but he once more refused, though declining to acknowledge the legality of the king's action. When Ferdinand *d.*, Carlos was engaged in assisting Miguel of Portugal against his rebellious subjects, and could not join his own partisans, who proclaimed him king, but were defeated. In 1834 he fled to England, returning soon to head a rising in Biscaya, which failed, and he again had to escape, after two years of adventure, in which he himself won no distinction. He *d.* in 1855; his son Carlos succeeded to his claim, but was expelled from France, and took no part in the abortive Carlist risings of 1846 and 1848. In 1860 he and his brother Ferdinand landed at Catalonia, but were captured, and only saved their lives by a humiliating surrender of their pretensions. Their brother John now put forward his candidature, afterwards resigning it to his son, Don Carlos VII., who raised a Carlist war in 1872, and for a time had some success, but was finally driven out of the country in 1876. After giving trouble in many countries he finally settled in Italy, where, through want of decision, he failed to avail himself of the opportunity which presented itself after the Hispano-Amer. war, when a discontented nation was not disinclined to look after his restoration as

the solution of their difficulties. His son Don Jaime was subsequently recognised as the legitimate pretender, but the recognition had no practical results. There was a striking resurgence of Carlism during the Sp. civil war, owing to the somewhat unexpected adherence of the Basque Nationalist and Catholic party to the Republican Gov. But it soon became evident that this resurgence did not mean that the remotely connected Bourbon prince (Don Jaime), whom Don Alfonso Carlos (1849-1936) is said to have named as his successor, would ever find any wide acceptance in modern Spain.

Carloforte, tn. of Italy, situated on the is. of San Pietro, near the coast of Sardinia. It has large salt works, and the zinc and lead mined in Sardinia are exported from the roadstead between this tn. and San Pietro. Pop. 7000.

Carloman: 1. Son of Charles 'Martel' and brother of Pepin. He succeeded his father in 741, and, with Pepin, repelled the Ger. invaders in 743. C. advanced into Saxony and captured the duke of Saxony. Later he entered a Benedictine monastery. 2. Younger brother of Charlemagne, with whom he in vain contested the Frankish kingdom. *D.* 771. 3. Second son of Louis II., whom he succeeded in 879. Proclaimed sole king of France on the death of his brother, Louis III. Killed while boar-hunting, 884. 4. Fourth son of Charles the Bald, a turbulent prince who, being accused of treason, had his eyes put out (c. 876).

Carlos, Don (1545-68), Sp. prince, only son of Philip II. of Spain, was from his boyhood of defective intellect and violent temper, and showed unmistakable signs of insanity; nevertheless an arrangement was made that he should marry Elizabeth, daughter of Henry II. of France, but soon after the death of Philip's second wife (Mary Tudor), that monarch cancelled his son's engagement and married Elizabeth himself. After an illness in 1562 the prince's derangement became more violent, and his vicious mode of life caused much scandal. In 1567 he was imprisoned on a charge of plotting to murder his father, and *d.* within six months after, under mysterious circumstances which have never been fully explained. He was generally believed to have been poisoned, but this has not been proved. In Motley's *Rise of the Dutch Republic*, the story of his life is vividly related, and sev. writers, including Schiller and Alfieri, have founded dramas upon it.

Carlos I. (1863-1908), king of Portugal, succeeded his father Luiz I. in 1889. He was a lover of peace, and encouraged literature (he was the author of the best translation of Shakespeare in the Portuguese language), science, and art, but the latter part of his reign was disastrous, owing to the policy of his chief minister, Senhor Franco. The king and his eldest son were assassinated in Lisbon, Feb. 1, 1908.

Carlota, La, tn. in the prov. of Cordova, Spain, 16 m. S.S.W. of the tn. of Cordova with manufs. of linen. Pop. 6000.

Carlovingians, or **Carolingians**, a Fr. dynasty, named after its greatest monarch Carolus Magnus (Charlemagne). About the year 623 Clotaire II., one of the Merovingian kings, gave his son Dagobert the kingdom of Austrasia (roughly speaking Lorraine and Franconia), with Pepin as mayor of the palace, whose son Pepin II. made himself master of both Austrasia and Neustria in 687, though he did not assume the royal title. His natural son, Charles Martel, seized the reins of gov. on his father's death, and became renowned as a warrior and administrator, but still contented himself with being 'duke' and chief minister to the nominal king. (For his great victory over the Saracens, see *Creasy's Decisive Battles*.) His son, Pepin III., put this bold question to the pope: 'Which has the greater right to the throne, the man who has the name and not the power, or he who has the power but not the name?' Receiving the answer he desired, he deposed Childeric, and became king, reigning from 752 to 768. He was succeeded by his son, Charlemagne, one of the greatest monarchs in European hist., both as conqueror and ruler. Extending his kingdom across the Pyrenees to the Ebro, eastward to the Elbe, the Bohemian Mts., and even to Croatia and Dalmatia, and southward to N. Afs. he was crowned by Pope Leo III. as head of the Holy Rom. Empire. He was a patron of learning, establishing schools and univs., in which he was greatly assisted by Alcuin of York. Charlemagne's son, Louis le Debonnaire, shared his domains between his sons, Charles II. taking France (840). Forty years later Charles III. reunited the empire but was deposed by Odo of Paris, and though there were other Carlovingian monarchs their authority was little more than nominal. The dynasty ended with Louis V., who was succeeded by Hugh Capet (987).

Carlovitz, see **KARLOVCA**.

Carlow: 1. Co. of Eire in the prov. of Leinster. Area about 349 sq. m., mostly arable. It is bordered by mts. in S.E. (Mt. Leinster), the rest being level or undulating. Chief tns., C., Tullow, Bagenalstown. Pop. 36,000. 2. Municipal bor., chief tn. of above co., on R. Barrow, about 50 m. from Dublin, on C. railway. Seat of Catholic bishop of Kildare. Till 1885 sent one member to Parliament. Ruins of an anct. Anglo-Norman castle dating from 1180 can be traced. There are flour-mills and much granite rock near by. St. Patrick's College was founded in 1795; in 1798 Irish rebels attacked the tn., but were repulsed. Pop. 7000. See J. Ryan, *History and Antiquities of Co. Carlow*, 1833.

Carloway, Doon of, remains of a circular tower at C., a tn. of Ross-shire, on the is. of Lewis in Scotland.

Carl Rosa Opera Company, formed by Carl August Nicolas Rosa (q.v.) in 1875. Became foremost private repertory opera company in the Brit. Isles.

Carlsbad, see **KARLOVY VARY**.

Carlsburg, see **KARLSBURG**.

Carlshamn, see **KARLSHAMN**.

Carlskrona, or **Karlskrona**, fortified seaport and naval station of Sweden, on five rocky is. in the Baltic, which are connected together and with the mainland by fourteen bridges. It was founded in 1680 by Charles XI. It has a magnificent harbour with a naval arsenal and dockyard. Pop. 28,000.

Carlson, Fredrik Ferdinand (1811-1887), Swedish historian and statesman, b. at Kungshamn, Uppland. He was educated at Upsala Univ., and held, among other posts, those of tutor to the Swedish princes, 1837-46; and prof. at the univ. of Upsala, 1849. In the National Diet he represented the univ. and then the Academy of Sciences of Stockholm from 1850 to 1865. His chief work is *Sveriges Historia under Konungarne af Pfalziska Huset* (a hist. of Sweden in 7 vols.) (1853-1870).

Carlsruhe, see **KARLSRUHE**.

Carlstad, see **KARLSTAD**.

Carlstadt, Andreas Rudolf Bodenstein af (1480-1541), Ger. theologian, b. at Karlstad. He was a prof. of Wittenberg Univ., and while studying theology in Rome he became imbued with the same doctrines as Luther. His views, however, were more advanced than those of the latter, and the two found themselves in opposition, as C. denounced the practices of the Church without limit. He was accused of taking part in the peasant's revolt and fled to Switzerland about the year 1525.

Carlton, tn. 3 m. from Nottingham, England, with a pop. of 22,000 principally engaged in mining and railway industries.

Carlton Club, so called from being near the site of C. House (famous during the Regency), the headquarters of Conservatism since its foundation by the duke of Wellington in 1832. The present building, 94 Pall Mall, was designed by Sir Robert Smirke. In 1922 the club was the scene of an historic meeting of the leading Conservative members of Parliament and others, when one section, under the lead of Mr. (later Sir) Austen Chamberlain, decided to continue to support Mr. Lloyd George and the Liberal wing of the Coalition party, and another section, comprising the larger body, broke away and decided to throw in their fortunes with Mr. Bonar Law, who became Prime Minister.

Carlisle, Scottish tn. in the co. of Lanarkshire, about 5 m. N.W. of the tn. of Lanark. It is a mining tn., and quantities of coal and iron are found here. It is also the centre of a fruit-growing dist. Pop. 10,500.

Carlyle, Alexander (1722-1805), Scottish minister. He took his degree at Edinburgh Univ. and afterwards went to the univs. of Glasgow and Leyden. In 1748 he became minister of Inveresk, a position which he held for the rest of his life. He adopted the views of the writer John Home, one of his friends (and was censured for attending Home's *Douglas*, 1757), and favoured the moderate party in the Church. He numbered among his friends Adam Smith and David Hume, as well as other men famous in the literary

world. Was nicknamed Jupiter C., on account of his fine presence and bearing. Moderator of the General Assembly. His *Autobiography* was pub. in 1860.

Carlyle, Alexander James (1861-1943), Scottish historian, son of Rev. J. E. C., minister of the Free Church of Scotland, Bombay; educated at Glasgow and Oxford Univs. He was ordained to the curacy of St. Stephen's, Westminster, 1888. Secretary to S.P.C.K., 1890-91; rector of St. Martin's and All Saints', 1895; examining chaplain to the bishop of Worcester, 1897-1901; became chaplain and lecturer in political science and economics at Univ. College, Oxford. In Aug. 1930 he was made canon of Worcester, and from 1934 until his death was hon. president of the International Institute for the Philosophy of Law. He wrote with his wife *Hugh Latimer* (1900); with his brother Sir R. W. C., *History of Medieval Political Theory in the West* (6 vols.) (1922-30); *The Christian Church and Liberty* (1924); and *Political Liberty* (1941).

Carlyle, Jane Baillie Welsh (1801-66), wife of Thomas C. (q.v.); b. near Haddington, the daughter of Dr. John Welsh; among her ancestors were John Knox and Sir Wm. Wallace. As a girl she was a pupil of Edward Irving, who in 1821 introduced her to C.; they became great friends, and their friendship ripened into a stronger feeling. He was, however, in poor circumstances; Mrs. Welsh also discouraged his wooing, and a formal engagement was long postponed, but the wedding finally took place in Oct. 1826. For years C.'s income was small, and his wife, who was not used to hardships of which he made light, suffered in health and spirits. After sev. changes of residence, between Edinburgh and Craigenputtock, they removed in 1834 to London, and settled down in Cheyne Row, Chelsea. Here, as C.'s reputation increased, they made many friends, among others Lord and Lady Ashburton. This intimacy was in one way unfortunate; Mrs. C. thought herself slighted by Lady Ashburton, and said so; her husband thought her unreasonable, and she, greatly hurt, formed a circle of friends of her own. In 1857 Lady Ashburton d., a year later Lord Ashburton married again, and his second wife and Mrs. C. became close friends. But there were also other troubles, arising from C.'s bad health, irritable temper, and his constant worrying about every noise or other interruption to his work. All household anxieties fell on his wife, and she suffered much from loneliness while he was entirely engrossed in his books. He failed to notice this, and though kind in great things, often vexed her in little ones. They were warmly attached to each other, but both too nervous and highly strung for a peaceful union. In 1863 Mrs. C. was hurt in a cab accident, and the shock brought on serious results. Her husband, greatly troubled, did all he could to give her every comfort she required, but in 1866 she d. suddenly in her own carriage, and the shock completely overpowered

him. See *Letters and Memorials of Jane Welsh Carlyle*, prepared for publication by Thomas C., and ed. by J. A. Froude (3 vols.), 1883; *New Letters and Memorials*, ed. by Alexander C. (2 vols.), 1903; *Letters to her Family*, ed. by L. Huxley, 1924; *Letters to Joseph Neuherg*, 1848-1862, ed. by T. Scudder, 1931; also life by Townsend Scudder, 1939.

Carlyle, John Aitken (1801-79), younger brother of Thomas C., after studying medicine at Edinburgh and in Germany, tried to establish a practice in London, but failed; he then obtained a post as private physician first to the countess of Clare and afterwards to the duke of Buccleuch. In 1843, having saved a moderate competency, he settled near his brother, and devoted himself to literature. He began translating Dante's *Divina Commedia*, but only completed the *Inferno*, his rendering of which (pub. 1849) was highly praised; he also ed. Dr. Irving's *History of Scottish Poetry*. Settling in Scotland during the latter part of his life, in 1878 he founded two medical bursaries at Edinburgh Univ.

Carlyle, Thomas (1795-1881), Scottish historian and man of letters, the second son of James C. by his second wife, was b. on Dec. 4 at the little vil. of Ecclefechan in Dumfriesshire. After acquiring the rudiments of education from his parents, he went for a time to the par. school, and then, in 1805, to the Annan Academy, where for the first two years at least he was profoundly unhappy, finding his only comfort in omnivorous reading. He entered himself in Nov. 1809 as a student of Edinburgh Univ., and there he remained until 1813, when he came down without taking a degree. It was at this time that he began to prepare himself to take orders in the Church of Scotland, supporting himself the while by teaching. In 1814 he obtained the post of mathematical master at Annan Academy at a salary of about sixty pounds, and during the two years he was there he decided that he had not a call to the ministry. There seemed no career open to him except that of teaching, and from Annan he went to Kirkcaldy to take up a somewhat better paid position as assistant-master at the par. school. There he became intimate with Edward Irving, who was at this time head of a school in the same town, and fell in love with one of Irving's pupils, Mary Gordon, the 'Blumine' of *Sartor Resartus*. The friendship endured, but the love affair was nipped in the bud. By Nov. 1818, C. had come to the conclusion that schoolmastering was the most detestable occupation in the world, and, having saved seventy pounds, he threw up his post, and went with Irving to Edinburgh. It was his intention to become a lawyer, but he soon tired of the study of the law, and abandoned all desire to enter that profession. He contrived to pay his way by giving private lessons. Here he made his first plunge into authorship, writing articles for the *Edinburgh Encyclopedia*. Irving in 1821 introduced C. to Jane Baillie Welsh (q.v.), with whom Irving was in love, and desired to marry if he

could obtain his release from his engagement contracted earlier with a Miss Martin. C. was kept in ignorance of the state of affairs, and he too fell in love with the girl, who, after Irving's marriage in 1823, did not actually encourage him, but clearly could not bring herself to dismiss as a suitor. C. in 1822 became tutor to Charles and Arthur Buller, both of whom acquired some distinction in the world, at what seemed to him the splendid salary of two hundred a year. C. had soaked himself in Ger. literature for some years past, and these studies dictated his earlier works, *The Life of Schiller*, which, after

THOMAS CARLYLE

appearing serially in the *London Magazine* in 1823 and 1824, was pub. in 1825; and *Wilhelm Meister's Apprenticeship*, a trans. of Goethe's novel, 1821. With Irving he had visited London in 1821, and made some acquaintances in literary circles; and after his return he persuaded Miss Welsh to become his wife. They were married on Oct. 17, 1826, and settled in Edinburgh, furnishing on the proceeds of *German Romance*, a vol. of trans. from Musaeus, La Motte Fouqué, Tieck, Hoffmann, Richter, and Goethe. He now depended entirely for his livelihood on his pen, and he was so fortunate as to secure admittance in 1827 to the *Edinburgh Review*, his first contribution being an essay on Jean Paul Richter. Soon he was in full work, writing for the prin. periodicals, the *Foreign Quarterly*, the *Westminster Review*, and *Fraser's Magazine*. It was in the last-named that in 1833-34 *Sartor Resartus* appeared, but it was so little popular that it was not until four years later he could find any one to bring it out in book form.

In the summer of 1834 he took up his residence at No. 5 Cheyne Row, Chelsea, London, and there he wrote *The French Revolution*, which appeared in 1837. He eked out a meagre income by delivering courses of lectures on Ger. literature, 'Heroes, Hero-worship, and the Heroic in History,' etc., but he hated the work, and was relieved when Mrs. C. came into her mother's small fortune in 1842, and he could devote himself exclusively to his books. He pub. *Past and Present* in 1843, and two years later gave to the world the epoch-making *Cromwell's Letters and Speeches*. *Latter-day Pamphlets* was issued in 1850, and the *Life of John Stirling* in the following year. He now devoted the greater part of his time to the composition of *Frederick the Great*, the first vol. of which appeared in 1858, and the last in 1865. Long before this he had been recognised as one of the leading men of letters in the kingdom, and a proof of the high esteem in which he was held was forthcoming in 1865, when he was nominated against Disraeli as a candidate for the office of lord rector of Edinburgh Univ., and was elected by 657 to 310 votes.

The death of his wife from heart disease, while driving in Hyde Park, on April 21, 1866, caused him much grief, and the rest of his life was embittered by the knowledge, which came to him too late, that he had, by his perverse ways and cross-grained temper, caused her great distress. He prepared for pub. her *Letters and Memorials*, but these were not pub. until two years after his death. He was much pleased when in 1874 the Prussian Order of Merit was bestowed on him, a compliment singularly appropriate, since Frederick the Great founded the order. In the same year Disraeli offered him the choice of a baronetcy or the Grand Cross of the Bath, which touched him to the quick, for, as he said, Disraeli was the only man of whom he had always spoken with contempt. The letters exchanged on this occasion were worthy of the writers, and will always find a place in any collection of the correspondence of great men. C. refused both honours, but he thought more kindly of the statesman ever after. He d. on Feb. 4, and a burial service at Westminster Abbey was offered, but, in accordance with his wish, his remains were interred at Ecclefechan. C. won his place in the world of letters with difficulty. *Sartor Resartus*, his first important work, that fantastic gospel of clothes, set more against him at the time of its pub. than it is easy now to conceive. *The French Revolution*, too, had its detractors, the true Carlylian style, in spite of its brilliance, annoying the critics. Yet the style was the man. No man could acquire such a style, it was born with him, and his imitators, who at one time were numerous, have paid the penalty of oblivion for their attempts to ape the master. 'His faults of style,' said that discerning critic, Leslie Stephen, 'are the result of the perpetual straining for emphasis of which he was conscious, and which must be attributed to an excessive

nervous irritability seeking relief in strong language, as well as to a superabundant intellectual vitality.' C. saw things so vividly that he was compelled to try to portray them vividly, and the conventional styles giving him no outlet, he made a style for himself, which is, however, always clear. *The French Revolution* marked him out as a writer of importance, and this impression was confirmed by his *Cromwell*, in which he gave a new, and probably truer, conception of the Protector's character. The fourteen years' labour that it took to produce *Frederick the Great* produced a work second only, if indeed second, to the *French Revolution*. As a picturesque historian C. has no equal. He had knowledge, as a matter of course; he had virility, and he had the power to convey his thoughts in a fashion so vivid that to read him once is never to forget him.

It has been said that all C.'s powers of persuasion as a religious teacher were devoted to that paganisation of Christianity which was the cultural aim of Nazism, coupled with inculcation of Carlylean hero-worship, 'burning and boundless,' for a leader. Certainly violence was irresistibly attractive to him. He praised it whether it showed itself in the excesses of a mob, in Cromwell's Irish massacres, in Frederick's ruthless meanness, or in events in his own lifetime. 'Though a tender-hearted man himself, there was a disagreeable amount of aesthetic cruelty in his make-up, and the gleams of beauty and of fantastic humour, cosmic and human which give his writings their value, are combined with much insincere rhetoric' (Desmond MacCarthy). His guiding principle in the interpretation of hist. was: Right must triumph; therefore might must be right. He tried to read that into hist. and his own faith depended on success. Yet time hardly diminishes his stature as an historian. He was greatest as an historian, and *The French Revolution* was by universal consent, his greatest hist. His highly documented life of Cromwell is the opposite of *The French Revolution*, both in its historical merits and its historical defects. But both works, with their opposite faults and opposite merits, left an ineffaceable mark on the Englishman's view of the Fr. Revolution and of the life and times of Cromwell. *The French Revolution* remains one of the greatest intellectual pleasures the world has to offer. 'Its humour, its pathos, its trenchancy, its dramatic power and insight into human nature, make it one of the greatest, though certainly the strangest of histories. It lacks very much that later histories of the revolution have got. But it has got those qualities they all lack' (Prof. G. M. Trevelyan). The prin. authority for C.'s life is his *Reminiscences*, ed. by J. A. Froude (1881) and in a better ed. by C. E. Norton (1887), who also ed. the *Correspondence* with Emerson (1883), with Goethe (1887), and *Letters of Thomas Carlyle, 1826-36* (1888). Froude's *Life* (4 vols., 1882-84) is not wholly reliable. See also R.

Garnett, *Life of Thomas Carlyle* (with bibliography), 1887; A. Carlyle (ed.), *Love Letters of Thomas Carlyle and Jane Welsh*, 1909; and the monumental *Life of Carlyle* by D. A. Wilson (6 vols.), 1923-34.

Carlyle, Thomas (1803-55), Scottish jurist, b. in Kirkcudbrightshire, was called to the Scottish Bar in 1824, and acted as defendant's counsel in the Campbell heresy trial, 1831. Joining the Irvingite church in 1832, he was in 1838 appointed 'Apostle' to N. Germany, and during his residence there wrote his *Moral Phenomena of Germany*, which attracted attention.

Carmagnola, tn. of Italy, in the prov. of Turin, situated on the R. Po. Its manufs. are silk and jewellery, and it trades in corn and cattle. Pop. 13,000.

Carmagnola, Francesco Bussone, Count of (1390-1432), one of the *condottieri*, b. at Carmagnola in Piedmont, Italy. He entered the service of Filippo, duke of Milan, who raised him to the rank of count and made him governor of Genoa. His success in the field roused the duke's jealousy, and before long there was a coolness between them, ending in a definite rupture. C., in revenge, offered his services to the Venetians. The political situation of Venice made his assistance most welcome, and the fact that the duke had tried to poison him gave the senate confidence in his loyalty to them. He defeated the duke's army at Maclodio, and took Brescia from him. After this peace was made, lasting for only one year. On the renewal of hostilities C. again took command, but he was also in communication with the duke, who tried to seduce him by bribes. His indifference resulted in reverse and failure, and the senate, tired of his duplicity, enticed him to Venice, where he was brought before the Committee of Ten, tried, tortured to extort a confession of guilt, and beheaded.

Carmagnole (from Carmagnola, N. Italy): 1. Peasant costume of Piedmont and the Midi, carried by S. revolutionaries to Paris in 1793. 2. Wild song and dance which went with the costume, and were in great favour with the revolutionaries during the Terror in Paris. The refrain of each verse was:

Vive le son, vive le son,
Dansons la Carmagnole, vive le son du canon!

Carman, William Bliss (1861-1929), Canadian poet, b. at Fredericton in New Brunswick, April 15, 1861, son of Wm. Carman, and related on his mother's side to R. W. Emerson. Educated at the collegiate school of Fredericton, and the univs. of New Brunswick, Edinburgh, and Harvard. He became a journalist, and from 1890 to 1892 was office editor of the *New York Independent*. His chief poetical publications were: *Low Tide on Grand Pré*, the earliest and perhaps the best (1893); *Ballads of Lost Haven* (1897); *Songs from Vagabondia* (with Richard Hovey) (1894), with various continuations—the last in 1901; *Behind the Arras* (1895); *A Winter's Holiday* (1899); *Christmas Eve at St. Kevin's* (1901);

Ballads and Lyrics (1902); *The Word at St. Kevin's* (1903); *Songs from a Northern Garden* (1905); *The Rough Rider and other Poems* (1909); *April Airs* (1916); *Later Poems* (1921); *Far Horizons* (1926); *Wild Garden* (1929). In a prose work, *The Kinship of Nature* (1904), he developed his philosophy of nature-worship. In April 1929 the Royal Society of Canada awarded him the Lorne Pierce medal for contributions to Canadian literature.

'Carmania,' steel turbine steamer, triple screw, owned by the Cunard line. It was built by J. Brown & Co. Ltd., of Glasgow, in 1905, and launched at Clydebank. Length 650 ft., breadth 72 ft., speed 20 knots. As an armed merchant ship, it was severely damaged in action with a Ger. armed merchant ship in the S. Atlantic in Sept. 1914, when the Ger. ship was sunk. After the war it was refitted and operated in the Liverpool-New York and London-Boston-New York service until 1931. It was sold to ship-breakers in 1932.

Cardmarthen, co. tn. of Carmarthen-shire, Wales, situated on the R. Towy. It is built on the site of the Rom. fort of *Mardunum*, and possesses the remains of a Norman castle. Though of great antiquity and legendary fame, it has few old buildings. Once the prin. centre of the Welsh wool trade, it has now sev. important industries. Originally a parl. bor., since the sixteenth century it has given its name to one of the two parl. areas into which Carmarthenshire is divided. Pop. 10,000.

Carmarthen Bay, large opening on the S. coast of Wales, chief tns. Tenby (Pembrokeshire) and Llanelly.

Carmarthenshire, co. of S. Wales, area 918 sq. m.; chief rvs. the Towy, Taf, and Teifi. On the S.E. border Carmarthen Van, in the Black Mts., rises to 2632 ft., and Mynydd Mallaen in the N.E. to 1430 ft.; there are many other groups in the co., mostly grassy hills under 1000 ft. The valleys are fertile, and the hillsides afford good pasturage. The co. produces coal, slate, limestone, clay, and some lead, but its industries are chiefly agric., especially dairy-farming and stock-raising, the coal-mining, iron-founding, and smelting works being confined to the S.E. Along the coast there are extensive sands and marshes. There are two co. parl. divs., Carmarthen and Llanelly. Pop. 180,000. The antiquities of C. are numerous and interesting, including Brit. and Rom. remains, and many medieval ruins. Old Welsh folk-lore and superstitions linger in the valleys, and the traditional heavier hats and plaid shawls are hardly yet extinct.

Carmathians, see KARMATHIANS.

Carmaux, tn. of S. France in the dept. of Tarn, on the R. Cérrou, 10 m. N. of Albi. There are coal mines in the neighbourhood, also brick and glass works. Pop. 11,000.

Carmel, Mount, range of mts. in Palestine 18 m. long, extending from the plain of Esdraelon in a N.W. direction through the plains of Sharon to the bay of Acre, where it terminates in the only promon-

tory on the Palestine coast. The highest point is 1810 ft. It is very fertile and beautiful, and hares, partridge, quail, woodcock, and jackals are found. El-Mahragah ('the place of burning'), a cliff 1700 ft. above sea level, is the reputed scene of Elijah's sacrifice, and close by is the cave in which he is said to have lived. According to Tacitus, a god Carmel was worshipped here. Towards the N. end are sev. hotels and pensions, and, within recent years, it has become a popular residential area for the inhab. of Haifa and for summer visitors.

Carmelites, Order of, or Friars of our Lady of Mount Carmel, commonly called in England White Friars, on account of their grey scapular, was founded in 1156 by an It. crusader, Berthold, who estab. a hermitage on Mt. Carmel with some few companions. It was believed by many, however, that a succession of anchorites had occupied this spot from the time of Elias till that of Christ, and that, its members being then converted, the community had continued without a break. The controversy on this question reached its height in the seventeenth century, and was only stopped by a papal edict in 1698. In 1238, the C. were driven out of Palestine by the Saracens, and settled in Cyprus, then spreading throughout Europe. Their rule was modified to suit the W. climate, and the C. were in 1247 changed by Pope Innocent III. from hermits into mendicant friars. In England they flourished greatly, and possessed fifty-two houses at the dissolution of the monasteries. In the fifteenth century an order of Carmelite nuns was founded, with a lax rule, which St. Teresa in 1562 attempted to restore to its primitive austerity. This rule was taken up by the men and resulted in the formation of a new order of Discalced or Barefooted C., which prospered far more than the old order. See A. de St. Marie, *L'Ordre de Notre-Dame du Carmel*, 1910.

Carmen, port of Mexico in the state of Campeche, Yucatan. It is situated on the is. of C., and possesses a good harbour. There are exports of dye woods. Pop. 7500.

Carmen Sylva, pen-name of Elizabeth (q.v.), queen of Rumania.

Carmichael, James Wilson (1800-68), Eng. painter, b. at Newcastle-on-Tyne. He was chiefly known for his pictures of marine subjects; wrote two works of some value: *The Art of Marine Painting in Water Colours* (1859), and *The Art of Marine Painting in Oil Colours* (1864). His pictures were exhibited at the Royal Academy and elsewhere, his first appearance being in 1838. He painted in London from 1845 to 1862, when he went to Scarborough, where he d.

Carmignano, tn. of Italy, in the prov. of Tuscany, 13 m. N.W. of Florence. The manuf. of straw plait and hats is carried on, and there is an export trade in wine. Pop. 13,000.

Carmina Burana, collection of songs, mostly in Lat., but some in Ger., written by Goliards or wandering scholars of the twelfth and thirteenth centuries. These

men were clerks, and the songs have generally the form of hymns. They vary greatly in character, some being lofty in tone, others worldly, satirical, and even distinctly immoral. The MS. is now at Munich, but was once kept at the abbey of Benediktbeuren in Bavaria, whence the songs derive their name. See ed. by A. Hilka and O. Schumann, 1930.

Carminatives, remedial agents which relieve flatulence, colic, etc. The ordinary condiments, as pepper, mustard, ginger, cinnamon, cloves, nutmeg, peppermint, may be used as C. They are also used in conjunction with purgatives to prevent painful griping and as gentle tonics to stimulate digestion.

rows. Here and there the rows are irregular, the gaps being accounted for by the houses in the neighbourhood, for which the peasant builders have utilised this conveniently accessible stone. There are various groups of menhirs round C., situated at Kermario (place of the dead), Kerlescan (place of burning), Erdevén, and Saint-Barbe. The object and origin of these stones are uncertain. Rom. remains were found about 1½ m. away from C. when the Bossenno, another group of mounds, was explored by Miln, 1874-1880. Pop. of com. 29,000.

Carnac, see **Karnak**.

Carnahuba, **Carnuba Palm** (*Copernicia cerifera*), Brazilian palm which is of

THE MENHIRS OF CARNAC

D. McLeish

Carmin, red colouring matter obtained from the cochineal insect. It was discovered in 1756 by a Franciscan monk at Pisa, whilst conducting experiments in medicine. In manufacturing C. the cochineal is exhausted with boiling water, and the colouring matter precipitated by the addition of acid or acid salt.

Carmona, tn. of Spain in the prov. of, and 20 m. N.E. by E. of the city of, Seville. It is visited by the residents as a holiday resort. The manufs. are woollen goods, leather, and earthenware, and it trades in wine, olive oil, and grain. Pop. 23,000.

Carn, see **CAIRN**.

Carnac, vil. in the dept. of Morbihan, France. It is famous on account of the great megalithic monuments in the neighbourhood. Long avenues, consisting of thousands of blocks of rugged grey granite, extend over 1½ m. of heath. The blocks are in the form of obelisks with the apex reversed: none are more than 18 ft. high. These menhirs, or standing stones, are in eleven parallel

handsome appearance and great use. The under part of the leaves exudes quantities of wax which is manufactured into candles and serves to adulterate beeswax.

Carnarvon, co. tn. of Carnarvonshire, N. Wales. It is situated on the Monal Straits, and is 63 m. W. of Chester by rail. It was once the Rom. station *Caer Seint*, the cap. of the Segontiaci. The castle, one of the finest examples of medieval fortification in the Brit. Isles, lies to the W. of the tn. It was built by Edward I. in 1284, and is in excellent preservation. It is an irregularly shaped building with thirteen polygonal towers; the famous Eagle Tower was built by Edward II. The castle was besieged by Owen Glendower in 1402. The investiture as Prince of Wales of Prince Edward took place at the castle on July 13, 1911. The par. church lies outside the tn. at Llanbilly. A ferry connects Tal-y-Foel with C. The tn. is a municipal bor. and market, and with other bors. returns one member to the House of Commons. The chief industries are shipbuilding, fishing, and

tanning; slate and copper ore are also exported. Pop. 8500. C. Bay, to the S., is a very favourite summer resort.

Carnarvon, dist. and tn., N.W. of Cape of Good Hope prov., S. Africa, 102 m. N.N.W. of Beaufort W. For the most part the dist. is very dry, but it is possessed of an immense reservoir, the Van Wyk's Vlee. Pop. tn. (white) 1000.

Carnarvon, George Edward Stanhope Molyneux Herbert, fifth Earl of (1866-1923), Eng. Egyptologist, b. June 20, at Highclere, Berkshire, eldest son of Henry Howard Molyneux, fourth earl. Educated at Eton, and at Trinity College, Cambridge. He succeeded to the earldom June 28, 1890. With Howard Carter (q.v.) he undertook the excavation of the tombs of the twelfth and eighteenth dynasties in Egypt in 1906. He pub. *Five Years' Exploration at Thebes* (1912). In Nov. 1922 Mr. Carter discovered the tomb of Tut-an-kh-Amen of the eighteenth dynasty at Luxor. Shortly after, however, on April 23, 1923, the earl d. at Cairo of erysipelas and pneumonia resulting from a mosquito-bite.

Carnarvon, Henry Howard Molyneux Herbert, fourth Earl of (1831-90), Eng. politician, succeeded to the title in 1849. After taking his degree at Oxford, he took a prominent place as a member of the House of Lords, and in 1858 was made under-secretary for the colonies, succeeding to the secretaryship of state in 1866. He introduced the Bill for federating the Canadian provs., the N. America Act; but resigned office owing to the disapproval of the Reform Bill of 1867. In 1874 he again joined the Conservative Cabinet, but resigned in 1878 over the E. question and Disraeli's policy. In 1885 he was made lord-lieutenant of Ireland and came into conflict with Parnell over a private interview in which he was alleged to have made overtures on behalf of the Conservative party in regard to Irish Home Rule. He again resigned. In 1887 he advised the investigation of *The Times's* charges against Parnell.

Carnarvonshire (Welsh, *Cae'r-narfon*, *Cae-ryn-Arfon*), co. of N. Wales, bounded N. by the Irish Sea, E. by Denbigh and Merioneth, S. by Cardigan and Tremadoc Bays, W. by Carnarvon Bay and the Menai Straits, dividing it from Anglesey. The area is 569 sq. m. A large part of the co. is occupied by the Lleyn Peninsula jutting out into the Irish Sea and forming Carnarvon and Cardigan Bays. A small portion of the co. is detached on the N. coast of Denbighshire. C. contains some of the finest scenery in Wales, with splendid mts. and beautiful valleys. The mts. include Snowdon (Wyddfa or Eryri), 3560 ft., the highest point in England and Wales, at its foot lie the well-known valleys of Beddgelert and Llanberis. The centre of the co. is the most mountainous, with Carnedd Llewelyn (3434 ft.), and Carnedd Dafydd (3426 ft.). The tidal R. Conway is navigable for about 12 m. and divides Carnarvon from Denbigh; the Nant Ffrancon runs through the Bettwy-Coed valley to Beaumaris Bay; the co.

also boasts of many lovely lakes, and places of resort, such as Cricieth, with its castle, Penmaenmawr, near the Great Orme's Head, Llandudno, etc. Lead, copper, and some gold are found, and the slate quarries, especially those at Penrhyn, are most productive. Sheep and dairy farming are carried on in the valleys, and the Welsh ponies are bred here. In ant. times C. was inhabited by the Segontiaci; from here Agricola effected the conquest of Anglesey; many remains of Brit. earthworks, etc., are to be found in various parts of the co. C. is in the diocese of Bangor, with a small portion in St. Asaph. It returns one member to the House of Commons. Pop. 121,000.

Carnatic, or **Karnatic**, European name of a region of S. India, lying between the Coromandel coast and the E. Ghats. It now forms part of Madras. In the eighteenth century it was ruled by the Nawab Sa'adat-Allah of Arcot and his successors, and was the centre of the struggle for supremacy in India between France and Great Britain. In 1801 it came under Brit. rule. The dist. abounds in temples, some of great age and beauty. The pop. consists chiefly of Brahmanical Hindus.

Carnation, name given to many double-flowering varieties of plants which have sprung from *Dianthus caryophyllus*, the clove-pink, a beautiful specimen of Caryophyllaceae. They are cultivated in Britain, and range in colour from red to white, yellow, and violet, and many of them are variegated. They never occur in a wild state, but they are hardy and require only a rich, light soil in which to bloom. Propagation may be effected by means of layering, cuttings, and seeds, but the most successful of these methods is by layering.

Carneades (215-130 B.C.), Gk. sceptic philosopher, b. at Cyrene, was the successor of Arcesilaus (315-241 B.C.), founder of the Middle Academy, which embraced the new sceptical reaction against the dogmatism of the dominant schools and as a weapon against the stoics. More is known of his teaching than his life. His masters were Diogenes, the Stoic, and Hegesinus. His chief study was the works of Chrysippus, by exposing whose fallacies he estab. his own philosophy. By C., scepticism was carried over into the realm of ethics as well; and it is narrated that while on a political embassy to Rome in 156, he created a sensation by arguing most eloquently in a public discourse on behalf of justice; and then the next day speaking with equal effect against it. But the fact that his eloquence and brilliant argumentation incited the young Romans to study philosophy was displeasing to Cato, who expelled him.

Carnegie, tn., Allegheny co. Pennsylvania, U.S.A., 6 m. S.W. of Pittsburgh. It was formed into a bor. in 1894, and gains its name from Andrew C. (q.v.), it possesses large steel and iron works; there are alkaline and lithia mineral springs hard by. Pop. 12,500.

Carnegie, Andrew (1835-1919), Amer.

manufacturer and philanthropist. b. at Dunfermline in Fifeshire, Scotland, Nov. 26, 1835; elder son of Wm. C., damask-linen weaver. In 1848, his parents emigrated to America, settling at Allegheny City, Pennsylvania. The boy entered a cotton factory as a weaver's assistant, and for some time his wages were a little over one dollar per week. At the age of fourteen he became a telegraph boy in Pittsburgh, and learned to telegraph. Then, joining the Pennsylvania railroad, he became telegraph operator, and ultimately rose to be superintendent of the Pittsburgh div. It was at this time that he laid the foundation of his fortune by the introduction of sleeping-cars on the railway, and by his successful investments in oil lands near Oil City. It was after the Civil war, during which he had rendered valuable service to the gov. as superintendent of military railroads, that his great work began, in the development of the Pittsburgh iron and steel industries. He estab. the Keystone Bridge Works and the Union Iron Works, for the manuf. of steel rails. He then built the Edgar Thomson Steel Works, and in 1883 acquired the Homestead Steel Works. His sphere of business extended with great rapidity, until in 1901 the whole of the vast C. enterprise was taken over by J. Pierpont Morgan, as the U.S. Steel Trust, and C. himself retired from business. From that time, he lived somewhat in the manner of a Scottish laird, at Skibo 'Castle' in Sutherland. Public attention was fixed by the manner in which C. utilised his vast wealth for philanthropic purposes. Chief among his works was the provision and equipment of libraries in England and Eng.-speaking countries. He distributed over £10,000,000 for this purpose alone. For the benefit of Scottish education, he gave in 1901 a sum of £2,000,000 to provide class fees for students, and he also made presentations to Eng. and Amer. univs. In 1903 C. founded the Dunfermline Trust with an income of £25,000, for the improvement of his native tn. He also erected homes and provided funds for his old employees. The C. Hero Fund was started in 1901 for the U.S.A. and Canada; in 1908 for the United Kingdom. Its purpose is 'to place those following peaceful vocations who have been injured in an heroic effort to save human life, in somewhat better positions pecuniarily than before, until again able to work.' He d. at Lenox, Massachusetts. See also **CARNEGIE TRUST FUNDS**. C.'s pubs. include *An American Four-in-hand in Britain* (1883); *Round the World* (1884); *Triumphant Democracy* (1886); *The Gospel of Wealth* (1900); *Empire of Business* (1902); *Problems of To-day* (1908); *Autobiography* (1920). See B. J. Hendrick, *The Life of Andrew Carnegie*, 1933.

Carnegie Trust Funds. The Carnegie Corporation of New York, incorporated by an Act of the New York legislature in 1911, which constituted Andrew C. (q.v.), Elihu Root, and others, and their successors, a body corporate to receive funds and apply the income to the

advancement of knowledge among the people of the U.S.A. by aiding technical schools, institutions of higher learning, libraries, scientific research, hero funds, useful pubs., and by other appropriate means. For its corporate purposes, C. transferred to the corporation \$25,000,000 par value first mortgage gold bonds of the U.S. Steel Corporation. The total endowment is over \$130,000,000. Andrew C. was the first president and Elihu Root the first vice-president of the corporation. Other C. trust funds are the *Carnegie Foundation for the Advancement of Teaching*, instituted in 1906 to apportion adequate retiring allowances to univ. profs. and lecturers, and to teachers in technical schools of the U.S.A., Canada, and Newfoundland. Its total endowments and reserves are over \$30,000,000. *Carnegie Institution of Washington*, originally organised under the laws of the dist. of Columbia and incorporated as the C. Institution, and reincorporated in 1904. Its purpose is to encourage investigation, research, and discovery. The various divs. of the institution include the depts. of embryology, genetics, historical research, meridian astrometry, terrestrial magnetism; the laboratories of geo-physical and nutrition research, and the Tortugas laboratories; the Mt. Wilson Observatory; and the dept. of early Amer. hist., including Middle Amer. archaeological research. *Carnegie Trust for Universities of Scotland*, constituted in 1901 to administer a sum of \$10,000,000, in bonds of the U.S. Steel Corporation, given by Andrew C. for improving and extending the opportunities for scientific study and research in the univs. of Scotland. *Carnegie United Kingdom Trust*, constituted in 1911 with the object of devoting its income to the improvement of the well-being of the masses of the people of Great Britain and Ireland by such means as are embraced in the meaning of the word "charitable" in Scots and Eng. law. The trustees concentrate on the development of public libraries by grants to municipal libraries for the purchase of books and by grants in aid of co. library development and grants to important special libraries which are prepared to lend books through the Central Library for Students. In rural development, the trustees support the National Council of Social Service and Rural Community Councils. Its income is over £100,000 a year. The *Carnegie Endowment for International Peace*, instituted in Washington in 1910 has depts. for international relations and education, international law, and national economy and hist.

Carnelian, or **Cornelian**, (Low Lat. *carneolus*, from *carneus*, flesh-coloured, though some say the original spelling was *Cornelian*, derived from Lat. *cornu*, horn, from the appearance of the stone when fractured (others dubiously refer 'cornelian' to the fruit of the cornel), reddish variety of chalcedony (q.v.), but sometimes brown, yellow, or white. Usually bright and clear. Found chiefly at Cambay, India. Composition: silica

(98 per cent), peroxide of iron, magnesia, alumina, potash, and soda. Used for engraved seals.

Carnforth, tn, in the co. of Lancashire, England, about 6 m. from Lancaster by rail. Its chief industry is iron. Pop. 3000.

Carnières, tn, of Belgium in the prov. of Hainaut, on the route from Mons to Charleroi. There are stone quarries, coal mines, and iron works in the neighbourhood. Pop. 9000.

Carniola, mountainous dist. in Yugoslavia, S.W. of Austria, with its coast on the Adriatic. Has quicksilver mines, grape vines, and other fruit.

Carnival (*carnem*, flesh, *levare*, to lighten).

This feast is named the Carnival, which being

Interpreted implies 'farewell to flesh.'

BYRON, *Beppo*, vi.

It commenced on the feast of Epiphany, or Twelfth Day, and ended on Shrove Tuesday, but was afterwards restricted to eight days before Ash Wednesday, the feast preceding the long fast. Its origin was doubtless the Saturnalia of the pagan Romans, who on becoming Christian incorporated many of their rites and customs in their new religion. In Rom. Catholic Germany, *Fasching*, as the C. was called, was the precursor of the drama, and at Nuremberg the first Fast Eve's play was produced. This developed later into masques and mysteries. In Germany only the Catholic cities of the Rhine formerly kept the festival, but it has been revived in Hamburg, Leipzig, and Berlin. As a rule, Protestant countries do not observe it. Italy is the country in which it is most celebrated. On Shrove Tuesday, after sunset, every one sallies forth with a lighted taper. The object is to put out as many tapers as possible of other people while preserving their own alight. Special names were given to the chief days, viz. Greasy Sunday, Blue Monday, or Fools' Consecration. On the Sunday before Lent the procession of the *Bœuf Gras* takes place, the animals being led through the streets by butchers in costume. At the Nice C. *mi-carême*, an effigy of King C. is paraded through the streets.

Carnivora (Lat. *carnem*, flesh, *vorare*, to devour) form in zoology an important mammalian order. As the name implies, the members are all flesh-eaters, but they are not the only creatures which feed on their fellows—the diet of blood-sucking bats and some marsupials, such as the opossum, bear evidence to this fact—and many of these so-called carnivorous animals are either omnivorous or largely herbivorous. The order is usually divided into the sub-orders *Fissipedia*, or terrestrial members of the group, and *Pinnipedia*, or the aquatic forms, with flippers for limbs; the latter div. is, however, by some zoologists considered to be a separate, though nearly allied, order. The characteristics of the C. are the sharp teeth, small incisors, well-developed brain, simple stomach, reduced

or absent cæcum, zonary placentation, incomplete or absent clavicles; there are never less than four toes on each foot; the scaphoid and lunar bones are fused in the manus (hand); and the claws are generally sharp and powerful. In the *Fissipedia* the most typical feature is the dentition, which is obviously adapted to the mode of life of the animals. There are nearly always six pointed incisors in each jaw, and two long powerful canines. The cheek-teeth vary in number, but the last premolar in the upper jaw and the first true molar in the lower differ from the others in their larger size, and are called *carnassial* or *sectorial*; in front of the carnassial tooth are grinders with cutting edges, and behind are others which are broad and tuberculated. In the *Pinnipedia* there is no carnassial tooth, the incisors are never less than two in each jaw, and the cheek-teeth do not vary in formation. The mode of progression in the former sub-order is digitigrade, semi-digitigrade, or plantigrade; in the last the pes and manus are both fully webbed for swimming purposes, but the hind limbs may be used when the animals travel on land. Considerable difficulty is experienced in classifying the C., but the usual plan among the terrestrial forms is to divide them into three groups, the *Achiroidea*, represented by the cats (including the tiger, leopard, lion, etc.), the *Cynoidea* by dogs, and the *Arctoidea* by bears. The *Pinnipedia* consists of the walrus and various seals. Fossil species of both sub-orders have been abundantly discovered, and have proved of great scientific interest. The geographical distribution of the animals is world-wide but for Australia and New Zealand, and our domestic pets include two typical representatives in the dog and the cat.

Carnivorous Plants, see **INSECTIVOROUS PLANTS**.

Carnmoney, par. of N. Ireland in co. Antrim, 5 m. N. of Belfast. Agriculture is the chief employment, and flax spinning is carried on. Pop. 9600.

Carnot, Lazare Hippolyte (1801-88), Fr. statesman, was the second son of Gen. Lazare N. Marguerite C., b. at St. Omer. He shared his father's exile till 1823, and on his return devoted himself to literature and philosophy. Entering politics, he was elected deputy for Paris, 1839, becoming one of the leaders against Louis Philippe; he was minister of education in 1848, and retired on refusing to take the oath to the Emperor Napoleon.

Carnot, Lazare Nicolas Marguerite (1753-1823), Fr. soldier and statesman, b. at Nolay, Burgundy, France. He entered the Fr. Army, 1784, as an engineer, having obtained a captaincy on the completion of his studies at the military school of Mazières. In 1786 he pub. his celebrated *Essai sur les machines en général*. In 1791 he became a member of the National Assembly and an influential power on the Committee of Public Safety. He fled to Germany, and there wrote a defence of himself, which caused his colleagues' ruin. He was recalled to Paris in 1800, and became

minister of war, conducting the It. and Rhendish campaigns with great credit. This ended, he retired from public life, and wrote his *Traité de la défense des places*. Again in 1814 France was in difficulty, and C. came forward to help, magnificently defending Antwerp against the allies. He was minister of the interior during the Hundred Days.

Carnot, Sadi Marie François (1837-94), Fr. president, the eldest son of Lazare Hippolyte C. A strong Republican, he was elected to the National Assembly in 1871 and joined the ministry in 1878; in 1880 he was minister of public works, and in 1885 minister of finance. In 1887, after the 'decoration scandals,' he was elected to the presidency and had to meet the danger from the anti-Republican movement under Gen. Boulanger; his success was repeated during the Panama scandals of 1892, and his ability and integrity were proved. In 1894 he was assassinated by an It. anarchist, Caserio, after speaking at a public banquet at Lyons.

Carnotite, vanadate of uranium and potassium, containing a high percentage of uranium oxide; occurs in Utah and Colorado as a yellow sediment. It is a source of both uranium and radium.

Carnoustie, tn. and police burgh in S.E. Angus, Scotland, 10 m. E.N.E. of Dundee. It is a favourite watering-place on the North Sea, with excellent sea bathing and golf. The large artillery and camping grounds, known as Barry Links, are in the neighbourhood. Pop. 6000.

Carnuntum, Rom. fortified station, of which the remains exist near Hainburg, in Lower Austria. It was the centre of Rom. military operations on the Danube, and of the trade in amber from the N. belonging first to Noricum and later to Pannonia. The name connected with *karn*, cairn, points to its Celtic origin.

Carnutes, Celtic tribe of central Gaul, between the Seine and the Loire. The chief tns. were Cenabum (not Genebium), now Orléans, and Chartres. They were subdued by Julius Cæsar, and in return for military services retained their institutions under Augustus, becoming *federali* of the Rom. Empire.

Carnwath, par. and vil. of Scotland in Lanarkshire, 27 m. S.E. of Glasgow. Coal and iron are obtained in large quantities from the neighbourhood. Pop. of par. 5250.

Caro, Annibale (1507-66), It. poet, b. at Civita Nuova in Ancona. He was tutor and secretary in a rich Florentine family, named Gaddi, and was presented to an eccles. benefice in Rome. In 1543 he became the confidential secretary of Pietro Lodovico, duke of Parma, and afterwards to his sons. His best-known works in verse include translations from the classics, especially a fine one of the *Æneid*, a comedy *Gli Straccioni*, *Rime e Canzoni*, sonnets, and an amusing eulogy of the big nose of the president of the Accademia della Virtù, Leoni Ancona. His prose works consist chiefly of translations from Aristotle. His poetry is marked by high qualities, and his letters

by remarkable finish of style. He d. at Rome.

Carob-tree, see CERATONIA SILIQUA.

Carol (O.F. *carole*, a dance with song), in accepted Eng. usage, a song for the Christmas festival. Diez suggests that the origin of the word is 'chorus'; others derive it from *corolla*, a little crown or garland. The earliest meaning applied to the word seems to have been a 'ring-dance' or 'to dance in a circle.' Stonehenge, once called the giants' dance, was also the Giants' carol. Dancing and singing were part of religious worship from the earliest times. Caroling, dancing with singing, was handed on from pagan ritual to the Christian Church. In 1209 the Council of Avignon forbade dancing and secular singing in churches. In the cathedral of Seville the choristers perform a castanet dance round the lectern thrice a year. Caxton, in the *Golden Legend*, refers to the 'carolles of virgins,' and Chaucer uses the word in 'I saw her dance so comely, carol and sweetly sing.' In Spain many carol Cs. refer to gipsy girls dancing and singing. The Manx people have a collection of Cs., locally called 'carvals,' which were sung in the churches on Christmas Eve, each singer bringing with him a candle. Most of these Manx Cs. consist of tales of judgement day and hell, and not of the Nativity or the joyful themes of Christmas-tide. The Bretons have also a large collection of anct. Cs. The earliest printed collection was issued in 1521 by Wynkyn de Worde; this contains the famous *Boar's Head Carol*, still sung at Queen's College, Oxford, to usher in the boar's head. There are numerous collections of Fr. Cs., called *Noëls*, and sev. Ger. *Wiegendlieder*, cradle-songs associated with the Babe of Bethlehem, the lullaby *Dormi, Fili*, being one of the best known. Some of the fifteenth-century Cs. are very quaint, and embody curious legends, such as the *Cherry Tree Carol*, and the familiar 'I saw three ships come sailing by.' That the singing of Cs. as an excuse for the asking of alms was a very early custom seems likely from an Anglo-Norman C. now in the Brit. Museum. The word C. is freely used by poets in reference to people or birds singing joyously, such as in Tennyson's *Elaine*, 'carolling as he went a true-love ballad,' or in Spenser's *Epithalamion*, 'the cheerful birds do chaunt their lays and caroll of love's praise.' See W. S. Rockstro, *Thirteen Carols of the Fifteenth Century*, 1891; E. Rickert, *Ancient English Christmas Carols*, 1910; and *The Early English Carols*, ed. by R. L. Greene, 1935.

Carol II., king of Rumania, see CHARLES II.

Carolan, Turlogh, see O'CARLON, TOR-LOCH.

Carolina, North and South, see NORTH CAROLINA; SOUTH CAROLINA.

Caroline, Amelia Elizabeth, of Brunswick (1768-1821), queen of George IV., was the daughter of Charles Wm. Ferdinand, duke of Brunswick, and of Princess Augusta of England, a sister of George III. She was a bright, headstrong, foolish

woman of thirty-one when she came to England to marry the Prince of Wales. The marriage was unhappy from the wedding-night, when the bridegroom was drunk. After the birth of a daughter, Charlotte, a separation took place, and the princess went to live at Blackheath. In 1806 an inquiry was made into the charges of adultery brought against her by Lady Douglas, but the commissioners decided that she was guilty of nothing worse than indiscretion and that Lady Douglas had committed perjury. The matter was reopened by the prince six years later, with the same result. Weary of continual persecution at the hands of her consort, she went abroad in 1813. When she became queen seven years later, she returned to England. She was now tried before the House of Lords for misconduct with Bergami but the bill was not proceeded with. So strong was the feeling in her favour, that had she been found guilty it is in the highest degree probable that George IV. would have lost his throne. A few days after the coronation, at which she was not even permitted to be present, she d. As her coffin was borne through the metropolis on its way to Brunswick, the people showed their sympathy with her by attacking the military, and, in defiance of the authorities, ~~forming~~ the cortège to proceed through the city. There are biographies by Clerici, 1907, and Lewis Melville, 1912.

Caroline Islands, scattered archipelago in the Pacific Ocean, included in Micronesia, between 5° and 10° N. and 135° and 165° E. The total land area is 380 sq. m. and total area 800 sq. m. Pop. about 40,000. They are divided into three groups, E., W., and Central. The chief is. are Ponape and Kusaie in the E. group, Yap in the W., Truk in the Central. The Pelew Is., of which Babeltop is the largest, are administered from Yap. The climate is healthy, but the is. are subject to severe storms and the rainfall is heavy. Among the chief products are copra, pearl and turtle shell, and bêche de mer. The natives, very mixed ethnologically, are excellent boat-builders and navigators and successful agriculturists. Yap is remarkable for its peculiar currency; in addition to the ordinary shell-money, huge limestone disks are used, from 6 in. to 12 ft. in diameter; these are brought from the Pelew Is., and are piled round the chief's treasure-house and apparently regarded as public property. The C. I. were discovered in 1537 by the Portuguese Diego da Rocha, who named them Sequelra Is.; in 1686 they were renamed by Adm. Francisco Lazearo in honour of Charles II. of Spain. In 1899 they were bought by Germany from Spain for 25,000,000 pesetas. In Ponape and Kusaie colossal stone structures exist, pointing to a prehistoric race well advanced in general culture. In the is. of Lélé the ruins appear like a citadel with basaltic ramparts; there are also numerous canals and apparently artificial harbours with high sea walls built in the water. The whole is. of Ponape is strewn

with basalt blocks of huge size put together without mortar, once having formed massive walls. The present Polynesian peoples could not have planned or executed these works, and they are attributed to a race of the new Stone Age, possibly coming from the Asiatic mainland. In 1919 the C. I. were assigned to Japan under the mandate of the League of Nations. Naval and seaplane bases were built among the is., which remained in Jap. hands until Sept. 1945 when they were surrendered to the United Nations. The naval base at the Ulithi atoll has since been dismantled. The is. were taken over by the U.S.A., July 1947. Pop. of the is. 31,000, principally Kanakas.

Caroline Matilda (1751-75), queen of Denmark and Norway, was the daughter of Frederick, Prince of Wales; in 1766 she married Christian VII., king of Denmark and Norway, and fell under the malign influence of the royal physician, Struensee (q.v.); he became her lover, and the open liaison roused the anger of the people, who did not believe in the mental incapacity of the king. When Struensee was arrested she shared his fate and made an attempt to shield him. He did not try to conceal their guilt, and on his execution she was divorced and sent to Celle, where she d., 1775. See Sir F. L. Wrayall, *Life of Caroline Matilda, Queen of Denmark and Norway*, 1864; W. H. Wilkins, *A Queen of Tears*, 1904.

Caroline Wilhelmina (1683-1737), queen of George II., was the daughter of John Frederick, margrave of Brandenburg-Anspach. Five years after her father's death in 1687 her mother married Elector John George IV. of Saxony, and C. lived with her mother at Dresden. Left an orphan in 1696, the girl lived at Berlin with her guardians, Elector Frederick III. of Brandenburg and his wife, Sophia Charlotte, daughter of the Electress Sophia. Nine years later she married George Augustus, electoral prince of Hanover, by whom she had many children, the eldest being Frederick, afterwards Prince of Wales. See P. Quennell, *Caroline of England*, 1939.

Carolingians, see CARLOVINGIANS.

Carolus, Eng. gold coin, struck in the reign of Charles I. It was rated at £1, but appreciated in value to £1 3s. 9d. Its official title was unit, and it was also called a broad. 'C dollars,' Sp. coins of Charles III. and IV., were long current in the E., especially in China, containing eight reals; they were known as pieces of eight. They are still current in some of the tea-growing dists. of China, and as the people hoard them they have greatly exceeded their intrinsic value.

Carolus-Duran, name adopted by Charles Auguste Emile Durand (1837-1917), Fr. painter, b. at Lille, July 4. He first studied at the Lille Academy, and then went to Paris; in 1861 he travelled in Italy and Spain, where in particular he studied the style and technique of Velázquez. His first success was with a subject picture, *Murdered, or the Assassination*, which is now in the Lille Museum. Later he became a portrait-

painter. In 1869 a portrait of his wife, called 'The Lady with the Glove,' was bought for the Luxembourg. He was the head of one of the prin. studios in Paris; and some of the most celebrated artists of his day, including J. S. Sargent, were his pupils. He had extraordinary power of vivid realism, and his handling of surfaces was exquisite. In 1904 he was made a member of the Académie des Beaux Arts, and, 1905, director of the Fr. Academy at Rome.

CARP

Carolus Magnus, see CHARLEMAGNE.

Caronia, seaport on the N. coast of Sicily, in the prov. of Messina, 20 m. E. of Cefalu. Pop. 6000.

Carora, tn. of Venezuela, in the state of Lara, situated on the R. C. Rubber, leather, and hides are exported, and horse-raising is an industry. Pop. 8000.

Carotid Arteries, two arteries which convey the blood supply to the head. They pass through the neck on either side of the windpipe, and each opposite the angle of the jaw divides into two, one branch serving the nose and eyes, and the other branch the brain. The pulsation in these arteries is easily felt from the surface.

Caroto, or **Carotto**, **Giovanni Francesco** (or **Gianfrancesco**) (c. 1480-1546), It. painter, b. at Verona; worked in Mantua under Mantegna, whose style he imitated. After returning to Verona he painted frescoes in the church of San Tommaso Cantuariense (Thomas à Becket). Among his best works are the frescoes in Sant' Eufemia, Verona, depicting scenes from the book of Tobit. One of his earlier works was a 'Virgin and child, with an infant John the Baptist' in the Gallery of Modena. According to Vasari he afterwards worked for the Visconti and Monteferrat families. There are pictures by C. in many churches and galleries of Mantua and Verona, including his 'Glory of the Virgin' (signed and dated 1545) in Verona, where he d.

Carouge, tn. and suburb of Geneva, Switzerland. It became part of the canton of Geneva in 1815 previously belonging to Savoy. It is situated on the R. Arve. Pop. 7500.

Carp (*Cyprinus carpio*) belongs to the sub-order Ostariophysi of the order Teleostei. Originally it belonged to Asia, but it has been introduced into Europe and for sev. centuries has flourished in Britain. The fish, which is closely related to such well-known species as goldfish and minnows, often grows to a very large size, and may weigh as much as 50 lb.; examples have been known to attain a great age also, some living as long as 200 years. In colour they are brown above, light beneath, have a compressed body covered with large scales, a long dorsal fin and shorter anal fin, and round the mouth depend four barbels. The C. usually inhabits quiet lakes, ponds, or sluggish streams, and during winter hibernates in mud; it is capable of living for a considerable time out of water. Its food is either vegetable or animal. The female is very prolific and spawns on weeds in May or June. The Crucian or Prussian C., a native of Europe, has the technical name *Carassius vulgaris*, while *C. auratus*, or golden carp, is the goldfish (q.v.).

Carp, **Petrache** (1837-1919), Rumanian statesman, b. at Jassy. He was the leader of the Young Conservative or Janinist party, the Janinim being a literary society which he founded with Rosetti and Maiorescu and changed into a political association. The object of the party was to improve the condition of the peasantry, introduce a gold standard, and develop industries by means of foreign capital. He came into power in 1888, passed a Bill for the distribution of state lands, and succeeded in introducing a gold standard. He was, however, unable to retain office, and was succeeded, 1891, by L. Catargiu. He trans. some of Shakespeare's plays into Rumanian. In the Privy Council, from Aug. 3, 1914, he alone supported King Charles's desire to side with the Central Empires in the First World War.

Carpaccio, **Vittore** (c. 1450-1522), It. painter, b. at Venice, of an old Venetian family. Little is known about his life. He may be regarded as a forerunner of the finest Venetian masters. His chief works were painted between 1490 and 1519. He was certainly a pupil of Lazzaro Bastiani, rather than his master, as formerly held, and he may have travelled with Gentile Bellini to Constantinople. His greatest works are at Venice; the series of pictures in San Giorgio degli Schiavoni, brought so prominently to notice by Ruskin, was painted by order of the hospice of San Giorgio from 1502 to 1508. The 'Madonna and Child,' in the National Gallery, commonly attributed to C., may have been painted by members of his studio. See P. C. Molmenti and C. Ludwig, *Life and Works of Vittore Carpaccio*, trans. by R. H. Cust, 1907.

Carpathians, great mt. system in central Europe, extending from Bratislava to

Orsova, in crescent form, for 800 m. The Danube valley divides them from the Alps, and the March from Silesia and the Moravian mts. After forming the boundary between Hungary and Rumania, they turn S., cut by the Danube, which flows in a picturesque gorge between Bazias and Turnu-Severin. They then slope down to the Rumanian plain in beautiful wooded declivities, intersected by valleys of numerous rivs., fed by the high rainfall of the dist. For the purpose of classification the whole system may be divided into two great groups, the E. and W. C. The E. C. stretch from the mouth of the Nera to the source of the Theiss. The W. C., start at the Theiss, and terminate at Bratislava. The chief groups of mts. are 'Little C., Beskids, Central C., White Mts., Lomnitzer Spitze, Eisthaler Spitze, and the High Tatras group, including the highest peak in the C., Gerlsdorfer, 8737 ft. Few mts. reach or pass into the snow line. There are no glaciers but glacial lakes, Meerangen, are hidden away in the snow-bound recesses at an elevation of 6000 ft. The best known passes are Teregová, from Orsova to Temeswar; Vulkur, in the valley of the Schyl; Rottenthurm, in the S. Transylvanian Alps, in a gorge formed by the Alata; Turzburg, between Bucharest and Brasov; and Jablunka between Bratislava and Cracow. The C. form a watershed for the Baltic and the Black Seas, the most important rivs. rising there being the Danister, Vistula, Theiss, Maros, and Szanos. Besides having more mineral wealth than any other mt. system of Europe, the region of the C. is rich and fertile, and well wooded with oaks, beeches, evergreens, and firs. In the less civilised parts wild animals are found, including the wolf, bear, and lynx, and occasionally chamois and ibex. The lammergeier, or bearded vulture, is found here. Geologically there are four zones of the C.: (1) The outer zone lying towards Russia, of soft tertiary rock, containing salt and petroleum; (2) the sandstone zone, extending S.E. from the March; (3) the crystalline zone of Palaeozoic rocks; (4) the volcanic zone, containing no active volcanoes, but subordinate mts. of volcanic origin. Gold, silver, quicksilver, copper, and iron are the chief minerals obtained. See I. Phillimore, *In the Carpathians*, 1912.

Carpeaux, Jean Baptiste (1827-75), Fr. sculptor, b. at Valenciennes. His father was a mason, and during his early years the family was extremely poor. For two years he worked in a drawing school in Paris, and in 1854 entered the École des Beaux Arts. He was awarded the Grand Prix de Rome for his statue of 'Hector with his Child, Astyanax.' At Rome he felt the influence of Michelangelo, and became more vigorous in style and passionate in expression. He sent sev. works to Paris, which were exhibited in the Salon and gained medals. C. must be regarded as one of the influences which have helped to free modern sculpture from the weight of academic classicism. Among his chief works are 'La Palom-

bella' (1856); 'Neapolitan Fisherman' (1858); 'Girl with a Shell' (1869); 'Ugolino and his Children' (1863); and 'Statue of the Prince Imperial' (1866), after which he was made a chevalier of the Legion of Honour. In 1869 he executed one of the groups, 'Dancing,' for the opera house, which aroused much prejudice by its strong realism, vigour, and vitality. His last work, a fountain, is in the Avenue de l'Observatoire, Paris. Many of his drawings and studies are at Valenciennes.

Carpel, term applied in botany to the organ, possibly to be regarded as a transformed leaf, found in the centre of the flower, whose function it is to produce ovules. There may exist only one C. in the flower, and the gynaecium is then said to be monocarpellary, e.g. sweet pea and other legumes, but if more than one should be present it is polycarpellary; in any case the C. or Cs. are important parts of the female essential organ of the flower, and the aggregate number constitutes the gynaecium. When the Cs. of a polycarpellary pistil are united to one another the condition is syncarpous, e.g. primrose; when they are free from each other it is apocarpous, e.g. buttercup. The fusion of Cs. affects the way in which the ovules are placed within the ovary, e.g. those which are folded on themselves first, and then fused by their adjacent margins, bear ovules in the centre, when the placentation is said to be axile, e.g. bluebell. The placenta is a swollen cushion formed from the fused margins which are themselves called septa. The style is a prolongation of the upper part of the C., and the stigma is the terminal knob borne at the apex of the style.

Carpentaria, Gulf of, situated on the N. coast of Australia, between Capes Arnhem and York. The most important is. contained in it are Groote Eylandt and Wellesley Is., the largest of which is Mornington Is. It receives the Mitchell Flinders, Leichhardt, and Albert Rs. The coast is low and swampy. It was named in 1623 by Carstensz, after Pieter Carpenter, governor-general of the Dutch Indies.

Carpenter, Edward (1844-1929), Eng. author, b. at Brighton, son of Charles C., barrister and retired naval officer. On leaving school at Brighton he went to Trinity Hall, Cambridge; tenth wrangler in 1868. Took orders, and was curate to F. D. Maurice at St. Edward's. Becoming dissatisfied with his creed, renounced orders and became unit. extension lecturer on astronomy in Yorkshire mts. In 1883, took a cottage at Millthorpe, Derbyshire, worked in the fields, and grew his own fruit and vegetables. Wrote poetry: *Narcissus* (1873); and *Towards Democracy* (under the influence of Whitman) (1883) - and prose: *Civilisation, its Cause and Cure* (1889); *Love's Coming of Age* (1896); *Angels' Wings* (1898); *Art of Creation* (1904); *The Intermediate Sex* (1908); *My Days and Dreams* (autobiography) (1916). He visited Ceylon, and his *From Adam's Peak to Elephantia* (1892) extols the oriental peace of mind. His whole life was in fact a reaction

against Victorian conventions and respectability. *D.* at Guildford, June 28.

Carpenter, Lord George (1657-1732), Eng. general, entered the army, 1672. He served in Ireland and Flanders, and in Spain as quartermaster-general to Peterborough, 1705. He commanded the cavalry at Alinanza, 1707, at which battle he was second in command. He joined the Hanoverian party, defeating the pretender at Preston, 1715. In return for his services he was made governor of Minorca and commander-in-chief of the forces in Scotland. He was created baron, 1719; M.P. for Westminster, 1722-1729. His grandson was created Viscount Carlingford and Tyrconnel in the Irish peerage, but the earldom became extinct in 1853. *See* *Life of Lord George Carpenter*, 1736.

Carpenter, John (c. 1370-1441), London's tn. clerk, 1417-38; and M.P. for the city in 1436 and 1439. Compiled the city's privileges in the *Liber Albus*. Left a bequest which formed part of the foundation of the City of London School. Was an executor of Dick Whittington's will.

Carpenter, John Alden, Amer. composer, b. Park Ridge, Illinois, Feb. 28, 1876. He studied under Amy Fay and Sebebeck, and at Harvard under J. K. Paine. His first notable works were *Improving Songs for Children* (1907) and *Gitanjali*, a song-cycle of poems by Tagore. His first symphony, *Sermons in Stones*, was written in 1917. A ballet pantomime, *The Birthday of the Infanta* (after Oscar Wilde), was produced by the Chicago Opera Company in 1919, and *Skyscraper*, also a ballet, by the Metropolitan Opera Company of New York in 1926. For the Washington bi-centenary in 1932 he wrote *Song of Faith* for chorus and orchestra, and *Patterns* (piano and orchestra) was played by the Boston Symphony Orchestra in the same year. His symphonic poem, *Seadrift*, followed in 1933; concerto for violin and orchestra in 1938; and his symphony for the fiftieth anniversary of the Chicago Symphony Orchestra in 1940. In 1943 he wrote *Song of Freedom*. His work shows variety and skill in orchestration. Awarded the cross of the Fr. Legion of Honour (1921).

Carpenter, Dr. Lant (1780-1840), Unitarian minister and theological writer, b. at Kidderminster. He studied at the academy of Northampton (1797), and at Glasgow Univ. (1798-1801). He became an assistant master at a school in Birmingham, and subsequently librarian of the Liverpool Athenæum (1802-5), when he was chosen as Unitarian minister of a boarding-school in Exeter (1805-17). From 1817 to 1829 he held a similar position in a school at Bristol. He was drowned in Italy, off the coast of Leghorn. Dr. C. pub. numerous sermons and polemical tracts, and wrote *Unitarianism, the Doctrine of the Gospel* (1809); *Systematic Education* (2 vols.) (1815), etc. His *Memoirs* were ed. by his son, R. L. C., in 1842.

Carpenter, Mary (1807-77), Eng. philan-

thropist, b. at Exeter, daughter of Dr. Lant C., a Unitarian minister, and sister of Dr. W. B. C. She was educated in her father's boys' school at Bristol. Her interest in poor children was aroused by Dr. J. Tuckerman of Boston, and in 1835 she started a working and visiting society and later a ragged school with a night school in the poorest part of Bristol. The visit of the Hindu philanthropist, Ram-mohun Roy, 1833, aroused her sympathies with India, and the first of her journeys to the E. was taken, 1866, where she initiated sev. reforms for women and children. She wrote many books embodying her schemes for the education of destitute children and those on the border of a criminal or vagrant life. Her book *Juvenile Delinquents* was instrumental in the passing of the Youthful Offenders Act, 1854. She d. in Bristol. *See* life by J. E. C., 1879.

Carpenter, William Benjamin (1813-85), Eng. naturalist, son of Dr. Lant C., b. at Exeter. He graduated M.D. at Edinburgh, 1839, was made F.R.S. in 1844; gold medallist of the Royal Society, 1861; and was Fullerman prof. of physiology at the Royal Institution from 1845, being a most popular and admirable lecturer. His works include *Principles of General and Comparative Physiology* (1839); *The Microscope and its Revelations* (1856). *Principles of Mental Physiology* (4th ed. 1876); He was registrar of the univ. of London, 1856-79.

Carpenter Bee (*Xylocopa*), so named from its habit of boring holes in dry timber and forming little cells in which to lay eggs. The partitions between the cells are made of the wood-stuff fastened together with saliva. *X. virginica*, a N. Amer. species, is as large as a humble bee.

Carpentier, Georges, Fr. boxer, was b. at Lens near Calais in 1894, and worked in a coal-pit as a boy. At a boxing academy in the tn. he attracted the attention of the proprietor, Francois Descamps. When fourteen, he won a fight against Salmon, one of the best-known boxers at 7 st. 2 lb. He won the championship of France in every weight and div. On July 16, 1914, he fought Gunboat Smith at Olympia, London, for the world's heavyweight white championship, and won it through the disqualification of Smith for a foul. His most sensational fight in England was with the heavyweight Joe Beckett on Dec. 4, 1919, for the championship of Europe, the Prince of Wales being present at the match. Only two blows were struck, Beckett being knocked out a few moments after the fight started. He fought Dempsey in New York, July 3, 1921, for the world's championship, and was thoroughly beaten in the fourth round. He served in the Fr. Air Force during the First World War, and again on the outbreak of war in 1939 until the fall of France in 1940. During the Ger. occupation of Paris, the restaurant business which C. was running before the war was requisitioned by the Gers., but on being asked by them to manage it on their behalf, he refused.

Carpentras, tn. 16 m. N.E. of Avignon by rail, in the dept. of Vaucluse, France, which as Carpentoracte of the Romans was flourishing before Caesar's invasion of Gaul. Its interesting buildings include a fourteenth-century loge's palace, a third-century triumphal arch, anct. fortifications, an old cathedral, and an aqueduct of forty-eight arches. The chief manufs. are silk, chemicals, and earthenware. Pop. 11,800.

Carpentry may be defined as the art of working timber into various shapes with different varieties of tools, and combining the pieces to support a weight or sustain a pressure. The difference between C. and joinery (*q.v.*) is that the former is concerned with the essentials, the latter with the ornaments, of a building. In building, C. covers all carcassing work: roofs, floors, partitions, centering, shuttering, and shoring. In furniture, it provides the roughest types. Heavy work, ranging from case-making to bridge building, also comes within the sphere of C. The composition and resolution of mechanical forces form the principles of the science of C., and the skilled carpenter must have either a practical or theoretical knowledge of such laws. It is beyond the scope of this article to go into such principles, but some explanation may be given of the terms and general processes of C.

Any assemblage of pieces of timber connected together is called a frame. The points of meeting of the pieces of timber in a frame are termed joints, and one of the first requisites in C. is a knowledge of the various ways of joining pieces of timber so as to stand different strains and pressures. When one piece of timber is not long enough, it is joined to another piece in the same direction by various methods; this is called technically lengthening a beam. The roughest method of doing this is by fishing; the ends of the beams are placed together, and a piece of timber is placed on each side and secured by bolts passed through the whole. Another method is halving the beams so that they present a level face when joined together, and can be united by means of bolts. Scarf-joints are employed when it is necessary to maintain the same depth and width throughout the beam. In this method a part of the thickness of the timber is cut away from each beam; the parts cut away are on opposite sides, and correspond to each other, so that the beams will fit into each other, and can be bolted. Different varieties of scarf-joints are employed where the timber is subjected to compression, tension, or to a bending strain, etc. Hard-wood pieces called keys are inserted into the holes of a scarf-joint before the bolts in order to compress the beams closely together; they must not be driven in too hard or the fibres of the wood will be strained. In bolting together scarf-joints side plates of iron are used to protect the wood. Another mode of joining timber is by mortise and tenon, which is employed wherever one piece of timber meets another without crossing it.

A hole called a mortise is made in one piece of timber, and a projecting portion called a tenon is left on the other. The tenon is driven into the mortise and secured in position by glue, or by a pin penetrating it laterally through the side of the mortised beam, or by an external iron strap which passes round the beam and is riveted in the other, the beam which has the tenon. When the two pieces of timber do not meet each other at right angles, modifications of the mortise and tenon joint are adopted, so that a bearing surface may be provided which is at right angles to the direction of the thrust exercised by the entering timber. Other operations performed when timbers cross each other are notching, cogging, and housing; these joints must be strengthened by bolts or straps. When greater strength is required than a single beam will give, the processes of building and trussing beams are used. Building beams is combining two or more beams in depth so as to have the same effect as one large beam; the beam is cut in two and supported with cross-beams in the operation of trussing.

The framework by means of which the covering of a building is supported is known as the roof. The simplest form of roof consists of a series of pieces of timber with their own ends resting on the walls and their other ends meeting at a ridge-pole. These are called rafters, and their lower extremities are connected by a piece of timber called a tie, as otherwise this framework would thrust out the roof when loaded with the weight of the covering. The whole frame is known as a couple; such a simple form of roof, however, can only be used when the building is less than 20 ft. long. When the tie is longer than that, it is apt to sag in the middle, and a fourth piece, called a king-post, is added to unite it directly with the apex of the rafters. Cross-pieces, called struts, are added if the rafters are liable to sag; their centres are thus united to the centre of the tie. If the span is longer than about 30 ft. it is inadvisable to leave the rafters unsupported for half their length, and the following formation is substituted: The centre of each rafter is joined to the tie by a piece which falls perpendicularly on it; the rafters are also joined to each other by a piece which runs parallel and above the tie. The perpendiculars and the section of the tie enclosed by them thus form a parallelogram with the rafters. The horizontal piece is called a collar-beam, and the suspending pieces queen-posts. The whole frame is known as a truss; the trussed frames are placed at intervals of about 10 ft. They support horizontal pieces known as purlins, which run the whole length of the roof, and support the common rafters and their covering. All roofs, of whatever size, are founded on the above models, unless it is not desired that there should be a tie-beam, as in churches, etc. The walls are then made stronger or the roof principals are modified in shape to meet the greater horizontal pressure.

The framing of timber supporting the

floor of the room above and the ceiling of the room below is called the naked flooring; there are three main kinds of flooring—single, double, and framed. Single flooring consists of one series of joists which stretch right across from wall to wall without any support. The flooring boards are laid on the top of these joists, and to the under side is affixed the ceiling of the lower storey. Double flooring has a middle series of binding joists, resting on the walls in the same way as the joists of single flooring; above these joists are the bridging joists and below are the ceiling joists. Both these are notched into the main joists where they cross them, and support respectively the floor above and the ceiling below. Framed flooring has beams in addition to the binding, bridging, and ceiling joists; the binding joists do not cross the whole width of the room, but are framed into these beams at intervals. A double ceiling of lath and plaster is occasionally used to deaden sound; the most general method, however, is the insertion of plugging between the roof and the ceiling. Framed floors are used where there are large spans, double floors ensure evenness of floor and ceiling, and single floors give strength combined with lightness where the spans are not very great. If the span for a single floor exceeds 8 or 9 ft., the joists should be strutted together to prevent twisting. Rough wooden profiles of the cornices of a room are made, and afterwards lathed round and plastered. This process is known as cornice bracketing.

The frames of timber which are used to divide the upper storeys of a building into rooms are called partitions. When these are not required to bear any heavy weight, they are formed as follows: A piece of timber, called a sill, is laid along the floor, and a corresponding piece along the ceiling joists. The lath is nailed to the vertical pieces, known as quarters, with which the space between is occupied. If the partition has to support any weight it has to be trussed with posts and braces, and brickwork or concrete may be used to fill up the space. When a staircase is made of wood, the pieces of timber upon which it rests, and which form the framework, are known as the carriage. They are two in number, and are fuclined at the angle which it is desired that the steps should have; they are called technically rough strings. A piece of timber, which projects horizontally from the upper level to which the staircase leads, forms the support for the rough strings and also for the joists of the landing; this is called a pitching or apron piece. When bridges or vaults are in course of construction, curved frames are needed to support the arch stones; these frames are known as centres. The ribs of which the centres are composed are built of a series of short timbers shaped to the curve required; they are placed about 6 ft. apart, and are connected by horizontal ties as well as by diagonal bracing. The centres serve to support the narrow boards which carry the stones of the arch. When the arch is properly keyed, the centres are struck

gradually so that the arch takes its proper bearing slowly. Staging is built up of two rows of standards, or large square timbers, resting on a sill of timber on the ground. Longitudinal beams at the top support a platform, on which a small railway may run. If the staging is large and required for a travelling crane, it is known as a gantry. Consult J. Wilson, *Wilson's Combined Works: Building Construction, Carpentry, and Joinery*, 1921, and *Carpentry and Joinery*, 1921; F. W. Lewis, *Home Carpentry and Cabinet-making*, 1921; C. Ellis, *Modern Practical Carpentry*, 1927; R. Greenhalgh, *Practical Joinery and Carpentry*, 1923, and *Joinery and Carpentry* (4 vols.), 1939-40.

Carpet (It. and Low Lat. *carpita*, a coarse cloth, from Lat. *carpere*, to pluck), heavy woven fabric, used as a covering on floors. They were first made and used in the E., where the custom of sitting cross-legged on the floor and of praying in a low, crouching position necessitated the use of some soft covering to the floor. When Cs. were first brought to England, they were used as a rich covering for beds and tables, straw, dried rushes, or sand being spread over the floors. When Cs. were first spread over floors they were regarded as a great luxury, and only in keeping with a lady's boudoir. Hand-woven tapestries were commonly made during the Middle Ages in convents and by ladies of rank, and were sometimes spread over the floors. The industry first developed in France, where a factory was estab. in 1607 at the Louvre by Henry IV. Other C. factories were estab. in Chailloit, 1627, and at Beaurais, 1661. In 1695, with the revocation of the edict of Nantes, most of the weavers—for the majority were Protestants—fled across the Channel, and thus the industry was started in England. The Flemish weavers first settled in Bristol, but the knowledge of the art soon spread to N. Eng., and notably to Kidderminster, Dewsbury, and Glasgow. The chief varieties of Cs. are the Brussels, Wilton, Persian, Turkey, Indian, Kidderminster, and Axminster. Like Cs., rugs came to us originally from the E., where the rug or C. is the most important, often indeed almost the only furnishing of the house. Indian, Persian, and Turkish Cs. and rugs are the best examples of the art.

General Principle of Manufacture.—The original method of C. making was by hand, and to this day Cs. are made both in Europe and in oriental countries in precisely the same manner as of old. The principle is very simple. The warp threads forming the chain are wound on two horizontal beams and the weavers sit side by side in front, the C. as it is woven being gradually wound on the lower beam and the warp correspondingly unwound from the upper beam. The yarn for the pile is cut into tufts and knotted by the weaver. The interlocking of warp and weft forms the weave of the C. Hand-weaving is slow, and therefore the product is very expensive. The first type of machine-made C. to be made in England was the Brussels C.

Brussels Carpet.—This C. is composed

of a mixture of linen and worsted, the cloth or reticulated part of the structure being entirely of linen, and the worsted only showing on the upper surface and making the pattern. Through the coarse linen fabric, worsted thread of different colours is drawn and held in loops over the wires. When the work is complete, the wires are removed and the remaining loops give a soft pile and make the figured surface of the C. Brussels Cs. were introduced into Kidderminster from Tournai in 1745.

Wilton Carpet or Velvet Pile.—This is made with longer loops, woven over sharp wires, which, when withdrawn, cut the worsted, leaving a full velvety pile, but otherwise is similar in manuf. to Brussels. The C. may afterwards be sheared to even the surface. In recent years, many Wilton looms have been erected capable of weaving seamless Cs. 12 ft. wide or more.

Persian Carpets.—This manuf. dates from very early times. They are thicker and softer than ordinary Cs., are of great durability, and are renowned for their beautiful designs. They are made by knotting woollen yarn on warp threads, the tufts thus formed being firmly held in place by the wool yarn. Old Persian Cs. are highly valued and are of great value.

Turkey Carpets.—These are somewhat similar to Persian Cs., being made in the same fashion, but their designs are stiffer and more geometrical in character. The colouring is very rich. The industry flourishes chiefly at Uskiah in Asia Minor; Cs. of the same kind were formerly made at Axminster (1755-1835), and are still made at Wilton.

Indian Carpets. Like Persian, are woven by hand, the design being formed by knitting into the warp tufts of woollen threads of the proper colour one after the other. But modern Indian Cs. are much inferior to the earlier Indian pile Cs. in pattern owing to the debasing influence of W. designs.

Kidderminster Carpet.—This is made in the greatest quantities in Scotland and Yorkshire, and is the oldest kind of machine-made C. It is made by the intersection of two or more cloths of different colours, woven in stripes of different shades. They are made in layers, and are called accordingly two-ply or three-ply. The back of the C. is exactly the same pattern as the face-side, but the colours are reversed. There is no pile, the yarn lying flat on the surface, as in worsted cloth.

Axminster Carpet.—It was first made in England by Thomas Whitley in 1755. It is usually made to order, being made in one piece according to the dimensions of the room for which it is required. They resemble Turkey Cs., and are made in tufts of coloured worsted or woollen tied under the warp, the linen threads being rammed down and concealed. As is the case with Turkey Cs., the difficulty lies in changing the colours so as to form the required pattern. In 1839 Mr. Templeton of Glasgow patented a method of making

Chenille Axminsters. The chenille is woven on a separate loom, cut into strips, and bound into tufts, and is then woven into the C., being used as the weft thread. The process of weaving the fur into the C. is performed on a setting loom. Chenille Cs. are very popular, partly on account of the variety of colours which can be used, and partly owing to the comparative cheapness. *Royal Axminsters* do not require the chenille to be woven separately; the tufts are cut by machinery and are threaded into the C. by the linen weft. The later types of loom for weaving the fabric can produce a C. 5 yds. wide without a seam.

Seats of Manufacture.—Brussels and velvet-pile Cs. are largely made at Kidderminster, and also at Durham and Halifax. Kidderminster Cs. come from Kilmarnock and Bannockburn in Scotland, and from Dewsbury and other places in Yorkshire. Only a small quantity is made in Kidderminster itself. The finest Persian Cs. are made at Kurdistan. The patent chenille Axminsters are made to a large extent in Glasgow. In the U.S.A., Cs. are chiefly manufactured in Philadelphia, where the first factory was estab. in 1791, and in Lowell. The most famous Fr. Cs. are the Savonnerie, made in Paris, and the Aubusson Cs. See R. S. Brinton, *Carpets*, 1919; A. F. Kendrick and C. H. O. Tattersall, *Hand-woven Carpets, Oriental and European*, 1922; A. Hackwell, *Die Chinesische Teppiche*, 1921; R. Beaumont, *Carpets and Rugs*, 1924; F. J. Mayers, *Carpet Designs and Designing*, 1931.

Carpet-bagger, slang political term for a candidate who stands for election in a locality to which he is a stranger. The term was used contemptuously after the Civil war in the U.S.A., for the N. politicians, who, by the help of the Negro vote, controlled the S. administration.

Carpet Bedding. In gardening, the name of a certain formal arrangement of beds, adorned chiefly with bright-coloured foliage-plants, or low-growing flowering ones, such as lobelia, cerastium, aubrietia, colons, sedum, thrift, echeverius, saxifrages, or box, so arranged as to resemble a figured carpet. The patterns are usually geometrical designs, but sometimes birds, butterflies, or other objects are represented. This style is not so popular at present as it was some fifty years ago, owing to its extreme formality (cf. Dutch gardens with clipped box or yew trees). The soil is banked up for the dwarf plants to bring them to the same level as the taller growers, and present an even surface throughout.

Carpi: 1. Com. and tn. in the prov. of Modena, Emilia, Italy. 9 m. N.N.E. of Modena. It has a castle, two cathedrals, and a fine Renaissance church of the fifteenth century, also the bishop's palace. Silk industries thrive. Pop. (com.) 31,000. 2. Vil. on R. Adige, 28 m. from Verona, where Prince Eugene defeated the Fr. in 1701.

Carpi, Ugo da (1450-1523), It. painter and engraver, claimed to have discovered the art of chiaroscuro printing, but Ger.

research would seem to have proved that the art was practised in Germany in 1499 or before, whereas the earliest of C.'s prints is dated 1518. C. used three blocks in his famous engravings after Raphael.

Carpineto, tn. in the prov. of Rome, Italy, 37 m. from the city of Rome. Bp. of Pope Leo XIII. (1810-1903). The windows and the rose window of the church of Santa Maria del Popolo were damaged in the Second World War. Pop. 5000.

Carpini, Joannes de Plano (c. 1182-1252), b. in Umbria, W. Italy, was a Franciscan traveller. Was a companion and disciple of St. Francis of Assisi. He was sent to China by Pope Innocent IV. at the head of an embassy to negotiate with the Mogul powers, and to use his diplomacy to turn them from their avowed intention of devastating Europe. He set out from Lyons in April of 1245, and returned in 1247. Soon after C. was rewarded by the pope with the bishopric of Antivari in Dalmatia, but it is probable that he did not long survive the hardships of his remarkable journey. He had a genius for recounting his adventures, and Hakluyt pub. portions of his original work; complete text first pub. 1839 as vol. iv. of the *Recueil de voyages et de Memoires of the Geographical Society of Paris*. Ed. for Hakluyt Society by C. R. Beazley, 1913.

Carpinio, tn. of Italy in the prov. of Foggia, 22 m. N.E. of San Severo. Pop. 6000.

Carpinus, see HORNBEAM.

Carpobalsamum, name given both to the dried fruit and to the oil obtained from the fruit of *Commiphora opobalsamum*, a species of Burseraceae which yields balm of Gilead. The oil is aromatic and volatile, and should be used while fresh or it becomes inert.

Carpocrates, or **Carpocras** (Καρποκράτης, or Κάρποκρας), Alexandrian gnostic philosopher, probably of Hadrian's reign (A.D. 117-38), who fl. in the second century and founded the sect of Carpoctrations, who existed as late as the sixth century. They were avowed eclectics, taught that Christ was a human being of pre-eminent goodness, and that the world was created by angels. The Supreme Deity was the Monas. They believed in pre-existence of the soul, and worshipped Zoroaster, Pythagoras, Plato, and others, as well as Christ, as benefactors of mankind.

Carpology (Gk. καρπός, fruit, λόγος, word), the name given to the div. of botany which comprehends all that relates to the structure of the fruit.

Carpophore (Gk. καρπός, flower, φέρειν, to bear), botanical term used to indicate the prolonged axis of a flower which passes up between the carpels to the top, and which serves to attach the carpels to the plant when they have split apart, e.g. in a silique. Examples occur in the Umbelliferae, Geraniaceae, and Rosaceae.

Carpus (Gk. καρπός, wrist), in anatomy, the series of bones between the forearm and hand. In man there are eight small bones in two irregular rows of four. The

upper row articulates with the radius, the lower with the metacarpal bones of the hand. Rudiments of carpal bones are found in all mammals.

Carpzov, **Benedikt** (1595-1666), Ger. jurisconsult, son of B. C. (d. 1624). Privy Counsellor to the elector of Saxony, and author of *Practica nova Imperialis Saxonica rerum criminalium* (1635); *Definitiones forenses* (1668); and other works.

Carr, **Herbert William** (1857-1931), Eng. philosophical writer. Educated at King's College, London Univ., and became prof. of philosophy there. Publications: *The Problem of Truth* (1912); *Henri Bergson* (1912); *The Principle of Relativity* (1920); *Gentile's Theory of Mind as Pure Act* (1921); *The Scientific Approach to Philosophy* (1924); *Changing Backwards in Religion and Ethics* (1927).

Carr, **John** (1721-1807), Eng. architect, called C. of York, b. at Horbury, near Wakefield. He made his reputation as an architect of the Palladian school. The court-house, castle, and jail at York, Newark tn. hall, and the par. church of Horbury, were all built according to his designs. Though of humble origin, he was twice mayor of York, and d. leaving £150,000.

Carr, **Joseph William Comyns** (1849-1916), Eng. art critic and dramatist; educated at London Univ. He was one of the editors of the *Academy*. He became Eng. editor of *L'Art*, 1875. He was director and one of the founders of the New Gallery, Regent Street, where many of Burne-Jones's works were first exhibited. Among his publs. are *Drawings by the Old Masters* (1877); *Examples of Contemporary Art* (1878); *Essays on Art* (1879); *Papers on Art* (1883-84); and *Modern Landscape*. C. also wrote *A Fireside Hamlet*; *The United Pair*; *Forgiveness*; *King Arthur*; *Some Eminent Victorians*; and adapted various novels for the stage.

Carr, or **Ker**, **Robert**, Earl of Somerset (d. 1645), Scottish politician, favourite of James I. of England. In 1603 he accompanied James to England as page. In 1604 C. broke his arm in a tilting match before the king. His appearance pleased James, who substituted a favourite for a constitutional adviser, and loaded him with honours. Knighted 1607; Viscount Rochester, 1611; earl of Somerset, 1613. C. married Lady Essex, after procuring her divorce from her first husband. His influence now began to wane before that of Villiers. In 1615 he was implicated in his wife's poisoning of Sir Thomas Overbury (1613). Bacon conducted the prosecution as attorney-general; both earl and countess were condemned to death, but received the royal pardon. See A. Amos, *The Great Oyer of Poisoning*, 1846; S. R. Gardiner, *History of England*, 1885-1900.

Carracci, see CARACCI.

Carrageen Moss, otherwise known as Irish or Sea Moss, edible seaweed technically called *Chondrus crispus*, found on rocky shores of N. Europe and N. America. It is reddish-brown in colour, 2 to 12 in.

long and repeatedly forked. After it has been collected it is bleached in the sun and dried, when it is ready to be sold. When boiled in fresh water or milk it yields a pleasant drink, or can be made into jelly. It is also used for making size, stuffing mattresses, and feeding cattle.

CATLAGUEN MOSS

Carranza, Bartolomé (de Miranda) (1503-76), Sp. priest, b. in Navarre. He entered the Dominican order, and became prof. of theology at Valladolid. Charles V. sent him to the Council of Trent, 1546, and he also sat in that of 1551. He accompanied Philip II. to England, and became Queen Mary's confessor, working zealously to establish Catholicism. Chosen archbishop of Toledo in 1557, he was accused of heresy by the Inquisition, nominally owing to his *Comentarios sobre el Catechismo Cristiano* (1558), and spent the rest of his life in prison.

Carranza, Emilio (1905-28), Mexican airman, descendant of Venustiano C., president of Mexico. Served in the operations against Yaqui Indians and in warfare against rebels. Regarded as the most intrepid airman of his country, his best flight being from San Diego to Mexico City, a distance of nearly 1600 m. accomplished in 18½ hrs. Killed in an accident in New Jersey while attempting a non-stop flight from Long Is. to Mexico City. Won great popularity in U.S.A. by his 'beau geste' flight, shortly before his death, from Mexico City to Washington.

Carranza, Venustiano (1859-1920), president of Mexico, b. in Cuatro Ciénegas, in the state of Coahuila, and educated in Mexico City. In early life he cultivated his extensive farms in Coahuila. He made sev. attempts to enter Parliament, but was defeated through the efforts of President Díaz. In 1911, he sided with the revolutionary president Madero—to whom, however, he was not believed to be loyal. He was, under Madero, elected governor of Coahuila. When, after the murder of Madero, the presidency was seized by Huerta, in 1913, C. declared war

against Huerta. In Aug. 1914 C. obtained the surrender of the administration; and in Oct. 1915 was recognised as president by the U.S.A. He was not formally elected, however, until the end of 1916. Another revolution broke out in 1920; C. was defeated, and was captured on May 16, and, five days afterwards, while sleeping in a badly guarded hut near Tlaxcala-Tonga in the state of Puebla, he was shot dead.

Carraa, tn. in W. Italy, on the Avenza, famous for its marble quarries, which have been worked for over 2000 years. The supply seems inexhaustible, though much has been wasted by the use of primitive machinery, 500,000 tons being quarried to produce 150,000 tons exported. The marble used for sculpture is peculiarly white and flawless and of great durability, but few of the numerous quarries produce this variety. Nearly all the surrounding heights are of marble, and mt. railways are taken half-way up the mt. side to serve the quarries. The tn. contains many fine marble churches and an academy for sculpture, founded by Napoleon C. is quite near to the site of ant. Luna, a celebrated Etrurian city. Pop 24,000.

Carrel, Alexis (1873-1944), Fr. doctor of medicine, b. at Sainte Foy-les-Lyon, France, June 28. After studying medicine for a time when quite a youth and becoming a member of the Lyons Univ., went to the U.S.A., where he became connected with the Univ. of Chicago. In 1909 he was elected an associate member of the Rockefeller Institute for Medical Research. In 1912 he was awarded the Nobel prize (amounting to £7800) for medicine on account of his brilliant success in suturing of blood vessels and in transplantation of human organs. He conducted some remarkable experiments in 1913 on cats, keeping vital organs alive for some hours after their removal from the body. At the outbreak of war, he returned to France, and became famous as the chief inventor of the C.-Dakin treatment of wounds by irrigation—every part of the wound being repeatedly sterilised with a solution chiefly of hypochloride of sodium, applied through a system of rubber tubes. In 1919 he returned to the Rockefeller Institute and continued his work there until his retirement in 1939. In the following year he returned to France, and was placed by the Vichy Gov. in charge of the Foundation for the Study of Human Relations, where he remained until the liberation of France in 1944. Charges made against him of collaboration with the Gers. were denied. There was no trial and C. d. the same year or Nov. 5. See Sir Wm. Macpherson (ed.), *Official Medical History of the War* (1921-24).

Carrel, Nicolas Armand (1800-36), Fr. journalist and publicist. He was for a time secretary to the historian Thierry. In 1828 he pub. *Résumé de l'histoire de la Grèce moderne, Résumé de l'histoire d'Ecosse*, and *Histoire de la contre-révolution d'Angleterre*. In 1830 C. founded the *National* with Thiers and Mignet, the organ of Liberal opposition, becoming chief editor. He spoke fearlessly against

the gov., and uttered an indignant protest at the execution of Marshal Ney. Though moderator, as well as leader, of the popular party, he was imprisoned by Louis Philippe's gov. for his writings. He was killed in a duel by the editor of the *Presse*. A statue was erected to him, 1887, at Rouen. C's *Œuvres politiques et littéraires* (5 vols.) were ed. by Littré and Paulin, 1857-58.

Carrer, Luigi (1801-50), It. lyric poet and scholar, native of Venice. He gave up the law for literature, becoming prof. of philosophy at Padua, 1830; later, director of the Correr Museum, Venice. His poems included idylls, epigrams, sonnets, hymns, and tragedies, but the best are ballads (introduced from Germany) and odes. His *L'anello di sette gemme* (1838) told in poetical form the hist. and customs of Venice. Vols. of poems and ballads appeared in 1832, 1838, and 1841; prose and poetry, 1837; and odes and sonnets in 1868. See lives by Veludo, 1851; Venanzio, 1855; and Sartorio, *L. Carrer*, 1900.

Carrhae, anct. city of Mesopotamia, about 25 m. from Edessa, the Haran of the Bible and Assyrian inscriptions. The crushing defeat of Crassus by the Parthians in 53 B.C., when the Rom. standards were lost, is frequently mentioned in classical literature.

Carriacou, is. of the Brit. W. Indies and the largest of the Grenadines, being 8 m. long, and from 2 to 4½ m. wide. Cotton is grown. Hillsborough, on the W. coast, is the tn. and harbour. Pop. 3000.

Carriage (Lat. *carrus*, car, chariot, wagon), a means of carrying; any vehicle intended to convey goods, but especially passengers, by road or rail. Hence, railway C., hackney C., gun C., and various other compounds. Cs are structures on two or more wheels, and vary greatly in size and shape. Possibly they were first developed from the Egyptian sledges and rollers used for conveying heavy loads. Chariots were known also to the anct. Israelites, Gks., and Rom., chariot racing being a favourite sport at the public games of Greece and Rome. The covered C. of to-day dates from about the fifteenth century. In 1555 the first Eng. C. (excluding the war-chariots of the anct. Britons) was made by Ripon for the earl of Rutland. By the seventeenth century they were much used, and ousted the sedan-chair, being themselves replaced by the cab in 1820. The hansom cab was introduced in London in 1834 by Joseph Hansom. Other two-wheeled Cs. are the stanhope, tilbury, gig, and dog-cart. In the eighteenth century many improvements were made, the body was suspended on straps, attached later to 'C'-shaped springs. The use of the private four-wheeled C. drawn by one or more horses (often the 'C. and pair,' with two horses) was especially marked during the Victorian era. The brougham was introduced in 1839, other types being the landau, victoria, and four-in-hand. Open four-wheeled Cs. are the phaeton,

wagonette, and brake. The drag and the omnibus have seats both outside and in. Cs. have various different special names in different parts of the world, but the word is commonly used in England of the four-wheeled, private, horse-drawn vehicle. See also CAB; CART; COACH and COACHING. See H. McCausland, *The English Carriage*, 1948.

Carriage-building, see COACH-BUILDING.

Carriage Dog, see DALMATIAN DOG.

Carriage Licences. The rates for local taxation licences in respect of Cs., motors, or mechanically propelled vehicles are as follows: for horse-drawn or mule-drawn Cs. with four or more wheels, £2 2s. if to be drawn by two or more horses, £1 1s. if by one horse only; Cs. with less than four wheels and hackney Cs. 15s. The rates for motor cars are graduated according to the h.p. of the car, and range from £6 for a car not exceeding 6 h.p. with £1 5s. additional for every unit of h.p. Higher rates were imposed in 1939 on cars over 15 h.p. £10 is the duty for a hackney motor having a seating capacity for not more than four persons; £12 where the seating capacity is more than four but not more than eight; £24 when the seating capacity is not more than fourteen and the vehicle is fitted entirely with pneumatic tyres, and £30 for other vehicles; and so on, up to £96 for a vehicle seating sixty-four persons, if entirely fitted with pneumatic tyres, and for other vehicles £120; with an additional £1 5s. and £1 10s. respectively for each person in excess of sixty-four (excluding the driver in every case).

Carrick, The, one of the three divs. of Ayrshire, Scotland. The earl of C. is the Prince of Wales's title as steward of Scotland.

Carrick, Thomas Heathfield (1802-75), Eng. miniaturist, b. near Carlisle, educated at the grammar school there; a self-taught artist. He neglected his chemist's business for painting. In 1836 he moved to Newcastle; 1839 to London. From 1841 to 1866 exhibited annually eight miniatures. Among the most famous are those of Carlyle, Sir It. Peel, Rogers, Wordsworth, Longfellow, Charles Keen, Farren, Macready, Daniel O'Connell, and Robert Owen. In 1845 awarded a medal for his invention of painting miniatures on marble; awarded a Turner annuity by Royal Academy about 1868. See Royal Academy catalogues (1841-66).

Carrickfergus, seaport tn. in co. Antrim, N. Ireland, is situated on Belfast Lough. William III. landed here just before the battle of the Boyne. The castle of C., dating back to the twelfth century, is still used as a fortress. Flax spinning and oyster fishery are the chief industries. Pop. of tn. 4600.

Carrickmacross, mrkt. tn. of Eire, in the co. of Monaghan, with manufs. of leather and boots, and a trade in grain. Pop. 2100.

Carrick-on-Shannon, riv. port and mrkt. tn. of Eire, situated on the Shannon in the co. of Leitrim, 37 m. S.E. of Sligo. There is trade in shipping, dairy produce, and corn. Pop. 1000.

Carrick-on-Suir, tn. in co. Tipperary, Eire, connected with Carrickbeg, in Waterford, by a bridge over the Suir. It has an anct. castle and par. church. Woollen manuf. is the chief industry. Pop. 5000.

Carrier, Common, in Eng. law, one who undertakes for hire to carry goods or passengers from one place to another either by land or water. He is distinguished from the private C. by being ready to accommodate the public generally and has different responsibilities in law. Examples of land Cs. are omnibus companies, railway companies, wagoners, firms such as Carter Paterson & Pickford and others; Cs. by water are owners of steamships, ferry-boats, and the like. Up to 1933 the carriage of goods by road was uncontrolled and the Road and Rail Traffic Act of that year was passed as a result of a widespread feeling that the fierce and cut-throat competition in the industry which developed during the years following the First World War was becoming dangerous. This Act (which took effect as from 1934) imposed a measure of control by making it necessary for any person carrying goods for hire or reward to have a licence to do so, and to operate subject to specified conditions and in certain cases within defined limits. Since 1934 no person may use a goods vehicle on a road for the carriage of goods for hire or reward or for or in connection with any trade or business carried on by him except under a licence. Licences are of three classes (see *under* TRANSPORT ACT, 1947). The 'A' licence applies to the C. or public carrier and it entitles the holder to use his vehicle for the carriage of goods for hire or reward, but not for the carriage of goods in connection with any trade or business carried on by him except that of a carrier of goods. It is a condition of the licence that the vehicles are maintained in a fit and serviceable condition; speed limits and regulations as to loading are complied with; requirements as to drivers' hours are observed; and that records of work, journeys, and loads are kept (Sect. 8 (1)). Under the Transport Act, 1947, it shall be a condition of every licence that, except under a permit granted by the Brit. Transport Commission, goods shall not be carried for hire or reward in any authorised vehicle if the vehicle, at any time while the goods are being so carried, is more than 25 m. from its operating centre, and the Road and Rail Traffic Act, 1933, shall have effect as if the said condition were included among the conditions specified in subsection 1 of section 8 of the Act. But this additional condition is not applicable where the goods carried are liquids carried in bulk in a tank permanently fixed to the vehicle, or in a tank not so fixed of which the capacity is not less than 500 gallons, or are goods of a special character which under any statutory provision may only be carried in a specially constructed vehicle, or where the carriage is an ordinary furniture removal, (1) the goods carried are meat or livestock;

or the goods consist of felled timber carried in a specially constructed carriage. The general effect of this clause (52 of the Act of 1947) is that goods vehicles used under licence are not allowed to carry goods for reward more than 25 m. (measured as air miles) from their base, and that this becomes an additional condition of the licence.

A C. of goods must transport any except specially dangerous articles to the place to which he professes to carry goods. A fixed rate of payment must be charged to all employers alike, payment being made beforehand if desired. Otherwise the C. has a lien on the goods taken for his charges. He is in the eyes of the law responsible for all acts of his employees. Also, unless his liability be limited by a special contract, he is responsible for all goods entrusted to him until they have been delivered, and must make good any loss or damage occurring through any cause except 'the act of God, or the public enemy' (in the narrowest signification). These stringent rules exist to guard the interests of employers, and prevent their being entirely at the mercy of the C. If goods are to be warehoused with Cs. for a time previous to carriage, extraordinary liability is not incurred by them until the actual time of carriage, though of course ordinary care and precautions must be taken. In England if a number of Cs. are engaged in the transfer of goods, the first is held liable, as insurer, as being the party with whom the contract was originally made. Personal delivery is expected of land Cs. Water Cs. can only take goods to the wharf, but notice must be given of the vessel's arrival and discharge of cargo. A special contract may be entered upon for the carriage of goods, but no C. can exempt himself from liability for goods not mentioned in the Carriers Act by a mere printed notice that he refuses to hold himself responsible. A definite contract signed by the employer is essential before the C. can shake off his responsibilities as insurer. The Carriers Act of 1830 granted certain exemptions from liability to C. Cs. by land. A ship owner's liabilities are much the same, except as limited by the Merchant Shipping Acts, and by the contract of affreightment. At common law railways are C. Cs. only of such goods as they profess to carry. But as regards other goods, etc., their liability for neglect or default is dealt with by the Railway and Canal Traffic Act, 1851, and amending Acts. A railway is a C. C. of a passenger's personal luggage and therefore an insurer of its safety; but this is not so if the luggage has been taken by the passenger out of the control of the railway. Hence, in the event of accidents the railway is only liable if negligence can be proved. By the Railway and Canal Traffic Act of 1851 liability as to animals was limited. Railways are not C. Cs. of the passengers they carry and therefore are not 'insurers' of their safety. Passenger Cs. are not responsible for mishaps caused by the passengers' contributory negligence. They must accept as passengers all who comply with their

rules (as to tickets, use of cars, etc), except people of disorderly behaviour or those who have some contagious disease. See R. Temperley, *Carriage of Goods by Sea Act*, 1924, 1925; H. W. Disney, *Law of Carriage by Railway* (8th ed.), 1929; W. H. Gunn, *Law of Inland Transport*, 1932.

American Railways.—There is a vital difference in the Amer. law as to C. Os., railways being considered C. Os. of passengers, with the consequence that they are sued almost every day for accidents in which passengers are injured.

Carrier (Disease Carrier), person who, recovered from an infectious disease, retains the germ for various periods of time and is, therefore, capable of spreading the infection; notably in the case of typhoid, paratyphoid, cholera and dysentery, diphtheria, scarlet fever, and meningitis. The germs are carried in the feces, urine, throat, tonsils, and nose.

Carrier, Jean Baptiste (1756-94), Fr. revolutionist, b. at Yvetot. Elected to the Convention, 1792, he helped to form the Revolutionary Tribunal, voted for the death of the king, demanded the arrest of the duke of Orleans, and assisted in overthrowing the Girondists. C. was sent to Nantes, 1793, to repress the civil war started by priests and Royalists in la Vendée. He massacred over 16,000 Vendean and other prisoners without trial, sparing neither women nor children. Many were crowded into boats and sunk in the R. Loire ('Republican baptism'); others were shot down or guillotined. After Robespierre's fall, justice was demanded against this fiendish Jacobin, and after trial by the Paris tribunal he was guillotined.

Carrière, Eugène Anatole (1849-1906), Fr. genre-painter, b. at Gournay-sur-Marne, lived at Paris. Pupil of Cabanel; marine, third class, 1885. Called by Edmond de Goncourt 'the modern Madonna painter,' for his frequent treatment of maternity. Among his works are 'The Nymph Echo' (1880); 'Kiss of Innocence' (1882); 'Two Friends'; 'Marguerite' (1884); 'Sick Infant' (at Montargis); 'The Favourite' (1885); 'Théâtre de Belleville'; 'Christ on the Cross' (1897); 'Young Mother' (1897) (at Avignon). His famous 'Maternity' (1892), is in the Luxembourg, Paris. His portraits of Daudet, Edmond de Goncourt, Anatole France, Metchnikov, and others are also remarkably good. There is a decorative panel at the Sorbonne by C., (1898), and in the Hôtel de Ville, Paris.

Carrière, Moritz (1817-95), Ger. philosopher and writer on aesthetics; studied at Giessen, Göttingen, Berlin, and in Italy; 1849 prof. of philosophy at Giessen; secretary and prof. of ant. hist. at the Academy of Plastic Arts at Munich, 1853. At first a Hegelian, he later followed the system of Fichte more closely. He also ranked high as an art critic. Among his works are a treatise, *Aristotle the Friend of Plato* (in Lat.) (1837); *Die Religion in ihrem Begriff* (1841); *Die philosophische Weltanschauung der Reformationszeit* (1847); *Die letzte Nacht der Girondisten*

(a poem) (1849); *Das Wesen und die Formen der Poesie* (1854); *Ästhetik* (1859); *Die Kunst in Zusammenhang der Kultur-entwicklung* (1887); *Lebenserinnerungen* (ed. W. Djeil) (1914). See *Gesammelte Werke* (14 vols.), 1886-94.

Carrier Pigeon, variety of the family Columbidae, remarkable for the huge white wattle round the eyes and at the base of the beak. It is essentially a fancy bird, and the messenger pigeon proper is called the homer.

Carrington, settlement of New S. Wales, co. Gloucester, suburb of and 25 m. from Newcastle, New S. Wales. Large foundry and engineering works. Pop. 3000.

Carrington, Charles Robert Wynn-Carrington, see LINCOLNSHIRE, EARL OF.

Carrington, Sir Frederick, Major-General (1844-1913), Eng. soldier, educated at Cheltenham College, entered the army in the 24th Regiment, 1864. He commanded the Light Horse in the Transkei war, 1877; led the colonial forces against the Sekukuni in the Transvaal, 1878-79; and in the Basuto war, 1881. Commanded the native levies in the Zulu rebellion, and was commandant of Bechuanaland police, 1893; becoming also military adviser to the high commissioner in the Matabele war. K.C.B., 1897. In the S. African war (1899-1902) he commanded the Rhodesian field force, helping with Mahon to raise the siege of Mafeking, 1900.

Carrington, Henry Beebe (1824-1912), Amer. soldier and military historian, b. in Connecticut, graduated at Yale, 1845, studied law at Yale Law School, 1847. In 1869 prof. of military science in Wash. College. Among his many works are *Russia as a Nation* (1849); *History of the Battles of the American Revolution* (1876); *The Washington Obelisk and its Voices* (1887).

Carrington, Richard Christopher (1826-1875), Eng. astronomer, educated at Cambridge; from 1849 to 1852 observer at Durham Univ. After 1852 he conducted various private observations (especially of the minor planets, fixed stars, and the sun), mostly at his private observatory at Redhill, near Reigate, Surrey. Secretary of Royal Astronomical Society, 1857-62; F.R.S. 1860. He pub. *Catalogue of 3735 Circumpolar Stars* (1857) and *Observations of the Spots on the Sun* (1863), which greatly influenced the study of solar physics.

Carrion Crow (*Corvus Corone*), Brit. species of Corvidae, closely connected with *C. Corax*, the hooded crow. In S. America and the U.S.A. the name is given to *Catharista atrata*, the black vulture, a species of Cathartidae which greatly resembles the turkey-buzzard. The colour of this bird is black, and its naked head is also dark of hue. Both species act as scavengers, but the former will also attack young living animals.

Carrion Flowers are those which attract short-tongued flies by means of their meat-like appearance or their foetid smell and so become pollinated. Two such species are *Amorphophallus Titanum*

and *Arum maculatum*, both belonging to the order Araceae. They both emit a very disagreeable odour, and the former is of a red and yellow colour, which serves as an additional attraction. The genus *Stapelia*, which belongs to the Asclepiadaceae, has the same property to induce flies to fertilise its flowers, and the flowers themselves are of a dark red colour.

Carroccio, large war-chariot drawn by oxen, used by the medieval republics of Italy to carry their banner into battle. On a rectangular platform, painted red, were set the city's standard and an altar, at which the priests held services before battle. It was surrounded by the bravest soldiers in the army, was regarded both as a rallying point and as the palladium of the city's honour. Its capture was considered the deepest humiliation. First used by the Milanese in 1033, it later played a large part in the wars of the Lombard league against Emperor Frederick Barbarossa. The Milan C. was lost in the battle of Corte Nuova, 1237. The first Florentine one appeared in battle 1238.

Carroll, Charles, of Carrollton (1737-1832), Amer. patriot, b. in Maryland; educated at Jesuit colleges of Saint-Omer, Rheims, and Louis le Grand; studied law in Paris and London. He returned to America, 1764, inheriting a large estate. In 1775 member of the Committee of Observation and elected delegate to the Provincial Convention. In 1776 C. was sent to persuade the Canadians to war against England, and was delegate to Congress. He was the last surviving signer of the Declaration of Independence. In 1789 U.S.A. senator for Maryland; 1799, member of the Maryland and Virginia boundary commission. In 1810 he retired from public life. See life by K. M. Rowland, 1898; and L. A. Leonard, *Life of Charles Carroll of Carrollton*, 1918.

Carroll, John (1735-1817), Amer. Rom. Catholic prelate, cousin of above, b. in Prince George's co., Maryland; educated in Flanders; joined Society of Jesus in 1753; became a priest in 1769 and a professed father in 1771. He returned to Maryland in 1774, and took a prominent part in Amer. politics. Estab. and endowed through his influence Georgetown Univ. (completed 1791). He was consecrated a bishop in 1790, and became archbishop in 1811; as a staunch Federalist he opposed the war of 1812. He was the greatest Rom. Catholic priest in the U.S.A. in his time.

Carroll, Lewis, pen-name of Charles Lutwidge Dodgson (1832-98), Eng. mathematician and author, b. in Cheshire, educated at Rugby and Oxford. He took a first in mathematics, 1854; took orders, 1861; and was mathematical lecturer at Christ Church, 1855-81. He lived a retired life at Oxford, but delighted in the company of children, especially girls. A few of his witty pamphlets on univ. affairs were collected and pub. as *Notes by an Oxford Chiel* (1865-74). His mathematical speculations were intricate and ingenious. Among such publications, under the name of C. L. Dodgson, are

A Syllabus of Plane Algebraical Geometry (1860); *Guide to the Mathematical Student*; *Elementary Treatise on Determinants* (1867); *Euclid and his Modern Rivals* (1879-85); *Curiosa Mathematica* (1888, 1894). His fame rests chiefly on *Alice's Adventures in Wonderland* (the first version of which was *Alice Underground*, a MS. which Dodgson gave to Mrs. Reginald Hargreaves, d. 1934, who was then Alice Pleasance Liddell, daughter of the dean of Christ Church, Oxford, and the original of Alice) (1865), and its continuation, *Through the Looking-Glass* (1872), both illustrated by Tenniel. These books are still the delight of children and grown-ups alike. They are full of whimsical fancies, grotesque absurdities, and unforgettable remarks and incidents. Though occasionally plagiarised, they are inimitable; and have become widely read classics, having been trans. into various tongues. The story of the conception of these books will be found retold in the obituary of Mrs. Hargreaves in *The Times*, Nov. 17, 1934. The first dramatised version appeared in London, 1886, but the play of necessity loses much of the charm of the book. In 1928 the MS. of *Alice in Wonderland* was sold to Dr. Rosenbach, an Amer. dealer, for £15,000, and later in the same year resold to Mr. E. R. Johnson of New Jersey for \$150,000, or £30,000. Later, Dr. Luther H. Evans, librarian of Congress, paid \$50,000 (£12,500) for the vol. at an auction and in 1948 presented the MS. and C.'s own drawings to the Brit. Museum 'as a gift from America to the Brit. people.' A centenary exhibition of C.'s works, portraits, etc., was held in London, 1932. The sole available copy in England of the first version of *Alice in Wonderland* was that owned by Sir Leicester Harmsworth, who also possessed a copy of a skit called *American Telegrams*, only one other copy of which is extant. C.'s other works are *Phantasmagoria and other poems* (1869), *The Hunting of the Snark* (humorous verse) (1876); *Doublets, a Word Puzzle* (1879); *Rhyme? and Reason?* (1883); *Principles of Parliamentary Representation* (1884); *A Tangled Tale* (1885); *The Game of Logic* (1887); *Sylvie and Bruno* (illustrated by Furniss) (1889); *Symbolic Logic* (1896). See S. D. Collingwood, *Life and Letters of Lewis Carroll*, 1898; I. Bowman, *The Story of Lewis Carroll told for Young People by the Real Alice*, 1899; W. de la Mare, *Lewis Carroll*, 1932; L. Reed, *The Life of Lewis Carroll*, 1932; F. B. Lennon, *Lewis Carroll*, 1947.

Carrollton, formerly a post-vil. of Jefferson par., Louisiana, on R. Mississippi, now suburb of New Orleans, U.S.A.

Carron, vil. near Falkirk in Stirlingshire, Scotland, on the R. C., is celebrated for its old-estab. iron works founded in 1759. Carronades and other guns were made here till 1852, when more modern armaments superseded them. Now, an extensive manuf. of stoves, grates, and boilers is carried on, which supports almost the entire vil. Pop. 3200.

Carronades, short cast-iron guns, attached to the carriage by loop and bolt

instead of trunnions, were invented in 1752 by Gen. Robert Melville, and made at Carron by Gascoigne for use in the navy. The metal was not so thick as that of most guns of the same calibre, and the powder chamber was at the muzzle, as in mortars. Only small charges of powder could be used, and they were of short range. Smaller long-range guns have rendered them obsolete.

Carron Oil, linewater and linseed oil mixed in equal proportions, as a dressing for burns. The name is derived from the C. foundry in Scotland, where, from its frequent use in the ironworks, its reputation was made. It is a soapy, thick mixture, now often replaced by neater dressings, such as a solution of bicarbonate of soda and a thin smearing of vaseline, or oxide of zinc ointment.

CARROTS

Carrot, plant of the genus *Daucus* and order Umbelliferae. The common C. (*Daucus Carota*), originally a native of the E., has been naturalised in Europe and America, and is a biennial plant. In E. U.S.A. it is often a pernicious weed. The root of the cultivated variety is much thicker and pleasanter in taste than that of the wild. The leaves are pinnately compound, the flowers creamy-white to pink or purplish in the central ones. The foliage is beautiful for decorative purposes and in Charles I.'s reign ladies sometimes even wore the leaves instead of feathers. Introduced into England early in the sixteenth century, it forms an article of food both for cattle and for man. The roots are also used for poultices. Cs. contain colouring matter used in some parts of Britain to colour butter. The white Belgian C. gives the largest crops. It has a thick white root, pale green above the earth. These are inferior to the red varieties for nutritive purposes. A deep, sandy soil, well drained and deeply trenched, suits best. It should be prepared and manured in autumn. The main crop is sown from late March to

April. The plants must be thinned out after sowing and kept free from weeds. During the winter the roots may be stored in a cellar or shed. Long-rooted kinds need about 3 ft. of soil; short horn varieties thrive in 6 in. of good compost on top of poorer soil.

Carrun, bor. in Victoria, Australia, 22 m. from Melbourne. Pop. 5000.

Carruthers, Robert (1799-1878), Scottish journalist and miscellaneous writer, b. at Dumfries. In his youth he was apprenticed to a bookseller, becoming editor of the *Inverness Courier*, 1828, and proprietor, 1831. He ed. *The Poetical Works of Alexander Pope* (1853). He collaborated with Robert Chambers to produce the *Cyclopædia of English Literature* (1843-1844); and with Wm. Chambers on his bowdlerised *Household Edition of Shakespeare* (1861-63).

Carruthers, William (1830-1922), Scottish botanist. Educated for the Presbyterian Church, but soon took up botany instead, becoming assistant in the botanical dept. of the Brit. Museum in 1859 and keeper in 1871. He was the pioneer in this country of seed testing, especially of pasture grasses. His contributions to the study of paleontology and of carboniferous flora were notable. He wrote many papers on systematic, palæontological, and agric. botany.

Carse, Scottish term for low, alluvial lands adjoining rivers, examples being the C. of Gowrie, C. of Falkirk, C. of Stirling. C. soils are usually very fertile, consisting of argillaceous deposits, but sometimes they are barren clays.

Carsebreck, loch in Stirlingshire, the great Scottish curling centre, 11 m. by rail from Stirling.

Carse of Gowrie, fertile dist. of Scotland, extending some 15 m. between the Tay and the Sidlaw Hills in Perthshire and Angus.

Carshalton, urban dist. of Surrey, England, 3 m. from Croydon, and 11 m. S. of London. Has an old church, some old fine houses and a public park; but it is chiefly a residential dist. for Londoners. Pop. 30,000.

Carsoi, com. of Italy on the site of the ant. Carsoi, 40 m. N.E. of Rome. There are extensive vineyards. The Palazzetto Orsini was completely destroyed in the Second World War, together with the medieval houses fronting the square. Pop. 7000.

Carson, Christopher (1809-68), familiarly known as 'Kit' C., Amer. trapper, guide, and soldier. He emigrated from Kentucky to Missouri as a hunter and trapper. His knowledge of Indian languages and habits made him excellent as a guide in Frémont's Rocky Mts. explorations, 1842-44. C. served under Frémont during the conquest of California, 1846-47, and settled in New Mexico, 1854, becoming U.S.A. Indian agent at Taos. For his services in the Civil war he was breveted brigadier-general. He d. at Fort Lynn, Colorado. He figures in Willa Cather's *Death Comes to the Archbishop*. See lives by De Witt C. Peters, 1858; E. S. Ellis, 1899; S. Vestal, 1928; and B. C.

Grant (ed.). *Kil Carson's Own Story of his Life*, 1926.

Carson, Edward Henry, Baron, of Duncarn, co. Antrim (1854-1935), Irish statesman, b. Feb. 9, second son of Edward Henry C., C.B., of Dublin, was educated at Portarlington School and Trinity College, Dublin. Here he obtained his M.A. degree, and later the honorary distinction of LL.D. He represented Dublin Univ. in Parliament as a Conservative, 1892-1918; then sat for Duncarn div. of Belfast, 1918-21. In 1894 he was appointed Queen's Counsel at the Eng. Bar, having held that office at the Irish Bar since 1889. Having acted as solicitor-general for Ireland in 1892, he was knighted, and became

LORD CARSON

solicitor-general in 1900, retaining the position till 1906. In 1896 he became Privy Councillor for Ireland, and in 1905 Brit. Privy Councillor. He led the Unionist campaign against the Parliament Act; and in 1912 he successfully engineered the signing of the covenant by which, at Belfast, Sept. 28, 1912, thousands bound themselves to refuse to recognise any Home Rule Parliament. The Ulster Unionist council became, in the latter part of 1913, a provisional gov., and C. was its head. In 1914 the First World War altered the complexion of matters; and C. joined Asquith's gov. in June 1915 as attorney-general, but resigned in Oct. as he disagreed with Sir Edward Grey's policy in the Balkans. Under Lloyd George C. was first lord of the Admiralty from 1916, and he supported the Irish Convention of 1917, in which year he quitted the Admiralty, but remained in gov. as a member of the War Cabinet. At the close of the war he agreed to dividing N.E. Ireland from the rest of the country. Of commanding presence and magnetic in appearance, and speaking

with a musical brogue, C. was one of the most formidable yet attractive forensic orators of his day. He was given a life peerage June 1, 1921, and became a lord of appeal D. Oct. 22, at Cleve Court, Munster.

Carson City, cap. of Nevada, U.S.A., and the co. tn. of Ormsby co., 121 m. N.E. of Sacramento, on the Virginia and Truckee railway. Its chief industry is agriculture, and it is the centre of a mining dist. Pop. 2000.

Carso Plateau, situated on the gulf of Trieste, was the scene of fighting between the Austrians and It., during the First World War. The first campaign in this area commenced in Sept. 1916, when the It., under Cadorna succeeded in capturing the heights at San Grado and other important positions. Further It. progress on the C. P. was made in Nov. 1916. The road to Trieste was, however, blocked by the Austrian strong positions on Mt. Hermada, and in the spring of 1917 plans were made for capturing these. In the middle of May operations commenced and much progress was made in the sector S. of Gorizia. Brit. monitors in the gulf of Trieste assisted in these operations. After a lull fighting began again in Aug. 1917, but, though yet further progress was made on the C. P., the It. debacle of Caporetto (*q.v.*) caused their forces on the C. P. to retreat hurriedly and no further fighting took place in this theatre.

Carstairs, par. 3½ m. E.N.E. of Lanark, with an important railway junction, in the S. of Lanarkshire, Scotland. Pop. 2000.

Carstairs, William (1649-1715), Scottish minister, son of a minister of Cathcart, near Glasgow, who had been taken prisoner at the battle of Dunbar by Cromwell and exchanged. He was educated at the college of Edinburgh, and in Holland, where he studied under the most celebrated profs., and was probably ordained in the Dutch Church. He also made the acquaintance of William of Orange, and became his confidential adviser. In 1672 he came to London, and was arrested by Lauderdale on petty charges of creating disturbances. Nothing was proved against him, and he was kept a prisoner in Edinburgh Castle for five years. He returned to Holland, and from there made frequent visits of investigation, acting as agent between Eng. and Scottish conspirators, in conjunction with Shaftesbury, Russell, and Argyll. After the Rye House Plot, which he really did not uphold, he was arrested and again imprisoned, and on his release he sought security in Holland, where he became chaplain to William of Orange. In reconciling the Scottish Church his influence was invaluable, his advice having the greatest possible weight with William. Under Anne he was elected principal of Edinburgh Univ. and presented with a living.

Carstens, Armus Jakob (1754-98), Ger. artist, b. near Schleswig. He was apprenticed to a wine merchant for five years, but at the age of twenty-two he went to Copenhagen to study art. Then followed a period of great poverty in Lübeck and

Berlin, during which he barely supported himself by portrait-painting. He was released from penury by the success of his great composition 'The Fall of the Angels,' which contains 200 figures, and which gained for him the patronage of the court, a professorship at the Berlin Academy, and a pension. He now visited Rome, in order to study the works of Michelangelo and Raphael, and his enthusiasm for these masters had a most stimulating effect on Ger. art. His numerous drawings represent chiefly subjects from the anct. classic poets and from Ossian and Shakespeare. Towards the end of his life he broke with the academy, and *d.* at Rome in extreme poverty.

Cart (probably from Old Norse *kartr*, of O.E. *cræt*, of doubtful meaning), term for various kinds of vehicle, strictly two-wheeled, topless and springless, usually designed to carry heavy loads and to be drawn by one horse. It is the most primitive form of carriage or chariot (*q.v.*). *Cs.* are generally for agric. or postal purposes, for transport of goods or luggage (farmer's *C.*, tradesman's *C.*, carrier's van). Combined with other words it may denote special kinds of pleasure-carriages. Examples are the dog-*C.* (originally made for the conveyance of sporting dogs), a rather high, two-wheeled carriage with seats back to back, in front and behind. These are particularly suited for tandem driving. The gadabout is a dog-*C.*; the Whitechapel *C.*, gig (stanhopes and tilburies included) are other varieties. The governess *C.* is a very low, two-wheeled pony-carriage with two side seats facing inwards. Other two-wheeled *Cs.* are the Irish jaunting car, the Canadian calash, and the Amer. trotting sulky. The dump-*C.* is one that can be unloaded by tilting the body of the vehicle, and is much used for carting away stones and refuse.

Cartagena, fortified seaport of Spain, 326 m. S.E. of Madrid. It was formerly the largest naval arsenal in Europe, and its harbour, enclosed by hills, and commanded by a fortified is. on the S. side of the narrow entrance, is capable of holding the largest fleet. It has a naval wireless station. Built by Hasdrubal (242 B.C.) under the name of New Carthage, it was of great importance under the Romans. *C.* was twice taken by the Brits. In the eighteenth century; was seized by the com., 1873; and retaken by the national force, 1871. Pop. 114,200.

Cartagena, cap. of Colombia, was founded 1533. It has a fine harbour, and the Dique Canal connects the port with the Magdalena R. *C.*, once the richest city in the New World, was taken by Drake, 1585; pillaged by Fr. buccaners, 1697; bombarded by Adm. Vernon, 1741; taken by Bolívar, 1915, but surrendered to the royalists soon afterwards. Freed from the Sp. yoke, 1821. Exports cotton, sugar, hides, tobacco, coffee, cacao. Pop. (including suburbs) 106,800.

Cartago, cap. of the prov. of C. in Costa Rica, Central America, 12½ m. E.S.E. of

San José, on the transcontinental railway. It is situated on a fertile tableland, 4930 ft. above sea level, at the base of the volcano Irazú (11,200 ft.), near which are hot mineral springs—the resort of invalids. An earthquake in 1723 caused the city to be flooded by water from the crater; in 1841 the greater part of the city was destroyed by earthquake. It is noted for its fine coffee. Pop. 13,100.

Carte, Richard D'Oyly, see D'OYLY CARTE.

Carte, Thomas (1686–1754), Eng. historian, received his education at Univ. College, Oxford, and took his M.A. degree at both Eng. univs. He was appointed reader at the Abbey Chapel, Bath, but resigned (1714) rather than swear allegiance to the Hanoverian gov. He pub. *An History of the Life of James, Duke of Ormonde* (1735–36) and *A General History of England* (1747–55). Most of his MSS. are preserved in the Bodleian Library, Oxford.

Carte blanche, a blank paper with an authoritative signature, to be filled up as the recipient wishes. Thus, the *C.* sent by Charles II. to the Eng. Parliament, to be filled with their own terms as the price of his father's life; and that given in 1832 to Earl Grey for the creation of new peers. In piquet, a hand containing no picture cards.

Cartel (Fr., from It. *cartello*, dimin. of *carta*, paper), term applied to a document which regulates the exchange of prisoners of war. The *Cs.* decree the values of prisoners of different rank, who are now exchanged on this basis instead of by ransom. A *C.* ship is one of truce, exempt from capture; it is used to convey prisoners who are to be exchanged. *C.* has now come to mean an industrial combine or trust, and this meaning is derived from the Ger. use of the word *Kartell*, which was first applied to a combine of railway material manufacturers in 1879. The industrial *C.* arose out of the need to control the stocking of the market in order to stabilise prices. From that it developed into an organisation which instituted a central selling office to dispose of the product for the benefit of all members of the *C.* In some *Cs.*, however, each constituent member was left free to operate its own market, although the output and price were controlled by the *C.* In 1883 'Irma,' the International Rail Makers' Association, came into being, and was the first of the international *Cs.* which became a feature of modern industry, especially after the peace treaties following the First World War. States at one time politically and still industrially united were then split up, making international industrial agreements essential. In small industries, such as the magnesia industry, the *C.* amounts to a close combine governing a monopoly. In larger industries, however, an international *C.* may be no more than an agreement between national combines to respect each other's markets. International *Cs.* have been engendered by the tariff system, and being liable to the abuses often allied to a monopoly, *Cs.*

have been from time to time subjected to political control.

International Cartels.—Although C. in the strict sense, means a production and marketing agreement between private firms directed at the restriction of output or sales by the member firms, at an allocation of the price of products, its meaning in current usage has extended so as to include patent and process exchange agreements between firms in different countries—such, for example, as those concluded by Standard Oil, International General Electric, and other Amer. concerns, with foreign interests. Often patent exchange arrangements contain marketing agreements and, in fact, the marketing agreements may be the reason for exchange of patents and processes. This type of C. arrangement is, probably, the one which primarily concerns Amer. firms. International Cs. are sometimes formed under governmental auspices and with gov. participation and, indeed, some of the most notorious international Cs. have been negotiated by govts. This was true of the tin and rubber Cs.; while, again, the U.S. Gov. entered into agreements for wheat and coffee. If, in the future, other govts. participate in international Cs. in industrial materials and manufactured products, not only will much of the international trade of the world be brought under a high degree of commodity control, but the distinction between Cs. and commodity agreements will tend to disappear. In the course of the Second World War anti-C. critics were loud in their condemnation of international Cs., regarding them as monopolistic, conspiratorial, and even fascist in character; whereas pro-C. critics, like Lord McGowan of Imperial Chemical Industries, have described Cs. as a means of assuring orderly marketing, planned expansion of international trade, and elimination of cut-throat prices. It may be plausibly argued that most of the big international Cs. have sprung from the existence of a serious lack of balance between productive capacity and current consumption of the products in question, and also that a functioning international C. has generally postulated the effective prior organisation of producers in the domestic market. Extensive Amer. participation in Cs. would seem to require a considerable degree of co-operation between firms in the domestic market, but since the U.S.A. is committed to an anti-trust policy at home, such participation seems improbable, at least in those industries in which exporting firms are not only many in number but also occupied in producing for the domestic market. Amer. hostility to monopoly is not necessarily shared by other countries, and many European countries may favour international Cs., together with import restrictions, export bounties, and other measures designed to cope with excess production.

The menace of the great Ger. Cs. which existed before the Second World War lay in the fact that these great combines were

producers for the Ger. war machine. Most of them were excessive in size, were monopolistic, and essentially anti-democratic. For these reasons decartellisation laws were made for the Amer. and Brit. zones of occupation in Germany early in 1947. Some five U.S. zone concerns, with about £25,000,000 assets, were automatically considered as being 'excessive' concentrations by employing 10,000 or more persons: the Opel motor works at Russelsheim; the Bosch works at Stuttgart; the Metall Gesellschaft at Frankfurt; the Gute Hoffnungs Hütte, with headquarters at Oberhausen (in the Brit. zone) and large subsidiary works at Nuremberg; and the Degussa works. The trial in 1947 before an Amer. military tribunal at Nuremberg of Germany's vast chemical combine, I. G. Farben Industrie (Dye Trust) as war criminals showed that the combine participated in no fewer than 500 undertakings outside Germany, apart from its foreign manufacturing plants and holding companies. Working intimately with Nazi foreign policy its international affiliations and contracts ran into thousands, including C. agreements with major concerns in America, Britain, France, and many other European countries, which were used as an economic weapon in the preparation of war. From 1935 onwards, all C. agreements were cleared by Farben through the military economic staff of the *Wehrmacht*. Their deliberate purpose was to restrict industrial development and scientific research outside Germany, especially in countries which Hitler designed to attack. It was also shown at the trial how a C. arrangement among Farben, the Aluminum Company of America, and the Dow Chemical Company greatly restricted the production of magnesium in the U.S.A. and prohibited exports to Europe except to Germany and, in negligible amounts, to Great Britain—so that Britain and the rest of Europe became completely dependent on Germany for magnesium, for which Britain was in a desperate situation on the outbreak of war. The trial also showed how, by means of C. agreements with the Standard Oil Company of New Jersey, Farben delayed the development and production of buna rubber in the U.S.A. until 1940, while at the same time making Germany independent of rubber imports. See *International Cartels, Combines, and Trusts*, with essay by the Ger. authority, R. Lefmann, trans., 1927; also H. Levy, *Monopolies, Cartels, and Trusts in British Industry*, 1927; A. P. L. Gordon, *The Problem of Trust and Monopoly Control*, 1928. See also under COMBINE and TRUSTS (COMMERCIAL).

Carter, Elizabeth (1717–1806), Eng. poet and translator, famous for her knowledge of languages, pub. her first vol. of poetry at the age of twenty-one, and in the following year trans. from the It. of Algarotti *Sir Isaac Newton's Philosophy explained for the Use of Ladies*. Her trans. of Epictetus (reprinted in Everyman's Library), etc., won the admiration of Dr. Johnson and other learned contemporaries.

Carter, Howard (1873-1939), Eng. Egyptologist, b. at Swaffham, Norfolk, youngest son of Samuel John C., animal painter. Educated privately. Went to Egypt on the staff of the Archaeological Survey, 1890; engaged in excavation till 1899, notably with Sir Flinders Petrie at Tel-el-Amarna. Became inspector-general of antiquities dept. of Egyptian Gov., and made numerous excavations; and finally, under the direction of the earl of Carnarvon, on Feb. 17, 1923, opened the sealed door of the tomb of Tut-ankh-Amen, a noted king of the XVIII. dynasty, who reigned 1300 years B.C. Publications: *The Tomb of Thout-mosis IV.* (with P. F. Newbery), 1904; *Description and Excavation of the Tomb of Hâtshesitâ* (1906); *The Tomb of Tut-ankh-Amen* (with A. C. Mace), 1923-1933).

Carter, Robert Brudenell (1828-1918), Eng. ophthalmic surgeon, received his medical training at the London Hospital. During the Crimean war he served as staff-surgeon, and won both Eng. and Turkish medals. In 1870 he was appointed ophthalmic surgeon to St. George's Hospital, and from 1893 to 1903 still attended that hospital for consultations. The Royal College of Surgeons gave him in 1881 the Hunterian professorship of pathology and surgery, and he later accepted the Luncheon lectureship from the London Medical Society. He trans. Ger. ophthalmic works, and was the author of sev. original treatises on eye diseases.

Carteret, Sir George (c. 1609-80), Eng. naval officer and Royalist politician, nephew of Sir Philip C. (d. 1643). By 1633 he was a captain in the navy; comptroller of the navy, 1639. C. became lieutenant-governor of Jersey, 1643. He was knighted, 1646, and was one of the original proprietors of New Jersey in America, 1650. Forced to yield Jersey to the Commonwealth, 1651, C. served for a time under Vendôme in the Fr. Navy. He was treasurer of the Eng. Navy, 1661-1667. C. became sole proprietor of E. New Jersey, 1676; he was also one of the original proprietors of Carolina.

Carteret, John, first Earl Granville (1690-1763), Eng. statesman, was educated at Westminster School and Christ Church College, Oxford. From univ. he entered immediately into the vortex of the political life of the metropolis, and in 1711 took his seat in the House of Lords as second Baron C. As he was Whig by conviction, he followed the leadership of Stanhope and Sunderland. From 1719 to 1724 he distinguished himself for his diplomatic services. Dispatched by Stanhope as ambas. extraordinary to Sweden, he negotiated two treaties; one between Sweden and Hanover and Prussia, the other between Sweden and Denmark. In 1723 he was present at the somewhat ineffectual congress of Cambrai. His notable lord-lieutenancy of Ireland dates from 1724. The abolition of Wood's coinage was due largely to his recommendations, and though he embroiled himself with Swift over his

determined prosecutions for *Drapier's Letters*, he ended by gaining the dean's highest respect and admiration. From 1730 to 1742 he devoted his activities to the overthrow of Walpole's ministry, and having achieved his object, became the true leader of the subsequent Cabinet. When the Pelhams came into power in 1744, C. ceased to be a political force, though in 1751 he accepted the Lord Presidency of the Council. C., who was twice married, is described by Horace Walpole as of 'commanding beauty,' and enjoyed a high contemporary reputation for his oratory, wit, and sociability no less than for his classical learning.

Carteret, Philip (d. 1796), Eng. navigator, was commander of the second, and unseaworthy, vessel in Wallis's expedition to the S. hemisphere in 1766. Having accidentally lost sight of his leader, he was alone when he discovered Pitcairn Is. and when he gave his name to one of the Solomon Archipelago. He contributed considerably to contemporary geographical knowledge.

Cartesian Ovals, see OVALS.

Carthage, anct. city situated on a promontory at the N.E. extremity of the bay of Tunis (Africa), the cap. of one of the most important empires of the anct. world. Known to the Romans as Carthago and to the Gks. as Carchedon, its true name was Kirjath-Hadesath, or New Town. This name was given either to distinguish it from Tyre or from an earlier settlement at Utica. Its exact position on the promontory is not known, but the city was distinguished by its citadel (Byrsa), which was approached by sixty steps. It had two harbours, one for merchant ships and one for warships. Outside the walls of the city was the beautiful suburb of Megara. C. was settled by the Phœnicians of Tyre, a branch of the great Semitic race, about the middle of the ninth century B.C. There were already Punic settlements in the N. of Africa—Utica, Tunis, and Hadrumetum—but of these C. finally obtained the chiefdom. The story of the city's first struggles for power are unknown, for she does not enter hist. till the sixth century B.C., when she is already the centre of a prosperous commerce, and the ruler of extensive dominions, extending from Cyrene to the straits of Gibraltar, with most of the W. Mediterranean sea, and with settlements in Spain and Gaul. The pop. of the city and its dist. consisted of (1) pure Phœnicians; (2) the Libyo-Phœnicians, the offspring of intermarriages between the settlers and Africans; (3) the Libyans themselves, reduced to servitude and forming a large part of the Carthaginian army; (4) the Nomads, wandering tribes which furnished the city with irregular cavalry. The extent of the commercial genius and maritime daring of the Carthaginians may be seen from the fact that Hanno, one of their admirals, is reported to have sailed, in the sixth century B.C., round the N.W. of Africa and up the Senegal R., returning then only through the failure of his provisions. The hist. of C. is mainly taken up by its wars with the Gks. and

Roms., and to the first of these we must turn. The struggle was waged chiefly in Sicily, where C. came into conflict with the Gks. of Syracuse. In 480 B.C., a great battle was fought at Himera, between Hamilcar and Golo of Syracuse, and the former was defeated and slain. Some time later the war was renewed, and Hannibal, grandson of Hamilcar, entered Sicily to avenge his grandfather, which he did by storming Selinus and capturing Himera. In 405 a treaty was made, but seven years later war broke out afresh, and Dionysius, tyrant of Syracuse, was besieged in his city. He was saved, however, by the pestilence which broke out among the Carthaginians, and the latter were quite defeated. The struggle continued, till in 344 Syracuse sent for help to the mother city of Corinth, and received auxiliaries under Timoleon, who inflicted a crushing defeat on the Carthaginians at the Crimissus in 340. There was peace for thirty years, until Agathocles was tyrant of Syracuse. Then C. again attacked, but Agathocles transferred his forces to Africa, and carried the war to the very walls of C., which he would have taken had he not been suddenly called home. In 277 B.C., Pyrrhus was called to the aid of the Syracusans, but Rome and C. were engaged against him, and he could do nothing permanent. More important even than this war was the mighty struggle with Rome. Treaties made between the two cities in 509 B.C., and about 450 B.C., show that C. was then the superior, and was gradually increasing her restrictions on Rom. commerce. The first war lasted from 264 to 241 B.C., and once again Sicily was the cause. The Roms. hastily built a fleet, and won two great sea-fights at Mylae (260) and at Ecnomus (256 B.C.). Regulus carried the war into Africa, but his army was entirely cut to pieces. Peace was made after another naval victory for Rome. From 241 to 236 B.C., C. was engaged in a bloody civil war, which demonstrated the insecurity of her home rule. This led the great Hamilcar to establish himself in Spain, and to try to found there a new empire which should subdue Rome. After his death and that of his son-in-law Hasdrabal, his son Hannibal, sworn enemy to Rome, was chosen leader of the army. His attack on Saguntum in 219 B.C. was the commencement of the second Punic war (see HANNIBAL). The battle of Lame in 202 put an end to this war, and for the next fifty years the hist. of C. is mainly a record of political struggles. It was continually harassed by Rome, and in 149 B.C. C. was goaded into the third Punic war. It lasted for three years. C. being taken and utterly destroyed. At that time the city is said to have had 700,000 inhab. *Consult* monograph by R. Bosworth-Smith, 1878; F. W. Kelsey, *Excavations at Carthage*, 1926; and the *Cambridge Ancient History*, vol. iv.

Carthage, co. seat of Jasper co., Missouri, U.S.A., on the Spring R., 150 m. S. by E. of Kansas City. It is the seat of the C. Collegiate Institute (Presbyterian). It is a market centre, and manufs.

furniture and machinery. It was the scene during the Civil war of a skirmish called the battle of C. Pop. 10,500.

Carthage, Cape, promontory of N. Africa, jutting out into the Mediterranean. N. of Tunis lagoon are ruins of the anct. city of C.

Carthage, Synods of, chief of these were held in A.D. 411-12, the first to refute the tenets of the Donatists (q.v.), and the second to discuss the Pelagian heresy. Augustine and Petilian were the chief protagonists of the first synod, while Marcellinus, tribune to the Emperor Honorius, was president, and decided against the Donatists. In the ensuing year, Paulinus of Milan was cited to appear at the synod held at the instance of Aurelius, bishop of C., as the accuser of Coelestius. Here the Pelagian heresy received its first condemnation, and at the same time, its first explicit recognition. *Consult* Schaaf, *Church History*.

Carthago Nova, see CARTAGENA.

Carthamin ($C_{15}H_{11}O_2$), red colouring matter prepared from safflower. It is used as a dye for silks and cottons and requires no mordant.

Carthamus, genus of Composite common to Asia, Africa, and the Mediterranean. *C. tinctorius*, the safflower, is an annual found wild in Egypt and the Levant; the flowers contain a colouring principle, and are used by dyers as the source of delicate rose colours and rich scarlet, while mixed with talc they form the cosmetic known as rouge.

Carthusians, monastic order founded in 1086 by St. Bruno and six companions, who retired to La Chartreuse, and there built hermitages, dressed in rude habits, and ate only vegetables and coarse bread. The fifth prior, Guigo, in 1130 composed a list of rules, entitled the *Statuta Guigonis*, or *Consuetudines Cartusiae*, and in 1176 the order received papal recognition. The C. were divided into two classes, fathers (*patres*) and brothers (*converses*), and each occupied a separate cell, furnished sparsely with a straw bed, pillow, coverlet, and writing materials. They lived in isolation, and never left their cells except for festivals or for the funeral of a fellow C. Their habit consisted of a haircloth shirt, a white cassock, and over these a black cloak. The order at one time counted sixteen provs., and possessed many magnificent convents: La Grande Chartreuse, near Grenoble, the original monastery, and the home of the famous liqueur; Certosa, near Pavia; and a richly decorated convent at Naples. Their prin. seats were in Italy, France, and Switzerland, but most of these have been destroyed, or have fallen into decay. The C. were despoiled and exiled from France during the Revolution; and as in 1880 they had declined to accept indulgence from the decrees against religious orders, the brothers were evicted during the anti-clerical movement of 1902, and their home was sold by gov. authority. The order was estab. in England in 1180. The London Charterhouse (a corruption of Chartreuse) was founded in 1371, and abolished during the dissolution of the

monasteries by Henry VIII. Strangely enough, this building eventually became a 'masterpiece of Protestant English charity' (Fuller). The C. nuns arose at Salette, on the Rhône, 1229. They followed the rules of the monks with some modifications, notably that of a common refectory.

Cartier, Sir Georges Etienne (1814-73), Canadian statesman, entered the Canadian Parliament in 1848. A leader of a rebellion against Brit. rule in 1837, his political ideas underwent so radical a change as to prompt him to join the reconstructed Liberal-Conservative party in 1854. As attorney-general for Lower Canada, he promoted the codification of the civil law of that prov. (1857-64). His alliance as joint premier of Canada with Sir John Macdonald lasted from 1858 to 1862. As a statesman he was largely responsible for the entrance of Quebec into the federation (1864-67), for the removal of seigneurial tenure from Lower Canada, and for the Grand Trunk railway as well as for the final determination, to construct the Canadian-Pacific. Received a baronetcy for his services.

Cartier, Jacques (1491-1557), Fr. navigator, famous as the discoverer of the great St. Lawrence R., Canada. In 1534 he put out with two ships from St. Malo with intent to find the N.W. passage to Japan. Disappointed, he returned home, but in 1536 he set sail once more, landed in Pillage Bay, opposite Anticosti, which he named the bay of St. Lawrence—a name afterwards extended to the riv.—and learned from some Huron-Iroquois Indians that he was in the land of Canada—a native word for village. Exploring the riv. in long boats as far as the site of Montreal, he was able to look down from Mt. Royal on to the Ottawa and St. Lawrence stretching far to the W. The attempt in 1541-43 to find the mythical Saguenay, a wealthy kingdom, which, according to Indian story, lay up the Ottawa, ended in failure. The four-hundredth anniversary of his landing in the bay of St. Lawrence was officially celebrated in Canada in 1934, when Adm. Sir Roger Keyes and Mr. H. A. L. Fisher were present as the representatives of the Brit. Gov.

Cartilage, gristly tissue existing at various parts of the body. It takes the place of bone where yielding is required, as at the joints and in various tubes. It is the precursor of bone, and in the foetus C. exists instead of bone, except in the case of some of the flat bones. It is of three kinds. Hyaline C. is glassy and is found at the end-joints, such as the points where the ribs are connected to the breast-bone and in the nasal Cs. It contains no blood vessels. White fibrous C., in which there are white fibres arranged in layers, occurs in the knee-cap and vertebral column. Yellow elastic C. has a matrix of yellow elastic fibre, and is in the ear, epiglottis, and Eustachian tubes. None of these varieties of C. contains any nerves.

Cartilaginous Fishes, or Elasmobranchii, sub-class of the Pisces, so called on account of their gristly endoskeleton.

They are, with a few exceptions, entirely marine, and include the sharks, dog-fishes, skates, and rays. See ELASMOBRANCHII.

Cartmel, mkt. tn. on the London Midland Region railway, 12 m. N.W. of Lancaster in Lancashire, England. It is famous for its remains of an Augustinian priory. Pop. 300.

Cartography, see MAPS.

Carton, Richard Claude (1853-1928) (whose real name was Critchett), Eng. dramatist and actor. His comedies enjoyed a considerable vogue for some twenty-five years from the appearance of *The Great Pink Pearl* and *The Treasure* (both of these with Cecil Raleigh) in the eighties. Other plays were *Liberty Hall*, perhaps his best, produced in 1892 and revived in New York twenty years later; *Lord and Lady Algy*, in the vein of Oscar Wilde, but far less adroit in dialogue; *Sunlight and Shadow*; *The Home Secretary*; and *Other People's Worries*.

Carton-pierre, substance very similar to papier mâché, used as a substitute for plaster in making mouldings for walls, roofs ceilings, etc.

Cartoon (It. *cartone*, pasteboard, from Lat. *charta*, paper), design on strong paper, representing, in full size, some contemplated work of art, and intended to assist the artist in the composition of his work. The design when finished is transferred by tracing or pouncing to the surface finally to be worked upon. The most famous Cs. are those of Raphael which were executed for the celebrated tapestry of the Vatican. These designs were purchased by Charles I., repurchased by Cromwell for the nation, restored by William III., who built for them a gallery at Hampton Court, and lent to the S. Kensington Museum, 1865. Unfortunately, out of the original twenty-five, only seven remain. Those of Leonardo da Vinci ('The Battle of the Standard') and Michelangelo ('Soldiers attacked while Bathing') have perished, but others are preserved in the Ambrosia Gallery, Milan, and in the Sala Borgia. Modern Ger. artists have prepared accurate Cs., the most noteworthy being the designs of Cornelius for his fresco paintings in Munich. In England there was a revival of C. work in 1813-44, during the competition for the House of Parliament paintings. Dyce and Macise have left fine examples in this line. A large-sized drawing in a periodical may be called a cartoon. The word C. is commonly used to-day as a synonym for a political or social caricature. See CARICATURE.

Cartouche: 1. In architecture signifies any scroll-shaped ornamentation, such as the volute of an Ionic capital, the oval tablets on which the arms of the popes were engraved, and the oblong devices in Egyptian monuments and papyri containing royal names carved in hieroglyphic characters. It is used especially of any inscriptive tablet sculptured so as to represent a half-unrolled sheet of parchment. 2. Meaning originally 'a roll of paper,' was used of the wooden case enclosing cannon balls and later of the waterproof canvas case for cartridges.

The word cartridge, meaning a case for explosive charge, is merely a corrupt form of C.

Cartridge, case containing the powder required to charge a fire-arm, sometimes containing the bullet also. In the Cs. for cannons or large guns, the C. contains powder alone. It is formed of a serge or flannel bag, containing a fixed quantity of powder tied round the neck and stiffened by worsted hoops. Since serge is inclined to smoulder after ignition, silk bags are frequently used for salutes and drill. For small arms, the C. consists of a

EDMUND CARTWRIGHT
An engraving by J. Thomson.

brass C.-case, containing bullet, powder, and primer. Cs. originally came into use for muzzle-loading rifles, and in these bullet and powder were wrapped together in a paper cylinder. When required for use, the end of this was torn or bitten off and the powder poured down the muzzle. The bullet and the C.-paper were then rammed down on top. A somewhat similar C. was in use with the first breech-loaders, and the introduction of the steel, soon changed to copper, percussion cap marks the next stage in development. This cap, containing a detonating compound of chlorate of potash, sulphur, and charcoal, soon led to the introduction of the modern C. case, and made it adaptable for all kinds of rifles. The modern C. for breech-loading small arms consists of a solid brass cylinder at the base of which is the detonator, and most pistol and revolver Cs. are constructed on the same pattern. In the case of breech-loading shot-guns, the C. generally consists of a stout paper case with a brass base, or else of thin brass throughout. Ignition may be either by pin or central fire. Blank Cs., which are used for drill, salutes, etc., contain only powder and primer, but no bullet; while dummy Cs. contain no powder. These last are used for drill

purposes, where practice in the handling of Cs. might sometimes lead to dangerous accidents. *See also* AMMUNITION.

Cartwright, Edmund (1743-1823), Eng. inventor of the power-loom, was b. at Marnham, Nottinghamshire. Educated at Oxford, he afterwards obtained the rectorship of Goadby-Marwood, Leicestershire. A visit to Arkwright's cotton mills resulted in his invention, and he set up power-loom first at Doncaster, then at Manchester. He met with great opposition and no pecuniary gain, but in 1809 the gov. made him a grant of £10,000.

Cartwright, Sir Fairfax Leighton (1857-1928), Brit. diplomatist, serving, at various times, in European caps., in Central America, and in Teheran. He is remembered for his unremitting efforts, during his tenure of the embassy at Vienna from 1908, to secure a peaceable solution of the difficult question of Austro-Turkish relations regarding Bosnia-Herzegovina, the outcome of which was the annexation of the country by Austria-Hungary. In these efforts he attracted the ill will of the Ger. emperor, William II., and in 1913, when it was proposed to appoint him ambas. to Berlin, the emperor intimated that C. was not *persona grata*. Wrote *The Mystic Rose from the Garden of the King*, trans. from Persian poetry and tales (1925).

Cartwright, John (1740-1824), 'the father of reform,' entered the navy in 1758, and within eight years had been advanced to the rank of first lieutenant. He retired from the service in 1777, his sympathies with the Amers. preventing him from joining Lord Howe's fleet. He had already begun to express his political opinions, and his first pamphlets were on the question of Amer. taxation. He pub. in 1774 his first plea on behalf of the colonists, entitled *American Independence the Glory and Interest of Great Britain*. He became an ardent reformer, and held meetings and wrote tracts to further the movement of political liberty. He desired to ventilate his views on the floor of the House of Commons, but was unsuccessful in each of his sev. efforts to find a constituency to return him to Westminster. He was one of the originators of the Society for Constitutional Information in 1780. *See* F. D. Cartwright (his niece), *Life and Correspondence of Major Cartwright*, 1826.

Cartwright, Sir Richard John (1835-1912), Canadian statesman, entered the Canadian Parliament as a Conservative, but finally joined the Liberals in 1870, and became their minister of finance in 1873. He was remarkable for his strict economy, and during the years of opposition, 1878-98, acted as financial critic to his party. In 1896 he was appointed minister of trade and commerce under Sir Wilfrid Laurier, and from 1898 to 1899 represented Canada on the Anglo-Amer. Joint High Commission at Quebec and Washington. Though he retired from the senate in 1904 owing to failing health, he was acting Premier in 1907 during Laurier's absence at the Imperial Conference.

Cartwright, Thomas (1533-1603), Eng.

divine. During a stormy life of persecutions, he did much to strengthen and organise Puritan doctrines. In 1570-71 Whitgift deprived him of both his divinity professorship and his fellowship at Cambridge. The rest of his life was divided between visits to the Continent, to Geneva, Antwerp, the Channel Is., etc., and imprisonment, chiefly in the Fleet, for his pronounced Presbyterian views.

Cartwright, Thomas (1631-89), Eng. divine, grandson of the above. Educated at Northampton and Oxford, he became tabarder of Queen's College, and studied under Tully, 1650. Secretly ordained by Bishop Skinner, 1655, C. became vicar of Walthamstow, 1657. He was prebendary of Wells, 1660; of St. Paul's, 1665; dean of Ripon, 1675; bishop of Chester, 1686. He was a staunch supporter of James II., who made him bishop of Salisbury. See J. Hunter's ed. of *Diary of Thomas Cartwright, Bishop of Chester*, 1843.

Cartwright, William (1611-43), Eng. dramatist and divine, b. near Tewkesbury, was sent as a king's scholar to Westminster, whence he was chosen (1628) as a student of Christ Church, Oxford. He took his M.A. 1625, and entered into holy orders. He was nominated one of the Council of War, and in 1642 was imprisoned by Lord Say, but released on bail. His plays and poems were collected (1651) by Humphrey Mosely, the comedy, *The Royal Slave*, a satire on the Puritans, being the most noteworthy.

Carucate (from Med. Lat. *carrucata*, from *carruca*, a wheeled plough), formerly measure of land, being the amount that could annually be ploughed by a yoke of oxen. The *carucage* was an impost levied on each C. of land. Some think the C. was always equivalent to a hide of land, and Richard II.'s tax of five shillings on every *carucata terre sive hyda* may be quoted in support of this view. The term, which was evidently of Dan. origin, was used in dists. inhabited by descendants of the Danes. In the beginning of the thirteenth century its size was fixed at 100 ac.

Carum, name of an umbelliferous genus of sub-tropical and temperate plants, which are glabrous herbs with perennal tuberous roots, pinnate leaves, and white flowers. *C. petroselinum* is the common parsley, and *C. Caru*, the common caraway, is cultivated for its fruit, known as caraway seeds (*q.v.*).

Caruncle, botanical term for a hard, small extra seed-covering, or *ruil*, also called a *strophole*. Examples may be seen in species of Euphorbiaceae, e.g. in *Euphorbia lathyris*.

Carúpano, one of the first-class ports of Venezuela, S. America, in the state of Bermúdez on the N. coast of the peninsula of Paria, with a lighthouse and excellent harbour. Sulphur, copper, silver, lignite, and lead are mined in the neighbourhood. High tariffs and poverty keep down the foreign trade, the exports for which are cocoa, coffee, hides, etc. Pop. 26,000.

Carus, Julius Victor (1823-1903), Ger. zoologist, studied medicine at Leipzig,

Würzburg, and Freiburg, and in 1849 became keeper of the museum of comparative anatomy at Oxford. His appointment to the chair of comparative anatomy at Leipzig dated from 1853. Though he was the author of sev. scientific text-books, such as *Handbuch der Zoologie* (with Gerstärker, 1863, etc.), his splendid monographs on many problems in zoological research were his most valuable contribution to contemporary science.

Carus, Marcus Aurelius (282-83), Rom. emperor, surnamed Persicus, who was elected by the soldiers on the death of Probus. He was a scholar and a soldier, and immediately after his accession he set out to war against the Persians, first conferring on his two sons, Carinus and Numerian, the title of Cæsar. He ravaged Mesopotamia, conquered the important cities of Seleucia and Ctesiphon, and advanced beyond the Tigris, when his sudden death by lightning put an end to his hopes for the conquest of Persia and Arabia and the submersion of Egypt.

Carus, Paul (1852-1919), Amer. writer, b. at Isenburg, Germany, July 18, 1852; son of Dr. Gustav C., educated at Settin Gymnasium and the univ. of Strassburg and Tübingen. He was the author of a large number of works on science, relativity, religion, and on Buddhist and Chinese philosophy.

Caruso, Enrico (1873-1921), It. tenor, b. at Naples, one of a large family in humble circumstances. He began his study of singing at eighteen, under Guglielmo Vergine; and he made his first appearance on the stage in 1894. In 1899, at Milan, he created the part of Loris in Giordani's *Fedora*. He was the original prin. tenor in Gileà's *Adriana Lecouvreur* and Franchetti's *Germania*. In the spring of 1902, at Monte Carlo, he sang with Mme Melba in *La Bohème*. He was then engaged for Covent Garden, London, where he appeared as the duke in *Rigoletto*, May 14, 1902. Without any special musical training he early attained a world-wide fame. Sang at Covent Garden for some years prior to 1907, when he received the M.V.O. In the same year he went to the Metropolitan Opera House, New York, earning almost fabulous sums. He sang there throughout the years of the First World War, proving a tremendous draw. His most popular and characteristic roles were Carlo in *Pagliacci*, Rodolpho in *La Bohème*, the duke in *Rigoletto*, the lover Grioux in *Manon Lescaut*, Edgardo in *Lucia*, and Radames in *Aida*. The gramophone records of his voice are known the world over, and brought him a colossal income. His voice was singularly free from strain and reached top notes of rare power and virility, yet always velvety and sympathetic. He married Dorothy Park Benjamin in 1918. Ruptured a blood vessel in his throat while singing in 1920, and as the result of ensuing complications he d. in Naples the following year. See Dorothy Caruso, *Enrico Caruso*, 1946.

Carutti, Domenico, Baron of Cantogno (1821-1909), It. diplomat and historian, first attained distinction as the author of

many valuable historical works, including *Political Essays, Principles of Free Governments*, and hist. of Victor Amadeus II. and Charles Emmanuel III., the first and second kings of Sardinia. His public advancement was continuous from his secretaryship in 1800-61 to the post of minister for foreign affairs under Cavour. In the same year he entered Parliament, and from 1862 to 1869 acted as plenipotentiary at Amsterdam. In 1869 he became Privy Councillor, and from that time he contributed to many historical reviews, and completed (1875-80) his exhaustive *History of the Diplomacy of the House of Savoy*.

Carvacrol, phenolic liquid. Formula $C_{11}H_{10}O$, boiling point 236° . It occurs in the essential oil of *Origanum majoranoides* (the sweet majoram of Cyprus), but is generally obtained by heating carvone with phosphoric acid.

Carvajal, Tomas Jose Gonzalez (1753-1834), Sp. statesman, attracted considerable attention by the marked aptitude he showed for finance, and from 1790 held many financial appointments, until in 1813 he rose to become secretary of state. Eight years later he became a member of the Privy Council, and in 1833 served on the great Council of War. He has a further claim to distinction as the author of *Los Salmos* (1775).

Carvel (for *caravel*, from Gk. *καράβος*, a light ship, through It. *carabella*): 1. Has been used in different countries of very various ships. Columbus discovered America in a caravel, that is a roundish galley-rigged vessel, with three towers on deck. The Fr. use C. for a herring-boat; the Turks for a man-of-war. 'C. built' is applied to a boat 'whose planking is flush with edges laid side to side' as distinct from 'clinker built'. 2. Is used in Manx and Breton literature as a synonym for carol or ballad. Originally it always referred to a lyric set to some dance measure.

Carver, George Washington (1860-1940), Amer. Negro chemurgist and agric. experimenter. B. of slave parentage in Missouri, he none the less succeeded in taking the degree of Master of Science at the Iowa State College, working there as a botanist until 1896, when he went to the Tuskegee Institute, in Alabama. He spent his life in agric. research for the betterment of the S. and of his people. Persuading farmers to vary their crops by planting soil-enriching peanuts and sweet potatoes instead of soil-exhausting cotton, he next solved the problem of finding new uses for these crops, which had become over-abundant as food-stuffs. From the peanut he made cheese, flour, coffee, milk, dyes, ink, soap, etc. From the sweet potato came flour, vinegar, molasses, rubber, etc. Years before plastics from wood waste were first attempted, C. was making synthetic marble from wood shavings. In 1940 he gave his life savings of \$33,000 to establish the C. Foundation to carry on his research. See R. Holt, *George Washington Carver*, 1947.

Carver, John (c. 1575-1621), Pilgrim Father who emigrated to America in the

famous *Mayflower*, and was appointed the first governor of the sturdy Plymouth colony (1620-21). He had taken refuge at Leyden about 1607 as the result of religious persecution in England.

Carver, Jonathan (1710-80), Brit. traveller, served in the Fr. and Indian wars, and after the peace of 1763 set out on a journey of exploration westward. Finally he reached the Mississippi by way of the Fox and Wisconsin Rrs., and obtained from the Indians a grant of land between the St. Croix and the Mississippi. Explorer of the country of the Upper Mississippi, he was the first Brit. traveller to visit the falls of St. Anthony (1766). His *Travels through the Interior Parts of North America in the years 1766, 1767, 1768*, was pub. in London in 1778. No narrative of early travel in N. America has ever outtrivalled the popularity of this work. C., however, was in serious financial straits and this success came too late to relieve his poverty. The sequel or second part of his work described the manners and customs of the Indians, but it is little more than a paraphrase of earlier Fr. accounts and even C.'s authorship has been questioned. This plagiarism in the second part and occasional falsification in the first, however, do not seem to justify doubts on the main facts of the first part of his work, for his original *Journals* or *journals*, now in the Brit. Museum, fully bear these out.

Carvin, tn. to the N. of the dept. of Pas-de-Calais, France, 10½ m. S.W. of Lille. It has coal mines, and beet, brandy, etc., manufs. Pop. 19,500.

Carving, one of the oldest means of decoration and artistic expression. The word denotes cutting (A.-S. *carfan*; Gk. *γρᾶφειν*), and differs from mere draughtsmanship in that it secures relief and durability by incisions into the material and by the modelling of its surfaces. C. is thus a general term, and may be applied to sculptural work in wood, ivory, precious stones, terra-cotta, stone, marble, clay, wax, etc., but the C. in the first material only will be dealt with in the present article. Oak, on account of its durability, is the most suitable wood for C.; mahogany, teak, chestnut, and Amer. walnut produce good work, whilst lime, sycamore, and the barks of fruit trees are employed for fine work. The fact that the fibres of wood run in a vertical direction and are deficient in lateral cohesion limits the scope of the carver. In all delicate work, such as tendrils or thin stems, the wise artist will take care to follow the grain instead of drawing across it; otherwise his detail will, in course of time, break away. The carver's kit consists of chisels for drawing lines, gouges for making hollows, etc., the 'V' tool for veining, and a mallet. Commercially many mechanical devices are in use for cheapening and lightening his work. Thus in the case of fretted or scroll work the ornament is glued on the ground after being cut with a fret saw. This method often produces unsatisfactory work, as the two woods, being differently affected by the atmosphere, tend to

separate. Another machine has a revolving drill which is directed over the ground of the decoration, whilst what is called the C. machine has a number of drills moving over the surface to be carved in accordance with a tracing point which works over the ground of an iron model of the required design. After fixing his piece of wood to a bench the workman sketches or traces his drawing. Then he grounds out the spaces between the lines with his gouge. The next process of 'bosting' consists in shaping and modelling the details of his pattern, and finally he must clean up the whole. The success of his work largely depends on his appreciation of the appropriate relativity of light and shade. C. is one of the most primitive and popular forms of ornamentation. Among savages to-day there is often a just appreciation of the effective contrast of plain with decorated surface. They apply their skill to various objects. Thus the Ijos of the Niger adorn their paddles, the Kaffirs their spoon handles, and the N. Amer. Indian his wooden pipe stem or fish hook. The Egyptians from earliest times carved the faces of the dead in their mummy cases, and in the Cairo Museum is the statue of an elderly man, carved from a solid block of sycamore, which goes back probably to 4000 B.C., and as a work of realism has never been surpassed in that country. In Greece the earliest sculptors worked in wood, and for a long time their *éōava*, or images of the gods, were religiously preserved. In Europe there are two great periods of C., the Gothic (twelfth to fifteenth centuries), and the Renaissance (sixteenth to seventeenth centuries), but of the two the former produced work immeasurably superior. In the Gothic period the wood carver was a master craftsman, who travelled with his hand from church to church. He was actuated by high religious and social ideals, and was encouraged to respect the dignity of his craft by the prominence given to it in all church decoration. Thus pulpits, choir stalls, roofs, rood screens, font-covers, lecterns, doors, and retables all owed much of their beauty to his skill. For the splendour of his architectural imagination, for the patient minuteness and accuracy of his detail, and for his loving and faithful imitation of natural forms, the Gothic workman is unsurpassed. The endless and fascinating diversity of treatment was due to the free play given to individual carvers, whilst the splendid richness of Gothic work owed not a little to their harmonious colour schemes of blues, reds, greens, golds, etc. The magnificent roof of Westminster Hall and the elaborate pinnacled and canopied choir stalls of the abbey both belong to this period. Italy is the true home of Renaissance work, and contains perhaps the finest illustrations. But, speaking generally, this period is characterised by failure to grasp the essentials of true composition by an increase in dexterity and high finish at the expense of artistic principles, and by brainless extravagance in detail and tasteless over-elaboration.

The most representative examples of Renaissance C., which is more ornate than Gothic, may be found in domestic work, and especially in oak chests, cupboard, mantelpieces, etc. Conventional leaves and patterns were substituted for the beautiful vine, oak, maple, and acanthus foliage of the earlier epoch. The great school of Grinling Gibbons, whose work can be seen at Hampton Court, Chatsworth, etc., dominated the seventeenth and eighteenth centuries in England. Yet the very flamboyance and profusion of his art detract from its obvious excellence in technical dexterity. It is certain that he is unequalled in the skill with which he carved drapery out of lime wood and modelled flowers, birds, fruit, foliage, etc., in the highest relief. In modern times the art of C. has fallen on evil days, but the decline in the art is due rather to the diminished demand for such costly ornament—costly in comparison with rival mechanical decorations—than to any assured decrease in the amount of talent available. The mosques of the Moslem world and also the Hindu temples of India contain some of the most intricate and delicate wood work. The Arab worker knew well how to combine foliage and geometrical designs, and to introduce animals and figures, and was possessed, above all, of unlimited patience, as the labyrinths of elaborate joinery on his screens alone suffice to show. Lack of restraint often spoils the effect of what is otherwise magnificent Indian C. The Hindu, however, has realised better than any other the value of the circle in ornament, just as the Jap. has best reproduced the lotus and water-lily, and as the Chinaman in all microscopic work has again and again proved his superiority. To-day there has been a revival of C. and sculptures as decorations on buildings as may be exemplified in the buildings of the Architectural Association. See H. A. Tappin, *Grinling Gibbons and the Woodwork of his Age*, 1914; T. J. Beveridge, *English Renaissance Woodwork, 1600-1730*, 1924; A. Vallance, *English Church Screens*, 1936.

Carvone, terpenic ketone. Chemical formula, $C_{10}H_{16}O$. Boiling point 230° at 755 mm. It occurs in caraway oil and in other essential oils. On heating with acids it isomerises into carvacrol (*q.v.*), but with aqueous acids it forms a hydrate.

Cary, Henry Francis (1772-1844), b. at Gibraltar, educated at Rugby, Sutton Coldfield, Birmingham, and Oxford; ordained 1796. Pub. his dignified trans. of the *Divina Commedia* in 1814, and afterwards trans. Pindar's *Odes* and Aristophanes' *Birds*. Assistant librarian of the Brit. Museum, 1826-37. Buried in Westminster Abbey. Of the four hundred trans. of Dante in Eng. which are said to exist, those by John Carlyle, Philip Henry Wicksteed, and Thomas Okey, in prose, may have superseded C.'s; while Laurence Binyon's rendering into Eng. triple rhyme is unsurpassed in its kind. But C.'s blank verse is still to be preferred to the Spenserian and other forms of some recent rhymed trans.;

and into whatever book of quotations search be made for a Dantesque phrase, it will generally be found to be *C.*'s trans. that is used. Although *C.* used blank verse at the end of a period in which the Miltonic influence had overlaid this medium he succeeded in lending to it sufficient simplicity and flexibility to reflect the tone of Dante's style.

Carya, botanical name of the genus of *N.* Amer. trees which comprehends the various kinds of hickory, in the family Juglandaceae. They are cultivated on account of their hard and elastic wood, which surpasses all other wood as economical fuel, and for the edible fruit called pecans. *C. oliviformis* is a swamp species with a slender stem and delicious hickory-nuts; *C. sulcata* is the thick-shell bark and *C. alba* the white-shell bark.

THE CARYATIDES OF THE ERECHTHEUM, ATHENS

Caryatides (Gk. *Karyatides*, women of *Caryæ*), draped female figures which take the place of pillars in architecture, and are comparable with the *Atlantes* (*q.v.*), or male figures, of the same function. The most celebrated examples are those of the Erechtheum at Athens, as in the illustration, of which the *C.* of St. Pancras Church, facing Euston Road in London, are reproductions.

Caryocar, one of the two genera of *Caryocaraceae*, or *Rhizophoraceae*, is peculiar to tropical America, and is noted for its fruit. The wood is very durable and is used in ship-building; it is reddish, hard, and compact. *C. nuciferum* yields the suwarrow, or sours, nuts of commerce, and *C. butyrosa* the butter-nuts, which contain a thick oily substance.

Caryophyllaceae, large family of cosmo-

politan Dicotyledons, many species of which occur in Britain; they have no economic use, but are often cultivated on account of their pretty flower. The inflorescence is a dichasial cyme. The flowers are polypetalous and hypogynous, with usually five free or joined sepals, five petals, twice as many stamens, a syncarpous gynaeceum with two to five carpels, a unilocular ovary with free central placentation. The opposite leaves and swollen nodes are characteristic of this order. *Lychnis*, which includes corncockle, ragged robin, and red campion; *Dianthus*, which includes the carnation and sweet-william; and *Stellaria*, which includes chickweed and stitchwort, are three of the chief genera. *Gypsophila* is often used in floral decorations.

Caryophyllus aromaticus, or *Eugenia caryophyllata*, species of *Myrtaceae* which grows in the tropics as a small evergreen shrub; the flower-buds of the plant are gathered before they are open, dried in the sun, and sold in the well-known form of cloves (*q.v.*).

Caryopsis, syncarpous fruit, usually composed of two carpels and having a dry closely attached pericarp, as seen in grass seeds and oats.

Caryota, genus of *Palmaceae*, some of the species of which grow to a height of 60 ft. in the E. Indies. The leaves are bipinnate, and the shape of the leaves has given the genus the name of fish-tail palms. The large green or purple flowers grow in groups of three, one female between two males, and the fruit is a berry. *C. urens*, the wine-palm, is the best known species; it is noted for the peculiarity of producing a burning sensation to the skin when the pulp is applied to it. The wounded flowers exude an enormous amount of juice, from which toddy and jaggery, a kind of sugar, are obtained. The leaf-stalks are made into fishing-rods, and their fibres into ropes; the trunk yields a wholesome starch used as food.

Casablanca, Louis de (1755-98). Fr. naval officer b. in Corsica. He was mortally wounded at the battle of the Nile, and went down with his son, who refused to leave him, in his ship when it caught fire. Mrs. Hemans and André Chénier have celebrated him in their poems.

Casablanca, or *Dar-el-Beida*, seaport tn. on W. coast of Morocco, with 258,000 inhab., of whom over 40,000 are Europeans. It is the economic centre of Morocco. In 1907 *C.*, a small tn. trading in agric. products, was bombarded and occupied by Fr. troops. There are regular steamers to the ports of W. Europe and air lines to Toulouse and Oran, and railways and motor coaches to the interior. Its varied industries give it the appearance of a rapidly growing European tn. Its trade is more than half that of all the ports of W. Morocco. During the Second World War the tn. was the scene of the *C.* Conference (*q.v.*) between President Roosevelt and Mr. Winston Churchill, accompanied by the combined chiefs of staff (Jan. 14-24, 1943).

Casablanca Conference held on Jan

14-24, 1943, between Mr. Churchill and President Roosevelt, together with their leading political and military advisers, to give precision to the plans for the immediate future of the military activities of the Allies in N. Africa and also to decide on broad strategic plans generally. Stalin was invited to attend but neither came himself nor sent any responsible delegate. Full information of the proceedings was communicated to Moscow, but there were no reciprocal communications which might enable the W. Allies to measure the prospects in Russia in relation to their own plans, and Soviet secretiveness and suspicion remained a further barrier to the full co-ordination of allied efforts. But one of the immediate purposes of the conference was to draw as much of the weight as possible off the hard-pressed Russian armies by engaging the common enemy as heavily as possible at the best selected points. The conference did not conceal the intention of the Allies to make an actual invasion of the Continent of Europe. The conference adopted and pub. a formula regarding peace terms. It was that there must be unconditional surrender, not merely on the part of the dictators (with whom it had previously been declared that the Allies would never negotiate), but on that of the three Axis nations. See **AXIS**. The intention was to exclude the prospect of anything like the Fourteen Points advanced by President Wilson in the First World War, and also to disentitle the enemy nations from claiming any rights under the Atlantic Charter (*q.v.*) of 1941.

Casacalenda, tn. of Italy, in the prov. of Abruzzi e Molise, situated on the Ifferno. 40 m. N.W. by W. of Foggia. Pop. 6400.

Casa, Giovanni della (1503-56). It. poet and translator, b. near Florence in the Mugello valley, the son of a great Florentine family. He was made archbishop of Benevento and nuncio at Venice in 1514 by Pope Paul III. While holding these offices he made himself noteworthy by his violent attacks on the Protestants. He was then made secretary of state, a post which he held till his death. His lyrics, letters, and speeches are in a way excellent but he is chiefly known for his little work called *Il Galateo, ovvero de' Costumi*, which he wrote between 1551 and 1555. This book, with Castiglione's *Cortegiano*, gives a splendid portrayal of the manners at court at the time of the It. Renaissance. Forcellini's ed. of the *Opere*, 1752, is the best. He trans. Plato and Aristotle and compiled sev. biographies. Sev. of his poems were notoriously licentious, e.g. *Capitoli del foro*; but he is noted for being the leader of a reaction in lyric verse against the prevalent imitation of Petrarch.

Casale (anct. Bodincomagus?), city of N. Italy, on the r. b. of the Po. It was long an important stronghold, and still maintains its fortifications. In 1474 created cap. of the marquisate of Montferrat. Is the seat of a bishop, and contains a venerable cathedral, interesting churches, the Torre del Grand' Orologio,

and some fine palazzi. Leading industries: manufs. of silk, lime, and cement. Pop. 20,000; com., 35,000.

Casalmaggiore, tn. of Italy, in the prov. of Cremona, situated on the It. Po. The manuf. of glass, pottery, and cream of tartar is carried on. There are numerous fine buildings, including an abbey, hospital, custom-house. etc. Pop. 4210.

Casalpusterlengo, tn. of Italy, in the prov. of Milan, situated on the R. Brembiola. There are manufs. of silk, linen, and earthenware, also a trade in Parmesan cheese. Pop. 5000.

Casals, Pablo (b. 1876). Sp. cellist and conductor, b. at Vendrell near Barcelona. Educated at Barcelona and Madrid Conservatoire. First public appearance in England was at Crystal Palace, 1898, and in Paris the same year, since when his playing gained him international fame. In 1906 he married Guillermina Suggia, the Portuguese cellist (*q.v.*), and in 1914 Susan Metcalfe, Amer. singer. He founded the Pau Casals Symphony Orchestra of Barcelona in 1920 and was its conductor. He was made Citizen of Honour of Madrid in 1935 and Member of Honour of the Sp. Academy the same year. He has received many international awards and distinctions, and has pub. symphonic and choral works and chamber music.

Casamance, riv. in the W. of Africa in the Fr. colony of Senegal. It forms an estuary which enters the sea in about 12° 30' N.

Casamassima, tn. in Apulia, Italy, 14 m. from Bari. Pop. 8500.

Casamicciola, tn. on the is. of Ischia in the gulf of Naples, Italy. Since 1883 it has been entirely rebuilt, as the old tn. was destroyed by an earthquake. Many visitors go there between May and Aug. on account of its hot mineral springs (150° F.). Pop. 3500.

Casanova de Seingalt, Francesco (1730-1805). It. artist. Born in London, but gained his reputation in Paris as a painter of battle pictures and landscapes. His pictures can be seen at Rouen, Nancy, and Lyons.

Casanova de Seingalt, Giovanni Jacopo (1725-98). It. adventurer noted for his wit, accomplishments, and intrigues. He was b. in Venice, brother of Francesco C. (*q.v.*). His father was of old and good family, but owing to his having adopted the theatrical profession, he was alienated from his family. Giovanni's mother was Zanetta Farusi, a shoemaker's daughter. His grandmother had him educated in London beyond his social standing, and at the age of sixteen he entered a seminary at Venice, whence he was expelled for immoral conduct. Through his mother he was given a situation in the household of Cardinal Acquaviva, but as he found it very dull and irksome, he took to travelling. His career of intrigue and hazard led, after wanderings to one cap. after another, often in the most aristocratic society, to his imprisonment in Venice. Escaping from Venice, he was appointed to manage state lotteries in Paris. After further European wander-

ings, embracing England, Poland, and Spain, he returned once more to Venice in the capacity of state spy, and, later, retired to Bohemia. His famous *Memoirs* (1876) throw a strong light on the manner of life he led. See B. Dobrée, *Vicenzo Casanova*, 1933.

Casarano, tn. of Italy, in the prov. of Lecce, 10 m. S.E. of Gallipoli. Pop. 7000.

Casas, Bartolomé de Las, see LAS CASAS.

Casas, Ciudad de las, see SAN CRISTOBAL.

Casas Grandes: 1. Anc. city in the state of Chihuahua, Mexico, 130 m. from El Paso. It has ruined buildings erected by Pueblo Indians and discovered in 1660 by the Spaniards. 2. Ruins of a prehistoric city in Pinal co., Arizona, U.S.A., 50 m. from Tucson.

Casaubon, Isaac (1559-1614), Fr. theologian and classical commentator, b. at Geneva, his family having come originally from Dauphiné. At the age of twenty-four he was appointed prof. of Gk. at Geneva, and three years later he married the daughter of the great Fr. scholar, Henri Estienne. Henry Wotton, in the course of his continental tour, lodged with C. at Geneva. In 1596 C. accepted the Gk. professorship at Montpellier, and afterwards he lingered over twelve months at Lyons, awaiting his appointment to a Paris professorship. The univ. of Paris had closed its doors against all but Catholics and Henry IV. dared not appoint a Calvinist. However, he gave a pension to C., with a promise of the royal librarianship when it became vacant, which was not until 1604. After the assassination of Henry, C. was forced to move to London, where he was made prebendary of Canterbury and given a pension. He was unjustly charged, after the pub. of his reply to the *Annals* of Cardinal Baronius, with having sold his conscience in order to gain the favour of James I. The truth was that he had for some time been drawing near to the Anglo-Catholic Church. He devoted his life to classical study, though often hampered in many ways, and he helped to give a connected knowledge of the lives of the ancients. He pub. eds. of Athenæus, Aristotle, Diogenes Laertius, Theophrastus, Polybius, Theocritus, Persius, Suetonius, etc.; also the treatises *De Satirica Græcorum Poesi et Romanorum Satira* and *De Libertate Ecclesiastica*. C.'s *Correspondence*, in Lat., was collected by van Almeloveen (1709). His diary, *Ephemerides*, ed. by his son Meric (q.v.), is preserved in MS. in the Chapter Library, Canterbury, and was printed by the Clarendon Press, 1850. His life was written by Mark Pattison, 1875.

Casaubon, Meric (1599-1671), son of Isaac C. (q.v.), accompanied his father to England, and was educated at Christ Church College, Oxford. Was made prebendary of Canterbury and vicar of Monkton in Thanet, deprived of his appointments in 1644, but restored in 1660, and eventually became rector of Ickham. He inherited his father's taste for classical research, and vindicated the memory of Isaac C. in two Lat. works.

Casbeck, see KAZBECK.

Casca, Publius Servilius, tribune of the plebs in Rome in 44 B.C. He was one of the assassins of Caesar. He was killed at the battle of Philippi, 42 B.C.

Cascade, range of mts. in the U.S.A. situated in the N.W., and stretching in a N. to S. direction through the states of Washington, Oregon, and N. California. It is composed of granite in N. Washington, but all the remaining part is volcanic, covered many times over with flows of lava. The range has either on its crest or sides many extinct volcanoes, such as Shasta in California, rising to 14,392 ft.; Jefferson, 10,350 ft.; and Hood, 11,225 ft., both of which are in Oregon; Adams, 12,470 ft.; St. Helen's 10,000 ft.; Rainier, 14,526 ft.; and Baker, 10,827 ft., in Washington. The general height of the whole range runs from 6000 to 8000 ft.

Cascara Bark, obtained from *Rhamnus purshiana*, the Californian bearberry or buckthorn, which is a N. Amer. species of Rhamnaceæ. The bark is taken from the tree and dried, when it yields a fluid extract, known as *C. sagrada* (sacred bark), which is used as a cathartic.

Cascarilla, which is a S. Amer. genus of Rubiaceæ, is noted for its bark, which resembles that of cinchona, and is used as a valuable aromatic and tonic. It arrives in Europe in short, thin, brittle rolls, and so receives its name, which signifies little bark. The bark of *Croton C.*, a species of Euphorbiaceæ, is known as C. bark, and is used as a tonic.

Cascina, com. in Tuscany, Italy, on the R. Arno, in the prov. of Pisa. Cotton, linen, soap, and silk are its industries. In 1364 the Florentine soldiers defeated those of Pisa here. Pop. 27,000.

Case, in grammar, one of the forms of declension to which nouns, pronouns, and adjectives are subject. Means literally a falling, and was so applied because the subject of a sentence had to be imagined as an upright line, with the other words falling away from it. The Eng. language contains only the genitive and some trace of the dative (as in 'whilom,' 'seldom'); Lat. has six, nominative, genitive, dative, accusative, vocative, and ablative; Gk. has no ablative; Sanskrit has two additional Cs., locative and instrumental. Eng., Fr., and It. nouns and adjectives have lost their C.-endings, but their pronouns are still modified, while polysynthetic languages (as Finnish and Magyar) acquire very many.

Case, Action upon the, obsolete name for one of the forms of action into which remedies for civil injuries were classified by the common law (q.v.) of England. In the early days of Eng. common law the remedies for civil injuries were few and rigid. Hence the chancellor and his subordinates, who had control of the office out of which writs were issued, initiated in right of an assumed equitable (see EQUITY) jurisdiction, the practice of formulating writs to meet Cs. unprovided for by the common law. This practice at length received legislative sanction in the Statute of Westminster, which permitted actions to be framed in *consimili casu*, i.e. by analogy to

similar Cs. or sets of circumstances for which there already existed a stereotyped form of action or writ. Hence the term actions in *constitut casu* or, more shortly, 'actions on the C.' The common law readers subsequently exercised considerable ingenuity in extending the action upon the C. to meet all manner of Cs. bearing some analogy to existing forms. By the Judicature Act, 1873, all the old forms of action were abolished and no set style of pleading is now required at all, provided the plaintiff shows in his pleadings that the facts come within some legal principle. The fundamental importance of the evolution of forms of action out of actions upon the C. lies in the development of new and more equitable principles of law.

Case of Impositions, The, see RATES'S CASE.

Case, Thomas (1844-1925), Eng. philosophical writer, educated at Rugby and Oxford. In 1883 he was appointed lecturer in Gk. hist. at Christ Church, and in 1889 he was elected to the Waynflete chair of moral and metaphysical philosophy. His publications on philosophy, which are characterised by profundity allied with the spirit of Heraclitus, include *Physical Realism* (1886), *Metaphysics, Aristotle, and Logic*.

Case-hardening. In some parts of machinery toughness of material must be accompanied by durability of surface. These two conditions are satisfied by using wrought iron and transforming its external parts into steel. Such material is used for axles, pins, links, and the edges of cutters, the result being greater accuracy and durability. The piece is generally finished bright, and then heated up according to requirements with its surface in contact with leather, bones, or other charcoal or potassium cyanide, all means of causing the absorption of carbon to a small distance in the iron and the consequent formation of steel. Quenching in water produces the required hardness of surface. Such surfaces must be ground, since common cutting tools will not touch them.

Casein is a proteid, an important constituent of milk and the prin. one of cheese. From the former it is precipitated by means of rennet, which is an extract from the mucous membrane of the fourth stomach of a milk-fed calf. It is a valuable food product containing phosphates. It is also precipitated by mineral acids, but is not coagulated by heat. It is allied to albumen and also to legumin found in the seeds of leguminous plants such as peas and beans.

Casella, Alfredo (1883-1947), It. pianist and composer, b. at Turin, son of a teacher at the liceo there. He studied at the Paris Conservatory under Diémer (pianoforte) and Fauré (composition). He then toured successfully as a pianist and orchestral conductor. From 1912 he directed popular concerts at the Trocadero, Paris. In 1917 he founded in Rome the Società Nazionale di Musica (afterwards Società Italiana di Musica Moderna); reformed, in 1923, as the Corporazione

delle Musiche Nuove (It. section of the International Society for Contemporary Music). The various influences of Debussy, Schönberg, Stravinsky, Itavel, and other moderns may be recognised in all his works. In his compositions he may be classified as an anti-romantic, for his hope was to see his contemporaries in Italy abandon 'vocal melodramatic melody' for 'true music.' Works include *Courant sur l'eau* (ballet), *Pagine di guerra*, *L'Adieu à la vie*, and *Elegia eroica*—all to poems of Tagore; *A notte alla* (piano concerto), cello sonatas, symphonies, chamber music, etc.

Casemate (perhaps from It. *casa*, a house, and *matto*, mad, used in the sense of Eng. 'dummy,' or, perhaps, from Gk. *Khásmata*, pl. of *Khásmá*, gulf), loop-hole gallery or caponier, under the protection of which the garrison of a fort may fire upon the enemy below. Cs. are utilised to protect guns, hospitals, stores, etc., from high-angle or vertical fire; or they may be used as barracks. In architecture, a hollow moulding, such as the cavetto.

Casement, term applied to the wooden frame with a hinge which keeps the glass of a window in position. The earliest windows were all casemented or hinged; the block and pulley system is comparatively modern.

Casement, Sir Roger David (1864-1916), Irish rebel, b. at Kingstown, co. Dublin; younger son of Capt. Roger C. of Ballymena, co. Antrim. Became travelling commissioner to the Niger Coast Protectorate, 1892; in 1895 Brit. consul at Lourenço Marques, in 1898 at Loanda and then at Boma (Congo Free State). Reported Dec. 11, 1903, on the cruelties in the rubber plantations of the Upper Congo. Next, held consular posts in S. America, and in 1910 he made a report, not pub. till 1912, on the inhumanities on the rubber stations on the Putumayo R. in Peru. Knighted 1911; retired to Ireland 1913. He went to Berlin in Nov. 1914, soon after the outbreak of the First World War. In April 1916 he set out for Ireland in a Ger. submarine but on landing at Banna, Kerry, was arrested. Tried in London for high treason June 26-29, and, previously degraded from all his honours, was received into the Church of Rome and hanged at Pontonville, Aug. 3, 1916. In recent years the Eiro Gov. has asked vainly for the return of his remains to Ireland. See G. de C. Parminter, *Roger Casement*, 1936.

Casentino, name given to the valley of the upper Arno in the prov. of Arezzo, Italy. Tourists frequent it as the scenery is very picturesque. It was celebrated by Dante.

Caserta: 1. Prov. of Italy which up to the year 1871 was called Terra di Lavoro. It forms part of Campania, and stretches from the S. Apennines to the Tyrrhenian Sea. Although very mountainous, it is very fertile, and much wheat, olives, forage crops, fruit, and wine are grown there. Timber and marble are also got from this country. Its area is

2033 sq. m., and the pop. 797,000. 2. Cap. of above prov. and episcopal see. There are large silk works here. The royal palace was lightly hit in sev. places in the Second World War, and, being continuously used as the allied headquarters, considerable damage was done in the earlier stages of the occupation to the period furnishings and fittings. Pop. 35,000.

Case-shot, or **Canister**, is a projectile of artillery, designed for use at close quarters. A tin or sheet-iron cylinder is filled with bullets, varying in number and weight from $\frac{1}{4}$ oz. to 1 lb., the interstices between which are closed with sawdust. When this is fired it immediately breaks, scattering the balls considerable distances. As their velocity is small, they are ineffectual at a greater range than 300 yds.

Cash, denotes primarily ready money, money in a bank, in a chest, strongbox, or coffer; but since the institution of banks it has come to denote also bank-notes, cheques, money orders, and other documents containing an order to pay on demand as opposed to bills of exchange or other credit instruments (see also CURRENCY).

Cash Credit. A C. C. is simply an advance by way of a debit balance in current account, which advance is secured to the bank by a bond entered into by a couple of solvent parties who are guarantors for the borrower. It was a system invented in 1729 by the Royal Brit. Bank (which, though not strictly a Scottish bank, was promoted by Scotsmen with the object of transplanting to Eng. soil the peculiar system of Scottish banking), designed to get its superfluous capital into circulation by inducing parties to borrow and embark in business. It is unanimously acknowledged that the system, now general among bankers, has been of immense advantage to the country materially and morally.

Cash on Delivery System is an arrangement whereby the postal authorities, railway companies, and other common carriers undertake on behalf of the vendor to collect the price of goods delivered by them from the recipient and to transmit the money to the vendor. This system is highly popular in most European countries and in India and Japan, but, except as between the United Kingdom and certain Brit. possessions and Egypt, the system was not, until 1926, introduced into England, owing to the apprehensions of local retail traders. In the face of a long trial as between the United Kingdom and certain colonies and between the United Kingdom and European countries, these fears disappeared, and in 1926 the inland C.O.D. service, limited to parcel post, was introduced, with such successful results that in 1928 the system was extended to packets sent by registered letter post as well as to goods sent by rail to any part of Great Britain. By this service a sum (the trade charge) up to £40 can, under certain conditions, be collected from the addressee and remitted to the sender of a packet or parcel or

registered letter at a money order office or a parcel consigned by rail. Fees: for trade charge or value up to 10s., a fee of 4d.; up to £1, 6d., 2d., 8d., 2s., 10d., and for each further £5 or less, 2d., by rail 3d. extra. The fees charged in the United Kingdom on C.O.D. packets from abroad are from 4d. when the trade charge is not over £1, with 2d. extra for each additional £1 of trade charge up to the maximum, which is usually £40 (the fee for the collection of which would be 8s. 6d.), but to some countries is less. If trade charge cannot be collected, the rules for undeliverable parcels apply.

Cashel, Tipperary, Eire, the see of a Rom. Catholic archbishop and of a Church of Ireland bishop. Built on the S. slopes of a great height (the Rock of C.), it was the stronghold of the anct. kings of Munster, and contains many interesting ruins, a stone-roofed chapel built by Cormac McCarthy, 1127, a cathedral founded 1169, the palace of the Munster kings, etc. Dean Swift, the author of *Gulliver's Travels*, was born here. Pop. 3000.

Cashew Nut, or *Anacardium occidentale*, species of *Anacardiaceae* which is largely cultivated in tropical America. The fruit is a kidney-shaped nut with a hard shell containing an acrid black juice, but when this has been removed the kernel is found to be oily, pleasant, and wholesome. It is usually roasted for eating, and is often put into old Madeira wine in the W. Indies to improve the flavour. It is also prepared commercially as a 'butter'. The fleshy stalk has an agreeable flavour.

Cash Register, calculating machine for use in connection with the C. till of shops, to record the money received. Most are supplied with a number of keys, each representing a particular sum. On pressing these keys, or a combination of them, representing the sum of the purchase, a record is made of the purchase and the amount is also shown to the customer by means of an indicator. There are many elaborations of this idea.

Cashiering (Fr. *casser*, to break), a term in military law denoting the annulment of an officer's commission and his dismissal from the service. It may be awarded by a court martial as a punishment for a number of offences by way of alternative to imprisonment. In the words of the Army Act 'scandalous conduct unbecoming the character of an officer and a gentleman' is met by sentence of C.

Cashmere (India), see KASHMIR.

Cashmere, silky-woollen fabric originally manufactured from the hair of the Tibetan and Bokhara goats, and woven in C. (Kashmir). The hair is spun by women, afterwards dyed, and made into the famous shawls, one of which requires the wool of seven or more goats. These were sold in Europe at prices varying from £100 to £300, but since 1870 the demand for them has not been so great. Imitations have been made in France, and attempts have been made to acclimatise the C. goat in Europe and

the U.S.A. The name is also given to a fine woollen stuff, made in imitation of the shawl fabric.

Cashmere Goat, or *Capra laniger*, variety of the common goat of the ruminant family Bovidae. It occurs in Tibet, Bokhara, and Kirghiz, but attempts to introduce it into other countries have proved unsuccessful. It is a smallish goat, white, black, or brown in colour, with hanging ears, long horns, and long, straight, fine hair. The wool is used chiefly in the manuf. of C. shawls, which are very fine in texture, and have been valued at sev. hundreds of pounds.

Casimir IV. (1427-92) was, by birth, Jagiello, grand duke of Lithuania, but by his marriage with Jadirga, the daughter of Louis, king of Poland and Hungary, united Lithuania and Poland. He waged war against the Teutonic knights, and by the treaty of Thorn recovered from them W. Prussia in 1466. During his reign the aristocracy increased in power, and won special privileges at the diet of Nieszawa (1454).

John Casimir (1618-68) succeeded his brother, Ladislans IV. Brandenburg won her independence in 1657, and the Cossacks rebelled against Poland and

THE CASINO AT MONTE CARLO

(Canadian Pacific)

Casimir (properly **Kasimierz**), name of certain kings of Poland.

Casimir I. (1034-58), succeeded his father Mieczyslaw II. The early part of his reign was disturbed by anarchical plots, and from 1037 to 1040 he was obliged to leave the country. On his recall he recovered Silesia from the Bohemians.

Casimir II., the Just (1177-94), was a popular ruler and sided with the people against the nobles. During his reign the senate, composed of bishops, palatines, and castellans, was estab.

Casimir III., the Great (1333-70), was b. in 1310. He added Red Russia to his dominions (1341), founded the Polish law in the famous Statute of Wislica (1347), and subdued and won the friendship of the Teutonic knights and the Bohemians. He was a democratic ruler, and was, in consequence, called the king of the peasants. He founded the univ. of Cracow (1364), and encouraged friendly commercial relations between Poland and other countries.

finally joined Russia in 1654. Poland also suffered frequent attacks from Sweden and Russia, and C. was obliged to take refuge in Silesia. Poland lost Livonia to Sweden (1660), and the ter. beyond the Dnieper was ceded to Russia (1667). C. abdicated in 1668, and lived in retirement in France till his death in 1672.

Casimir-Périer, Jean Paul Pierre (1847-1907), the fifth president of the Fr. Republic. He was b. in Paris on Nov. 8, and was the grandson of Louis Philippe's famous premier, Casimir Pierre Perier. His first appointment which brought him into public life was that of secretary to his father, who was minister of the interior when Thiers was president. In 1874 he was made general councillor of the Aube, and was, by that dept., sent to the Chamber of Deputies in 1876. In this he was always re-elected until he was made its president in 1893. He was made Prime Minister, but resigned in May 1894, and was then again re-elected president of the Chamber of Deputies. In 1894,

after the assassination of President Carnot, he was made president of the Republic. His presidency only lasted six months, as he resigned in Jan. 1895. He gave up political affairs completely and interested himself in mining. He gave valuable evidence in support of Dreyfus at that famous trial. He d. on March 11.

Casino, or **Kursaal**, entertainment estab. Many seaside and holiday resorts on the Continent have a C., the most noteworthy being Monte Carlo, Ostend, and Boulogne. The building itself generally contains rooms for gaming-tables, conversation, music, reading, billiards, and dancing.

Casino, tn. in New S. Wales, Australia, 500 m. N. of Sydney. Pop. 3500.

Casket Letters, celebrated collection of documents which, if genuine, prove the responsibility of Mary, queen of Scotland, for the murder of her husband, Darnley. The earl of Morton, afterwards regent of Scotland, asserted that he had found the documents in a silver casket in June 1567, after Bothwell had fled from Edinburgh Castle. The casket is supposed to have contained letters, professedly written by Mary to Bothwell, some Fr. sonnets, a signed but undated promise by Mary to marry Bothwell, and a marriage contract between the two. The documents were produced by Moray in the commission, held at York and later at Westminster, in the same year, 1567. It was alleged that the documents were written by Mary, and the handwriting was compared with that of the queen. Mary herself vehemently denied the charge, and her request to see the original documents or copies of the same was never granted. The documents passed into the hands of the successive regents of Scotland and were lost, apparently after the execution of the earl of Gowrie (1581). The genuineness of the letters has frequently been doubted. Three theories have been held with regard to the letters: that they are wholly genuine, that they wholly forged, and that they are genuine in parts, with interpolations by another hand. One of the arguments used against the genuineness of the letters is that two of the most incriminating letters were written first in Scots, and that the copies pub. were a Fr. translation. Now, previous to her flight into England, Mary had always corresponded in Fr., and therefore, it has been argued, Mary could not have written the letters. Recent examination of Fr. and Eng. versions at the Record Office, however, has made this argument untenable. It has also been argued that Mary wrote the sonnets without any autobiographical reference, but purely as literary exercises. One ingenious suggestion is that they were really written to Darnley as early as 1565, but why Bothwell should have afterwards treasured them is not explained. Much of the information in the C. L. cannot be traced elsewhere, and much differs from statements found in other documents, but it is practically impossible to tell where the truth lies. A large number of historians have accepted the letters as

genuine, among them being Hume, Robertson, Lang, Tytler, Burton, Froude, and, among foreign writers, Ranke, Pauli, Mignet, and Gaedeke. Those who have held them to be forgeries include Goodall, Hosack, Schiern, Philipponson, and Chante-laune. The mystery of Mary's character can never be solved, but has always been an attractive subject to historians and men of letters. The controversy round the C. L. has called forth books too numerous to mention, and only a short list of the most prominent books on the subject can be mentioned: W. Goodall, *Examination of the Letters said to have been written by Mary Queen of Scots to James, Earl of Bothwell*, 1754; G. Chalmers, *Life of Mary Queen of Scots* 1822; F. Mignet, *Histoire de Marie Stuart*, 1854; J. Hosack, *Mary Queen of Scots and her Accusers*, 1870-74; T. F. Henderson, *The Casket Letters and Mary Queen of Scots*, 1890; M. Philipponson, *Histoire du règne de Marie Stuart*, 1891-1892; A. Lang, *Mystery of Mary Stuart*, 1900-4; R. H. M. M. M. M., *Indictment of Mary Queen of Scots*, 1923, and *Mary Queen of Scots: a Study of the Lennox Narrative*, 1924.

Caskets, or **Casquets**, group of rocky is. in the Eng. Channel, 8 m. off Alderney. They are very dangerous to shipping, and are the scene of the wreck of the *White Ship* in 1120, and the *Victory* in 1744, and many other vessels.

Caslau, or **Czaslau**, tn. in Czechoslovakia in the E. of Bohemia, 45 m. from Prague. It was one of the chief tns. of the Hussites, and the tomb of their blind leader Zizka was in the church until it was destroyed in 1623. It has large sugar and other factories. Pop. 10,000.

Caslon, William (1692-1766), first Eng. typesetter, b. at Cradley in Worcestershire. He estab. a small business in St. Luke's, London, in partnership with Bowyer and some other printers. For many years there were very few books of importance that were printed with any other type than that of C. He took as his model types of the Elzevir pattern.

Casoli, tn. in the prov. of Abruzzi o Molise, Italy, 18 m. S.S.E. of Chieti. The tn. is situated at an important road junction, and was the scene of fighting during the Second World War. It was captured by the allied Eighth Army on Nov. 28, 1943. Pop. 7000.

Casoria, tn. in prov. of Naples, Italy, and 15 m. N.N.E. of Naples. Produces wine and silk. Pop. 16,500.

Caspari, Carl Paul (1814-92), Ger. scholar and theologian, b. at Dessau. He was made a prof. of theology at Christiania in 1857, which appointment he held till his death. He wrote many theological and philological studies, and also an Arabic grammar. Besides his he pub. *Quellen zur Geschichte des Taufsymbols und der Glaubensregel* (1866-75), and *Kirchenhistorische Anekdoten* (1883).

Caspe, tn. in Spain in prov. of Saragossa. One of the oldest cities in Spain. It is visited a good deal on account of the sulphur baths of Fonte which are near. Pop. 9000.

Casper, second largest city in Wyoming, U.S.A., with large oil refineries. Pop. 17,000.

Caspian Sea (anc. *Mare Caspium*, or *Mare Hyrcanum*, Gk. *Kásmia θάλασσα*), the largest inland sea in the world, on the boundary between Europe and Asia, extending from 38° 40' to 47° 20' N. lat., and 46° 50' to 55° 10' E. long. Its length from N. to S. is 680 m., and its breadth varies between 130 and 270 m.; total area 170,000 sq. m. It lies mostly in Russian ter., having Russia and Persia (Iran) on the W., Russia on the N., the Transcaspien prov. on the E., and Persia on the S. The present sea formed part of a vast ocean which probably extended at one time to the Arctic Ocean, and united with the Black Sea in the W. More recently the C. and Aral waters constituted a distinct Aralo-C. Sea, traces of whose existence are the high-level terraces (beaches), which surround part of the C. shore-line, and in deposits of the C. type of fossil shells which are scattered over the Post-Pliocene Karakum sands eastward as far as the meridian of Merv. The coast-line is irregular, the prin. indentations being those of Mortvi Kuitak (W. of the bay of Kaldak), Kenderli, Karabugus, and Balkan. The C. has no tides, but its navigation is difficult because of violent storms. Greatest depth in N. basin, 2526 ft., and in S., 3006 ft. Its chief tribs. are the Volga, Ural, Emba, Terek, Kura, and Atrek Rs. Communication with the Black, Baltic, and White Seas has been estab. by means of canals connecting with the Volga. It abounds in fish, notably salmon and sturgeon, which also supply the caviare and isinglass manufactories on its shores. Many lines of steamers navigate the C., the chief ports being Astrakhan, Baku, Gurev, Derbent, Petrovsk, Lenkoran, Krasnovodsk, Ilych, and Tschikishliar in Russian ter., Astara, Meshed-i-Sar, Pahlevi, and Bandar-i-Gaz in Persia.

Casquets, *see* Caskets.

Cass, Lewis (1782-1866), Amer. statesman, b. at Exeter, New Hampshire. He entered the army in 1813, and in due course rose to the rank of general. For sev. years he was governor of Michigan and in the year 1831 was made minister of war. For a long period he was a senator, and in 1857 he obtained the position of secretary of state, which he held until 1860. Democratic candidate for President in 1848, he was beaten by Gen. Taylor. He wrote a hist. of the traditions and language of the Indians of the U.S.A.

Cassagnac, Bernard Adolphe Granier de (1808-80), Fr. journalist, b. at Avéron-Bergelle in the dept. of Gers. He started his career in Paris in 1832, writing to various papers defences of Romanticism and Conservatism, and his ardent defence of Guizot brought him not a little notoriety, and was the cause of many duels. In 1840 he went to the Antilles, peaced while there married a Creole, Mlle Cracovallon. In 1852 he was elected to commedial candidature of the dept. of other co. In 1868 he accused the Liberal

party of opposing the emperor, and of having received money for that purpose from the king of Prussia, but was unable to produce other than false evidence when called upon to do so. He fled to Belgium in 1870 after the proclamation of the republic, but returned in 1876 for the elections, and was elected deputy.

Cassagnac, Paul Adolphe (1843-1904), son of Bernard Adolphe C., in early life was associated with his father in politics and in journalism. He joined the fighting ranks upon the declaration of war in 1870, was taken prisoner at Sedan, and imprisoned for some time in a fortress in Silesia. From there he returned to Paris in 1872, once more associated himself with *Le Pays*, the journal of which his father was editor, and therein ardently upheld the Bonapartist cause against the Royalists and Republicans. In 1876 he was elected deputy for the dept. of Gers. His policy was one of strife and obstruction. In 1877 he was again imprisoned, and openly incited MacMahon to rebellion, but the refusal of the latter, and the death of the prince imperial in 1879, ended his hopes in this matter. He was the founder of the journal *L'Autorité*, and wrote a life of Napoleon III.

Cassana, Niccolò, generally called *Nicoletto* (1659-1714), It. painter, b. in Venice. The best of his many fine historical paintings, especially 'The Conspiracy of Catiline,' are in the gallery of Florence. He painted a portrait of Queen Anne of England and of various Eng. noblemen. D. in London. His father, who was a pupil of Strozzi, also painted historical subjects, one of his best pictures being 'St. Jerome' in the Mirandola church.

Cassander (306-297 B.C.), king of Macedonia, b. 354 B.C., was disinherited by his father Antipater, in favour of Polysperchon. He entered on a struggle with his rival, aided by Ptolemy and Antigonus, gained Athens and other Gk. cities, and invaded Macedonia. He put to death Olympias, mother of Alexander, and also, later on, his widow Roxana, and son Egeus. C. married Thessalonica, half-sister of Alexander, and (316 B.C.) founded the city which bears her name. He also rebuilt Thebes, which had been destroyed by Alexander. His son Philip succeeded him.

Cassandra, the most W. of the three points of the Chalcidice Peninsula, between the gulfs of Salonica and C. In olden times it was named Pallene.

Cassandra, in Gk. mythology, was the daughter of Priam and Hecuba. She was loved by Apollo, who promised to give her the gift of prophecy if she would fulfill his wishes. But on obtaining the promised gift, she refused to carry out her promise. Thereupon Apollo, in revenge, laid upon her the curse that none of her prophecies should be believed. So it was in vain she foretold the fall of Troy, in which she was captured and ravished by Ajax Oileus. She was afterwards murdered by Clytemnestra.

Cassano: 1. Tn. of Calabria, S. Italy,

34 m. N. of Cosenza, and 6 m. W. of Sileri. It is well situated, being 820 ft. above sea level. The rock above it is surmounted by an old castle, from which beautiful views are obtained. Warm sulphurous springs are found here. Pop. 8600. 2. Tn. on the R. Adda, Italy. The scene of two battles, one in 1705, when the Fr. defeated the Imperialists, and the other in 1799, in which the Fr. were beaten by the Russians and Austrians. Pop. 9000.

Cassans, tn. in the prov. of Apulia, Italy, 16 m. S.S.W. of Bari. Pop. 6000.

Cassation (*cassare*, in the Lat. of the jurists, to annul, Fr. word denoting the reversal of a judicial sentence.) The Cour de C., which received its full organization under Napoleon, became under the Third Republic the highest tribunal in France. It sits in Paris and hears appeals from all other courts except the administrative courts. It may also receive appeals from courts martial. The court, constituted as the *counsel supérieur* of the magistracy, has power to remove any judge nominated by the president of the republic. It consists of forty-nine members who, by the charter of Louis XVIII., are appointed by the head of the state, but hold office for life. The members include the first president, three sectional presidents and forty-five councillors with a parquet, i.e. ministerial staff, including a *procureur général* and six advocates-general. The court is divided into three sections: (1) Section des Requêtes, which examines whether the petitions or appeals are to be received; (2) Section de C. civile, which decides upon appeals in civil cases; (3) Section de C. criminelle, which decides upon appeals in criminal matters. The court does not decide upon the main question at issue, but only on the competency of the other courts to hear the particular case; and the legality of the forms and soundness of the legal principle by which the case has been already tried. Thus the functions of the Cour de C. are ordinarily restricted to errors of law and procedure, and strictly it is not a court of appeal at all; but in cases where evidence is adduced before it which was not available in the court below, it may send the case back for a new trial or enter the appropriate judgment. This was the course followed in the Dreyfus case in 1906. If the law is found to have been violated, the decision of the inferior court is annulled and the case sent to be tried again by another court. If this second court decides the case in the same manner as the first, and a petition is again laid before the Cour de C., then the three sections unite in order to examine the case anew, and if they in their turn annul the decision, the case is sent to be tried before yet another court. Should this third court decide in the same way as the other courts, and a petition against the decision be again presented to the Cour de C. that court requests a final explanation of the law on the point at issue from the legislature. If the court refuses the demand for a re-hearing its refusal is final. If the court grants the

demand the case is heard by the civil section, where, after the point is argued, annulment is granted or refused. Three judges of the Cour de C., elected for three years by the other judges of the court, are a constituent part of the Tribunal des Conflits. The institution of the Cour de C. proved highly beneficial to France. Placed by the nature of its office out of the immediate influence of political passions it has maintained its reputation for strict impartiality throughout all the changes of gov. and administration. Many of the most distinguished jurists of France are and have been numbered among its members.

Cassatt, Mary (1855-1926), Amer. painter, b. in Pittsburg, Pennsylvania, U.S.A. She went to Spain and afterwards to Paris to study art, where she soon came under the impressionist school of painters. She had her first exhibition of paintings in Paris in 1893, and, after that, for many seasons in Paris and New York. She specialised in painting women and children. Most of her works have found their way into permanent art collections in the big cities of the U.S.A.

Cassava, **Mandioc**, or **Madioc**, the name given to two varieties of *Manihot*, a genus of Euphorbiaceae. The plants are shrubs which grow to a height of about 6 ft. in tropical S. America, and their various products are very valuable. *M. utilisima*, the bitter C., contains a poisonous juice but when it has been driven off the plant is wholesome; the roots are ground to make mandioc or C. meal, also called Brazilian arrowroot, and the poisonous juice, or cassareep, is used as a condiment and preservative. The roots are also specially prepared to make tapioca. *M. Aipi*, the sweet C., has also edible tuberous roots; they are non-poisonous, and are grated directly into food, both for men and cattle. Both varieties are rich in starch.

Cassel, see KASSEL.

Cassel, Sir Ernest (1852-1921), Eng. financier and philanthropist, son of Jacob C., a banker in Cologne, where he received his education. He started life in a corn merchant's office in Liverpool, and upon

leaving there he went to London, where he soon found employment. In 1878, he married Annette, daughter of R. T. Maxwell, who d. in 1881. He financed the great Assuan dam in Egypt, also the Swedish railways, and the Central London tube railway, which was opened in 1900. He raised a loan for China, after the war with Japan, and assisted in the negotiating of three state loans for Mexico. In 1902 he presented to King Edward VII., with whom he had great friendship, £200,000 for the building of sanatoria for consumptives, and in Aug. 1910 he gave another £200,000 for the benefit of poor Eng. people in Germany and the poor Gers. in England. He retired from active business in 1910. When the First World War began, there was an ineffectual agitation against C., to have him removed from the Privy Council, of which he had been sworn in 1902. He was one of the largest subscribers to war loans, and in Sept. 1915 went to America in support of the Anglo-Fr. loan there. He d. at Brook House, Park Lane.

Cassel, Gustav (1866-1945). Swedish economist, educated at Stockholm and Upsala, where he took his doctorate in mathematics. Became prof. of political economy at Stockholm Univ. in 1904. Member of the gold delegation of the League of Nations, 1929-32 and, in 1933, Swedish delegate to the monetary and economic conference in London. He was an outstanding figure in economic science during the inter-war period, playing an important part in interpreting the abnormal monetary phenomena of the years between the wars. His *Theory of Social Economy* (1923) ranks as an outstanding work on economic theory, but he was first and foremost a monetary specialist, and was the leading theoretical expert on foreign exchange during the chaotic period after 1918. After 1911 he advanced the theory that under a system of inconvertible paper currencies the exchange rates tend to represent the ratio between the internal price levels of the countries concerned; in other words, they tend to adjust themselves towards what he called their 'purchasing power parities.' This conception was regarded as almost revolutionary in face of the old theory according to which exchange rates are determined by the trade balance; but he lived to see the general acceptance of his principle. Other works: *Money and Foreign Exchange after 1914* (1922); *The Downfall of the Gold Standard* (1936).

Cassel, John (1817-65). Eng. publisher, who founded the publishing firm Cassell & Co., was the son of an innkeeper at Manchester, and had only a poor education, but during his apprenticeship to a joiner, he contrived to gain much knowledge of Eng. literature and the Fr. language. In 1836 he came to London to work at his trade, but at this time his interests were mostly centred in the temperance cause. In 1847 he became a tea and coffee merchant, but soon gave up the business, and became an author and publisher. His chief ambition was to

supply good reading matter for the working class. In 1859 he entered into partnership with Messrs. Petter and Galpin, and in time numerous eds. of standard works were issued, also the well-known *Working Man's Friend*, *Family Paper*, and *Popular Educator*.

Cassia, genus of Leguminosae consisting of about 400 shrubs, trees, and herbaceous plants found in Asia, Africa, and America. The leaves are paripinnate, the flowers zygomorphic, some of the stamens are often reduced to staminodes or absent, and the pods have often a bitter, nauseous taste. Many of the species contain purgative properties, and yield the drug called senna, obtained either from the leaves or from the pulp of the fruit. *C. Fistula*, the purging C. or pudding-pipe tree, is a small tree with large yellow flowers, in long racemes, having the appearance of a laburnum, and is found wild in India and tropical Africa. This plant yields the C. pods or purging C. of commerce; *C. acutifolia* and *C. angustifolia* yield the senna sold by chemists. *C. lanceolata*, the Alexandrian senna-plant, is found wild in Arabia, whence it is exported under the name senna of Mecca. *C. Marilandica*, the Maryland senna-plant, is valued for the purgative properties of its leaves.

Cassia Buds, believed to be the immature fruits of *Cinnamomum Cassia*, which yields the aromatic C. bark used in the adulteration of cinnamon. In appearance they resemble cloves and in taste cinnamon, for which spice they are often used in confectionery.

Cassia, Via, one of the highways of ancient Italy. It led from Rome through Etruria to Florentia (Florence) and by way of Arretium and Luca (both in Etruria) and it deviated from the Via Flaminia just after crossing the Tiber. Though the date of its construction and the origin of its name are unknown, it was evidently a well-known road in Cicero's time (see *Philippics*). In the *Antonine Itinerary* it is confused with the Via Clodia.

Cassianus Bassus, Gk. writer of the sixth century, to whom have been ascribed *Geponika*, agric. treatises on rural economy (see *GEOPONIC*). An ed. with notes and index was pub. by N. Nicks at Leipzig in 1781. According to Seyffert, however, he was a Bithynian who lived about the middle of the twelfth century A.D. and undertook the work at the suggestion of Constantine VII.

Cassianus, Joannes Eremita, or **Joannes Massiliensis** (c. 360-448), monk and theologian, one of the first founders of monasteries in W. Europe. He was probably born in Provence, but spent his early life in a monastery at Bethlehem. With his friend Germanus he went to Egypt, Constantinople, and Marseilles, at which place he founded two religious houses, one a convent for nuns, and the other the abbey of St. Victor, which is said to have sheltered 5000 inmates during his lifetime. After his death he was canonised, and for a long time a festival was held at a certain season in his

honour at Marseilles. He opposed the doctrine of original sin in mankind. He wrote *De Institutione Coenobiorum*, and *Collationes Patrum*, treatises on monastic life.

Cassicus, genus of passeriform birds of the family Icteridae to which belong the Amer. orioles, or starlings. The species are distinguished chiefly by their long, straight, large, and sharply pointed bills. They are gregarious and feed on insects and fruit.

Cassidaria, genus of gastropod molluscs allied to *Cassia*, the helmet-shell. The species are found in the Mediterranean.

Cassides, group of coleopterous insects of the family Chrysomelidae, are often known as shield- or tortoise-beetles from their habit of withdrawing the head into the thorax. They are smallish, oval in shape, brightly coloured, and often metallic in appearance. The larvæ cover their bodies with dried excrement, so as to take from themselves all semblance of insects, e.g. some look like a tiny nest and some seem covered with lichen.

Cassini, name of an It. family of astronomers and geographers, of whom four generations have had charge of the observatory at Paris.

Giovanni Domenico Cassini (1625-1712) was b. at Perinaldo near Nice, and studied at the Jesuits' college, Genoa. In 1650 he was nominated prof. of astronomy at Bologna Univ. In 1657 he was made inspector of fortifications by Pope Alexander VII., and in 1669 he was made director of Paris Observatory. He determined the rotation periods of Jupiter, Venus, and Mars, discovered four of Saturn's satellites, and the div. of that planet's rings, etc.

Jacques Cassini (1677-1756), son of the former, was b. at Paris, and at the age of seventeen was admitted as member of the Academy of Sciences. Two years later he was made fellow of the Royal Society of London. In 1712 he succeeded to his father's position, and pursued various researches on the figure of the earth.

César François Cassini, de Thury (1714-84), son of the preceding, was b. in Paris, and succeeded to his father's position. He also continued the latter's surveying operations. He began the great topographical map of France, which was later completed by his son:

Jacques Dominique, Comte de Cassini (1748-1845), who also took an active part in the div. of France into depts. He helped to found the Institute.

Cassini's Ovals, see OVALS.

Cassino, tn., only a few jagged ruins of which now remain, in the prov. of Caserta, Italy, about midway between Rome and Naples. These remains are on the site of the anct. Casinum, which the Romans colonised about 312 B.C. In the tn. as it stood before 1944 were the ruins of a Rom. amphitheatre and many other old buildings. On a hill behind, 1700 ft. high, stood a famous old Benedictine monastery known as Monte C., founded by St. Benedict in 529. The site of the monastery was chosen by St. Benedict with a

view to defence against barbarian assault. The monastery was destroyed four times before 1944: in 589 by the Longobards; in 884 by the Saracens; in 1030 by the Romans; and in 1349 by earthquake. In 1866 it was dissolved, but some of the monks stayed on till almost the end. Its church possessed an eleventh-century Byzantine bronze doorway, also valuable frescoes, mosaics, and pictures. In the monastery was a theological seminary, a picture gallery, and a library of 40,000 vols. The pop. of C. was 19,000 before the Second World War. Nothing but a few walls and rubble of C. survived the Allies' bombing in 1944. The allied air forces, on March 15, 1944, dropped some 1400 tons of bombs on the tn. Thereupon ensued a protracted struggle for the ruins. The monastery had been previously attacked by the Allies as soon as it was estab. that the Gers. were using it as a fortress (see CASSINO, BATTLE OF). It was not, however, completely razed to the ground, for the W. end survived as far as the top-storey. The old tower at the S.W. corner lost its upper floors. But the great stairway was pulverised and the Cloister of the Benefactors was destroyed. Except for remains of piers, the basilica was demolished, as also the Cloister of the Prior, and the entire E. end was destroyed to the ground floor. But all the movable contents had been sent to Rome, including the contents of the library, which went to the Vatican. The rebuilding of the monastery started after the war.

Cassino, Battle of (Feb.-May, 1944), protracted battle for the tn. of C. and the Benedictine monastery known as Monte C., fought by the Fifth Army of Amer., Brit., and Fr. troops and, later, also by troops of the Brit. Eighth Army and some Polish troops, against the Ger. forces under Marshal von Kesselring, in the course of the allied invasion of Italy during the Second World War. The site of the famous Benedictine monastery or abbey, Monte C. and the tn. of C. and its surrounding heights, have provided a standard example of defence in It. military text-books for more than eighty years before the battles of 1944. The Allies, having on Feb. 1 crossed the Rapido R., Amer. and Fr. colonial troops of the Fifth Army broke through the Ger. Gustav line—a strongly fortified line running through Castel di Sangro, C., Castelforte, and Minturno—and bore down on C. There followed four house-to-house fighting in the tn., and by Feb. 11 part of it was in ruins. On Feb. 13 the Allies prised the Gers. out of the fortified basements of C. prison and, two days later, Amer. forces held about one-third of the tn. Having ascertained, beyond all possible doubt, that the Gers. were using Monte C. as a stronghold, the Allies prepared to bomb the monastery in the hope of removing the strongest enemy defence of the road to Rome and of C. itself; and on Feb. 15 the monastery was subjected to an aerial bombardment, accompanied by an artillery assault on the Ger. positions in and around C. and

far back in the Liri valley S. of C. But no decision was reached for the possession of C. and the situation remained a stalemate, with only desultory artillery exchanges, until March 15. On that date C. was heavily bombed, the Allies dropping some 1400 tons of bombs on an area of less than one square mile—a unique concentration even for this war. This bombing attack was part of a general plan of attack, for, immediately the bombing ceased, Brit. and Amer. artillery shelled Ger. positions in and around C., and infantry pressed forward

above the tn. the broken abbey stood like rough spikes of rock on a hill-top. On March 17 New Zealand forces led an assault on the tn., while Indian forces took some hill positions overlooking it. By now, however, remnants of buildings and masses of debris, much of it resistant to high explosive, had been improvised by the enemy as strong-points and snipers' nests. It now became obvious to the Allies, ironically enough, that an immense amount of rapid repair work was necessary to enable tanks and transport to advance at all through C. where there were craters

Imb War Museum: Crown copyright

THE MONASTERY OF CASSINO, MAY 18, 1948

in the C. area, while aircraft bombed enemy centres of communication. On March 16 allied tanks and infantry entered C. and penetrated enemy positions in the hills N.W. of the tn. But the Allies now found their advance held up by the terrible devastation wrought by the air assault. The Gers. took full advantage of the masses of rubble as sites for mortars against Brit. efforts to clear a path for tanks; and thereafter the battle for C. pursued a grim course among the ruins and rubble of the tn. Much of the tn. of C. had been built flush with the rock of the hillside up which wound the road to the monastery, and in its remnants of shattered walls C. now looked as if it were mainly a series of caves in the hillside. Castle Hill, a low spur rising sheer within the tn. on its N. side, stood like a steep crag, its pinnacle a jagged rock unrecognisable as buildings, while high

40 ft. deep and full of water. Some progress was made on March 19, the New Zealanders overcoming resistance except in two especially strong points—the rubble of the Hôtel Continental, which faced the Via Casilina as it turns S. in its course through C. and which provided a highly effective emplacement for two Ger. tanks which were built into the ruins; and near by, on the other side of the road, the remains of the Hôtel des Roses, which two centres of resistance commanded what was the main street of the tn. along most of its course. Other enemy strongholds were lodged in the old Rom. amphitheatre and in the ruins of the ducal palace, both W. of the railway station and commanding the approaches from it and the roads westward from C. But such progress as the Allies made was always delusive because the Gers. were still in possession of many heights overlooking C. On the same date

Castle Hill, which had been taken previously and lost, was retaken by Indian troops. Hand-to-hand fighting went on with undiminished fury. But by March 26, though continual and bitter fighting was still in progress, the battle for C. was now more or less a stalemate once again, and, for some time, the struggle died down to desultory artillery duels. Throughout the ensuing six weeks before the tn. fell in May, the allied positions and those of the enemy in the tn. were so close upon each other in a series of loosely formed lines—reminiscent of the opposed forces at Stalingrad—that the least observable momentary movement of head or limb generally meant death or wound from snipers. Meanwhile the Brit. command spent the interval in further preparations, regrouping their forces and secretly moving the Eighth Army to the W. side of the front. The Fifth and Eighth Armies resumed the offensive on the whole It. front on May 11 and the brunt of the most violent fighting fell on the C. sector after large forces had crossed the Rapido R. The Gers. again resisted stubbornly and, N. of C., five abortive counter-attacks were delivered by them on May 14. But Brit. troops were now advancing on C. up the It. valley towards the Via Cassilina, while N.W. of the tn. Polish forces had, at heavy cost, gained vital positions N.W. of C. and the abbey, while, as part of the general pattern of the offensive, Fr. colonial and Amer. forces were breaking through the Gustav line along the S.W. of the front. The Gers. defending C. now found themselves in danger of being outflanked by the Brit. and the Poles and so began to withdraw from the Gustav line between the coast and C. while still struggling to keep their hold on the Via Cassilina. On May 18 C. fell, at last, to Brit. troops, and the abbey was captured by the Poles. The Via Cassilina had been cut and a large proportion of the Ger. 1st Parachute Div. destroyed in its efforts to escape at the last moment. Thus ended what may be compendiously called the B. of C. A few prisoners were taken by the incoming Brit. troops, to whose eyes was presented a scene of pitiful desolation such as only this war could produce. The last Ger. stronghold, the Hôtel Continental, or its remains, was blown up by the Gers. as they left—their Parthian dart. A crypt below the chapel of a convent was found to have received over one hundred direct hits but was impenetrable by anything less than a 1000-lb. bomb, which is some measure of the protection which the Gers. enjoyed throughout after the bombing of C. the previous March. See also under ITALIAN FRONT in THE SECOND WORLD WAR; WORLD WAR, SECOND. *Allies' Invasion of Italy.*

Cassiodorus, Flavius Magnus Aurelius (c. 490–c. 585), Rom. historian, statesman, and man of letters, was b. at Scylaceum in Calabria of a distinguished family. He rose to positions of responsibility under Theodoric, being sole consul in 514. After the death of this prince in 526, he

was chief minister for some years, but about 540 he retired from public life, and it is possible that he then became a monk. He is our chief authority for the hist. of the Gothic kingdom of Rome. His most important work, *Variae*, contains the decrees of Theodoric and his successors, and his own edicts when chief minister, etc. His other chief works are *Institutiones divinarum et humanarum litterarum*, and *Historia Gothorum*, of which we possess only a later epitome.

Cassiopeia, constellation in the N. hemisphere, not far from the N. Pole and close to Cepheus. In Nov. 1572, according to the observations of Tycho Brahe, a new star of great brilliancy blazed out here for ten days. Its brilliancy then diminished, and at the end of sixteen months it disappeared. According to the Gk. fable, C. was the wife of Cepheus and mother of Andromeda, placed in the heavens with her head from the pole, so as to turn round apparently upside down because, according to Hyginus, she boasted of her own beauty as superior to that of the Nereids.

Cassiquiare (*Cassiquiare*), deep, rapid riv. of Venezuela, S. America, forming the Orinoco's S. bifurcation. Issuing from R. Orinoco it enters R. Guainia, a branch of Rio Negro, near San Carlos, widening from 300 to 600 yds. It establishes water communication between the Amazon and Orinoco Rs.

Cassiterides, group of is. first mentioned by Herodotus as the place where the Phœnicians exchanged their wares for tin. They were fixed to the W. of Spain, and have been identified with the Scilly Is. and Cornwall, or the Brit. Is. as a whole. Others have suggested various small is. off the Sp. coast.

Cassiterite, or **Tin-stone**, prin. ore of tin, and is the binoxide of that metal with sometimes a little peroxide of iron, manganese, and silica. Its common name is tin-stone. It is a black or brown crystalline substance, the crystal form being tetragonal prisms terminated by tetragonal pyramids. It has a brilliant adamantine lustre. To obtain the metal from the ore it is crushed and washed and then heated in a furnace with charcoal and lime to remove the oxygen. The metal so obtained is purified by first heating it upon the hearth of a reverberatory furnace until the more fusible tin melts and flows away from the alloys mixed with it as impurities. Afterwards it is stirred with green wood, when the other impurities are carried off with the scum so formed. These consist generally of copper and arsenic. The Malay States (Negri Sembilan, Pahang, Perak, and Selangor), the Dutch E. Indies, and Bolivia supply over three-fourths of the world's tin-ore. The rest is produced chiefly in Cornwall (where the matrix has to be crushed to concentrate the finely divided ore), Siam, China, S. Africa, and Australia.

Cassius, Avidius (d. A.D. 175), Rom. general under Marcus Aurelius. He distinguished himself greatly in the Parthian war, and was therefore made

military governor of Asia. In 175, Aurelius was ill, and C. proclaimed himself emperor on the strength of a rumour of his death. He was slain by his own soldiers before steps could be taken against him.

Cassius Longinus, Gaius: 1. Rom. general and conspirator. He was the motive force in the conspiracy which resulted in the death of Julius Caesar. In 53 B.C. he served as questor in the Parthian war under M. Licinius Crassus, and earned fame by his masterly bringing off of the remains of the Rom. Army, after the defeat at Carrhae. After the battle of Pharsalus, he became reconciled to Caesar, whereas before he had sided with Pompey. For some time things went smoothly, but then he was offended at the appointment of M. Junius Brutus, whose sister he had just married, as praetor urbanus. After the assassination of Caesar, he went to Syria and crushed Dolabella. When the triumvirate was formed, he was with Brutus at Philippi, and, his own wing being defeated, he ordered his freedman to kill him (42 B.C.). Brutus lamented him as 'the last of the Romans.' 2. Rom. jurist, governor of Syria, A.D. 50 in the reign of Claudius. He was banished by Nero in A.D. 66, because he had, among his ancestral images, a statue of C., the murderer of Caesar. Recalled by Vespasian. He wrote ten books on the *ius civile*, and some other works. 3. **Cassius, Lucius Longinus**, tribune 137 B.C., author of the celebrated legal maxim *Cui bono?*

Cassius Gaius, called *Parmensis* after Parma, where he was b. He assisted in the assassination of Caesar, and after the battle of Philippi joined Pompeius. He afterwards went over to Antony, and when they had been defeated at the battle of Actium, he was put to death by Augustus, 30 B.C. He was a poet, and his productions were prized by Horace.

Cassius Viscellinus, Spurius, Rom. soldier and statesman, and founder of the first agrarian law. He was three times consul, in 502, 493, and 486 B.C. His agrarian law so offended the patricians and other wealthy citizens that he was put to death by them: some say the deed was committed by his own father. But according to Mommsen, the story is pure invention.

Cassivellaunus, Brit. chieftain who ruled the dist. N. of the Thames at the time of Caesar's second invasion (54 B.C.). After some Brit. successes, Caesar took the camp of C., and the chief was compelled to promise tribute and make submission.

Cassock (Fr. *casaque*), military cloak. It was the name given in former times to the costume worn by soldiers, and it is not until a comparatively recent date that the word was used in an eccles. sense. The ant. style of Eng. C. was a double-breasted robe fastened at the shoulder, with sometimes the addition of a girdle at the waist. For all orders of the Eng. clergy black is the usual colour, though on some occasions purple is worn. In the Rom. Catholic Church it varies in colour according to the rank of the wearer.

Casson, Mrs. Lewis Thomas, see THORNDIKE, SYBIL.

Cassowary, or **Casuarium**, typical genus of the ratito family Casuariidae, which are found only in the Australian regions, and are closely related to the emeus. About ten species exist, which are generally divided into two groups, those with the helmet laterally compressed and those with a pyramidal helmet. The plumage of both sexes is a glossy black, the wings and tail are very small and the hen is larger than the cock. They are running birds with great powers of leaping, and when attacked they kick forward with their feet. They live in pairs in wooded

CASSOWARY

dist. and the cock usually incubates the eggs, about six in number, which the hen lays in a nest of leaves and grass. *G. benetti*, the mooruk, is the most common species.

Cast (moulding), see CASTING.

Castagno, Andrea del (1390-1457), It. painter, was b. at Castagna, in the dist. of Mugello. He was a member of the Florentine school, but may be called a draughtsman rather than a painter. His works are bold, but are often deficient in grace and delicacy. He d. of the plague at Florence.

Castaldi, Pamfilo (1398-1490), It. poet and humanist, b. at Feltré in Lombardy. He founded a school there, which earned great renown among foreign nations, and in which he became the teacher of the It. language and literature. Some It. writers, amongst them Bernardi, say that C. was the real inventor of printing with movable types, and that Johann Fust, who is supposed to have been one of C.'s pupils, and intimate friend, gave away the secret to Gutenberg. It is also alleged that in 1472 Galeazzo Sforza gave C. the authority to establish a printing press at Milan. See J. Bernardi, *P. Castaldi e l'Invenzione dei Caratteri Mobili per la Stampa*, 1865.

Castalia, fountain in Greece, now known as the Fountain of St. John, on Mt. Parnassus, sacred to Apollo and the Muses. It is named after C., daughter of Achelous, who threw herself into it to evade pursuit from Apollo.

Castalion, or **Chasteillon**, **Sebastiën** (1515-63), Swiss Protestant theologian and humanist, was b. near Bresse. In 1541 he visited Calvin at Strasburg, and in the same year the latter made him head of the college at Geneva. He was compelled to leave on account of small differences with Calvin, and lived in great poverty at Basle, till he was appointed prof. of Gk. in 1533. He pub. various works.

Castanea, small genus of Fagaceæ found in N. lands, the fruit of which is the chestnut. The horse-chestnut (*Aesculus Hippocastanum*) differs from this plant in order and everything but that is has a prickly fruit. In Spain, S. France, and Italy the fruit of the cultivated species is eaten raw, roasted, or ground into flour, and is extremely nutritious. The wood resists well the influence of water, and is well suited for mill-timber, water-works, and pallings; the bark is used in tanning. *C. vulgaris* yields the edible sweet chestnut, which is developed from three female flowers, whose parts are enclosed in a prickly capsule.

CASTANETS

Castanets (Fr. *castagnettes*, Ger. *Kastagnellen*, Sp. *castañuelas*), musical instruments of percussion, introduced into Europe from the E. by the Moors, and are used in dancing. They are made of two hollow shells of hard wood, fastened together by a cord, which is passed over the thumb and first finger. They are used in pairs, one in each hand, and are struck against one another, which produces a series of clicks, thus marking the rhythm of the music. They were used by the Gks. and the Romans to accompany their Bacchanalian dances.

Castanos, **Don Francisco** (Xaver) **de**, **Duke of Ballen** (1756-1852), Sp. general, b. in Madrid. In early youth he entered the army, and went to Berlin in order to study military tactics under Frederick the Great. In 1808 he defeated 80,000 Fr. under Gen. Dupont de l'Étang at Ballen, but was himself beaten by Lannes at Tudela the same year.

Castanospermum australe, Australian chestnut, constitutes in itself a genus of the Leguminosæ. The plant is a tree 30 to 40 ft. high, its foliage affords an excellent shade, and the fruit when roasted resembles a chestnut in flavour.

Caste (from Portuguese *casta*, breed, Lat. *castus*, pure, chaste), term generally employed to denote the div. of Hindu society into various sections or Cs. It has also been employed for any distinctions of class in any nations which have a similar exclusive effect. The system has prevailed in a greater or less degree among most peoples of the world. There are few traces of it amongst the Germanic races, and the idea derived from Herodotus that the Egyptians had a C. system was exploded by J. Ampère. However, it was found strongly marked in Peru, and ant. Persia had its threefold div. of the followers of Ahura Mazda into Atharvas (priests), Rathasvas (warriors), and Vastriyas (husbandmen), as the Zend Avesta tells us. The same distinctions are even now found in Africa and Polynesia, and the European social system is of a somewhat similar nature. However, it is in India that the C. distinction is found in its most fully developed form, and here it is most intimately connected with religion. According to a somewhat late hymn of the Rig-veda, possibly interpolated, the origin of the Cs. is to be carried back to their birth from Brahma, when the Brahmans sprang from his head, the Kshatriyas from his arms, the Vaishyas from his thighs, and the Sudras from his feet.

The C. system of India is probably tribal in origin. The Aryans and their retainers, by a process of natural selection, gradually resolved themselves into four classes—namely (1) Brahman or priestly C., composed of the Kshis, their descendants and disciples, to whom was entrusted the expounding of the Vedas and the conduct of religious ceremonies; (2) the Kshatriya, that is Rajput or governing and military C., composed of the maharajahs and their warrior kinsmen and companions, whose duty was to rule and fight, and administer justice and protect the community in general. This C. is represented in modern times by the Rajput and the Khatri. (3) The Vaisiya, a trading and agric. C. which, assisted by the conquered aborigines, tilled the land, raised cattle, and manufactured the arms and implements and household utensils required by the Aryan commonwealths. This C. is now represented by the Banya. (4) Besides the three Aryan Cs., but immeasurably beneath them, there was the servile or Sudra C., composed of captured aborigines, whose lives had been spared, and of the progeny of marriages between Aryans of different Cs., and of Aryans and the women of the country, all of which, by the rigid exclusiveness of the C. system, came to be regarded as degraded. Broadly speaking, the origin of the C. system was self-protection, and in India a man withdrew himself into a C. as a refuge from oppression and, in time, came to pride himself on being, not a citizen, but an

outsider. Thus the Gonds from being a people sank into a C., and the largest of the Indian Cs. are, as indicated above, probably tribal in origin. The vast majority of Indian Cs., however, correspond to a difference of environment rather than of race, and, to-day, there are great numbers of Cs., throughout the country which represent the different callings in the various provs. Every vocation is occupied by its own C. or Cs., which may not marry nor even eat with other Cs. But no C. of occupation is general throughout the country, for each prov. has a separate gradation of its own. The one C. that pervades all India is the Brahmin, which is subdivided into innumerable sections, between whom there can be no alliance of bride and bridegroom. There are Hindu Cs., such as the Sikh, which have originated as the disciples of religious reformers, and, indeed, this kind of C., produced by local religious revivals, is in many cases of very recent origin. Certain Cs., too, claim to be hybrids, having originated from intermarriages between men of a higher and women of a lower C., thus, e.g. the Eurasians, a community of the larger cities, sprang in modern times from alliances between Europeans and Indians. Mixed alliances have not always been prohibited, and before the C. system became finally estab. the marriage of men with women of lower grades of society were common, until the occupants of those grades, resentful of the position, forbade their women to marry outside it.

It has been justly said that never has human society been more complicated or artificial than in the C. Members of a C. are isolated from all others by their marriage laws, social customs, religious practices, and precedence. Marriage outside the C. is an abomination, while within the C. it is limited by strict rule. Each C. contains groups, and bride and bridegroom should come from different groups. Even in matters of eating and drinking and social intercourse the C. has become an isolated unit, and eating and drinking are still ceremonial rites, tinged with symbolism. Totems and fetishes are a feature of the C., and representative implements of the C. are held in reverence, and once a year are formally worshipped. To touch the fetish of a C. is a sacrilege, and this or other minor breaches are visited with fines. It is generally accepted that the C. system in its present rigidity is a development of comparatively recent Hindu hist., and in the present day the process of C. subdivision still continues, old Cs. producing new as offshoots. The rise of some separate Cs. may correspond to a rise in social status, but in other cases the reverse holds good, as when, e.g., the Rajputs took to the cultivation of vegetables or the Brahmins used the plough. Amalgamation of different Cs. only arises from religious reform, and it is to such influence that the Sikhs owe their separate identity; and this, too, is the explanation of the development of the theistic community which in recent years grew up in Bengal under the name of the Brahma Samaj

(q.v.). But apart from these religious revivals, which have had no great effect as consolidating influences, the tendency is still towards the isolation of the C. unit. Whether, however, the present awakening of autonomous aspiration, coupled with the demand of educated Indian women for greater freedom of outlook and opportunity, will give an impetus to this idea and modify the rigidity of the C. system remains to be seen.

See report on 'Caste, Tribe, and Race,' in 1901 *Indian Census Report*; E. Thurston, *Castes and Tribes of Southern India*, 1908; B. Fuller, *Studies of Indian Life and Sentiment*, 1910, 1917; K. Mayo, *Mother India*, 1927, 1931; C. S. Ranga Iyer, *Father India: a Reply to 'Mother India'*, 1927; E. Senart, *Caste in India*, 1930; Report of the Simon Commission, 1930; S. S. Nehru, *Caste and Credit in the Rural Area*, 1932; Dr. G. Chand, *India's Teeming Millions*, 1939.

Castel, Castello (from It. *castello*, Sp. *castillo*, from Lat. *castellum*, dimin. of *castra*, camp), prefix added to names of various tns., etc., in Italy, France, and especially in Spain and Portugal.

Castelar, Emilio (1832-99), Sp. orator and statesman, b. at Cadiz. He became known for his eloquence in political matters, and in 1864 founded *La Democracia*, in which he wrote bitterly against the gov., and thereby lost his professorship. After an insurrection in 1866 he was condemned to death, but was able to escape to Paris, returning when the revolution of 1868 began. In 1873 he assisted in the downfall of King Amadeus, and the same year was made dictator by the Cortes, but when Alfonso XII. was proclaimed king of Spain, he retired into exile for fifteen months, and was then elected deputy for Barcelona. The remainder of his life he devoted to the study of hist. and philosophy.

Castelbuono, tn. of Sicily, 8 m. S.E. of Cefalù; it contains an old Benedictine monastery; also mineral springs. Pop. com. 11,000.

Castel di Sangro, city of Apulia, Italy. The lower part of this old tn. was almost entirely destroyed by Ger. demolitions in 1943, and the upper tn. suffered severely from ground fighting. The sacristy of the cathedral was fired by the Gers. The churches of San Giovanni and San Nicola were completely destroyed and the cathedral was the only undamaged church (apart from its sacristy). Pop. 10,000.

Castelfidardo, tn. and com. of Italy, situated in the prov. of Ancona, 10 m. S. of that place. A victory was won here by the Piedmontese over the papal troops in 1860. Pop. com. 7,000.

Castelflorentino, tn. of Italy, in the prov. of Tuscany, situated on the R. Elsa, about 20 m. S.W. of Florence. The tn. suffered heavily in the Second World War, but its two outstanding monuments, San Francesco Church and the Chapel of the Visitation, were spared. Pop. com. 12,000.

Castelfranco: 1. Tn. and com. of Italy, in the prov. of Bologna, 16 m. N.W. by rail from the city of that name. The

manuf. of matches is carried on. The churches contain many valuable pictures of the Bolognese school. Pop. 17,000.

2. Also tn. in the prov. of Treviso, situated on the Musone. It is famous as the bp. of the painter Giorgione, and also for a victory gained by the Fr. in 1805 over the Austrians. There are manufs. of silk and woollen goods. Pop. 17,000.

Castel Gandolfo, tn. of Italy, in the prov. of Rome, and 14 m. S.E. of the city of that name. It is situated on a volcanic slope 400 ft. above Lake Albano. Here in the seventeenth century Pope Urban VIII. built a castle which was used as a summer residence by the popes until 1870. It reverted to the papacy under the Lateran Treaty of 1929. Pop. com. 3,000.

Castellammare: 1. Fortified and seaport tn. of S. Italy, 17½ m. S.E. of Naples. It lies on a sheltered portion of coast on the gulf of Naples, where it commands a magnificent view. In the fifteenth century it was pillaged by Pope Pius II., and again in 1654 by the duc de Guise. Its name is taken from the castello which was built there in the thirteenth century by Emperor Frederick II. The chief industries are the manuf. of cotton and macaroni. Pop. 30,000. 2. Tn. in Sicily 45 m. W.S.W. of Palermo. Trade in cotton, wine, corn, olive-oil, and anchovies. It stands at the head of a gulf of the same name. Pop. 18,000.

Castellamonte, mkt. tn. of Italy, in the prov. of Piedmont, 10 m. S.W. of Ivrea, and 20 m. N. of Turin. It has an old castle, and a large market-place. The prin. industry is the manuf. of earthenware. Pop. com. 6000.

Castellan, keeper of a castle in medieval times. In different countries his rank and office varied. In Franco and Flanders the owners of certain domains held the title, which ranked next to that of bailiff.

Castellana, tn. of Italy, in the prov. of Bari, situated on the Adriatic coast. It is 26 m. S.E. of Bari and 8 m. S.W. of Monopoli. Pop. com. 12,000.

Castellaneta, tn. of Italy, 24 m. N.W. of Taranto. It possesses a cathedral, and is the see of a bishop. Pop. com. 11,000.

Castellazzo, tn. and com. of Italy, in the prov. of Piedmont, 5 m. S.W. of Alessandria. Pop. com. 6,000.

Castelleone, tn. of Italy, in the prov. of, and 16 m. N.W. from, the tn. of Cremona, also 12 m. S.E. of Lodi. Pop. com. 10,000.

Castellesi, Adriano (1460-1521), It. cardinal and writer. Came to England on a papal mission and was made bishop of Hereford and, later, of Bath and Wells. Recalled to Rome by Pope Alexander VI. and made a cardinal. Was a good Lat. scholar and wrote *De Vera philosophia ex quatuor doctoribus Ecclesie* (1507); *De Venatore* (1512); *De Sermone latino et modo latine loquendo* (1513).

Castello, Sebastiano (1515-63), Fr. theologian, b. in Savoy, the original form of his name being Sébastien Châtillon. He studied at Lyons, and in 1540 became a teacher in a school at Geneva. His

religious views, however, did not coincide with those of Calvin, to whom he owed his position, so he was obliged to resign, and went to Basle, 1544. Here he was appointed prof. of Gk., 1553, and here he d.

Castello Branco, episcopal city of Portugal. It has an active trade in wine, olive oil, and cork, and possesses noted marble quarries. Many Rom. remains bear testimony to its great antiquity. Pop. 10,000.

Castello-Branco, Camillo, Visconde de Correia Botelho (1825-90), Portuguese author, b. at Lisbon. Studied in Oporto and Coimbra. Early an orphan bereft of both parents, he began his career of letters in order to gain a livelihood. Later on he went to the Episcopal Seminary in Oporto with the intention of entering the priesthood. He took orders, but his restlessness and want of stability forbade his keeping to one thing for any length of time, and in due course he resumed his former occupation. The best of his imaginative romances, written in the manner of Victor Hugo, are *O Romance de um Homem Rico*, *Retrato de Ruardina*, and *Os mysterios de Lisboa*. He was pioneer of novels of Portuguese social life and was excelled only by E. de Queiroz. Among his historical and biological books are *Noites de Lamego* and *Memorias d'a Bipo do Grão Para*. Created viscount, 1885, in recognition of his service to letters.

'Castello, De,' see VERGIL, POLYDORÉ. **Castello de Vide**, tn. of Portugal, in the prov. of Alentejo and the dist. of Portalegre, 40 m. S.E. of Abrantes. It has manufs. of cloth. Pop. 5000.

Castellon, or **Castellón de la Plana**: 1. Prov. of Spain in Valencia, bordering on the Mediterranean. There are silver and lead mines and factories of scarves, mantles, etc. Fishing is the chief industry. Pop. 308,000. 2. Cap. of the above prov. about 2½ m. from the Mediterranean. Field-gardens are cultivated, watered by the Nijares, whose waters are brought to the tn. by a magnificent aqueduct, Canal de Castellón. The tn. has manufs. of linen and woollen goods, earthenware, paper, and fire-arms, and is a centre of exports of fruit and wine. In the church of La Sangre are some fine works by the painter Francisco Ribalta. Pop. 36,600.

Castelnau, Noel Marie Joseph Fdoudard, Vicomte de Currières de (1851-1944), Fr. general, b. Dec. 24, at Saint-Affrique, Aveyron, where he attended the Jesuit school. After taking a science degree at Paris, he entered Saint-Cyr military school in 1869. He became general of div., 1910; assistant chief of staff, 1911. On outbreak of war, 1914, he commanded the Second Army in Lorraine. Afterwards employed between Somme and Oise, and in Champagne, and in Dec. made chief of staff. In Dec. 1915 he was sent on a mission to Salonika. When the Ger. attack was concentrated on Verdun (Feb. 1916), C., sent thither with overriding powers, safeguarded the r. b. of the Meuse. In Jan. 1917 he went on a mission to Russia. The great offensive planned

in 1918 was to have taken effect under his command in Nov., but Marshal Foch forestalled this plan and peace was declared. C. later entered the Chamber of Deputies as member for Aveyron (1919-24).

Castelnaudary (*Castrum Novum Arianorum*, previously *Sostomagus*), tn. of S.W. France, dept. of Aude, near the canal du Midi. It is finely situated, and possesses various interesting buildings. There are flour mills, manufs. of earthenware and woollens, and foundries. Pop. 8000.

Castelnouvo, seaport and com. of Yugoslavia, situated near the entrance to the gulf of Cattaro. Brass is manufactured. Pop. 1500.

Castelnouvo Berardenga, tn. of Italy, in the prov. of Tuscany, about 10 m. E. of Siena. Pop. com. 11,000.

Castel San Giovanni, tn. and com. of Italy, in the prov. of Piacenza, and 15 m. W. of the city of that name. Pop. com. 11,000.

Castel San Pietro, tn. and com. of Italy, in the prov. of, and 12 m. S.E. from, the tn. of Bologna. The churches of Santa Maria Margiore (par. church), San Bartolommeo, and the oratory of the Crucifixion were slightly damaged in the fighting of 1944. Pop. com. 16,000.

Castelvetro, tn. of Sicily, in the prov. of Trapani, and 25 m. S.E. of that place. It is chiefly notable for the production of white wines, which are considered the best in the is. Coral and alabaster ornaments are made, and there are manufs. of silk, flax, and cotton. Pop. 25,000.

Casti, Giovanni Battista (1721-1803). It. poet, was b. at Prato in Tuscany, and early took orders. He taught for some time in the seminary of Montefiascone, but then gave up his hope of advancement in the Church and his canonry of the cathedral for the sake of travel. In the service of Joseph II. of Austria, he visited most of the European courts, and on his return that monarch gave him the position of *poeta cesareo*, or poet laureate. In later life he resigned this position to avoid political strife, and settled in Paris as a private gentleman, to remain there till his death. His chief works are *Novelle galanti* (1793), a collection of tales in ottava rima, of which the plots are chiefly taken from La Fontaine and Boccaccio, and *Gli animali parlanti* (1802), an elaborate poetical allegory.

Castiglione, tn. and com. of Sicily, in the prov. of Catania, and 25 m. N.E. of the city of that name. It is noted for the quantities of filbert nuts grown there. Pop. com. 20,000.

Castiglione, Baldassare (1478-1529). It. statesman and man of letters, was b. at Casanatico, near Mantua, and received his education at Milan. About the year 1500 he entered the service of Guidobaldo da Montefeltro, duke of Urbino, whose court was one of the best in Italy. This prince sent him on an embassy to Henry VII. of England in 1506, and in 1524 he was charged by Pope Clement VII. with the difficult task of arranging a dispute between the sovereign pontiff and Charles V. This carried him to Spain, where he

was later naturalised and became bishop of Avila. He d. at Toledo, broken-hearted, it was said, at imputations of treachery which had been made against him. He was universally mourned, and Raphael's painting of him is well known. C.'s greatest claim to fame rests on his book, *Il Cortegiano*, written in 1514, which describes, in the form of dialogues, the composition of the ideal courtier. It is one of the noblest expressions of the Renaissance spirit, and has been trans. into most European languages.

Castiglione, Duke of, see AUGEREAU. **Castiglione Fiorentino**, tn. and com. of Italy, 10 m. S.E. of Arezzo. There is a Plarist college and also a large orphanage. The tn. was terribly damaged in the Second World War, and the fine houses and the city gates were demolished; the church of San Francesco lost its roof as also did that of San Lazzo, but the church of the Gesù was unharmed. Pop. com. 15,000.

Castiglione, Giovanni Benedetto (1616-1670), It. painter of the Genoese school, known in Italy as Il Grechetto (the Little Gk.), and in France as Le Bénédette, was b. in Genoa, and studied under Vandyck. He painted landscapes as well as historical pieces. His etchings are distinguished by light and shade effects. His best-known work is 'The Animals entering the Ark.'

Castiglione del Lago, tn. of Perugia, Italy. It was shelled in the stubborn fighting W. of Lake Trasimene in 1944. The church of the Maddalena was much damaged, but an altar-piece, attributed to Raphael, had previously been removed to safety.

Castiglione delle Stiviere, city of Lombardy, N. Italy, in the prov. of Como, 22 m. N.W. of Mantua. It is defended by an old castle, and is noted in hist. for a victory gained by the Fr. over the Austrians in 1798. Pop. com. 8000.

Castile (Sp. *Castilla*, from *castillo*, a castle), former kingdom of Spain, occupying the central tableland of the peninsula. The highest mts. are the Sierra de Gredos (Plaza de Almangor, 8730 ft.) and the Sierra de Guadarama (Pico de Penalara, 8100 ft.). The average altitude of the N. plateau is 2500 ft. Old C. or Castilla la Vieja occupies the N. dist., and New C. or Castilla la Nueva the S. part of C. The N. region is watered by the Duero and its affluents, but in the summer is very dry and barren. In the S. flow the Jucar, Tagus, and Guadiana. The valleys are very fertile. The kingdom of C. was formed during the eleventh century, and was united to the kingdom of Leon in 1230. In 1085 the Moorish kingdom of Toledo was conquered and added to the Castilian realm. Toledo became the cap., but Valladolid was also used as the royal residence. By marriage of Ferdinand of Aragon and Isabella of C. in 1469, the two kingdoms became united ten years later. In 1492, by the conquest of Grenada, the whole of Moorish Spain came under Christian rule. The chief

industries of the inhab. of Old C. are cotton and linen weaving and stock-breeding. Olives, saffron, pulse, and grain are cultivated in New C. The inhab. engage in stock-breeding and the manuf. of coarse woollens.

Castilho, Antonio Feliciano, Visconde de (1800-75), Portuguese poet, b. in Lisbon. He was blind from the age of six. In 1821 he pub. *Cartas de Echo e Narciso*, which attracted much attention. *Amor e melancholia* (1828), *A Primavera* (1837), and *O Outono* (1863), are the poems on which his reputation stands. During the revolution of 1845 he was obliged to take refuge in the Azores, and did not return to his native land till 1863. His play *Camoens*, adapted from the Fr., was completed in 1849. C. won a high reputation for scholarship. He trans. the *Metamorphoses* of Ovid in 1841, and the *Georgics* of Virgil in 1865. Consult the *Memorias* by his son, Julio de C., 1881.

Castilla la Nueva (New Castile), one of the historic divs. of the Iberian peninsula. It comprises the five provs. of Guadalajara, Ciudad Real, Madrid, Toledo, and Cuenca. It was in anct. times inhabited by the Celtiberian tribes. See CASTILE.

Castilla la Vieja (Old Castile), one of the historic divs. of the Iberian peninsula. It comprises the eight provs. of Palencia, Valladolid, Avila, Soria, Logroño, Segovia, Santander, and Burgos, and, in the form of an elevated plateau, extends as far as the bay of Biscay. See CASTILE.

Castillejo, Cristóbal de (c. 1494-1556), Sp. poet, b. at Ciudad Rodrigo, Salamanca. He was attached to the Emperor Ferdinand I., brother of Charles V., first as a page and later as secretary, and spent many years in Germany. His poems were first ed. in 1573, and later in 1598 and 1600. He strongly opposed the poetical innovations of the school of Boscan, which sought to introduce lt. metres, such as the sonnet and the *terza rima*, into Sp. literature. His poems are written in a gay or satirical vein, and have plenty of verve. A complete ed. of his works was pub. in Madrid in 1792.

Castillo de Locubín, tn. of Spain, in the prov. of Jaen, and 18 m. S.W. of the tn. of that name. Pop. 8000.

Castillo Solórzano, Don Alonso del (c. 1580-1643), Sp. writer. Remembered chiefly for picaresque stories which have formed the foundation of stories by far better known authors like Le Sage and Scarron. Le Sage's *Gil Blas* is much indebted to C.'s *Adventures of Trapazán*; Scarron's *Don Japhet d'Arménie* is based on C.'s *Marqués del Cigarral*; while Thomas Corneille's *Bertrud de Cigaral* is only an imitation of C.'s story. Other works include a Seville romance, pub. 1634 and trans. into Fr. 1661 as *Fouine de Séville* or *Hameçon des Courses*; *Tardes entretenidas* (1625); *Jornadas alegres* (1626); and *Teresa de Manzanaro* (1634) (novels); *Las Harpías en Madrid* and *Piezas del Jardín* (plays).

Castillon, tn. in the dept. of Gironde, France, on the R. Dordogne, 33 m. E. of Bordeaux. Here in 1453 the Eng. were defeated (see Shakespeare, *1 Henry VI.*,

Act iv.), and in the neighbourhood is the château where Montaigne passed the later years of his life. Pop. 3000.

Casting, name given to the process of manufacturing articles of given shape by pouring a molten substance into moulds and allowing it to solidify and take up the shape of the moulds. The art finds its application in the manuf. of iron Cs. (founding) of every description, of statues (in which case bronze is the metal usually employed), of type for printing purposes, of plaster casts, and in a somewhat different manner in the manuf. of china-ware and pottery. The C. of bronze vessels and images is a metallurgical process of great antiquity. It was a well-known art in anct. Egypt, many bronze statues belonging to this period having been discovered. From many passages in the O.T. it is evident that the Israelites were familiar with the arts of metallurgy, vessels and ornaments being cast in bronze for the furnishing of the Temple. Little is known, however, of the methods employed by the ancts. in the C. of metal articles, and it is probable that the treatment of metal by smiths' work was more common. The manuf. of cast iron is of comparatively recent date, one of the most important uses to which the latter was first put being the manuf. of cannon. In the reign of Queen Elizabeth sev. large foundries existed, wood furnaces being exclusively used. Owing to the use of wood as fuel the first foundries were always built near forests, and it is on this account that Sussex became the seat of the iron-smelting industry. Although this industry has long been extinct, many relics of it occur in Sussex cottages and farmhouses in the form of old-fashioned fire-grates, originally cast in the locality. Wood furnaces are particularly well adapted for smelting purposes, as wood does not contain the chemical constituents which cause coal to react in a harmful way with the molten metal, and the superiority at the present day of iron smelted in Sweden is due to the fact that wood is used as furnace fuel in that country.

The increasing demand for cast-iron articles and the limitations of the timber supply, however, resulted in the introduction in the beginning of the seventeenth century of the use of coal for smelting purposes. The iron being reduced from its ores and procured in a molten condition, the process of C. is in brief as follows: The foundry floor is covered sev. feet deep in sand, and pits of sand are arranged where the moulds are to be placed. To construct a mould it is first necessary to obtain a pattern of the article to be cast, and pattern-making forms of itself an important craft. An exact model of the article to be cast having been made, this is pressed down into the sand and the sand rammed tightly around it so that on withdrawing the pattern a cavity the exact shape of the article required remains. Precautions are made to ensure the mould's retaining its shape, special qualities of sand or loam being employed, and in the

case of large Cs. the mould is built up with metal bars. The pattern being taken out, the mould is then thoroughly freed from moisture, this precaution being necessary to avoid explosions caused by the instantaneous generation of steam at the high temp. caused by the introduction of the molten metal. Neglect of this precaution has resulted in the wrecking of a whole foundry. The mould is provided with flues to admit the molten metal and also to allow for the escape of the air displaced by it, and it is placed near the furnace in such a position that the molten iron may flow direct into it by means of channels made in the sand. The metal is allowed to run in until it overflows the channels, the sand being meanwhile rammed down around the mould in order to keep it firm. The work is covered with a layer of sand and left to cool and solidify. The mould is then scraped off, and the cast is chased and worked up for the purpose for which it was designed. The prin. defects likely to be found in Cs. are blowholes, shrinkage cavities, porous places and cracking resulting from the trapping of gas in the metal, the use of feeding heads which are too narrow, or excessive ramming which prevents natural contraction.

The making of patterns is one of the most important crafts connected with the C. industry. The object to be aimed at is the making of a pattern which can be easily taken out from the mould without damaging it. It is evident that in many cases the shape of the pattern would render this impossible were it made in one whole piece. The pattern is therefore carefully constructed in sections, with joints so situated that the parts can be extracted from the mould without fracturing the latter. In many cases a core is used by means of which the thickness of the cast may be regulated. The mould being made as before, a substance, usually clay, is pressed into it, so as to form a layer inside the mould of the thickness which it is required that the metal C. shall be. The remainder of the mould is then filled up by means of plaster of Paris, and this on setting constitutes the core. When the whole is set and dry the mould is taken to pieces, and the clay or other material used as an intermediate layer is removed. The mould is then put together again and the core fixed in position. On allowing the molten metal to enter, it fills up the space between core and mould and a cast of the required thickness results. The introduction of *machine moulding*, in which the mould and pattern are manipulated by machinery, has resulted in the attainment of a higher degree of accuracy in the manuf. of Cs. than was formerly the case. For cast-iron see under IRON AND STEEL. See also POTTERY: TYPE AND TYPEFOUNDING. See J. S. Gardner, *Ironwork*, 1927-30; H. L. Campbell, *Metal Castings*, 1936.

Casting Vote, vote given by the chairman of any assembly when the votes for and against any proposition and resolution happen to be equal, and therefore the deciding vote. Where the chairman

has already voted he may yet be entitled to a second or C. V. The privilege is given to the chairman of a bor. council, an urb. or a rural dist. council, and a vestry meeting; and to a person actually occupying the chair at a meeting, whether he be the chairman or not, in the case of a par. council or par. meeting under the Local Government Acts. The chairman of an incorporated joint stock company is usually entitled to a vote not only as a principal and proxy, but also to a C. V. on an equality of votes at any general meeting of the shareholders. In the House of Commons, if the members in a div. are equal, the Speaker must give the C. V., otherwise he never votes. Since 1848 the chairman of any standing committee of the House has been entitled to a C. V. To prevent any imputation of partiality, both the Speaker and any chairman of a committee in the House take care, where possible, to vote in such a way as to leave room for a further discussion by the House. According to the estab. rules of Parliament the chairman of a select committee has a C. V., but no other vote. In regard to all questions before private Bill committees the chairman has a second or C. V. In the House of Lords the rule in regard to the vote of the chairman of committees is different; although he may record a vote like any ordinary member, he has no C. V., the result being that the question is decided in the negative.

Cast Iron, see under IRON AND STEEL. **Castle** (Lat. *castellum*, dimin. of *castrum*, a fort; Fr. *castel*; It. *castello*; Sp. *castillo*; Dan. *kastel*), fortified building, a fortress. Before the Norman Conquest Cs. were almost unknown in England. The earliest pre-Norman fortresses consisted of earthen ramparts or rows of palisades erected on a naturally strong and commanding eminence. The site was defended either by difficulty of access, such as that presented by an escarpment, or by water, generally a riv. or a lake. These natural defences were supplemented by artificial ones, such as a mound dug out of the ground surrounding the spot; this device provided also, at one and the same time, a ditch. Sometimes primitive edifices were constructed upon piles. The lake dwellings and hill forts of Scotland are examples belonging to this period. The Barmukin of Kech in Aberdeenshire is a type. In England there are the forts of the Herefordshire Beacon in the Malvern Hills. In these spots traces are to be seen of circular stone walls surrounded by ditches. The oldest Cs. of which remains of any importance still exist are of Rom. origin. Richborough C. in Kent is the best example. Conisburgh C. in Yorkshire, which is nearly contemporaneous with this, may be Brit.; it is probable that the inner keep is of Saxon origin, and that the outer walls were built by the Normans. Later came Saxon Cs., like that of Castleton in Derbyshire. When William the Conqueror returned to Normandy in 1067 he left England in the hands of Odo of Bayeux and Fitz-Osborn, with orders to build Cs. at all important

points. Wherever a portion of the country was conquered there a C. was built to secure the conquest. These fortresses were like those of France, of the same period—Chauvigny, Beaugency, Loches, Falaise, Domfront, Chambois, and Nogent-le-Rotrou, for example. By the end of the reign of Stephen 1115 of these Cs. had been built. Each C. was the impregnable stronghold of a Norman baron, who used his power and position, not only to protect himself against the attacks of those Eng. who had been despoiled of their lands to provide a reward for him, but to oppress in every way the

or through a tower or fore-work in which was a stone staircase. This first floor was lighted by loop-holes in the walls, and here were the soldiers' apartments, the guard-room, etc. On the second floor was the baronial hall, where the governor and his retainers took their meals. Above this were the rooms used by the governor and his family; this floor was lighted by small round-headed Norman windows. The top was crowned with battlements. Outside the keep and surrounding it was a courtyard, called the inner bailey; this was divided by a wall from a second courtyard,

John H. Stone

RHUDDLAN CASTLE, FLINTSHIRE, NORTH WALES
An English (or Edwardian) castle built by Edward I. in 1277

conquered people. Wm. of Newbury says: 'There were in England as many kings, or rather tyrants, as lords of Cs.' Indeed, so great was the abuse that a treaty was made between Stephen and the duke of Normandy (afterwards Henry II.) that a certain number of the Cs. should be demolished within a stated time. This was done, but not to the extent stipulated. The Norman C. was built generally on an eminence, and on a bank of a riv. Its most characteristic feature was its innermost and strongest part—the keep. This was a square or an oblong tower, the walls of which, built of stone and mortar, were very thick; indeed, these solid walls were its chief defence. The basement was vaulted, no provision was made for the entrance of light, and air was admitted only by very narrow openings in the walls. Here were the store-rooms and the dungeons for prisoners. The entrance to the keep was usually on the first floor, admittance being gained either by a ladder

called the outer bailey. Round the inside of the inner wall were offices for retainers and soldiers, granaries, store-houses, etc. The wall of the outer bailey was from 8 to 10 ft. thick, 20 to 30 ft. high, and was surmounted by a parapet at least a foot in thickness. This parapet, with its crenellated embattlements, protected the defenders of the C., who discharged arrows, darts, and stones through the crenelles. At the angles of this fortification were the square or round towers called bastions; in or near one of these was the postern gate for the egress of messengers during a siege. The main gate was of enormous strength, flanked by towers and closed by a portcullis. Surrounding the whole fortress was a deep ditch or fosse, crossed by a drawbridge. Between the ditch and the prin. entrance there was often a high battlemented wall called a barbican, to defend the gate and the drawbridge, which could be pulled up against it, thus

cutting off communication. Later castles departed in architectural style and conception considerably from the Norman, assuming in the reign of Edward I. a more utilitarian plan, less in the nature of private dwellings, and more in that of barracks. Rhuddlan and Flint Cs. in Wales are examples of this Edwardian development. Numerous ruins remain. Some like Arundel and Alnwick have been rebuilt on the old plan. Others, notably Bodiam in Sussex and Tattershall in Lincolnshire, have been restored. A good impression of the appearance of a typical medieval C. may be derived from the extant ruins of Rochester, Durham, and Berkeley Cs. See F. M. Stenton, *The Development of Castles in England and Wales*, 1910; Sir C. Oman, *Castles*, 1926; N. G. Tranter, *Fortalices and Early Mansions of Southern Scotland*, 1935; H. Braun, *The English Castle*, 1936.

Castle, Egerton (1858-1920), Eng. author, educated at the univs. of Paris, Glasgow, Cambridge, and at the Royal Military College, Sandhurst. His novels include *Consequences* (1891); *The Light of Scarley* (1895); *Young April* (1899); *The Secret Orchard* (dramatised for the Kendals) (1901); and in collaboration with his wife, Agnes, *The Pride of Jennico* (1898); *The Bath Comedy* (1899); *Incomparable Brillaire* (1904); *If Youth but Knew* (1905); *The Lost Iphigenia* (1911); *The Grip of Life* (1912); *The Ways of Miss Barbara* (1914). He wrote *Saviolo* for Sir Henry Irving (1893) (with Pollock), and *Desperate Remedies* for Mansfield. An authority on swordsmanship; captain of the Brit. épée and sabre teams at the Olympic games, 1908.

Castlebar, co. tn. of co. Mayo, Eire. It is an important mrkt. tn. for agric. produce, and there are also breweries and some trade in linen. Here in 1641 the Irish massacred the Eng. garrison, and in 1798 the Fr. Gen. Humbert defeated the Eng. in a battle facetiously called the 'C. Races.' Pop. 4300.

Castleblayney, mrkt. tn., co. Monaghan, Eire. Pop. 1600.

Castlecary: 1. Mrkt. tn. of Somersetshire, England, 12 m. N.E. of Yeovil. There are manufs. of twine, horse-hair seating, etc., also brickworks. Pop. 1600. 2. Par. of Strirlingshire, Scotland, 6 m. S.W. of Falkirk. It is the site of a fort which defended the wall of Antoninus.

Castlecormer, tn. of Eire, in the co. of Kilkenny, and 10 m. from the tn. of that name. It is situated on the R. Dinin. Pop. 900.

Castleconnell, vil. on the Shannon in Limerick, Eire. Here are the ruins of Connell Castle. There is good salmon fishing.

Castle Donington, mrkt. tn. of England, in the co. of Leicestershire, overlooking the Soar and Trent valleys. It is 2½ m. W. of Kegworth by rail. There are manufs. of hosiery, silk, and baskets. Pop. 3000.

Castle Douglas, mrkt. tn. and bor. of Scotland, situated in Kirkcudbrightshire, on Carlingwark Loch. The sheep and cattle sales held here are noted. Pop. 3000.

Castleford, tn. in the W. Riding of Yorkshire, England, situated on the R. Aire, 10 m. S.E. of Leeds. It is a colliery dist., and there are chemical and glass works, also potteries. Rom. relics have been discovered in places near by, and the Rom. road, Watling Street, passed through the dist. Pop. 22,000.

Castle Garden, circular fort in Battery Park, New York City. It was built in 1807, and was originally called Fort Clinton, and was used for public functions. It was the headquarters for immigrants from 1855 till 1890, when it was equipped as an aquarium.

Castleisland, par. and tn., co. Kerry, Eire. Pop. of par. 5000, of tn. 1300.

Castleknock, vil. on the Liffey, co. Dublin, Eire, 5 m. from Dublin. Pop. 200.

Castlemaine, tn. of Talbot co., in the state of Victoria, Australia, on Forest Creek, and on the railroad from Melbourne to Echuca. The gold-mines near were among the first to be opened in the colony. Pop. 6000.

Castlereagh, mrkt. tn., co. Roscommon, Eire. Pop. 1200.

Castlereagh, Robert Stewart, Viscount, second Marquess of Londonderry (1769-1822), eminent Eng. statesman. He was the second son of Robert, first marquess of Londonderry, and was educated at St. John's College, Cambridge. He sat in the Irish Parliament in 1790, and was appointed keeper of the privy seal in 1797, and chief secretary for Ireland in 1798. C. actively supported Pitt in bringing about the union between England and Ireland, and on entering the Imperial Parliament, he became secretary of state for war (1805-6). On the death of Pitt, he resumed office under Portland. The failure of the Walcheren expedition (1809) brought about a quarrel between C. and Canning, the foreign secretary, which resulted in their retirement from office, and in the duel which took place the latter was wounded. In 1812 C. became foreign secretary under Lord Liverpool; it was during his period of office that Wellington won his brilliant victories, the success of the campaign of 1812-14 being largely due to C.'s steadfast and energetic policy. He represented England at the congress of Vienna (1814-15), the treaty of Paris (1815), and the treaty of Aix-la-Chapelle (1818). The despotic measures resulting from his domestic policy were extremely unpopular. He was regarded as being responsible for the 'Peterloo massacre,' and the 'Six Acts' (1819), and few statesmen have been so hated by the general public. Harassed by affairs, in a fit of insanity, he committed suicide with a penknife at his Kentish seat, Fonthill. As his coffin was being carried to Westminster Abbey, a shout of joy came from the crowd in the streets. C. was undoubtedly a harsh ruler, but the years of peace that followed Napoleon's fall were largely due to his wise diplomacy. See C.'s *Correspondence and Dispatches*, ed. Vane, 1847-53; the lives by Sir A. Alison, 1861; the Marchioness of Londonderry,

1904; J. A. R. Marriott, 1936; and Lord Salisbury's *Essays* (republished 1905).

Castle Rising, vil. near King's Lynn, Norfolk, England, and formerly an important tn. and seaport. It is notable for the ruins of a fine Norman castle, for a beautiful twelfth-century church, and for Bede House, founded in 1614 for a few poor women, whose successors even to-day wear the original Jacobean dress. Pop. 200.

Castleton, vil. in Derbyshire, England, 13 m. W. of Sheffield. It is situated at the foot of a hill, on the summit of which stands Peak Castle, erected by Wm. Peveril, the natural son of William the Conqueror. In the neighbourhood are Peak and Speedwell Caverns and the Blue John Mine. Notable also for its fluorspar. Pop. 700.

Castletown, formerly the cap. of the Isle of Man; in the extreme S. of the is., on the W. coast of C. Bay, 9 m. S.W. of Douglas. From a rock in the centre of the tn. rises Castle Rushen, said to have been erected in 960 by Guthred II. of the Orrys kings of Man. It was once the residence of kings, and was besieged for six months by Robert Bruce in 1313. The castle has now been converted into a prison and barracks. King William's College, in the vicinity, is a noted school for boys. C. is a popular resort for tourists. Pop. 2000.

Castor, abbreviation for *Castoreum* (Gk. *καστωρ*, beaver), reddish-brown substance obtained from the beaver, being contained in two pear-shaped pouches near the organs of reproduction. It contains a crystalline substance castorin, salicin, benzoic acid, and other substances, has a bitter taste and a strong, penetrating, and enduring odour. Formerly it was much esteemed as a medicine, being used in the form of a tincture as a stimulant and antispasmodic, but it is now used only in perfumery.

Castor (*Alpha Geminorum*), one of the two bright stars in the head of the 'twins' which form the constellation Gemini. It is a double star, that is to say, it consists of two stars so close together as apparently, to the naked eye, to form one star. The two component stars are nearly equal in size, and together form the appearance of a third magnitude.

Castor and Pollux (Gk. *Πολυδευκες*), twin gods of Greece and Rome, known as the Dioscuri. According to Homer they were the sons of Leda and Tyndareus, king of Lacedæmon, and brothers of Helen and Clytemnestra. According to another version, Zeus appeared to Leda in the form of a swan, and she bore two eggs, from one of which came P. and Helen, children of Zeus, and from the other C. and Clytemnestra, children of Tyndareus. Thus P. was immortal, while C. was subject to old age, sickness, and death. They both took part in the expedition of the Argonauts, during which P. slew Amycus, and in consequence became famous as a boxer and wrestler. C. was renowned for his horsemanship. They made war upon the Athenians to recover their sister Helen, who had been carried away by Theseus.

C. and P. seized the intended brides of Lynceus and Idas, sons of Aphareus, and in the battle that ensued C. was slain by Idas. P. avenged his brother by killing both the Apharidae, and then besought Zeus to grant immortality to his brother. Zeus allowed them to share immortality, so that each dwelt in the abode of gods on alternate days. It is also said that Zeus placed them among the stars as Gemini. The Dioscuri were worshipped as protectors of sailors. The Romans believed that they owed to them the victory at Regillus, and erected to their worship a temple opposite that of Vesta. They were always represented as riding white steeds, with a star shining on their helmets.

Castoreum, see **CASTOR**.

Castoridae, name of the third family of the sub-order *Simplicidentata* of the rodents. It contains a single living genus, *Castor*, the beaver, one species of which is European, the other N. Amer. Many extinct forms of this family are found as fossils.

Castor Oil, heavy viscid natural oil obtained by crushing the seeds of the C. O. plant, *Castinus communis*. These are first rolled, and then placed in hempen bags and subjected to high pressure by which the oil is squeezed out. The plant is grown chiefly in India, the greater part coming through Calcutta, but it is also grown in the U.S.A., France, and Italy. Chemically it is the glyceride of ricinoleic acid, and is soluble in alcohol, the sp. gr. varies from 0.960 to 0.968, and the freezing point from 10° to 18° C. The best is 'cold-drawn C. O.' which is extracted without heat and is pale yellow or nearly colourless and almost tasteless. It is used in medicine as a safe non-irritating purgative, the most suitable for young children. It causes only evacuation of the bowels, and is very useful for cases of gastritis, enteritis, and dysentery. The dose varies from a teaspoonful to two tablespoons, and as the cheaper varieties have a disagreeable taste, it is generally advisable to mix it with something more palatable, such as milk or lemon juice. The raw oil is used as a lubricant, as a mordant in dyeing, and in India as an illuminant.

Castration, operation of removing the testicles or reproductive organs of the male for various purposes. In human beings it is generally performed when these organs are injured or diseased, while in the E. it is a precautionary measure practised on slaves destined to become eunuchs or guardians of the harem or seraglio. The operation is also performed on horses, pigs, sheep, and cattle. The effect is much the same in all male animals treated in this manner. If it is done before puberty the masculine qualities are not developed. In human males the voice does not break nor the hair grow upon the face; in sheep and cattle the horns are either not formed or they take a shape similar to those possessed by females. A castrated cock does not crow, and its feathers are changed in character. Reproduction is quite impossible. If the operation is performed after puberty,

it is often dangerous in its effects, the change is slow in the masculine qualities, and procreative power is not immediately lost. It was in the seventeenth century that the Sistine Chapel in Rome substituted *castrati* for the imported adult male sopranos or 'falsettists' of Spain, whose effects were obtained by some process which is now unknown. The artificial male soprano or contralto was obtained by an operation in boyhood on the sexual organs which hindered the development of some of the characteristics of manhood and thereby perpetuated the boy's type of voice. Perhaps the most celebrated castrato singer of all time was Farinelli (q.v.).

Castren, Mathias Alexander (1813-52), Finnish philologist, b. at Tervola, in N. Finland. He studied in Tornea and also in Helsingfors. His intense interest in Lönnrot's publication of *Kalevala* seems to have impelled him to the study of the language and literature of his country. For this purpose he journeyed on foot through Finnish Lapland in 1838 and through Karelia in 1839, collecting ballads and songs of Finnish mythology. As a result of these excursions he pub. *De Affinitate Declinationum in Lingua Fennica* (1839), and a Swedish translation of the epic *Kalevala* (1841). With Lönnrot, he continued his literary researches in Finland, Norway, and Russia (1841-45), and worked at the St. Petersburg Academy (1845-49). In 1851 he was appointed prof. of the Finnish language and literature at the univ. of Helsingfors. He is considered the founder of Ural-Altaian philology. See life by J. W. Snellman in *Samlade Arbeten*, 1892-1901.

Castrense Peculium (Lat. *peculium*) literally denoted property in cattle (from *pecus*, cattle), but came to be used of the private property of a wife, or that which is given by a father or master to his child or slave. According to Rom. law a man had no property independently of his father, but C. P. that is money acquired by military service (Lat. *castra*, a camp), was regarded as the private property of a son. Later a man was allowed to be sole possessor of any professional earnings, and of property inherited through his mother, in which cases it was known as quasi-C. P.

Castres, tn. of France, in the dept. of Tarn, 46 m. E. of Toulouse. It is situated on both sides of the R. Agout, which is spanned by stone bridges. It is thought that the tn. is on the site of an old Rom. camp, hence its name; but its hist. goes back to the foundation there of a Benedictine abbey in 647. In the sixteenth century it was a Huguenot stronghold. The tn. is beautifully kept, and has an important trade in manufactured goods, leather, paper, dyeing, machinery, parchment, etc. Pop. 30,700.

Castries, or Port Castres, cap. of the is. of St. Lucia, W. Indies. It is situated in Carenage Bay and makes an excellent port and harbour. The port of C. is one of the best harbours in the W. Indies. It is land-locked and provides facilities for coaling and watering ships and for loading

and discharging cargo which are unequalled in these is. C. has a large trade in sugar and cacao. C. was largely destroyed by fire on the night of June 19, 1948. Buildings destroyed included gov. offices and the chief business houses. There was no loss of life, but some 20,000 of the pop. were made homeless. The fire started in a tailor's premises, and the police—the town's only fire-fighting force—had little hope of controlling the flames owing to the low pressure of the water supply, depleted by a long drought. The estimated pop. of C. and dist. is 20,800.

Castro, modern name given to the chief tns. of certain is. in the Gk. Archipelago, viz., Chios, Limno (Lemnos), and Mtiline (Mytilene), which are otherwise known by the names of the is.

Castro, Alfonso (c. 1495-1558), Sp. theologian, b. at Zamora. He entered the Franciscan order, and became private chaplain to Philip II., whom he accompanied to England in 1554 for the purpose of negotiating a marriage between that monarch and Queen Mary. He wrote a Lat. work on heresy, entitled *Adversus omnes hæreses libri xiv.* (1534). He was sent with Philip of Spain to England as his adviser, 1554, and criticized the burnings of Eng. heretics. His pub. sermons on heretics include *De justa hæreticorum punitione* (1547), and *De potestate legis penalis* (1550). Became archbishop of Compostella, 1557.

Castro, Cipriano or Cypriano (c. 1858-1921), Venezuelan military leader and president, b. in the Andean prov. of Tachira. His parents were Sp. mestizos of the peasant class. He early took an active part in local politics in Capacho, as a Liberal, forming a party called 'Castriistas.' In 1866 C. was successful in the 'battle of Capacho' against Morales, who was local representative of the López gov. In 1899 C. headed a rebellion against President Andrade. After engagements in Las Pillas, at Zumbador, and San Cristóbal, he pushed his way on to the cap., Caracas. Andrade fled to Curaçao, and C. declared himself *jefe supremo* (supreme military leader). He was made provisional president of Venezuela by the constituent assembly (1901), and in 1902 was formally elected president for six years. His administration was marked by numerous uprisings, first that of Hernández, then that of Poraza, and finally that headed by Matos (1902-3), who tried to win the support of foreign govs. C. went to Europe in Dec. 1908, leaving his powers in the hands of the vice-president Gómez, who seized the presidency in 1909, and was popularly confirmed. In 1913 C. unsuccessfully tried to regain power. He remained a wanderer, chiefly in Germany. He d. at San Juan (Puerto Rico), Dec. 5, 1924.

Castro, Inez de (d. 1355), Sp. noblewoman, whose ad story has been used by poets and dramatists. In 1340 she lived with her cousin, Costanca de Paza, the betrothed wife of Dom Pedro, the son of Alfonso IV. of Portugal. On the death of her cousin in 1345, she secretly married

Dom Pedro. Alfonso, fearing that this union would be injurious to Ferdinand, the young son of Costanza, ordered her to be put to death. When Dom Pedro ascended the throne in 1357 he avenged her death and, according to one tradition, ordered his nobles to pay homage to her exhumed body. See Camoens, *Lusiadas*.

Castro, João (Juan) de (1500-48), Portuguese admiral, b. at Lisbon, the son of Alvaro de C., governor of Lisbon. He had the same tutor as Emanuel I.'s son, the Infant Dom Luis, who had a lifelong attachment for his young playmate. They were both present at the siege of Tunis in 1535. Upon his return to Lisbon C. received from the king a commission for the command of San Pablo de Salvaterra in 1538. C. was a man always contented with small means, but thirsted to do deeds of bravery. He married a noble Portuguese lady who was equally indifferent to wealth. Sailed to the Indies and joined the *aventureiros* for the relief of Diu. In 1543 C. undertook the task of clearing the sea of pirates, and later on again he was sent out to the Indies, where he ultimately received the appointment of viceroy, but d. soon afterwards.

Castro del Rio, tn. in the prov. of Cordova, Andalusia, Spain, on the r. b. of the Guadajoz. Part of the old walls and a Moorish castle remain. There are manufs. of woollen goods and earthenware. Pop. 10,000.

Castrogiovanni, city of Sicily, 13 m. N.E. of Caltanissetta. It is built on a mt. at an altitude of 3000 ft. and occupies the site of the anct. Enna. In the neighbourhood is Lake Pergusa, which is associated with the Proserpina myth. There is a fine cathedral (founded in 1307), an anct. citadel, La Rocca, and a castle built by Frederick II. of Aragon. The chief trade is in rock-salt and sulphur. Pop. 32,500.

Castroreale, tn. of Sicily, on the Castro, 12 m. S.W. of Milazzo. It has hot sulphur springs. Pop. 11,000.

Castro-Urdiales, tn. in the prov. of Santander, Spain, on the bay of Biscay. The chief industry is fishing, and fish and timber are exported. To the Romans, under Vespasian it was known as Flavobriga. The tn. was sacked by the Fr. army in 1813. Pop. 10,000.

Castrovillari, tn. of Italy in the prov. of Cosenza, Calabria, situated in a fertile valley. Olive oil is the chief production, and the manuf. of casks is carried on. Pop. 10,000.

Castro y Bellvis, Guillen de (1569-1631), Sp. dramatist, chiefly famous for his *Las Mocedades del Cid*, from which Corneille borrowed his materials for his tragedy *Le Cid*. C. was a Valencian by birth, and soon came into prominence as a

man of letters. He lived at Madrid, and was very friendly with the famous Sp. dramatist Lope de Vega, to whom he was greatly indebted for his style. He wrote some forty plays, chief among which may be reckoned his *Pajar en propia Moneda* and *La Justitia en la Piedra*. C. has the characteristics of the Sp. writers of romance. His style is vigorous and passionate, and there is the romantic atmosphere so peculiar to the old Sp. romancers. He d. in great poverty.

Castruccio Castracani (1281-1328), It. general and soldier of fortune, b. of noble family in Lucca. In the early years of his career he served successively in France, England, and Lombardy. He was a staunch Ghibelline, and the people of Lucca made him the chief of their republic. In return for his services as adviser in his campaign against the Guelphs, the Emperor Louis of Bavaria made him duke of Lucca, Pistoja, Volterra, and Lunigiana, as well as count palatine. At the head of the Ghibelline party he carried on a war against the Florentines for fifteen years, at the end of which he d., on the very point of winning for himself a magnificent position as supreme authority in Tuscany, 1329. His death was a fatal blow to the Ghibelline party in Italy. Machiavelli's book, *Castruccio Castracani*, is more a work of imagination than a hist. of facts.

Castrum Lucii, see CHIALI.

Castrum Novum Arianorum, see CASTELNUOVO.

Castuera, tn. and com. of Spain, in the prov. of Badajoz, situated near the Guadallja, with a trade in wines and fruit. Pop. 7100.

Casualties. In law of Scotland, 'C. of superiority,' now virtually obsolete, were certain occasional payments analogous to anct. feudal dues, paid to the superior lord by a tenant for the recognition of his tenancy. The only C. that survived until recent times were those payable to the superior in consequence of the transmission of the feu (feud or tenancy) by sale or succession to a new vassal. The payment made by an heir on taking up his estate was known as a C. of relief (i.e. *relevare*, to take up). The Conveyancing Act, 1874, makes C. fixed, and not 'casual' or accidental, payments in the absence of express stipulation to the contrary. C. such as now exist may be redeemed in payment of certain capital sums.

Casualties in the First World War (1914-1918). 1. *British Empire Casualties*: The total number of officers and men of the Brit. Empire forces who lost their lives in and through the First World War was approximately 1,089,900, of whom 1,048,850 were military C. and 41,050 were naval. These C. were distributed as follows:

Brit. Isles (including Ireland)	812,300
Indian Empire (Brit. and Indian)	73,150
Dominion of Canada	62,800
Commonwealth of Australia	60,450
Dominion of New Zealand	18,200
Union of S. Africa	9,050
Newfoundland	1,800
Colonies	52,050
Total	1,089,900

The number of wounded was approximately 2,401,000, distributed as follows:

Brit. Isles (including Ireland)	1,849,500
Indian Empire (Brit. and Indian)	84,720
Dominion of Canada	166,100
Commonwealth of Australia	154,700
Dominion of New Zealand	45,950
Union of S. Africa	17,850
Newfoundland	3,630
Colonies	78,550
Total	2,401,000

The number of prisoners was approximately as follows.

Brit. Isles (including Ireland)	170,390
Indian Empire (Brit. and Indian)	11,260
Dominion of Canada	3,730
Commonwealth of Australia	4,080
Dominion of New Zealand	500
Union of S. Africa	1,540
Newfoundland	150
Total	191,650

The total military C. (including those of the Royal Naval Div.) reported up to the Armistice (excluding the 'missing' subsequently 'presumed dead') in the chief theatres of operations were:

Theatre of Operations	Killed (including died from wounds and other causes)		Wounded	
	Officers	Other Ranks	Officers	Other Ranks
France and Flanders	36,769	612,270	87,972	1,799,122
Dardanelles	1,655	29,360	2,786	70,571
Mesopotamia	1,447	38,315	2,646	50,586
Egypt	1,186	18,969	2,377	37,838
Salonica	340	9,460	826	16,088
E. Africa	428	10,702	479	7,446
Italy	120	1,972	311	4,423

The 'missing' naturally presented a problem in a war which in the character and extent of its operations had no precedent. In so far as reliance could be placed on lists of prisoners of war, the missing who did not figure in those lists might be regarded as killed. The process of 'presuming dead' those who did not return in the course of two years after the cessation of hostilities of necessity increased the C. of the dead by a large number and, incidentally, established the reliability of the prisoner lists. There were, at the Armistice, about 130,000 cases of Brit. officers and other ranks of whom no trace had, till then, been found; but as a result of the excavation work carried on in the war areas, some 70,000

of the bodies were found during the first decade after the Armistice. In spite of the scale on which operations were conducted, it is certain that few if any cases are on record of any man returning after being officially posted as dead. A year or two after the Armistice the great majority of the 'missing' were, though not till after exhaustive inquiry, 'presumed dead,' and their names accordingly transferred to the official rolls of the dead. In some few cases death was not presumed.

Brit. naval C. (including Mercantile Marine Reserve while serving in naval ships and merchant ships, but excluding the Royal Naval Div. and Brit. Mercantile Marine losses):

	Officers	Men
Killed in action or died of wounds	2,074	20,735
Died	400	11,433
Wounded in action	549	3,961
Missing	—	2
Prisoners of war and interned	262	994
Injured	256	392

Casualties

345

Casualties

Comparative figures of Brit. and Ger. C. on the Brit. sector of the W. front during the four years of hostilities, as compiled with the aid of the Federal Archives at Potsdam, give the following results: (1) The total Brit. officer C. was 115,741; Ger. 47,256, i.e. Brit. : Ger. = 5 : 2. (2) Brit. other ranks, 2,325,932;

Ger., 1,633,140; i.e. Brit. : Ger. = 3 : 2; (3) total Brit. C. to all ranks during the period in question was 2,441,673; Ger., 1,680,396; i.e. Brit. : Ger. = 3 : 2. (See *Statistics of the Military Effort of the British Empire during the Great War*, issued by the War Office in March 1922, a detailed but incomplete document.)

2. Allied and Associated Nations' Casualties:

	<i>Killed and Died</i>	<i>Wounded</i>
France	1,393,388	1,490,000
Belgium	38,172	44,688
Italy	460,000	947,000
Serbia	127,535	133,148
Rumania	335,706	not recorded
U.S.A.	115,660	205,690
Portugal	7,222	13,751

3. Central Empires' Casualties:

	<i>Killed and Died</i>	<i>Wounded</i>
Germany	2,050,466	4,202,028
Austria and Hungary	1,200,000	3,620,000
Bulgaria	101,224	152,400
Turkey	300,000	570,000

(The figures for Turkey are approximative.)

Casualties in the Second World War (1939-45). 1. *To all ranks of the Armed Forces of the British Commonwealth and Empire, reported from September 3, 1939, to the end of the war, excluding deaths from natural causes:* This statement gives the total number of casualties reported up to Aug. 14, 1945. It includes all men reported prisoners of war and, in the case of the armed forces of the United Kingdom, New Zealand, S. Africa, and the

colonies, all men reported missing during the war. The figures exclude (i.) civilian casualties due to enemy action, (ii.) casualties to merchant seamen, and (iii.) casualties to members of the Home Guard while on duty.

The total number of officers and men of the Brit. Empire forces who lost their lives in and through the Second World War was 353,652. These C. were distributed as follows:

United Kingdom	244,723
Canada	37,476
Australia	23,365
New Zealand	10,033
S. Africa	6,840
India	24,338
Colonies	6,877
Total	353,652

The number of missing was 90,844. The figures (except for Canada, Australia, and India) include those who rejoined:

United Kingdom	53,039
Canada	1,843
Australia	6,030
New Zealand	2,129
S. Africa	1,841
India	11,754
Colonies	14,208
Total	90,844

The number of wounded was 475,070, distributed as follows:

United Kingdom	277,090
Canada	53,174
Australia	39,803
New Zealand	19,314
S. Africa	14,363
India	64,354
Colonies	6,972
Total	475,070

The number of prisoners, including service internees, was 326,459. The figure includes 20,147 officers and other ranks missing but presumed to be prisoners of war, and prisoners of war who were repatriated or liberated or who escaped:

United Kingdom	180,405
Canada	9,045
Australia	26,363
New Zealand	8,453
S. Africa	14,589
India	79,489
Colonies	8,115
Total	326,459

The figures for the United Kingdom under the four categories of C. include men from overseas serving in those forces, in particular from Newfoundland and S. Rhodesia.

2. *Casualties to Merchant Seamen reported from September 3, 1939, to the end of the war:*

Deaths	30,189
Missing	5,264
Wounded	4,402
Internees	5,556
Total	45,411

The figure for deaths includes those who d. in internment and those presumed dead in missing ships, but excludes deaths from natural causes. The figures for deaths, missing, and internees include men of all nationalities who served in Brit. registered ships and fishing boats, and Brit. subjects who served on foreign ships requisitioned or chartered by His Majesty's Gov. during the war. The figure for internees includes those who were repatriated or who escaped.

Casuarinaceæ, Australian order of Dicotyledons containing the single genus *Casuarina*. The species are trees somewhat resembling the *Equisetum* in appearance, the branches being all long, drooping, green, and wiry, with channelled interodes and very small, scale-like sheaths in place of leaves. The flowers are in male and female catkins, the male flower consisting of a single stamen and two perianth-leaves, while the female consists of two syncarpous carpels, which form a unilocular ovary. The stamens and styles both hang out over their bracts and are wind-pollinated. The male flowers are borne in terminal spikes and the females resemble a pine-cone in appearance. The wood of the plants is called beef-wood, and young shoots afford fodder for cattle.

Casuarium, see **CANSOWARY**.

Casuistry (Lat. *casus*, instance, point of law), art of bringing moral principles to bear in particular cases—applied morality. From the seventh to the eleventh century *The Penitential Book* was used as a guide for conscience. Moral theology began with the schoolmen of the thirteenth century. The *Secunda Secundæ* of Thomas Aquinas is a well-known work on moral theology but too scientific for general use. The science was largely developed by the medieval Church in the fourteenth and fifteenth centuries. See *Pascal, Les Lettres Provinciales*, 1656-57; H. Sidgwick, *History of Ethics*, 1892; H. Rashdall, *Theory of Good and Evil*, 1907.

Casus Belli (Lat. *cause of war*), grounds which, by international law, are sufficient for declaring war. The causes for war were strictly defined, so that war might be used as the last extremity in conflicts between nations. See **INTERNATIONAL LAW**; **HAGUE CONFERENCE**.

Cat, in general, any member of the mammalian family *Felidae*, including the lion, tiger, panther, leopard, lynx, jaguar, etc., but the name is more usually limited to the smaller species. Cs. are typical *feloid* carnivores, distinguished by wonderful flexibility and strength of spine, perfect mechanism of the claws, a small, supple head, looseness of skin, swiftness of movement, grace, and muscularity. They are mostly splendid climbers and jumpers. They have thirty teeth, rough tongues, and long whiskers or feelers *vibrissæ*, to assist the eyesight at night. The pupils of their eyes expand and contract according to the light about them. The original abode of the domestic C. (*Felis domestica*) is not certainly known, but it is probably descended from the *Felis caffra* of anc. Egypt, which was worshipped at a very early period as an object of veneration, and not from the fierce, wild *Felis calus* of Europe. Cs. are more prone than dogs to revert to a wild or semi-wild state, but no true wild species exactly resembles them. They are hardly mentioned in anc. writers of Greece, Rome, or Judæa, and it is known that in the earlier medieval period of Europe Cs. were rather rare and costly. They have been long known in China (from 500 A.D.), whence comes a fine variety with soft, beautiful fur and pendulous tufted ears. The Manx, with merely a rudimentary tail, is supposed to have come from Japan, but is also called the Cornish C. In the widest sense the C. section (*Feloidæ*) of carnivores includes, besides *Felidae*, civets (*Viverridae*), aardwolves (*Proteleidae*), and hyenas (*Hyenidae*). Of domestic Cs. the most fancied breed is the long-haired (Persian). The most valued are of a very uniform pale silver or chinchilla colour, without marking or shading, and with green eyes, but to-day the championship award generally goes to a blue or cream, while the blue bring the highest prices and command the highest fees. Blue Persians should have deep orange or amber eyes. Other popular varieties are pure whites with blue eyes, deep coal-blacks with dark yellow eyes, red tabby,

Siamese (fawn), brown tabby, and silver tabby. They may also be tortoiseshell or smoke colour. Markings are an important point in judging short-haired varieties. Usually there is little difference between males and females. Pure sandy Cs. are nearly always males. All except the lion are monogamous. They are difficult to train and inclined by nature to be treacherous. Anger is shown by lashing of the tail, pleasure by a deep, rumbling purr in the throat. Russia, Iceland, India, Madagascar, and Abyssinia all have fine breeds of domestic C.

BLUE PERSIAN

T. Fall

Notable varieties are the Angora (long-haired), Maltese and Chartreux (bluish-slate colour), Siamese (pale cream, with feet, lower legs, muzzle, and ears all black), and the Paraguay domestic C. of America. As a race Cs. are not gregarious or co-operative, but prefer to live or hunt alone (see Kipling's *Just So Stories*, 'The Cat that Walked by Himself'), or in small family parties. The small species (especially the *Felis domestica*) have young very frequently, often as many as four or five at a birth. For about ten days after birth a kitten's eyes remain unopened. The eyes are always blue at first changing gradually later on to green or yellow in most varieties. Cs. soon grow attached to particular spots or corners of a house. They are good mousers if not spoiled by too much petting. Most kinds are not very affectionate. In Persians the kittens' playfulness gives place to extreme dignity. Cs. should be given two meals a day; the diet consisting of meat, rabbit (cooked or uncooked), cooked fish,

or fowl, bread scraps soaked in milk, and green vegetables. Cooking of certain meats or offal is necessary because of the possibility of worm infestation. Small bones should be avoided. Water should always be available for the C., and it should have at least two drinks of milk daily. Cs. are subject to numerous ailments, but care and attention to diet may keep the animal free of them. Among the more serious are canker of the ear, diarrhoea, inflammation of the bowels, influenza, mange, and worms. The methods of treatment are described fully in the pubs. of the manufacturers of C. medicines, but in serious cases a veterinary surgeon should always be consulted.

Shows. The earliest C. show in Britain was at the Crystal Palace, 1871; the first in Scotland soon after in Edinburgh. The National C. Club was instituted under Weir's presidency, 1887. Its ann. exhibition is usually held in autumn. The Scottish C. Club, formed 1894, holds an ann. show in Edinburgh or Glasgow. Besides the National C. Club shows, the shows recognised in England for championship purposes are those held at Newbury and Croydon, the Midland Cos. show held at Worcester, Malvern, or Cheltenham, and the S. Cos. show. The Siamese C. Club (founded 1901) holds a championship show each autumn in London. See I. M. Mellen, *A Practical Cat Book*, 1939; M. H. Clarke, *First Aid to Dogs and Cats*, 1941; M. Joseph, *Cat's Company*, 1916; P. M. Soderberg, *Cat Breeding and General Management*, 1948.

Cat, Christopher (fl. 1702-33). Keeper of the Cat and Fiddle Inn, London, and, subsequently, of the Fountain Tavern, in which the Kit-Cat Club held its meetings, 1703-20.

Catabrosa, inconspicuous genus of Gramineæ which grows in temperate countries. There is only one Brit. species, the whorl-grass, *C. aquaticus*, found in ponds, ditches, and wet sands.

Catacos, tn. of Peru, S. America, in the prov. of Piura. Pop. 4000.

Cataclysmal Action, theory of world hist. in vogue among geologists in the early part of the nineteenth century and thereabouts, to account for the revelations which had been made with regard to fossil remains. It attempted to explain the great differences in the fossiliferous remains in consecutive beds by assuming violent catastrophes which swept over the earth, killing the inhab. and altering its character. The theory is now abandoned, and the uniformitarian theory brought forward by Lyell, in which the course of events has been similar to those of modern times, takes its place.

Catacombs (Gk. *κατά*, down, and *κόβη*, a hollow), excavations forming subterranean galleries for the burial of the dead. The original term, *catacumbæ*, was at first applied to a particular burial place only—that of the basilica of St. Sebastian—and the word did not refer to the excavations for the tombs, but to the conformation of the ground in the locality. The full title of this burying-place was *cæmeterium ad catacumbas* (the burial

place in the hollow), often shortened to *catacumbas*. In time the term became applied to all burial places in general, and so, in the ninth century, to the *crypta* or *cemeterium* of the Christian vaults now known in England as the *catacombs*. There are C. in many places, but the most remarkable are those of Rome. These are the C. of the Christians, and the earliest belong to the second century, though by far the greatest number belong to the third and fourth. After the fourth century inhumation in C. became more and more rare, burial in

sixteenth century the reading of ancient writings brought about by the Renaissance turned people's attention again towards the C., and in 1578 they were accidentally rediscovered by Padre Bosio. This 'Columbus of the subterranean world' devoted thirty years of his life to exploring them, working out their plan, and restoring and studying their monuments. He wrote an account of his work in *Roma Sotterranea*. Ever since the C. have been the object of curiosity to millions, and the work has been continued by Aringhi and Boldetti in the seventeenth century,

A NICHE IN THE CATACOMBS AT ROME

E.N.A.

churches taking its place. But the great respect of the Christians for the dead caused the C. to be still held in extreme reverence; people continued to visit them in remembrance of their dead, and to do homage at the tombs of the martyrs. There remain curious notices to visitors, itineraries of pilgrimages, etc., belonging to this time. The faithful took with them precious perfumes, which they poured through the cracks at the top of the martyr's tomb, and of which they carefully collected again every tiny drop as it passed through the cracks at the bottom, after having touched the body of the saint. With the invasion of Alaric in A.D. 410, this cult ceased, the C. sharing in the general devastation. Indeed, at this time many of the holy relics were removed and deposited in the various churches for greater safety. There was, therefore, no longer any reason to visit the C.; all trace of them was lost and they were forgotten. Towards the end of the

Seroux d'Agincourt about 1825, and the devoted workers of modern times, Padre Marchi, his pupil De Rossi, J. H. Parker, and others. Valuable illustrations have been prepared by Itouil Rochette. The C. consists of an interminable series of long and narrow galleries, 3 to 4 ft. wide and 4 to 12 ft. high, crossing each other in all directions, forming multitudes of cross-roads, and constituting an inextricable labyrinth. In these galleries, hewn in the volcanic rock, the dead are buried in niches or *loculi*, tier above tier, from a short space above the ground to the arched ceiling, in five, six or seven rows. There is no masonry, the ground supporting itself. Many of the galleries are in two or three stages, communicating with each other by stairs. The galleries are interspersed here and there by spaces much larger than the ordinary galleries; these are the chambers or *cubicula*. Bolsner believes that the tomb of Joseph of Arimathea, with its horizontal niche

surmounted by an *arcosolium*, served the early Christians as a model for these tombs. At various distances—sometimes 300 paces—are vertical shafts for light and air. The *loculi* were closed by slabs of marble or huge tiles, and cemented with great exactness. On them was painted or incised a name and a date, with sometimes one or more of the Christian symbols, a dove, an olive-branch, or the sacred monogram. The *cubicula* were decorated with simple fresco-paintings, a curious mixture of pagan and Christian traditions forming the subjects. The chambers were family burial places, or contained the tombs of martyrs. The C. are entered from churches above them, and sometimes from simple openings in the ground. The old belief that the C. were secret places of worship of the early Christians is true only to a limited extent. There was no need for secrecy except during the fiercest of the persecutions when Christian worship was penal. There is every evidence, indeed, that at those times they were used for congregational worship. As places of refuge for any number of people or for any length of time, the C. must always have been impossible, though a hunted refugee may occasionally have found safety there. It appears to be established that the C. were entirely the work of the early Christians, and not disused sand quarries, as was once believed. The strata quarried for building purposes were quite unsuitable for the construction of C., which required strata of the hard volcanic rock. Among the more famous of the C. outside Rome are those of Naples, Syracuse, Palermo, Tuscany, Etruria, Malta, and Alexandria. The C. of Paris are improperly so called—they are mere charnel houses.

Catafalque (Fr., from It. *catafalco*, a word of unknown origin), temporary draped structure, representing a cenotaph, used for the lying in state and for the funerals of royalty and notable persons.

Catalan, group of the Romance languages, spoken to-day by over 3,000,000 people in the provs. of Gerona, Barcelona, Lérda, Tarragona, Alicante, Valencia, and Castellón de la Plana, Spain; in the Fr. dept. of Pyrénées Orientales; in the Balearic Is.; in the dist. of Alghero, Sardinia; and in parts of the Argentine Republic. C. dates from the thirteenth century, and closely resembles Provençal. During the fourteenth century it came to be regarded as a literary language, and still attains to that dignity, the revival of *jocs florals* at Barcelona in 1859 having aroused much popular enthusiasm. The greatest C. poet of the fifteenth century was Ausias March, who wrote beautiful *Cants d'amor* and *Cants de mort*. Of modern poets, Balaguer and Perdaguer are chief. Among the prose writers are Ramon Lull (Raymond Lully), Muntaner, and Desclot. *Consull* M. Mila y Fontanals, *Estudios de lengua catalana*, 1875; and Morel-Fatio, in Gröber's *Grundriss der romanischen Philologie*, 1888.

Catalani, Angellou (1779-1849), famous It. singer who was the daughter of a tradesman, and was educated at the

convent of Santa Lucia at Gubbio. Her glorious voice soon attracted attention, and she made a tour of Europe, receiving enormous fees, which were soon squandered, through the extravagance of her husband, Capt. Valabregue. Her first appearance in London was in 1806 and she remained in England, a prima donna without a serious rival, for seven years. It was she who introduced to the Eng. stage Mozart's *Nozze di Figaro*, in which she played Susanna to perfection. Her refusal, however, to allow other singers to share in her popularity meant that, during her management, opera in London was, for a time, ruined—for one singer does not constitute an opera or, recalling her husband's cynical affirmation: 'Ma femme et quatre ou cinq poupées—voilà tout ce qu'il faut.' She later obtained the management of the Théâtre Italien in Paris, together with a large subvention; but, on Napoleon's return, she left Paris and toured a number of European cities arousing the wildest enthusiasm. Later she returned to the Théâtre Italien in Paris, but followed the same ruinous system there which had temporarily eclipsed the opera in London. Every expense on orchestra, other singers, and scenery was cut down so that the receipts might go, together with the subvention, into the hands of her husband. To suit this state of things the operas were arranged in such a way that little of the original save the name survived; while the rest consisted of variations by Rode, and similar items, with the celebrated *Son regina*. Introduced instead of the concerted pieces and songs which had been excised. But though she came to financial grief over the Paris opera house owing to her husband's carelessness, she was unquestionably one of the famous operatic stars of all time with a voice of singular purity and power. She gave up public life in 1828. She was most liberal and generous in her subscriptions to charities and withal a woman of fine character.

Catalaunian Fields or Plain, scene of the battle in which Attila, king of the Huns, was defeated by the forces under the Rom. general Aetius in A.D. 451. The plain is generally thought to have been situated round Châlons-sur-Marne, in the old prov. of Champagne, France, but some authorities place it round Metz.

Catalectic Verses are such as are lacking a syllable in the last foot. Pattenham called them 'maimed' verses. See ACATALECTIC.

Catalepsy (from the Gk. *καταληψις*, seizure, or a taking possession of), term applied to a nervous affection, in which the patient becomes insensible, and there is a sudden suspension of all voluntary motion, the body becoming rigid and fixed, and so remaining until the end of the attack. In some cases there is complete insensibility, so that the person appears to be dead. In other cases the patient appears to be labouring under great mental excitement, and gives utterance to vehement ejaculations, or will even break out into song. The duration of the

attack varies; sometimes the patient recovers after a few minutes, sometimes after sev. hours, but in more serious cases the attack will run into weeks or months. In this case forcible feeding has to be administered, otherwise the patient would starve. C. is a complaint to which very sensitive people, women more especially, are prone, and the attack is usually occasioned by some great stress of emotion, whether depression of spirits, mental excitement, or religious emotion. In the last case it assumes the form of a trance or ecstasy. Swedenborg's trances were undoubtedly a kind of C. This complaint is also associated with hysteria, and does not necessarily mean mental derangement structurally, although it does happen that C. is sometimes one of the symptoms of madness. It belongs to the class of those nervous disorders in which the various organs refuse to perform their functions owing to the abnormal physical and psychic state of the patient. There is a good deal of imposture practised in this particular affection; at the same time, epidemic C. has been known to occur in which many people are affected at the same time. Moral means form a large part of the treatment as in the case of hysteria. C. is a type of schizophrenia. Fixation of the limbs in any position they are made to assume, and insensitiveness of the whole body to pain, are characteristic features of the condition.

Catalogue, in astronomy, the name given to a list of stars, to which is added the means of determining their positions, whether lats. and longs., or right ascensions and declinations. Such a C. not only forms a register of the stars in question, but also gives the means of computing the effects of precession, aberration, and nutation. The position of the star in the heavens at any given time can thus be computed. Another kind of C., such as a C. of comets, is concerned with purely physical investigations, such as double stars and nebulae.

Catalogues and Cataloguing (Gk. *κατάλογος*, register, from *κατά* *λογεύειν*, to enrol, pick out), list or enumeration, generally in alphabetical order, of persons or things (sale C., picture C.), especially of the contents of a library or museum. Library C. of a kind have existed since the earliest times and the modern library catalogue is but an extension of the C. of the medieval libraries and of the lists compiled by the first booksellers. The making of C. and bibliographies is a most important branch of literary work: the catalogue is the list of books gathered together in one library; the bibliography is the list of books written on any subject regardless of their actual location. The value of a literary collection may largely depend on good C. to make it of practical assistance. To meet ordinary reasonable demands two C. are essential, one arranged by authors, one by subjects. Some libraries have various other C., such as title C., and lists besides. The catalogue entry for each book has three distinct parts: (1) Author; (2) Title proper; (3)

imprint and collation, with various bibliographical details. C. are usually typed nowadays instead of being printed or written by hand, and the book form is largely being replaced by the card or sheaf catalogue, as this is more convenient when additions to or withdrawals from the entries are made. The separate cards generally stand on edge in drawers or trays; the sheaf entries are held in loose-leaf binders. Additions and withdrawals can be made to either card or sheaf C. at any time, thus ensuring that the catalogue is always up to date. Most libraries now compile their C. either in dictionary or classified form irrespective of whether the C. is on cards or in sheaf form. The dictionary C. arranges in one alphabetical sequence the author, title, and subject entries, whilst the classified form is arranged according to the classification symbol taken from the book classification system in use in the library. With a classified catalogue there are obvious advantages, as a logical arrangement of subjects is assured, the catalogue being based on a system which shows what books are grouped together on the shelves, whereas the dictionary arrangement is purely fortuitous. The first to make definite scientific rules for compiling book C. was Panizzi in 1839. In that year appeared his 'ninety-one rules' to be observed in making the library catalogue for the Brit. Museum. Every book was to be catalogued from information contained in itself; exact rules as to the entry of the author's name, the title of the book, and imprint details are laid down. These rules have since been modified to meet the important principle that under any author's name all the eds. of his works should appear in a single list. The revised Brit. Museum rules were reprinted in 1936. The general catalogue of the Brit. Museum is arranged under authors. Subject indexes are pub. periodically by the Brit. Museum in which subject headings are in alphabetical order. Most public libraries and others use an author catalogue based on the Anglo-Amer. code rules or on the Brit. Museum rules, and also a subject catalogue which is arranged according to the book classification system adopted by the library. Of subject classifications, that of J. D. Brown was devised in 1894. Subjects are grouped in an evolutionary order, and the main divs. are matter and force, life, mind, and record; it is a simple system, complete and capable of expansion. Very few libraries, however, use this scheme. The best known modern book classification system is Dewey's 'decimal classification,' and a later, but little used, scheme is Cutter's 'expansive classification.' The decimal classification was drawn up by Melvil Dewey in 1876 (14th revised ed., 1942). Dewey divides subjects into ten groups: general works; philosophy; religion; sociology; languages; pure science; applied science; fine arts and crafts; literature; travel, hist., and biography. Each group is divided into ten sections, and these are again subdivided. The fourteenth ed. of Dewey's

system appeared in 1942 and a recent survey showed that 97 per cent of the libraries in the United Kingdom and the U.S.A. use this system. C. A. Cutter pub. his book *Expansive Classification* in 1931. It is defined as consisting of 'seven tables of classification of progressive fullness designed to meet the needs of a library at its successive stages of growth.' Each progressive table is subdivided with greater detail. The universal decimal classification is an adaptation and expansion of Dewey's scheme. The Institut International de Bibliographie at Brussels, now known as the International Federation for Documentation, adopted the scheme in 1895 for the purpose of arranging its enormous card bibliography. Three important libraries using this scheme are the Science Library in London, the Engineering Sciences Library in New York, and the Verein Deutscher Ingenieure in Berlin. The Library of Congress, the national library of the U.S.A., has constructed its own classification system, and although no thought was given by its authors to its adoption by other libraries, many univ. libraries are to-day using this scholarly scheme. Two recent classification systems, although not yet widely known, should be mentioned: the Amer. system of H. E. Bliss—a system of bibliographical classification—and the Indian colon scheme of S. R. Ranganathan. See M. Dewey, *Decimal Classification*, 1876, 1942; C. A. Cutter, *Expansive Classification*, vol. 1: The first six classifications, 1891-93; J. D. Brown, *Library Classification*, 1912, 1939; W. C. B. Sayers, *Manual of Classification*, 1926, 1941; H. E. Bliss, *A System of Bibliographic Classification* (2nd ed.), 1936; S. R. Ranganathan, *Colon Classification* (2nd ed.), 1939; H. Sharp, *Cataloguing* (4th ed.), 1948. See also the *Cataloguing Rules* compiled for the Library Congress, 1906, and for the Library Association and the Amer. Library Association, 1908; and the Brit. Museum Rules, revised 1936.

Catalonia (Sp. *Cataluña*), formerly a prov. of Spain; contains the four provs. of Barcelona, Tarragona, Lérida, and Gerona. It occupies an area of 12,288 sq. m. in the N.E. corner of the Iberian peninsula with a pop. of 2,961,500. The surface of the country, which is much broken up by spurs of the Pyrenees, slopes gently down to the coast, and is drained by the Rs. Ter, Llobregat, Noguerra, Segre, and Ebro, none of which is navigable. The climate is generally healthy, temperate, and favourable to vegetation. The orange, fig, vine, pomegranate, myrtle, thorn-apple, esparto and heaths, maize, millet, rye, flax, liquorice, nuts, almonds, and other fruits grow easily. Goats and swine are reared, but there are no sheep, and hardly any cattle. C., which was probably peopled originally by Iberian races, has been much invaded by foreign settlers. It was one of the first Rom. provs. in Spain, and the country is full of Rom. remains. The Romans were followed by the Goths and Alans, the Arabs, Charlemagne and his troops, then

by Louis the Pious of Aquitaine, who placed the dist. under independent Frankish lords, after driving out the Arabs. Since then the country has been alternatively independent and annexed by Spain. Always, however, the Catalans demanded their independence. This political movement was stimulated by what may be called a renaissance of the local spirit in the nineteenth century, provoked by a revival of the study of the Catalan language and literature. The language has great affinity with the Provençal, and is a neo-Lat. dialect. The Catalans are revolutionary and warlike, frugal, industrious, enterprising, and energetic, differing in dialect, costume, etc., from the other inhab. of Spain. In the Sp. revolution of 1931, the Madrid gov. was morally compelled, after the monarchy had fallen, to allow C. to use its own language, flag, and anthem, while, however, continuing to acknowledge the overriding authority of the Sp. republic. C., however, then drew up its own provisional constitution and, finally, the Sp. Gov. gave way and delivered the Statute of Autonomy to C. (Sept. 1932), the new Catalan Cortés or Parliament being formed soon afterwards. After a rebellion in 1934 the Sp. Gov. suspended the Statute of Autonomy for an indefinite period. During the Civil war (1936-39) C. stood firm on the gov. or republican side and an autonomous gov. was again instituted in C. in Aug. 1936. The whole of the provs. offered a stout resistance to Gen. Franco's Nationalist forces in 1938, but with the fall of Borja Blancas in the offensive of Nov.-Dec. 1938 and the threat to Tarragona, C.'s fate was sealed. With the help of It. forces and by extensive aerial bombardment, Franco broke into the heart of C. and, by driving a salient through the Republican forces to the sea, cut C. off from the Valencia Gov. On Jan. 26, 1939, Barcelona fell, and by Feb. the whole of C. was in the hands of the Nationalists, their advance being preceded by the flight of tens of thousands of refugees, in pitiful plight, across the Fr. frontier.

Catalpa, genus of Bignoniaceae, occurs in Asia and more abundantly in N. America. *C. syriaca* is a native of the S. states of America, where it gains a height of 40 to 50 ft. along the banks of rivs. The flowers are large, trumpet-shaped, and white, variegated with yellow and purple; when it reaches a great height the branches become too long and naked and spoil the appearance of the tree. *C. bignonioides* grows as an ornamental tree in Britain and yields durable timber; *C. longissima* contains much tannin in its bark.

Cataluña, see CATALONIA.

Catalysis, term introduced by Berzelius to express the acceleration of the rate of a chemical reaction produced by some substance which is itself not permanently changed by the reaction. The terms positive C. and negative C. are sometimes used to express acceleration and retardation of the rate of reaction. In some instances it is certain that the

catalyser undergoes some change in the course of the reaction, being reconverted into its original form before the end of the process; in other cases no change at all is apparent. An example of the former class is provided by the part played by manganese dioxide when oxygen is obtained by heating a mixture of that substance with potassium chlorate. Some of the chlorate reacts with the manganese dioxide to form potassium permanganate, chlorine, and oxygen; the chlorine then reacts with the permanganate to form potassium chloride, manganese dioxide, and oxygen, these being the ultimate products of the reaction: In the acceleration of the combustion of hydrogen and sulphur dioxide in the presence of finely divided platinum, the metal does not appear to change at all during the reaction. Many other metals act as catalysers in certain reactions, with results which have very great commercial value. If acetylene mixed with hydrogen be passed over finely divided nickel, the gases condense to a yellow liquid resembling petroleum. A process by which the combination of sulphur dioxide and oxygen is brought about by the catalytic action of platinum is used in sulphuric acid manuf. No completely satisfactory theory of C. has yet been elaborated. C. is playing an increasingly important part in chemical industry, e.g. in the manuf. of edible fats from whale oil, cotton-seed oil, etc., and in the synthesis of methyl alcohol.

Catamaran (from a Tamil word derived from *catta*, to tie, and *marana*, wood), name given to a vessel or raft used by the Hindus of Madras. It is formed of three logs lashed together. The central log is longest, with a curved surface at the fore-end which terminates in a point. It is from 20 to 25 ft. long, and is managed by two men, who squat upon it and work paddles. The special use of the C. is that it can pierce through the surf on the beach at Madras, and so reach a vessel in the bay when any other kind of boat would founder.

Catamarca: 1. N.W. prov. of the Argentine Republic, being bounded on the W. by the Andes and on the E. by the Sierra Aconquija. The country is mountainous, with short streams and many salt lakes. The valleys are fertile, and produce red pepper, tobacco, and all kinds of grain and fruits. Copper is found in great quantity, many minerals are mined, including gold, silver, iron, and lead. Pop. (largely Indian) 145,200. 2. Cap. of the above prov., on the Rio del Valle, 250 m. N.W. of Córdoba, with which it is connected by rail. It has a Franciscan monastery, a national college, and a normal school for women. Weaving is the chief industry. Pop. 22,000.

Catamount, see PRIMA.

Catanduanes, or Katanduanes, is. of the Philippines, part of the Albany prov., Luzon, from the E. coast of which it is separated by the Maqueda Channel. Area, 710 sq. m. Length, c. 38 m. It is a fertile is., producing maize, rice, abaca,

sesame, cotton, corn, indigo, etc. The chief tn. is Bira. Pop. about 34,000.

Catania, name of a prov. and its cap. tn. on the E. coast of Sicily. It is everywhere mountainous, and is watered by the Giarretta and its numerous affluents. It forms the beautiful plain of C., the most fertile dist. in Sicily. The tn. is situated at the foot of Mt. Etna, near the mouth of the Giarretta. Its former port is now blocked up by lava. C. is a city which is always being destroyed and is always rising again upon its own ruins and upon lava. This accounts for its modern appearance. It was devastated by eruptions and earthquakes in 1669, 1693, 1818, and 1873. Its immediate environs are very desolate, the country being covered with lava and black sand; beyond is the fertile plain which yields grains, the vine, fruits, and vegetables in extraordinary profusion and excellence of quality. The tn. was founded by Gk. colonists in 728 B.C., became a Rom. colony—Catana—in the reign of Augustus, was occupied successively by the Goths, Vandals, and Saracens. In the Second World War C. was the scene of heavy fighting during the allied invasion of Sicily in 1943, and the tn. of C., being a key point in the so-called Etna line—the Ger. defence line from C. to San Stefano—was subjected to bombardment and air attack. The tn. was eventually captured by the Eighth Army on Aug. 5, 1943. The damage was heavy. The roof and windows of the cathedral were damaged, as also were the roof and windows of the collegiate church and of the Minorite church. Other churches seriously damaged were San Benedetto, San Dominico, San Francesco, and San Rosario. Pop. (of prov.) 686,000; (of tn.) 228,000.

Catanxaro: 1. Prov. of S. Italy, formerly called Calabria Ulteriore I. It is bounded by the Mediterranean on the W. and the gulf of Taranto on the E. There is excellent pasturage; vine, olives, and fruit are cultivated. Area, 2030 sq. m. Pop. 573,000. 2. Cap. of the above prov. It is an episcopal city, situated on a mt., 8 m. from the gulf of Squillace. There are the ruins of an old castle and a cathedral. Many of the prin. buildings were destroyed by an earthquake in 1783. There are fine olive groves; the chief industry is the manuf. of silk and velvet. The cathedral was severely damaged in the fighting of 1943, but it was not considered to be of sufficient monumental importance to justify repairs through the Monuments, Fine Arts, and Archives Sub-commission of the Allies. Pop. 44,000.

Catapult (Gk. *katá*, down, and *πάλλειν*, to hurl), ant. military engine for throwing stones, arrows, and darts. Some say that it was invented by the Syrians in 200 B.C., others that Dionysius, the tyrant of Syracuse, invented it in 399 B.C. It was used by the Gks. in the time of Philip, king of Macedonia, by the Carthaginians, and by the Romans. It disappeared at the beginning of the Middle Ages.

The C. had a bow of wood or steel, which was bent by means of a windlass.

the cord being finally released by a spring. See also BALLISTA.

Cataract, disease of the eye caused by the clouding of the liquid contents of the crystalline lens. This is situated with its anterior surface 3.6 mm. behind the anterior surface of the cornea and is the prin. image-forming part of the visual apparatus, the alteration of the curvature of its anterior surface giving accommodation, i.e. focusing for objects at varying distances. The cloudiness which is caused by lack of nutrition occurs at all ages, but more often in the cases of old people and young children. It is sometimes present at birth, exists in connection with some general diseases such as diabetes, in senile decay, or when the eye is subject to local injury caused by a blow. Heredity plays little or no part in its formation. It is painless and unaccompanied by inflammation. One eye is often affected alone, and blindness is caused for all general purposes, but the patient is able to distinguish light from darkness. The lens itself is not homogeneous, but consists of numerous concentric layers increasing in density from the outer to the central portion, the whole being encased in a transparent capsule. The formation of the C. is gradual, either starting from the centre or from the edges, and when it has covered the whole of the lens, the latter is filled with a homogeneous pearly white or amber-coloured opacity. In its early

stages it is seen by the ophthalmoscope invented by Helmholtz for examining the interior of the eye. C. may be either hard or soft; the latter, however, is the general condition for cases occurring in young people. Treatment must consist of an operation. As a palliative, however, a mydriatic such as atropine increases the opening of the pupil and so allows more light to reach the retina; but it is no cure, and has no power to arrest the progress of the malady. The operation can be performed by means of a puncture of the lens by a fine needle passed through the cornea at the margin and stirring the lens contents, when the substance of the lens passes into the aqueous humour of the eye and dissolves. This form of operation is generally performed on soft C. When the lens is hard it is extracted entire. With a narrow knife an incision is made in the upper part of the cornea at its junction with the sclerotic, the lens, with or without its capsule, is taken out, the cut edges put together, and the eye bandaged. In either case strong convex glasses must be worn after the operation to replace the missing lens. Some cases of operation for C. are unsuccessful, because the retina also is diseased.

Catarman, pueblo on the N. coast of Samar, Philippines, at the mouth of the C. R. The tn. was partly destroyed by a volcanic eruption in 1871. Pop. c. 10,000.

Catarrh, inflammation of the mucous

membrane, accompanied by a more than usual discharge of mucous fluid from it. In an ordinary cold the membrane of the nose and upper part of the throat is inflamed. The inflammation may affect the larynx, causing temporary loss of voice, or travelling to the lungs it may set up bronchitis.

Catarrhini, name sometimes given to a group of monkeys which comprises the families Cercopithecidae (baboons, macaques, etc.) and Simiidae (anthropoid apes). They differ from the Platyrrhini, which comprises the remaining two families, the Hapalidae and Cebidae, chiefly in having their nostrils close together and looking downward as opposed to those looking outward and separated by a broad cartilaginous septum. The C. moreover, have often ischial callosities or patches of brightly coloured skin on the buttocks, cheek pouches, thirty-two teeth, and their tails when present are never prehensile. The other species have thirty-six teeth, no ischial callosities or cheek pouches, and their tails are frequently prehensile. The former are denizens of the Old, the latter of the New World.

Catarroja, tn. of Spain, in the prov. of Valencia, and 6 m. S. of the city of that name. Fishing and the cultivation of rice are the chief industries. Pop. 8000.

Cataxi, warlike, cannibal tribe, living in W. Brazil. They go naked, and wear bangles and anklets. The men are very handsome, with fair complexions, and are extremely strong. They mould and ornament pottery and cultivate manioc extensively.

Catawba, name given to the grape and the wine expressed from the grape of *Vitis Labrusca*, the fox-grape of N. America. The fruit is dark red and very sweet, and the wine is light, with a rich musky flavour, and may be either still or sparkling. Its name is taken from the C. R. of the Carolinas, on which it is said to have been first cultivated.

Catbalogan, pueblo of the Philippines, cap. of the prov. Samar. It trades chiefly with Manila, over 300 m. to the S.E., the prin. exports being coco-nut oil and hemp. Pop. 8000.

Cat-bird, popular name of two very different species of birds which resemble one another only in that they emit a curious mewing sound. One of these, *Elanoides forficatus*, is an Australian bird closely allied to the bower-birds; the family to which it belongs is the Pardalidae. The other is an Amer. member of the family Turdidae, is related to the mocking-bird, and is called technically *Galeoscoptes carolinensis*. The colouring of the two is also different, the former being a bright green, the latter a slate-grey.

Catch, round in which each singer in turn catches up, as it were, the words from his predecessor and which is so contrived that this catching at each other's words distorts the sense, giving it a humorous or an absurd turn.

Catchfly, name applied to many species of the caryophyllaceous genera *Lycnis*

and *Silene* which are very common in N. lands. They obtain their name from their ability to catch insects by means of a glutinous substance which is exuded from the calyx and glandular hairs on the stalks. In both genera the calyx is gamosepalous and the stamens are ten in number, but in the genus *Silene* there are only three styles, while *Lycnis* has five styles and five carpels. *S. nutans*, the Nottingham C., is a night-flowering species, common in meadows, and is pollinated by moths; *L. viscosa*, clammy C., and *L. viscaria*, Ger. C., are European species with protandrous flowers which are pollinated by bees, butterflies, and moths. *S. maritima*, seaside C., has fleshy leaves; *S. rotundifolia*, round-leaved C., and *S. antirrhina*, snapdragon C., are Amer. species. *Dionaea muscipula*, the Venus's fly-trap, which belongs to the Droseraceae, is sometimes called the Carolina C.

Catching Bargain (also **Snatching Bargain**) means a purchase made from an expectant heir of his reversionary interest in real or personal property for an inadequate consideration. The law was formerly very stringent in setting aside such bargains, but mere undervalue will not now operate to nullify 'a bargain if made in good faith and without fraud or unfairness.'

Catchment Area, area in which water from rainfall, springs, etc., collects to form the supply of a riv., stream, or drainage area. The boundaries of a C. A. are the heights or ridges of land which divide it from another drainage area. A certain proportion of the rainfall is always lost by evaporation and absorption. The 'run-off' is that water which actually reaches the stream or riv. Also called a catchment basin.

Catchpoll (Low Lat. *chassipullus*, lit. 'chase-chicken'), obsolete term of reproach used to denote the assistant of a bailiff whose duty it was to make arrests. It was also used to mean a tax-gatherer.

Cateau, Le, Battle of, name given to the action fought on the W. front in the First World War on Aug. 26, 1914, during the retreat of the Brit. forces before the Ger. invasion of Belgium and France. The Brit. forces comprised the 3rd, 4th, and 5th Divs., or 2nd Army Corps, under the command of Maj.-Gen. Sir Horace Smith-Dorrien. The battle resolved itself into a desperate resistance by one half of the Brit. Army temporarily cut off from the other half, against a Ger. attack by no fewer than seven Ger. divs., backed by a superior force of artillery. In view of the Ger. pressure, Sir John French, the Brit. commander-in-chief, abandoned his plan of holding a position behind the Le C. road, preferring to withdraw further, towards the Reisel-Saint Quentin railway. He therefore ordered the two corps commanders, Sir Douglas Haig and Sir Horace Smith-Dorrien, to conform to this change of plan. Haig accepted, but Smith-Dorrien's situation was too precarious to permit him to do anything else but face the Gers. No support from the 1st Corps being

possible, his three divs. had to make the best of a situation which, on paper, seemed to point to annihilation. The sole protection to the flanks, which for the rest were practically 'in the air', was four cavalry brigades at Le Souplet and Scranvillers, the latter under Maj.-Gen. Allenby. The precise location of the battle was near Troisvilles, thence N. of Audencourt, Hautcourt, and N. of the Cambrai-Saint Quentin railway. The battle was, for the most part, an artillery duel, in which the Brit. guns were outnumbered by five to one. The Brit. guns were directed against the Ger. infantry, which was observed massing about a mile away and always advancing in successive waves, so that it presented a fair target, and must have suffered great losses from the Brit. shrapnel. After six hours' continuous bombardment, many of the Brit. batteries were out of action, and a couple of hours later the right flank of the 5th Div., under Sir Charles Ferguson, was turned, and the enemy were pouring through the gap between the two army corps. Smith-Dorrien then ordered a general retirement, which was effected in as good order as possible. Two battalions, however, the 2nd Battalion King's Own Scottish Borderers and the 2nd Battalion King's Own Yorkshire Light Infantry, either misinterpreted or ignored the order to retire and, continuing their dour resistance, were all but annihilated. In the retirement which followed their final heroic resistance, Corp. Holmes of the latter battalion won the V.C. by carrying a wounded soldier over a mile under heavy fire. On the same day Maj. Yate won the Cross for leading a gallant attack by a score of survivors of the same battalion, all, including Maj. Yate, perishing. Terrible losses were likewise sustained by the 1st Battalion Gordon Highlanders and the 2nd Battalion Royal Scots, who found their retreat by road cut off by the blazing vil. of Audencourt, so that they were forced to take to the open country and carry out a series of desperate rearguard fights. Numerous deeds of heroism were also recorded among the Brit. artillery, notably the famous 'L' Battery, R.H.A., of whose personnel Capt. Reynolds and Drvs. Luke and Brain all won the V.C. by getting a gun away under a storm of bullets. The extrication of the Brit. corps reflected the highest credit on the skill of Smith-Dorrien, whose intrepidity, determination, and coolness are commended in French's dispatch.

Cateau-Cambresis, tn. in the dept. of Nord, France, 14 m. S.E. of Cambrai. There are wool, cotton, sugar, and soap factories, breweries, and potteries; woollen goods are manufactured, and cattle-dealing is carried on. In the sixteenth century it was for a time held by the Eng., who, however, had to surrender to Dunlos. The treaty of C. was signed here in 1558, after the battle of Saint-Quentin. Pop. 8400.

Catechism (Low Lat. *catechismus*, from *catechizare*, to catechise; from Gk. *καταγγελλω*, to catechise, instruct; all from a root word

meaning echo): 1. Religious instruction given by means of questions and answers. 2. A book of elementary instruction containing, by means of questions and answers, an exposition of religious dogma. 3. Elementary instruction, oral or written, in any branch of knowledge. In the early days of Christianity the C. was the instruction given to pagans, Jews, and others in preparation for baptism and for admittance to the number of the faithful. He who received the instruction was called the catechumen, and he who gave it the catechist. The catechumens occupied a special place in the basilica, either under the portico or in the anterior gallery. They were not allowed to remain for the sacrament, this being a mystery into which they were initiated only after baptism. During the first centuries the preparation was long, taking at first three years, then two; later everything was changed, and infant baptism was instituted, the instruction being given afterwards and, as it were, a repetition of the baptism taking place under the name of confirmation. There remains no formula of C. used by the Church of antiquity; the C. was then a real and prolonged education in morals and dogma. The earliest Christian Cs. are those of Kero, a monk of St. Gall in the eighth century, and of Otfrid, a monk of Weissenburg in the ninth. It was from the time of the Reformation that the little books called Cs. spread and multiplied. This was due to a renaissance of religious proselytism springing from the emulation between Catholics and Protestants. The Catholic Church found it necessary to define and formulate its faith, and for this purpose it issued in 1566 the *Summa Doctrinarum* of Peter Canisius, in opposition to the Protestant Cs. of Luther. A little later came that of the Council of Trent, laying down a uniform plan of instruction, and giving a model to the curés, who were enjoined to teach it at least on Sundays and feast days. This was a period of great enthusiasm, provoked by the spread of Protestantism, for the C.; priests were instructed to make the teaching as attractive as possible to the children, by the use of gentle and maternal language, the offering of little rewards, and so on. Later came other Cs., among the Catholics those of Bellarmine in 1603, of Bossuet in 1687, and the *Schema de Parvo* in 1870; among the Protestants, the *Genera Catechism* of Calvin in 1536, the *Catechism of Heidelberg* in 1563, the *Zurich Catechism*, and in 1549 the C. which, with additions by Bishop Overall in James I.'s reign, forms the Eng. Protestant C. of the present day. The Scottish Presbyterians have Craig's C. (1592) and that of the Westminster Assembly of Divines (1643) now in use. The Jewish Cs. include *The Thirteen Articles of Belief* (twelfth century) of Maimonides, Rabbi Levi's *Book of Education*, and those of Leser and Piscotto in use at the present day.

Catechol, see PYROCATECHIN.

Catechu, or Cutch (*cate*, tree, *chu*, juice; Malay *kachu*), extract obtained from sev. plants, especially from the wood of

Acacia catechu and *Acacia suma*, natives of India. This kind is known as 'black C.', and is used in tanning and dyeing. The best quality, called 'Pegu C.', is obtained in blocks covered by large leaves. The 'pale C. of pharmacy,' or 'gambir' (*terra japonica*) of commerce is a similar extract produced from the leaves of *Uncaria gambir* and *U. acida*, plants of the E. Indian Archipelago. It is sold in dry cubes about 1 in. square, and is used medicinally as an astringent, and also largely in tanning and dyeing, yielding a variety of drabs, browns, and olives. It is often used for colouring stout canvas. Its main

CATECHU

ingredients are catechuic acid or catechin, and a peculiar variety of tannic acid. 'Areca C.' is obtained from the fruits of the areca or betel palm.

Catechumen, see under CATECHISM.

Categorical, term in logic. Aristotle used it in its merely literal signification of that which is affirmative as opposed to the negative. In later logic it denoted a proposition which is asserted absolutely in contradistinction to one that is hypothetical or involves a condition. It still has this connotation, but the distinction between C. and hypothetical judgments is considered in modern logic to be one of substance or content, and not one that is merely dependent on the grammatical form of the words used. See A. Wolff, *Essentials of Logic*, 1926; B. Bosanquet, *Logic*, 1931; W. V. Quine, *A System of Logic*, 1934.

Categorical Imperative, name by which Kant in his system of ethics designates the fundamental principles of all moral laws. He held that the will or reason was guided in any given direction by an *a priori* cognition of what we ought and what we ought not to do in a particular set of circumstances; and that we were free to obey or disobey, morality being neither empirical nor a question of self-interest. This unconditional rule of duty which is valid because innate, Kant calls the C. I., and contrasts it with a command, the validity of which is dependent on some presupposed end, e.g. self-interest.

Schopenhauer attacked the theorem of the C. I. by saying that Kant confused reason with virtue and that in reality he made all actions depend upon self-interest.

Category (Lat. *categoria*, Gk. κατηγορία, accusation, assertion), term in logic and philosophy applied to certain general classes under which objects of knowledge can be arranged. The name was first used by Aristotle for the classification of all kinds of predicates. His Cs. are ten in number: substance, quantity, quality, relation, place, time, situation, possession, action, and suffering. This arrangement was disputed by the Stoic philosophers, and various alterations and reconstructions have been made since. The other great use of the term is the Kantian. Kant applied the term to the conceptions which the mind forms to raise the matter of knowledge received from the senses into an intelligible notion. His Cs. are (1) Quantity, including unity, plurality, totality; (2) quality, including reality, negation, limitation; (3) reality, including substance, causality, reciprocity; (4) modality, including possibility, existence, necessity. These Cs. only deal with the *a priori* conceptions of the understanding, and later philosophers have extended the use of the term to cover any necessary conception under which reality may be thought, and have given them an objective instead of only a subjective significance. Hegel was the completer of this work, begun by Fichte, and he divides all Cs. into three great classes—being, essence, and concrete thought—each subject to much subdivision. J. S. Mill classifies all describable things as (1) feelings or states of consciousness; (2) the minds which experience these feelings; (3) the external objects supposed to excite sensations; (4) the successions and co-existences, likenesses and unlikenesses between feelings or states of consciousness.

Catena (properly Vincenzo di Biagio) (c. 1470-1531), It. painter, a disciple of Giovanni Bellini. He worked chiefly on portraits and religious and historical subjects, his prin. works being 'Knight Kneeling before the Madonna' (National Gallery); 'Madonna between St. Francis and St. Jerome' (Venice), and 'Count Raymond Fugger' (Berlin). There are many examples of his work at Venice—in the Doge's palace and in the churches and the academy.

Catenary (Lat. *catena*, a chain), name given to the curve in which a cord or chain of uniform material and sectional area hangs when loaded with its own weight alone. The Cartesian equation

of the curve is $y = a \cosh \frac{x}{a}$. The uni-

formly distributed rope curve is called the common C. to distinguish it from other curves which are formed when the distribution is otherwise. Thus when the loading of any portion is proportional to the horizontal projection of that portion the curve formed is the parabola, as in the case of the chains of a suspension bridge. The properties of the common

C. are interesting and various. The chief are: (1) If a horizontal line be drawn at a distance below the lowest point of the string having a weight equivalent to the tension at the lowest point, then the tension at any point in the string or chain is equal to the weight of a portion equal to the distance of the point above the horizontal line. The latter line is called the directrix of the C. (2) The radius of curvature at any point is equal to the portion of the normal intercepted between the curve and the directrix. (3) Of all curves the given length, drawn between two fixed points in a horizontal line, the common C. is that which has its centre of gravity furthest from the line joining the points. (4) The horizontal component of the tension at all points in the string is constant. (5) The area bounded by the vertical line through the vertex and the vertical line through the other extremity of any arc is equal to the length of arc multiplied by the height of the other extremity above the directrix. If the string or chain vary in diameter, so that the area of section at any point is proportional to the tension at that point, the curve in which the string hangs is called the C. of uniform strength.

Catenipora, name given by Lamarck to a genus of fossil corals called *Halyptiles* by Fischer. These concatenates are known as chain-corals, and occur only in the Ordovician and Silurian.

Cateran (Gaelic and Irish *ceathnach*, a soldier), originally an Irish or a highland irregular soldier, a keru; now usually meaning a highland freebooter or reaver.

Caterham, urb. dist. in the Wimbledon div. of Surrey, England, 7 m. S.E. of Croydon, and 20 m. S. of London. The Metropolitan dist. lunatic asylum is here, and the guards' barracks. Pop. 20,000.

Caterpillar, name given to the larvæ of the Lepidoptera, or butterflies and moths. It is a worm-like animal which consists of a head and thirteen segments, the first three being thoracic and the last ten abdominal. On the first three segments there are six true legs, each of which is jointed; and the abdominal segments often bear a varying number of tubular *pro-legs*, each ending in a circle of small hooks, the last two being claspers. These larvæ are curiously dissimilar to the perfect insect in that they possess large mandibles, while their maxillæ and labial palps are small. The spinneret, or the organ by which the silk is exuded, opens on the middle of the labium, and sometimes projects as a spine. The sense of sight is very rudimentary for, though half a dozen pairs of simple eyes (ocelli) are present on the sides of the head, they are probably merely sensitive to the difference between darkness and light. The other senses also are but feebly developed, since this larval stage is essentially a feeding period in the life-history of the insect, and every effort is made in the direction of storing up food ready for the resting stage. As might be expected in this voracious creature, the stomach is extremely large, and it is also very simple in structure. The

skin often contains odoriferous and other glands; it is very thin, and a slight wound will cause it to break and exude so much blood that the larva soon dies. The sexual organs are rudimentary and cannot be seen externally, but that they do exist has been fully proved, and in a few cases the sexes are said to differ in colour. The C. is frequently a brightly coloured creature, more especially when its unpleasing taste gives it no cause to fear birds or other enemies, but at other times it is colourless, or takes on the hue of the plant on which it lives. It may be smooth or covered with hairs. Mimicry prevails very greatly among the

CATERPILLAR

A, small antenna; E, simple eyes; H, 'horn', ST, stigmæ, S, segments, 1, first pro-leg, 5, fifth pro-leg

various species, and the appearance of some, which resemble twigs, is most remarkable in its perfection. A serious enemy to the larvæ is the ichneumon fly, which has the unfeeling habit of depositing its eggs in the soft bodies of the feeding lepidoptera; as the eggs hatch the resulting larvæ use up the reserve material in the bodies of their host, so that when the resting-stage comes the creature has no stored up food and consequently dies. A C. should be distinguished from a maggot, which is the limbless larva of a fly, and a grub, which is a larva having three pairs of jointed legs, but no pro-legs.

Catesby, Mark (c. 1679-1749), Eng. naturalist, b. in London. From 1710 to 1719 he travelled in N. America and gathered together a remarkable collection of plants. From 1722 to 1726 he was again in Carolina. On his return he pub. *Natural History of Carolina, Florida, and the Bahama Islands, Hortus Brianno-Americanus*, and a work on the fishes, reptiles, and insects of the is. of Providence (1731-43).

Catesby, Robert (1573-1605), Englishman, b. at Lapworth, Warwickshire, of good fortune and family. In 1604 he joined a group of conspirators, including Thomas Winter and Guy Fawkes, and was the moving spirit in the Gunpowder Plot (Nov. 5, 1605). On the discovery of the plot he attempted to escape, but was shot at Holbeach in Staffordshire.

Catfish, name given to any member of the sub-order Siluroidea, the species of which are characterised by having a naked

or bony skin without scales, a small maxillary bone, and the presence of barbels about the mouth. They inhabit all temperate and tropical regions, and only rarely enter salt water. Over 1000 species are known to exist, and those vary greatly in nature and habit; among them may be mentioned *Malapterurus electricus*, the C. of the Nile which gives an electric shock, *Silurus planis*, the wels of Ger. riva, which weighs 300 to 400 lb., *Ictalurus ponderosus*, the white channel-cat of the Mississippi, which is one of the largest fresh-water fishes, and the genera *Callichthys*, *Doras*, *Oxydoras*, and *Rhinodoras*, which travel overland in dry seasons for new ponds. *Amiurus nebulosus*, the common C. of N. America, has now been introduced to sev. places on the European continent. Species of the S. Amer. *Corydoras* are often to be seen in tropical aquaria. The term C. is also applied to the genus *Anarrhichas*, marine in habitat and not closely related to the above. *A. lupus* is common on the Brit. coasts; in spite of its forbidding appearance, it provides excellent food.

Catgut, name given to the cord made from the intestines of the sheep, ox, horse, mule, and ass—never from those of the cat. It is supposed that the proper word was *kitgut*, *kit* meaning a small fiddle, and that it has become confused with the word *kit* used for cat. C. is made into strings for harps, violins, and other musical instruments, for bow-strings, whipcord, for hanging weights of clocks, suturing wounds, and for belts for driving lathes. The intestines are thoroughly cleansed, scraped, rendered aseptic, and drawn through a perforated brass thimble.

Cathari, or **Cathars**, or **Cathartists**, widespread heresy extending among the Gnostics of the Middle Ages, gave rise to this name, which signifies 'the pure ones' (Gk. καθαροί), 'connoting cleansing, purification.' The C. assumed different names in different countries. In the E. they were called Bogomils or Paulicians; in the W. they were called Paterini, because they held their meetings where the rag-pickers used to meet, in the street Pateria. The heresy first started in the tenth and lasted till the middle of the fourteenth century, when it became rooted out by the Inquisition. Some curious tenets are ascribed to the C. They were divided into two classes, the 'Perfecti,' and the 'Credentes,' or 'Believers.' The Perfecti were saints on earth to whom the Believers gave unquestioning obedience, and whom they even adored. They believed that Satan was the ruler of this world, which was a kind of purgatory or hell, but they believed in the ultimate salvation of all mankind; man might have to return to this world more than once before his reconciliation with Christ was complete. Some even held the doctrine of metempsychosis.

Catharists, see ALBIGENSES.

Cathartic, medicine used to produce evacuation of the bowels. The term is often used to describe a purgative moderate in its action, more forcible than

a laxative, but more gentle than a drastic purgative. The action usually is to cause an increased flow of secretion from the lining of the alimentary canal and so aid in the removal of irritating matter.

Catharometer, instrument used for ascertaining the rate of flow, or any change in the composition of a gas at a given point. An electrically heated wire is put into the gas and the changes in its resistance consequent on cooling are indicated. The instrument can also be used for measurements on liquids.

Cathay, name by which China was commonly known in Europe during the Middle Ages, introduced by Marco Polo and derived from Khitai or Khitan, the earliest Mongolian tribe known to have conquered China who disappeared early in the twelfth century. The Russians still call China 'Kital.'

Cathcart: 1. Par. and tn. in Renfrewshire and Lanarkshire, Scotland, near the White Cart Water, and 3 m. S. of Glasgow, of which it is a suburb. Industries, paper-making and dyeing. Pop. of par. 47,000. 2. Dist. and tn. in S. Africa, in the S.E. prov. of Cape Colony, 109 m. N.W. of E. London by rail. Pop. of tn. 850 whites.

Cathcart, Charles Murray, second Earl (1783-1859), Eng. soldier. Son of Sir Wm. Schaw C. Joined the Life Guards in 1800. Served as lieutenant-colonel at Salamanca and Vittoria. Took part in battle of Waterloo (1815), and received the C.B. Of a scientific disposition, he discovered the mineral greenockite. Sent to Canada in 1846 as commander-in-chief.

Cathcart, Sir George (1794-1854), third son of the first Earl C., likewise a brilliant soldier, and took part in the European campaigns. Was aide-de-camp to the duke of Wellington, and served at Quatre Bras and Waterloo. Was present with his father at the Congress of Vienna (1814). Appointed commander of King's Dragoon Guards in 1838 and sent to Canada to quell the Insurrection. In 1852 was made governor of the Cape and brought the Kafir war to a speedy termination. Made K.C.B. in 1853. Killed at Inkerman. Wrote *Commentaries on the War in Russia and Germany* (1850).

Cathcart, Sir William Schaw, first Earl (1755-1843), Eng. soldier and diplomatist. Son of Charles, ninth baron C. He first studied the law, then entered the army, and took part in the Amer. campaign. Made lieutenant-colonel of Coldstream Guards (1781), and commander-in-chief in Ireland (1802). Took part in attack on Copenhagen (1807). Was present at Congress of Vienna, and created earl in 1814.

Cathedral (Lat. *cathedra*), a seat or throne, prin. church of a diocese, that in which the archbishop's or bishop's throne is placed. In the primitive churches the throne was placed in the apse, behind the altar, in such a position that the bishop faced the officiating priest; its position is now usually on the S. side of the choir. Originally C. had a civil as well as a religious function, political assemblies being held in them under the

presidency of the bishop. Until the end of the twelfth century they were of no extraordinary dimensions—many of the abbey churches were much bigger. But at this period, kings and ecclesiastics co-operating, magnificent buildings sprang up, and in the thirteenth century grand ceremonies took place in and about them, when amid the pealing of bells the bishop and chapter went forth to receive the king at the entrance to the town. The administration of the C. and of the diocese is carried on by the chapter. For a description of various celebrated Cs., see under ARCHITECTURE.

Cathelineau, Jacques (1759-93), linen-merchant of scanty means, who headed the Vendéens in their opposition to the Fr. revolution—called by the peasants the Saint of Anjou, on account of his great piety. Seized the castle of Gallais, together with a cannon (nicknamed the Missionary), and offered a stout resistance to the revolutionary insurgents. Very successful at first, seizing Fontenay and Saumur. C. was then created general of the forces. Made an attempt in 1793 to capture Nantes, and succeeded; was mortally wounded; his troops at once dispersed.

Cather, Willa Sibert (1876-1947), Amer. authoress, b. at Winchester, Virginia, daughter of Charles F. Cather. When about eight years old she was taken to a Nebraska ranch. She graduated from Nebraska Univ. in 1895, and became Eng. mistress in Alleghany High School. On *Pittsburgh Daily Leader*, 1897-1901; associate editor, and eventually managing editor, *McClure's Magazine*, 1906-12. She did not marry. Her best novels are of the pioneering life in the W., and as she acknowledged herself a follower of Henry James, her work is notable for its form and style, which owe something, too, to Turgenyev and Flaubert. *Death Comes for the Archbishop* (1927), which depicts with sympathy and insight the facts of a priest's life in New Mexico a century ago, is probably her finest novel. *Shadows on the Rock* (1931) is a very good story of eighteenth-century Quebec. She also pub. a number of short stories, and in 1936 a vol. of essays entitled *Not under Forty*. Other works: *April Twilights* (verse, 1903); *The Troll Garden* (1905); *Alexander's Bridge* (1912); *O Pioneers* (1913); *The Song of the Lark* (1915); *The Bohemian Girl* (1917); *My Antonia* (1918); *Youth and the Bright Medusa* (1920); *One of Ours*, Pulitzer prize novel (1922); *A Lost Lady* (1923); *The Professor's House* (1925); *My Mortal Enemy* (1926); *Lucy Gayheart* (1935); *Sapphira and the Slave Girl* (1940).

Catherine, St. I. St. C. virgin and martyr, whose festival falls on Nov. 25. Little known about this saint; always depicted in art with her wheel and crowned. Various legends exist, amongst which may be cited the translation of her body by angels after her martyrdom to Mt. Sinai. Her prayer before her death, that the world might be converted, was granted, for when Constantine defeated Numantius, the world became Christian.

2. St. C. de Ricci, of noble parentage,

b. in Florence in 1522. Entered the convent of Dominicans at Prato, and d. in 1589. Pope Benedict XIV. canonised her, 1746, and her calendar date is Feb. 13. 3. St. C. of Bologna, b. in 1412. Belonged to a noble family. Joined the order of Poor Clares at the age of eleven, and in later years was appointed prioress of the convent of Poor Clares at Bologna. Had a beatific vision of the Virgin and Infant Son. 4. St. C. of Genoa, b. of noble parents in 1447. Canonised by Clement XII. in 1737. Unhappily married, consequently separated. Devoted her life to nursing the lepers and the sick and poor. 5. St. C. of Siena, b. in 1347. Her father was a dyer by trade. Subject to ecstatic visions from her earliest childhood, she belonged to the order of St. Dominic, and her father confessor, Father Raimondo of Capua, wrote a detailed account of her life and visions. This saint was evidently subject to cataleptic fits, brought on through her unnatural and terrible mortifications, but she was rewarded for her holy zeal with most glorious visions. On one occasion she declared that she saw Our Lord seated in glory in the midst of His disciples. On another occasion she received the stigmata or supernatural impression on her hands and feet of the scars and wounds inflicted upon the Saviour on the Cross. Although an illiterate girl, she exercised great religious and political influence, for she was instrumental in bringing the pope back to Rome, and she succeeded in reconciling Florence to the holy see. During her short life here on earth she was at times subject to the most terrible temptations, but Christ appeared to her and comforted her. She d. at the age of thirty-one. 6. St. C. of Sweden, daughter of Prince of Nierck and St. Bridget. Placed in a nunnery of Risborg when seven. Became abbess of Vatzon and d. in 1381.

Catherine I. (1680-1727), wife of Peter the Great, was of obscure birth. Her first husband, a Swedish dragon, was slain and she herself was taken prisoner at Marienburg. She became the mistress of Bauer, and then of Menshikov, but the tsar fell in love with her, and in 1723 she was crowned empress of Russia. On his death in 1725 she continued to reign alone through her favourite, Menshikov. Energy, good sense, and a lively interest in science and art characterised her rule. The 'Verkhovny Tainy Sovyet,' or supreme privy council, was instituted in her reign.

Catherine II. (1729-96), empress of Russia, was the daughter of the prince of Anhalt-Zerbst, the governor of Stettin and a Prussian field marshal. In 1745, after having adopted the name of Catherine Alexeievna, and renounced her membership of the Lutheran, in order to join the Gk. Church, she was allowed to marry Peter, the nephew of the reigning Empress Elizabeth, and the prospective heir to the throne. Her husband had all the pettinesses of a small Ger. prince, and was besides disfigured with small-pox, addicted to loathsome habits, and actuated

by a mean type of military enthusiasm, which has been aptly described as corporal's mania. For a few months Peter reigned as Peter III., but in 1762 he was murdered, probably at the instigation of his wife, and C. came to the throne. Though it is a disputed point, it is probable that her son, Paul, who bore a strong resemblance to Peter III., was really her son by her husband. She was a harsh mother to him, and whilst she lived, denied him every vestige of authority. As a ruler C. showed herself to be possessed of indomitable energy, an iron will, and great ambitions for territorial expansion. But her determination to advance her various paramours to

CATHERINE II. OF RUSSIA

Engraving of a print by Caroline Watson
after a picture by Rosselin

high offices, regardless of their capabilities, played havoc with her army organisation, her generals being often quite incompetent, and detracts from every estimate of her as a statesman rather than a scheming politician. Thus in 1763 she triumphantly placed her former lover and favourite, Stanislaus Poniatowski, on the Polish throne, and would always insist, despite every evidence to the contrary, that Potemkin, who enjoys the unenviable reputation of being the most notable of her many admirers, was superior to Suvarov in strategic genius. The most conspicuous of her services to her country was her consolidation of the empire and the enlargement of its frontiers. For she insisted on her full share of the spoil after each of the three iniquitous partitions of Poland (the first in 1772), and successfully manoeuvred the acquisition of Courland, nor did she come out of the war with Turkey, which ended with the peace of Kainardji in 1774, or the subsequent war with Sweden, which terminated in 1790, without substantial additions to her sphere of influence. As empress,

C. who was a disciple of Voltaire, prided herself on being guided by 'circumstances, conjectures, and conjunctions,' and not by any rigid system. This probably accounts for the irresolution and instability which marred much of her work, as also for her passion to begin enterprises which she had not the perseverance to complete: In her own words, she was a splendid *commenceuse*. During her reign the internal administration of Russia was good probably because, when her ardour slackened, there were officials willing to carry out her plans. Of her foreign policy it may be said that she was always influenced by her desire to build up a great and flourishing kingdom—a patriotic desire which won her the loyal admiration of all her people and the respect of many rival powers. But sometimes her aims were extravagant, as for instance when she entertained the idea of overthrowing Brit. supremacy in India, or of reviving, under Russian suzerainty, the Gk. empire at Constantinople. As a woman she was flagrantly and frankly immoral; her lovers, of whom the first was Count Soltikoff and the last Platon Zubov (with whom she lived when she was sixty-seven), succeeded one another without intermission, and occupied almost a definite post to which a huge salary was attached. Her admiration of Voltaire led her to despise religious sects, but though her irreligion induced her to favour toleration, she refused permission to build dissenting chapels. To her *entourage* she was both kind and generous, and in her household she insisted on conformance to all the outward decencies. She had a passion for writing very poor stuff, and loved the flattery which Voltaire and her encyclopedists freely lavished on her. Her innate conservatism was shown in her bitter hostility towards the Fr. revolution, as also her unwillingness to proceed to the emancipation of the serfs. See life by Katherine Antony, 1926.

Catherine de' Medici (1519-89), daughter of Lorenzo de' Medici, and wife of Henry II. of France. She was an orphan, and married, in her fourteenth year, the second son of Francis I. For many years she lived childless and obscure, her whole policy as dauphiness being to gain and keep the favour of Diane de Poitiers and the duchesse d'Estampes, the mistresses respectively of her husband and father-in-law. She observed much, however, and gained a keen insight into the intriguing statecraft of the period. During the reigns of her husband and her son, Francis II., her life was little less passive, though she artfully managed to help the schemes of the Huguenots—not out of any sympathy for them, but to play them off against the Guises (uncles of Mary Stuart, wife of Francis II.), whom she hated and feared while appearing to support them. Her one aim was to control the power of the Guises and make her family supreme. On becoming regent at the accession of her second son, Charles IX., she entered upon a course of preposterous cruelty and corruption. Craftily she played with England and Spain, and the Huguenots,

using them unscrupulously to serve her own purposes, stirring up the discord and hatred which culminated in the massacre of St. Bartholomew's Day. She *d.* discouraged and in despair a short time before the assassination of her youngest son, Henry III., leaving the country in a state of anarchy and confusion. C. had all the Medici love for art, and she found time to take an active part in planning the Tuileries, in enriching the Bibliothèque Nationale, etc.

Catherine Hall, identical with St. Catherine's College, Cambridge. The college was opened on St. Catherine's Day, 1473. Its founder was Dr. Robert Woodlark, who had been chancellor of the univ. in 1459 and 1462. The subjects laid down for study were such as tended 'to the exaltation of the Christian faith, the defence and furtherance of Holy Church, the growth of the sciences and faculties of philosophy and sacred theology.' Law, which was becoming a very lucrative profession, was rigorously excluded, as public feeling was strongly against its being combined with the priesthood. The statutes do not specify any other subjects of study, but other instruction, law not excluded, is now given.

Catherine of Aragon (1485-1536), daughter of Ferdinand, king of Spain, and of Isabella of Castile; wife of Henry VIII. of England, and mother of Mary I. C. had first been married to Prince Arthur, eldest son of Henry VII., but was left a widow after five months. Her father refused to pay the rest of her large dowry unless the king would consent to her marriage with Prince Henry. Henry VII. obtained a special dispensation from the pope sanctioning the union. On his accession Henry VIII. had his marriage publicly ratified. After twenty years there was no son, and this, together with the king's affection for Anne Boleyn, made him seek a divorce. After repeated promises of a dispensation from the pope, Henry first married Anne and then convened an eccles. court in London to try the question; the court pronounced his marriage with C. null. C., who had been a faithful wife and good mother, retired with the title of Dowager Princess of Wales. *See* life by G. Mallingy, 1942.

Catherine of Braganza (1638-1705), daughter of King John IV. of Portugal, and wife of Charles II. of Great Britain. C. brought Charles an enormous dowry, together with Bombay and the fortress of Tangier in Africa, but the marriage was exceedingly unpopular in England. It was also very unhappy, for Charles treated his wife with contempt and indifference, and heaped insult upon her. He, however, took her part twice against his infamous court. After a miserable life as 'a stranger in a strange land,' she returned to Portugal in 1693.

Catherine of France, or Valois, daughter of Charles VI. of France (1401-38), married Henry V. of England, as arranged by the treaty of Troyes, 1420. Their son was Henry VI. (1422-61). Henry VII. and the Tudor house were descended from her and her second husband, Owen Tudor.

Catherine Parr, sixth and last wife of Henry VIII., daughter of Sir Thomas Parr. She was a learned woman, well versed in literature and theology, and a zealous Protestant, which made her obnoxious to the Papal party, and also irritated her husband, for she tried to persuade him into completing the work of the Reformation. She was regent during Henry's expedition to France in 1544. After the death of Henry she contracted a marriage—of affection on her part and of interest on his—with Sir Thomas Seymour, lord-admiral of England, who neglected and ill-treated her. She pub. two vols. of devotional writings.

Catheter, instrument used in surgery for the purpose of allowing the passage of fluids through tubes in the body which for some cause have ceased to allow passage naturally. Thus, it is introduced into the urinary bladder of persons unable to pass their urine or into the Eustachian tube when it is stopped up by catarrh. It is a hollow tube made either of silver (by reason of its cleanliness) or of a more flexible material, such as gum elastic or vulcanised rubber. The urinary C. in the male is about 10 in. long and curved into a requisite shape, which in the case of the flexible materials can be produced by warming and bending. In the female the tube is shorter (being only 5 in.) and straighter. The introduction of the instrument must be carefully performed. The Eustachian C., which is generally of silver, is curved slightly at one end and about 7 in. in length.

Cathetometer, instrument for the accurate measure of small differences of height or of level between two near points. It consists of an upright graduated rod, carefully levelled in a vertical position, upon which a horizontal telescope slides up and down. The rod is provided with a vertical scale which indicates the difference of level between the two points under observation and the difference of height between the two objects in the distance traversed by the telescope on the vertical bar. As constructed for the physicist, with numerous additional arrangements to ensure accuracy, such as cross-wires and the micrometer eyepiece of the telescope, the C. records with a high degree of accuracy. One of the most usual uses is to test the difference between the levels of the mercury in the tube and in the cistern of a barometer.

Cathode, or **Kathode**, negative pole of an electric cell, the conductor by which an electric current leaves an electrolyte, and passes over to the negative; the opposite of the anode, which is the positive conductor. *See* under ANODE and ELECTROLYSIS.

Cathode Rays, streams of very swiftly moving particles emitted normally from the surface of the cathode in a vacuum discharge tube. The particles have been demonstrated to possess negative charges and considerable momentum and are known as electrons. A beam of C. R. is deflected by a magnetic field precisely as an electric current would be, i.e. it

moves in a direction at right angles to the beam and to the field. See also RADIO-ACTIVITY.

Catholic Apostolic Church, designation of a body of Christians who are better known under the name of Irvingites, given to them on account of their connection with the Rev. Edward Irving. Irving, when a minister of the Scottish Church, Regent's Park, London, turned in the direction of mysticism. He insisted that the miraculous gifts of the early church were to be continued throughout the new dispensation. Just at the time there came reports of miraculous gifts of healing and of tongues, and his congregation received them as authentic. In 1832, Irving was deposed from the ministry, and formed a congregation which later took to itself the title of C. A. C. This sect does not differ in any of its dogmas from the Church Catholic, but its superadded complicated ministerial arrangements. After Irving's deposition, at meetings held for prayer, certain persons claiming prophetic gifts marked out six others as 'called to be apostles of the Lord.' In 1835 six others were designated in the same manner to complete the number of twelve. These apostles are invested with the special spiritual powers of the apostles; they alone can ordain. To them is committed the discipline of the Church Universal, and the care of the mysteries of God. They alone have the power of interpreting the sayings of the prophets. The apostles then proceeded to ordain others to the ministries of prophets, evangelists, and pastors, and also to choose seven deacons to look after temporal affairs. The duty of the prophets consists in exhorting to holiness, interpreting Scripture, opening prophecies, and explaining symbols. The chief work of the evangelist is missionary endeavour, and the pastor has the charge of individual congregations. The original plan was to form a central governing body of forty-eight apostles to control the Church Universal, but this has never been carried out. The last of the original twelve *d.* on Feb. 3, 1901. The liturgies of the C.A.C. are liturgically excellent, being based on those of the Anglican, E. Orthodox, and Rom. Churches. There is an abundance of ceremonial, an extreme use of symbolism being one of the main features of the cult. In the Brit. Isles the number of adherents of the C. A. C. is 15,000. The church possesses a fine Gothic building in Gordon Square, London, W.C. See G. Miller, *History and Doctrines of Irvingism*, 1878.

Catholic Church (Gk. καθολικός, universal), name adopted in the second century by the Christian Church, to indicate the whole body of believers. It arose in special distinction from the Jewish Church, which was intended for one nation alone, whereas Christianity was for the whole earth. As heresies arose, the great test of the truth came to rest in the unanimity which the various churches founded by the apostles showed where the apostolical traditions had been handed down. Hence the C. C. was the term used to denote the body

of orthodox Christians, in opposition to local sectaries. This notion of orthodoxy acquired prominence in the E. where the Holy Orthodox Church maintains the auct. faith. In the W., the growth of the papacy as the centre of church gov. led to the word Catholic meaning 'in communion with Rome.' When the Reformation came, the Reformers did not all repudiate the term Catholic, and the Eng. Church retained the word in her creeds. But by common consent the word Catholic continued to be applied to the Rom. Church, and this usage generally continues, more especially on the Continent.

Catholic Creditor, in Scots law, where a creditor's debt is charged on sev. different parts of his debtor's property, he is called a C. C. A C. C. may realise simultaneously all his securities if necessary for fully satisfying his debt. But he is bound to allocate his catholic (Gk. καθολικός, universal) debt proportionally against all the secondary creditors affected by it, and not in such a way as to prefer one creditor to another. If he takes full payment out of one security to the exclusion of the other securities, he must assign the other securities to the secondary creditors.

Catholic Emancipation, the freedom from civil disabilities which was granted to Rom. Catholics in the United Kingdom and Ireland at the end of the eighteenth century and beginning of the nineteenth. After the Reformation, Rom. Catholics in both kingdoms suffered under many disabilities and were harassed by numerous penal restrictions and regulations. The saying of mass in England was made felony for a foreigner and high treason for a native. Rom. Catholics were not allowed to purchase land, and persons educated in the Rom. faith were incapable of inheriting property. In Ireland, Rom. Catholics so holding land could be dispossessed without ceremony by the nearest Protestant relative. Rom. Catholics were not allowed to undertake the guardianship even of Rom. Catholic children. In 1780 a Bill by Sir George Saville was introduced to repeal the most oppressive of these regulations in the case of those Rom. Catholics who would submit to a certain test. This test required the denial of various doctrines subversive of the State, such as: that no faith is to be kept with heretics; that princes excommunicated may be deposed or put to death, and that the pope has any temporal jurisdiction in England. The Bill was passed, but the effort to include Scotland under it led to such outbursts of fanaticism that the project had to be dropped. The Gordon Riots in England occurred at the same time out of sympathy. In 1791 another Bill was passed still further alleviating the Rom. Catholic burden, and in 1793 this Act was made to comprehend Scotland. Meanwhile the agitation among Irish Romanists to secure similar concessions was by no means successful, though here the laws were strictest. Attempts had been made in 1780 and the discontent finally broke

out in the rebellion of 1798. In 1824 a Rom. Catholic Association was formed under the influence of O'Connell, stimulated by the fact that many of the reforms which had been promised in order to bring about the Union in 1801 had not been carried out. In 1829, the duke of Wellington reluctantly came to the conclusion that the peace of the empire would be imperilled if the numerous disabilities were not removed, and the Catholic Emancipation Bill was carried, followed in the same year by the Catholic Relief Bill. This gave Rom. Catholics the right to sit in the Houses of Parliament, and gave them admission to most civil offices. At the present time no Rom. Catholic may be sovereign, regent, lord chancellor, lord keeper, of Great Britain, or lord high commissioner to the Church of Scotland.

Catholic Epistles, name given to seven epistles among the canonical books of the N.T. which are addressed to the Church Universal and not to the Christians at particular times. Of the seven epistles, those bearing the names of James, Jude, Peter (2), and John (3), only John 1, and Peter 1. were at first generally received as canonical. The title Catholic distinguishes this group of epistles from those bearing the name of Paul.

Catholics, Old (Ger. Altkatholiken), name assumed by certain Ger. Catholics who, in Aug. 1870, headed by Dr. Dollinger and Prof. Friedrich of Munich, protested against the dogma of the personal infallibility of the pope. An Old Catholic congress was held in 1871 at Munich, and it was resolved to unite as closely as possible with the Jansenists of the Netherlands—the Church of Utrecht. A second congress was held at Cologne in 1872, at which Prof. Friedrich declared the Old Catholics' hostility to the whole papal system. The first Old Catholic synod met at Bonn in 1874, and abolished auricular confession and compulsory fasting and recommended sev. drastic reforms. Later congresses permitted priests to marry. The movement has not increased of late years.

Catholic Truth Society, estab. in Great Britain for the spread of an intelligent comprehension of the Rom. Catholic faith. It was founded in 1872 by Dr. Vaughan, but was revised and enlarged in 1884. Its work is both educational and propagandist. It provides and circulates among Rom. Catholics books of devotion and works of instruction on the faith with polemical works enabling them to defend their position. It also publishes books for Protestants, explaining and defending the faith and practice of the Rom. Church. It also endeavours generally to promote the sale of cheap Catholic books of any kind. All its works are popular, and issued at low prices. The society is non-political, and has the cordial approval and support of eccles. authorities. The head offices are at 38 Eccleston Square, London, S.W.

Catholic University of America. In 1862 the bishops of the U.S.A. desired to found a univ. under Rom. Catholic

auspices, 'in which all branches of literature and science, both sacred and profane, should be taught.' Twenty years later Miss Mary Gwendoline Caldwell of Newport, R.I., gave \$300,000 for this purpose, Pope Leo III. formally approved and the Middleton estate, Washington, was purchased. The School of Sacred Sciences was opened in Caldwell Hall in 1889, and six years later McMahon Hall of Philosophy, Science and Letters, the gift of the Rev. James McMahon. The schools of law formed a separate body between 1896 and 1903. The univ. has full powers to confer degrees, and is under the gov. of the bishops, who have plenary authority in all that pertains to discipline, courses of study, and methods of instruction. It requires all students to take physical training, encourages debating societies, and produces many religious and literary publications. A teachers' college for instructing members of the teaching sisterhoods was approved by Pope Pius X. in 1912, and in 1914 was incorporated as a separate institution, the Catholic Sisters' College.

Catholic University Question (Ireland). The demand by Irish Rom. Catholics for the estab. of a Rom. Catholic univ. began even before the time of Disraeli. Parliament was for years consistently opposed to the proposals for any Rom. Catholic endowment, Disraeli basing his personal opposition to the estab. of a univ. on the support given by the Irish Catholic members to the disendowment of the Protestant Church of Ireland. From 1873 there existed the univ. of Dublin and the Royal Univ., but those institutions failed to satisfy the demands of the Rom. Catholics, who alleged that Dublin Univ. remained practically a private college, and the Royal Univ. no more than preparatory colleges for Dublin. A royal commission was appointed in 1901 to inquire into the C. U. Q. The report of the commission, which had not a single Irish Catholic layman upon it, stated that the Rom. Catholic pop. of Ireland, which was in an overwhelming majority, was without any adequately endowed univ., and pointed out that, apart from any question of denominations, the matter could only be settled definitely by formulating a scheme satisfactory to the Rom. Catholics. The commission recommended the endowment and equipment of a new college in Dublin on the scale required by a univ. college of the first rank, that college to be for Catholics. Notwithstanding these recommendations the C. U. Q. remained in abeyance for two years, when, in 1903, the matter was fully discussed in the debate on the civil services and revenue estimates. Finally, in 1908, the Irish Univ. Act was passed, which provided for the substitution of two new univs. at Dublin and Belfast for the Royal Univ. and Queen's College, Trinity College being left outside the Act altogether. The two new univs. were made self-governing bodies, free from all religious tests as a condition of holding any position in any foundation under the Act.

Catholikos: 1. The title of the head of the Armenian Church. 2. In the later Rom. empire the title was given to the receiver-general, or deputy receiver, in a civil diocese. In its general sense it seems to have been applied to the superintendent-general of missions or of churches on and beyond the borders of the Rom. empire.

Catilla, Lucius Sergius, member of a noble family in Rome who has become famous through the writings of Cicero and Sallust rather than by his own deserving. Born about 109 B.C., he took a prominent part in the civil conflicts in Rome, serving under Sulla. He had high intellectual qualities, great strength of body and mind, courage, civil and military capacity; but with all this he combined a moral depravity which made him disgracefully prominent even in that depraved age. His nature was brutal and savage, and this he stimulated by lustful and bloodthirsty revels on attaining a victory. In 67 B.C. he obtained the office of prætor, and went to govern the prov. of Africa. Here he laid plans for overthrowing the empire, and worked treacherously to gain his ends during Pompey's absence in Asia with the army. Returning from Africa in 66 B.C., he attempted to seize the consulship by open violence. He failed, but tried again and again by conspiracy and force to win it for himself, but he was constantly foiled by Cicero. He fell, still fighting against the forces of the gov., in 62 B.C.

Catillus, fossil genus of molluscs allied to *Crenulata* and *Perna*, received its name from Brongniart. In the chalk occur species of large size, remarkable for their largely fibrous texture, from which circumstance Sowerby called them *Inoceramus*.

Cat Island, see **BAHAMAS**.

Catkin, or Amentum, botanical term applied to an inflorescence which is a crowded, often greenish, more or less pendulous spike bearing male or female flowers. In the oak, hazel, and sweet chestnut there are male catkins, and both male and female in the willow, poplar, and birch.

Catmint, or Catnip, name applied to sev. plants on account of the fondness which cats exhibit for their odour. The term is particularly applied to *Nepeta Cataria*, a species of Labiate which is related to the ground-ivy; the flowers are white, spotted with pink, and are arrayed closely together. Other species of *Nepeta*, such as *N. cærulea*, which bears blue flowers, are called C., while *Anisomeles malabarica* and *Calamintha officinalis*, both belonging to the Labiateæ, receive the names of Malabar C. and medicinal catmint or C. respectively.

Cato, Dionysius, reputed author of *Dionysii Catonis Disticha de Moribus ad Filium*, a book of moral injunctions and precepts which was very popular in the Middle Ages. It was trans. into many languages, and Caxton printed a version at Westminster in 1483. Each apophthegm is enclosed in a couplet of dactylic hexameters. The tone of the book may

be described as monotheistic rather than Christian. There is an amusing reference to it in Chaucer's *Nonne's Tale*. Nothing at all is known of the writer.

Cato, Marcus Porcius (98-48 B.C.), known as Cato the younger, surnamed *Uticensis* (from the place of his death, Rom. statesman. After serving as a military tribune in Macedonia, he gladly renounced fighting for a prov. appointment in Asia, where he learnt so to appreciate the merits of the general, Lucullus, that he gladly supported his claims to a triumph against the vain-glorious ambitions of Pompey. Though he was no politician, Cæsar found it worth his while to dispatch C. on the unpopular mission of subduing Ptolemy in Cyprus, 58 B.C. For C. had unflinchingly opposed, first, his five years' command in Gaul, then his candidature for the consulate in 59, and finally his agrarian laws for rewarding his veterans. C.'s prætorship in 54 was characterised by his sturdy effort to suppress bribery. In 49 he had already decided to retire from public life, when the civil war broke out, and he determined to crush the tyrant Cæsar. Having persuaded the senate to give the supreme command to Pompey, he crossed with the latter to Dyrrhachium, where he remained when his general marched to defeat at Pharsalia. With a remnant of troops, C. crossed the Libyan desert, and shut himself up in Utica until he learnt of Scipio's fall at Thapsus, when he stabbed himself rather than surrender to Cæsar. Addison's tragedy of *Cato* gives a vivid picture of the heroic end of this uncompromising Stoic; his last hour was spent in reading Plato's dialogue on the soul's immortality. Posterity has perhaps magnified his fame because he was the last of the old order of Roms. to die for a national ideal which he could not realise was an anachronism. Nothing gives greater insight into his character than a remark of Cicero's to the effect that he acted as if he were in the republic of Plato instead of in the dregs of that of Romulus.

Cato, Marcus Porcius Censorius (234-149 B.C.), 'the Censor,' Rom. statesman. He was brought up, like his plebeian forefathers, as a farmer, but in consequence of the patronage of L. Valerius Flaccus he became successively quaestor, ædile, prætor (193), and consul at Rome (195) with Flaccus. As a soldier he distinguished himself for his valour and for his extreme severity both during the Punic war and his command of Sardinia. Both in the final defeat of Hannibal at Zama (202) and in the battle of Thermopylæ (191), whereby the Gks. were rescued from the aggressions of the E. conqueror, Antiochus III., he played a conspicuous part, whilst his cruel subjection of the Celtiberians in Spain (194) earned him a triumph. In his projects of reform and in his enmities he showed a like passion and sincerity. It seems certain that he was largely responsible for the prosecution of Scipio Africanus for corruption—during the Carthaginian war he had often reproached the famous general for

his luxury—and his incessant cry of 'Delenda est Carthago' shows how much the prosperity of the rival city had aroused his hatred. His reforms were largely in the shape of sumptuary laws, designed to check the growing extravagance of dress, and banquets. These were carried out during his celebrated censorship, when he also thoroughly revised the senatorial and equestrian lists so as to keep out upstarts and foreigners. Both Cicero and Livy are fond of citing C. as the model of a Rom. citizen in the republican days. His personal integrity and rugged simplicity, his stern sense of duty and rigid discipline, his frank hostility towards the new Hellenic culture, and his narrow patriotism became proverbial. In his contemptuous dismissal of Carneades and the other Gk. philosophers, and in his jealous championship of the family, he showed his extreme conservatism. His *De Re Rustica*, a treatise on agriculture, has literary merits and an historic interest, which cause the reader to regret that his *magnum opus*, entitled *Origines*, which was a comprehensive hist. of Rome, should have been lost.

Catoire, George Lvovitch (1861-1926), Russian composer, *b.* in Moscow. His early work attracted Tchaikovsky's attention and showed his influence, but gradually, C. evolved an individual style, fine and elaborate, especially in his pianoforte quartet and later songs. His pianoforte concerto (E flat) was performed at Queen's Hall, London, in 1920. Became prof. of composition at Moscow Conservatoire. Works include: *Mzyri*, a symphonic poem after Lermontov, many songs and choruses, and two violin sonatas.

Catoptrics, that part of the science of light or optics which deals with the laws of reflection. See REFLECTION, LIGHT.

Catorce, tn. of Mexico, in the state of San Luis Potosí, 120 m. N. of the tn. of that name. It is noted as a silver and tin mining centre, and has numerous smelting works. Pop. 20,700.

Catostomus, genus of fishes of the family Cyprinidae, which are peculiar to the rivs. of N. America. They are distinguished from their ally, the carp, by having their lips thick and pendent, no barbels, a long dorsal and a short anal fin.

Cato Street Conspiracy, plot formed in London in 1820 to murder Lord Castle-reagh and the rest of the ministers at a dinner at Lord Harrowby's on Feb. 23, to set fire to London, to seize the Bank and the Mansion House, and proclaim a provisional gov. The plot was revealed to the police by one of the conspirators named Edwards, and the ringleaders were arrested. Thistlewood, the chief, Ings, Brunt, Tidd, and Davidson were hanged, and five others transported for life. The plot was so called from the place of meeting in Cato Street, Edgware Road.

Catrail, known as the Plot's Work; the name given to an earthenwork, consisting of a ditch with a rampart on either side with a breadth of from 20 to 26 ft. and 60 m. in length, which extends from

near Galashiels, through Selkirk and Roxburgh, to Peel Fell in the Cheviots. For an account of the various theories about the C., see *Blackwood's Magazine*, 1888.

Catrine, tn. in Ayrshire, Scotland, 2½ m. E.S.E. of Mauchline. It manufs. cotton. Pop. 3000.

Cats, Jakob (1577-1660), Dutch poet and humorist, studied law at Leyden, and later won renown as an advocate for his defence of a witch. Part of his life was spent on a farm at Grijskerke in Zeeland. Driven from his farm by the collapse of the dykes, he was for some time stipendiary magistrate at Middelburg and Dort, whilst in 1636 he became grand pensionary of Holland, and twelve years later keeper of the great seal. A knight-hood was one result of his embassy to Charles I. of England in 1627. The somewhat archaic character of his style and subjects has deterred many a student from reading his poems. He was by creed an Orangeman and a Calvinist, and enjoyed for many years a great vogue. His *Houwelijk* (1625), and the *Trouwlingh* (1637), a collection of tales about curious marriages, as well as his *Spiegel van den ouden en nieuwen Tijd* (1632) well represent the purity of his morals and diction, his homely wit and power of shrewd observation. His *Complete Works* in 19 vols., were issued in 1790-1800. See also Piggott, *Moral Emblems, with Aphorisms, etc., from Jacob Cats*, 1860.

Cat's-eye, stone so called from its likeness to a cat's eye. It is another variety of chrysoberyl, and is found in Ceylon, China, Brazil, and Malabar. The stone, when cut only but not polished, if the structural arrangement is perfect, produces a narrow and distinct line of light which much resembles that emanating from the interior of the eye of a cat. The colour of the stone varies; it is grey, brown, and black, with yellowish or greenish tints, or sometimes it is the palest apple-green or a deep olive colour. The line of light when held in front of the eye should cross the centre of the dome and be narrow and well defined. The chatoyant line is usually white. The hardness of the C. is 8.5, and the sp. gr. 3.5 to 3.8. The lustre is brilliant with iridescent ray—the cleavage is imperfect, the fracture conchoidal. It is, moreover, doubly refractive. It is soluble with borax or salts of phosphorus, but untouched by acids. There are three varieties of C. Quartz C. is softer, 7 instead of 8.5, and it is less lustrous than the C. belonging to the chrysoberyl variety. There is also Crocidolite C. or tiger's-eye, which is cut and artificially coloured. It is a much softer stone and of a silky lustre.

Catskill Mountains, large range of well-wooded mts. belonging to the Appalachian system of N. America; they are situated chiefly in Greene Co. and form one of the most beautiful situations in America. Their sides are very steep, and they attain to a height of nearly 4000 ft. in some places. The chief peaks are Round Top Peak and Overlook Peak.

An hotel, erected on the last-named peak, stands at an elevation of 3800 ft. The vil. of C. lies in the state of New York, and is 34 m. distant from Albany. It is the cap. of Greene Co., and is hilly, with irregular roads.

Cat's-tail Grass, or Timothy Grass, popular name of *Phleum pratense*, a species of Gramineæ which flourishes in all temperate countries but Australia, and affords good fodder. The inflorescence has free glumes and two distinct paleæ.

Catt, Carrie Chapman (1859-1947), Amer. suffragist, b. at Ripon, Wisconsin, U.S.A. After being educated at Iowa State College and taking a special course in law, she became superintendent of schools in Mason City, Iowa. She organised the Iowa Woman Suffrage Association in 1890, and then transferred her activities to the National Amer. Woman Suffrage Alliance. She served as president of that body 1900-04, and was again elected in 1915. Later, she became the leader in the campaign to submit a woman suffrage amendment to the Federal Constitution. This was adopted by Congress in 1919 and ratified by the necessary number of states in 1920. This gave the franchise to every female in the U.S.A. after she attained her twenty-first year. Mrs. C. was chosen president of the International Woman Suffrage Alliance 1904-23. In 1930 she won a \$5000 *Victoria Review* award for 'outstanding achievement' and another award in 1933 for bringing about a better understanding between Jews and Christians. In 1935 the Turkish Gov. issued a postage stamp bearing her portrait in honour of her position as head of the International Woman Suffrage Alliance. Awarded medal of the National Institute of Social Science, 1940.

Cattaro or Kotor: 1. Fortified Yugoslavian seaport in Dalmatia, at the head of the gulf of C., 40 m. S.E. of Ragusa, lying between the Montenegrin mts. and the Adriatic. The tn., besides being a strongly fortified military station, has a cathedral and a naval school, and gives its name to a see in both Rome and Gk. Churches. One time the cap. of a small independent state, C. in 1420 joined the Venetian republic, but was ceded to Austria in 1814 by the treaty of Vienna. Twice the tn. has been almost destroyed by earthquake, in 1503 and 1667. During the First World War C. was the base of the Austrian submarines; it was occupied by the It. in Nov. 1918, and in 1919 was given to Yugoslavia. Pop. 5000. 2. The gulf of C., a wide inlet of the Adriatic, length 20 m., and depth 15 to 20 fathoms, consists of three basins connected by narrow straits.

Cattegat, arm of the North Sea, some 150 m. in length, joining the Skagerrak on the N. and the Baltic on the S., and bounded E. and W. by Sweden and Jutland respectively. Its sandbanks endanger navigation.

Cattermole, George (1800-68), Eng. painter, b. near Diss in Norfolk. He became an associate of the Water-Colour Society in 1822; received a first-class gold

medal at the Paris Exhibition in 1855; studied oil painting in later years; illustrated the Waverley Novels and other books.

Catterick, vil. in the N. Riding of Yorkshire, England, 4 m. S.E. of Richmond. Near it is a large camp of the Brit. Army. There is also a race-course. Pop. 700.

Catti, or Chatti, anct. Ger. people who lived in a dist. round the higher reaches of the Weser, etc., corresponding roughly to the modern Hesse. In the first two centuries A.D. they frequently fought against Rome and were finally incorporated with the Franks in Clovis's kingdom.

Cattle. The influence of Brit. breeds of C. has been felt in all parts of the world, which in itself is evidence of their value. The Shorthorn is the most cosmopolitan breed, and the most commonly distributed in these is. In most parts of the world, except its place of origin, the Shorthorn is called the Durham breed—a more suitable term because Shorthorn applies to a number of other breeds. There are many other breeds, each having valuable characteristics developed from the unimproved condition in which they were found subsequently to the first great improvement wrought in the Longhorn breed by Bakewell in the latter half of the eighteenth century. There is little use in discussing breeds previously to this period, for, on the whole, the origin of Brit. breeds from the earliest periods is still a subject of debate. Gradually, in accordance with soil and climate, local breeds—some widely spread—had estab. themselves, and where the locality, dist., or area was very similar over a sufficiently extensive country, animals acquired indigenous features and characteristics which stamped them as breeds recognisable by certain peculiarities. There were, however, many parts of the country where the soil was so diversified that no special type was found. In dists. where the soil varies frequently, and consistency in breed is met with in only small areas, outside breeds have to be adopted, whether for meat production, milk producing, or both. The Shorthorn, in particular, adapts itself to such areas, and it is found in all parts of the country. These dists. are also much associated with the breeding of cross-breeds.

C. are kept with two main objects, production of beef and of milk, or both, and a very common div. of the breeds is made in accordance with these. In this connection, the term improved C. may be explained. Unimproved C., as a rule, fatten, and mature slowly, and yield a moderate supply of milk. The object of the breed maker or breed improver is to select animals which conduce to one or both of these purposes. To a great extent these two purposes are antagonistic, and where the objective is the development of beef, with its necessary accompaniment of early maturity, the milking properties are usually deteriorated; whilst it is only the exceptional animal which combines high milking

'Farmer and Stockbreeder'

- 1, Ayrshire, in calf
- 3, Jersey.
- 5, Shorthorn
- 7, Hereford heifer

- 2, British Friesian bull
- 4, Guernsey.
- 6, Red Poll
- 8, Devon bull.

properties with good meat-making qualities. The fusing of these two properties, especially in the Shorthorn, has met with success. It may be noted here that some continental breeds have superior milking properties to the generality of Brit. breeds. Brit. breeds have always shown an aptitude to produce meat, and whilst the pop. of these is. was comparatively small, and beef rather than milk was needed, Brit. breeders were right in paying more attention to beef. But the increase in pop. and in milk consumption has turned the modern farmer towards increasing the milking properties. Few would include in the div. of breeds more than the Shorthorn (either Coates or the Lincoln Red) and the Red Polls as dual-purpose breeds; though, despite their small size, Dexters are equally entitled to the claim. The animals of heavy build, emphasising the features of meat-producers, are the Hereford, Aberdeen Angus, Devon, Sussex, Longhorns, Welsh C., Galloways, and W. Highlanders. The light breeds yielding exceptional quantities of milk in ratio to their weight are the Jerseys, Guernseys, Ayrshires, Brit. Friesians, and Kerries. Among minor breeds with little influence outside the dist. to which they are indigenous are Zetland or Shetland C.

Pure breeds are in relatively small proportions to cross-breeds, or the animals of which the pedigree cannot be traced, though classed as belonging to the breeds to which they approximate. Animals, however, may be pure bred although the pedigree may not have been kept, provided the dam is the offspring of five generations of dams sired by a pedigreed bull. A pedigree is valuable when it records skilled mating and selection over a long period, but if it records the results of unskilled mating it may be harmful; for if bad features are perpetuated for a long series of generations, they become estab. to the prejudice of the offspring. It has been said that the Shorthorn is the most cosmopolitan breed. This results from the sev. breeds, including some of continental source, which went to form the Durham breed, subsequently known as the Shorthorn. As a grazing beast the Shorthorn is seen at its best on rich pastures. It is really a very highly bred animal, and, if pasturage is very good is sure to do well; but it is not the best breed on many poor pastures. It is difficult to draw hard and fast conclusions, because experience affords conflicting evidence; but except on the richest pastures, the Shorthorn is not so well adapted to very heavy land as are the native breeds of middle horns. This is illustrated by the Sussex breed in Sussex, the Devon in Devon, the Hereford in Hereford and on the Red Sandstone generally. Climatic conditions also have their influence, and the short-coated Shorthorn does not thrive so well under the same exposure as the long-coated W. Highlander. Nor is the Shorthorn generally so well suited to the high and wet hills as local breeds which have become acclimatised. It is evident,

therefore, that where the animals have to spend a considerable portion of the year on pasturage, no one breed can be regarded as universally the best; though it may be said that the Shorthorn is the best over the greatest area. The Hereford, the Welsh, the Sussex, and the W. Highlanders may be taken as examples of breeds which thrive well on rough grazing in winter time, even outside their indigenous dists. But the grazing value of a breed does not altogether settle its commercial value for the farmer: the yarding capabilities have to be taken into consideration, more especially where the grazing season is short and the yarding season is long, as in the bigger arable dists., where winter grazing is almost impossible, and where C. must feed on swedes or mangold and hay. Here the Shorthorn makes its special value felt, as does the Polled Angus, another splendid beef. The Hereford, Devon, Sussex, Galloway, Red Poll, and Welsh (both the N. and S. Wales or Anglesey and Castle Martins) yard well. The grazing cos. are the rearing homes of the greatest number of calves, though, of course, dairying dists. are the chief breeding grounds. At the same time large numbers of calves are taken from their mothers very soon after birth, and are sent long distances to be weaned. The calves from the great milking dists. of the vale of Aylesbury, Somerset, Cumberland, and other places are in great demand among raisers of heifers in other parts because of the good type of cow kept there. Farmers raising their own stock are as a rule very careful in their breeding; but the methods of the dairyman and small-holder, as a rule, have not always been above criticism. There is no economy, and, indeed, great harm may lie, in using other than well-bred bulls. The application of artificial insemination to C. breeding has been taken up in recent years in many countries. By this means the services of the best pedigree bulls are available for breeders, resulting in calves being superior to their dams, and herds developing into first-class C. The artificial insemination centres of the Brit. Milk Marketing Board provide inseminations for both beef and milk breeds.

The cow carries her young nine months, and it is regarded as being best to arrange the date of her first calving about May, so that by gaining about two months in each year the calving will work back into the winter months by the time she is in full profit. A cow is regarded as at full profit at her third calf, and if she is bred from regularly, the next four calves go further back, so that the period when she gives her fullest yield will be at the time of year when milk is most valuable. Ordinarily the lighter-framed milking breeds, which have little value comparatively when fat, are bred from when youngest, many stock-raisers thinking that from two years to two and a quarter years is best; but some keepers of heavier breeds think three years best. Where animals are bred from when young it is necessary to keep them better than

when they are older and have less growth to make. Helpers need to be strong when they breed, and should not be allowed to get into poor condition. Some cows dry off very early, and have a long off-lying period, during the first part of which they may be kept on moderate diet, but cows which milk but a short period (except through some special cause, such as illness, prematurely stopping the milk flow) are rarely worth keeping on. On the other hand, some of the very highest-bred beef-making cows, valuable for that very purpose, often milk but a short time. As the time for calving approaches the udder and teats enlarge and become firm. The appearance of the water bladder indicates immediate calving. After calving, a thin bran mash, or water containing a little oatmeal, should be given, though when greatly distressed gruel well fortified by whisky or beer should be administered. The cow-keeper's great fear is that his cows may abort or present their calves when immature. This often takes a contagious form, causing severe loss over years, and when this occurs those who are not acquainted with the necessary treatment should at once consult a veterinary surgeon. When the weather is at all fair, it is well to let the cow calve in the open, as on grass the calf is less liable to contract diseases through contact with germs, which may accumulate about buildings where cows frequently calve, and which often attack through the navel of newly born calves. To guard further against germ attack, the calf should be placed at once on a clean sheet, and the navel be dressed with antiseptic, such as carbolic oil, dilute lysol, etc. The calf should be allowed to suckle the cow as soon as it can stand, and weakly calves should have the milk squirted or spooned into the mouth, for it rapidly invigorates them. The first milk, called colostrum or beistings, is a special provision of nature suited to the digestion of the infant calf, and is very rich; and certainly calves which have the colostrum are less liable to constipation than those fed on milk from staler cows. The cow will instinctively lick a newly born calf whilst it is in a slimy condition, and it is well it should, as it acts as a form of massage, stimulating the vitality of the calf, and is generally accepted as being beneficial to the cow. Cows sometimes become very excited on first seeing the calf, and maternal solicitude and pleasure may be shown in the unpleasant form of tossing or kneeling on it, to which the calf quickly succumbs. It is therefore well to be acquainted with the hist. of the animal. Until more recent years there was great loss of cows which 'dropped' after calving; i.e. had milk fever or parturient apoplexy. Injections of iodine of potassium into the teats inaugurated successful treatment by injection, but other substances such as lysol have been successfully used, and now ordinary atmospheric air or pure oxygen gas is found to be efficacious, with or without a drug. Cows sometimes

'drop' from other causes than parturient apoplexy, and simple remedies and attention will get them on their legs again. Amateurs who practise the injection method should be fully impressed with the need thoroughly to disinfect everything associated with the process. When calves are brought up by suckling their mothers, rearing is comparatively simple. It is expected of a cow that she will maintain her calf and give a considerable quantity of milk besides; in fact it is a poor milker which will not rear two at once. Many farmers make a cow rear five during the course of a milking period: two during the first three months, two during the next three, and one subsequently. A calf at three months can be maintained without milk, as by that time it gets a good digestion, and with fresh grass and a little additional food, such as finely broken linseed cake, will do well, though if skim or separated milk is available it will be greatly to the advantage of the calf. If there is no separated milk given, linseed-cake meal and linseed should form the chief basis of the gruel, and a little sago is useful to prevent scour. Many calf-rearers make a mistake in giving hay too early; it is best withheld until the sixth week; but, under the impression that because hay is dry it will stop scour, some rearers give it freely, with the result that the digestion is overtaxed. Calves at first should be fed at least three times a day, and cleanliness must be observed in every way. Though rather more costly than simple mixtures made on the farm, unless the feeder can be relied upon to make his mixtures properly, some of the calf foods sold as proprietary articles are safer, and it is wiser to use them in such cases. A large number of calves die from being too generously fed when they have been unduly fasted; this often occurs when freshly calved calves are exposed in markets, or are sent long journeys to be reared. In such cases, allowing them as much milk as they will take is a form of killing by kindness. Scour is always the dread of the calf-rearer, whether it comes from chill, injudicious feeding, over-exercise, fright, or from contagion. A good scour mixture should always be at hand, and nothing is better than one composed as follows: Compound tincture of morphia and chloroform, 4 dr.; liquid bismuth, 4 dr.; oil of cloves, 1 dr.; cooled linseed tea, 7 oz.; the dose being a tablespoonful every eight hours.

The treatment of the calf after weaning, and when it is independent of the cow and hand-feeding, may differ considerably, according to the object in view. The practice of allowing the calf to suckle until it is a year old, as is done with some of the highly bred animals intended for show purposes, is not possible with ordinary stock to be sold as beef; though those animals which are brought to considerable weights at a year or a few months older necessarily require to be fed at high pressure from birth to butcher. Winter calves do well at grass during the early summer, and in mild climates,

where there is no fear of the husk worm, they may remain out until October, but in cooler dists., where the land is wet and liable to husk, it is found advisable to take them in by mid Aug. or Sept., or as soon as fogs keep the grass wet. Many rearers prefer to keep the calves in throughout summer, but provided there is shelter from sun there is no objection to even young calves being out in June and July. When calves from six months upwards come into the yards they naturally receive winter fare of hay, roots, and finely ground cake; though if they receive chaffed hay or oat straw, a small quantity of meal can be given to encourage their eating it. In the second year's grazing it is not necessary to give any extra food during summer, though it is not unprofitable to give a small quantity of cake, especially if it is desired to get the stock out early. In some dists. young stock receiving a little cake on grass, with a small quantity of hay in severe weather, if provided with shelter against wet or bad weather, will thrive well up to Jan. In other dists. young stock is rarely seen on the grass after the early part of Oct. In the second winter, when run as stores, the animals often get nothing but the browsing of straw with roots, and 3 or 4 lb. of cake, and will do well on it. Some pastures will fatten out two- to three-year-old C. during summer without any help, and a pasture reaches the high-water mark of grazing if it will fatten out a big beast to the acre without aid. It is customary to put those most forward in condition on to the richest grazings, so that they will come on the market as quickly as possible; because early summer meat generally sells well, as there is often a gap between the time when the yarded beasts are finished and that when the grazed beasts are ready. The second grade of C. will be fattened out after July, and up to the time when those to be fattened in the yards in winter are taken in. The falling powers of the grass will generally occasion the need for help as the season advances. The winter feeding does not materially differ from that of the previous year, except that the animals require more, and will consume, according to size, 50 to 80 lb. of roots per day, and in some cases as much as a hundredweight is satisfactorily given. The hay allowance may run to a stone per day, and chaffed straw to about the same weight or more. The cake allowance may start at 6 lb., and be increased to 8 lb., adding as much meal. Very much higher quantities are occasionally given, but there is no compensatory equivalent in return for the outlay. It is certainly a mistake to increase the quantity of a rich cake, such as linseed, beyond 8 lb. Such increase as is made should be in the starchy or carbonaceous foods, otherwise there will be great liability to scour, which is nature's method of relieving the system from overfeeding. Linseed cake is highly nitrogenous, and if too much nitrogen gets into the blood it is poisoned through being overazotised, so that the animal is liable to apoplexy. However,

the system generally revolts and prevents the digestion of more than is food for the beast by passing it rapidly through the intestines.

In all matters of C.-keeping the farmer has to be guided by his purpose and the nature of the food available. For this reason hard and fast rules cannot be laid down. The farmer considers whether it will pay him best to maintain his animals mainly on the raw material the farm provides, keeping them to an older age and then fattening them out, with a short period of healthy feeding, or whether he will rely largely on purchased concentrated foods. In the one case he keeps his animals as stores in good going condition; in the other he feeds them at high pressure, giving much concentrated food throughout their lives. Often the relative value of store stock and fat stock will make him alter his ordinary course. The buying of cattle at their proper value, of course, has a great effect on the profit of feeding. In some places animals are bought on their live weight, being weighed before being offered for sale; but this is by no means general. The weighbridge is an undoubted aid to the ordinary purchaser, but though he knows the weight, he still has to recognise the growing capabilities, the feeding powers, and the quality of the meat which will result. As regards indications of growth, animals that will grow well are generally long in the frame. Furthermore, the skin and hair as results of breeding and selection indicate thriving or lack of power to thrive. In the thrifty animal the skin is loose on the ribs when gripped by the fingers, readily lifting; moreover, when the lifted portion is rubbed between the tips of the thumb and finger it has a soft unctuous feel. A skin of this sort, as a rule, carries a nice soft hair, plentiful and not harsh. A good thriving animal has a big heart girth—that is, the measurement round the body behind the shoulders is big, the ribs are well sprung, and the hinder quarter from the shoulder back to the tail is full, as should be the round and buttocks—that is, the parts below the tail to the hocks. The top line and the belly line should be parallel, and from the setting on of the neck the fore part of the carcass should be well square with the hind quarter, giving the impression of a long, deep parallelogram. The fore part of the animal carries the least valuable meat, but beasts poorly developed in front rarely make good beefers. The strictly milking breeds are light in the fore quarters and full in the hind, gradually deepening from front to rear, thus providing ample room for digestion and for milk making—suggesting a wedge in shape. Looked at from behind over the back, the milking cow runs fine over the withers or shoulders, gradually widening, so as to show great width over the hips, suggesting yet another wedge shape. These two are described as giving the double wedge which a milking cow should possess.

Tuberculosis in Cattle.—Tuberculosis assumes its most serious form in the udder, the average in number affected in

England and Wales being one in five hundred; but the percentage differs in different dists., age and conditions of maintenance being important factors. Where a system of veterinary inspection is carried out, few animals are affected. In the industrial tns., statistics show that a proportion of raw milk, varying in different places from 2 to over 10 per cent, contains living tubercle bacilli. Some 5 to 6 per cent of all deaths from tuberculosis are due to the bovine type of bacillus, and some 2000 deaths, mainly of infants, in England and Wales occur annually from this cause. But in recent years there has been a steady increase in the supply of milk from tuberculin-treated herds.
